## TABLE OF CONTENTS

Inorganic Chemistry ..... 1
Organic Chemistry ..... 6
Physical Chemistry ..... 10
Fluid Flow ..... 14
Heat Transfer ..... 18
Distillation ..... 23
Mass Transfer ..... 26
Thermodynamics ..... 29
Kinetics and Reactor Design ..... 34
Conversion Factors ..... 40
Physical Constants ..... 44
Greek Alphabet ..... 48
Mathematics ..... 48
Chemical Process Safety ..... 51
Biochemical Engineering ..... 53

## Foreword

The purpose of this handbook is to make readily available in a limited number of pages some of the more important chemical, biological, physical, safety, and mathematical data and concepts that are fundamental to the practice of the chemical engineering profession.

With these principles you should be able to solve many chemical engineering problems.

## Good Luck!

AIChE would like to thank Professors David Murhammer, Chuck Coronella, Galen Suppes, and Joseph F. Louvar for their work on this Handbook.

## I. COMMON DEFINITIONS

Atomic number-the number of protons in the nucleus of an atom.
Avogadro's number-the number of molecules $\left(6.023 \times 10^{23}\right)$ in one gram-mole of a substance.
Equilibrium constants for the reaction $a A+b B=$ $c C+d D$
where reaction is in solution,

$$
K_{c}=\frac{[C]^{c}[D]^{d}}{[A]^{a}[B]^{b}} \quad \text { ([ ] refers to molarity) }
$$

where reaction is in the gas phase,

$$
K_{p}=\frac{p_{C}^{c} p_{D}^{d}}{p_{A}^{a} p_{B}^{b}} \quad(p=\text { partial pressure })
$$

Gram equivalent weight-
A. (nonredox reaction) the mass in grams of a substance equivalent to 1 gram-atom of hydrogen, 0.5 gram-atom of oxygen, or 1 gram-ion of the hydroxyl ion. It can be determined by dividing the molecular weight by the number of hydrogen atoms or hydroxyl ions (or their equivalent) supplied or required by the molecule in a given reaction.
B. (redox reaction) the molecular weight in grams divided by the change in oxidation state.
Ion product of water $\left(K_{w}\right)$-the product of the hydrogen ion and hydroxyl ion concentrations in gram-ions per liter;

$$
K_{w}=\left[\mathrm{H}^{+}\right]\left[\mathrm{OH}^{-}\right]
$$

Mass number-the number of protons plus the number of neutrons in the nucleus of an atom.
Molality (m)—(gram moles of solute)/(kilograms of solvent).
Molarity (M)—(gram moles of solute)/(liters of solution).
Normality (N)—(gram equivalents of solute)/(liters of solution).
Oxidation-the loss of electrons by an atom or group of atoms.
$p \mathrm{H}$-the negative logarithm (base 10) of the hydrogen ion concentration in gram ions per liter;

$$
p \mathrm{H}=-\log _{10}\left[\mathrm{H}^{+}\right]
$$

Reduction-the gain of electrons by an atom or group of atoms.
Solubility product (S.P. or $K_{\text {sp }}$ )—for the slightly soluble solid, $A_{a} B_{b}$, dissolving

$$
\begin{aligned}
& A_{a} B_{b}(\text { solid })=a A^{+}(\mathrm{aq})+b B^{-}(\mathrm{aq}) \\
& \quad \text { where } A^{+} \text {is any cation and } B^{-} \text {is any } \\
& \text { anion }
\end{aligned}
$$

S.P. or $K_{\mathrm{sp}}=\left[A^{+}\right]^{a}\left[B^{-}\right]^{b}=$ a constant at a given temperature

## II. PROPERTIES OF CHEMICAL ELEMENTS

| Name | Symbol | Atomic <br> Number | Atomic <br> Weight | Common <br> Valence |
| :--- | :---: | :---: | :---: | :---: |
| Actinium | Ac | 89 | $(227)$ | 3 |
| Aluminum | Al | 13 | 26.9815 | 3 |
| Americium | Am | 95 | $(243)$ | $6,5,4,3$ |
| Antimony | Sb | 51 | 121.75 | $\pm 3,5$ |

| Name | Symbol | Atomic Number | Atomic Weight | Common Valence |
| :---: | :---: | :---: | :---: | :---: |
| Argon | Ar | 18 | 39.948 | 0 |
| Arsenic | As | 33 | 74.9216 | $\pm 3,5$ |
| Astatine | At | 85 | (210) | $\pm 1,3,5,7$ |
| Barium | Ba | 56 | 137.34 | 2 |
| Berkelium | Bk | 97 | (247) | 4,3 |
| Beryllium | Be | 4 | 9.0122 | 2 |
| Bismuth | Bi | 83 | 208.980 | 3,5 |
| Boron | B | 5 | 10.811 | 3 |
| Bromine | Br | 35 | 79.904 | $\pm 1,5$ |
| Cadmium | Cd | 48 | 112.40 | 2 |
| Calcium | Ca | 20 | 40.08 | 2 |
| Californium | Cf | 98 | (249) | 3 |
| Carbon | C | 6 | 12.01115 | $\pm 4,2$ |
| Cerium | Ce | 58 | 140.12 | 3,4 |
| Cesium | Cs | 55 | 132.905 | 1 |
| Chlorine | Cl | 17 | 35.453 | $\pm 1,3,5,7$ |
| Chromium | Cr | 24 | 51.996 | 6,2,3 |
| Cobalt | Co | 27 | 58.9332 | 2,3 |
| Copper | Cu | 29 | 63.546 | 2,1 |
| Curium | Cm | 96 | (247) | 3 |
| Dysprosium | Dy | 66 | 162.50 | 3 |
| Einsteinium | Es | 99 | (254) | - |
| Erbium | Er | 68 | 167.26 | 3 |

| Rubidium | Rb | 37 | 85.47 | 1 |
| Ruthenium | Ru | 44 | 101.07 | 2,3,4,6,8 |
| Samarium | Sm | 62 | 150.35 | 3,2 |
| Scandium | Sc | 21 | 44.956 | 3 |
| Selenium | Se | 34 | 78.96 | -2,4,5 |
| Silicon | Si | 14 | 28.086 | 4 |
| Silver | Ag | 47 | 107.870 | 1 |
| Sodium | Na | 11 | 22.9898 | 1 |
| Strontium | Sr | 38 | 87.62 | 2 |
| Sulfur | S | 16 | 32.064 | $\pm 2,4,6$ |
| Tantalum | Ta | 73 | 180.948 | 5 |
| Technetium | Tc | 43 | (98) | 7 |
| Tellurium | Te | 52 | 127.60 | -2,4,6 |
| Terbium | Tb | 65 | 158.924 | 3,4 |
| Thallium | Tl | 81 | 204.37 | 3,1 |
| Thorium | Th | 90 | 232.038 | 4 |
| Thulium | Tm | 69 | 168.934 | 3,2 |
| Tin | Sn | 50 | 118.69 | 4,2 |
| Titanium | Ti | 22 | 47.90 | 4,3 |
| Tungsten | W | 74 | 183.85 | 6,5,4,3,2 |
| Uranium | U | 92 | 238.03 | 6,5,4,3 |
| Vanadium | V | 23 | 50.942 | 5,4,3,2 |
| Xenon | Xe | 54 | 131.30 | 0 |
| Ytterbium | Yb | 70 | 173.04 | 3,2 |
| Yttrium | Y | 39 | 88.905 | 3 |
| Zinc | Zn | 30 | 65.37 | 2 |
| Zirconium | Zr | 40 | 91.22 | 4 |

III. COMMON ANIONS

| Name | Symbol | Name | Symbol |
| :---: | :---: | :---: | :---: |
| Arsenite | $\mathrm{AsO}_{3}{ }^{=}$ | Hydroxide | $\mathrm{OH}^{-}$ |
| Arsenate | $\mathrm{AsO}_{4}{ }^{=}$ | Hypochlorite | $\mathrm{OCl}^{-}$ |
| Acetate | $\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{O}_{2}{ }^{-}$ | Iodide | $\mathrm{I}^{-}$ |
| Bicarbonate | $\mathrm{HCO}_{3}{ }^{-}$ | Iodate | $\mathrm{IO}_{3}{ }^{-}$ |
| Bisulfate | $\mathrm{HSO}_{4}{ }^{-}$ | Molybdate | $\mathrm{MoO}_{4}{ }^{-}$ |
| Bromate | $\mathrm{BrO}_{3}{ }^{-}$ | Nitrate | $\mathrm{NO}_{3}{ }^{-}$ |
| Bromide | $\mathrm{Br}^{-}$ | Nitrite | $\mathrm{NO}_{2}{ }^{-}$ |
| Carbonate | $\mathrm{CO}_{3}{ }^{-}$ | Oxalate | $\mathrm{C}_{2} \mathrm{O}_{4}{ }^{-}$ |
| Chlorate | $\mathrm{ClO}_{3}{ }^{-}$ | Perchlorate | $\mathrm{ClO}_{4}{ }^{-}$ |
| Chloride | $\mathrm{Cl}^{-}$ | Peroxide | $\mathrm{O}_{2}=$ |
| Chromate | $\mathrm{CrO}_{4}{ }^{-}$ | Permanganate | $\mathrm{MnO}_{4}{ }^{-}$ |
| Cyanamide | $\mathrm{CN}_{2}{ }^{-}$ | Phosphate | $\mathrm{PO}_{4}{ }^{=}$ |
| Cyanide | $\mathrm{CN}^{-}$ | Sulfate | $\mathrm{SO}_{4}{ }^{-}$ |
| Dichromate | $\mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{\text {a }}$ | Sulfide | $\mathrm{S}^{-}$ |
| Dithionate | $\mathrm{S}_{2} \mathrm{O}_{6}{ }^{-}$ | Sulfite | $\mathrm{SO}_{3}{ }^{-}$ |
| Ferricyanide | $\mathrm{Fe}(\mathrm{CN})_{6}{ }^{=}$ | Thiocyanate | CNS ${ }^{-}$ |
| Ferrocyanide | $\mathrm{Fe}(\mathrm{CN})_{6}{ }^{=}$ | Thiosulfate | $\mathrm{S}_{2} \mathrm{O}_{3}{ }^{=}$ |
| Formate | $\mathrm{CHO}_{2}{ }^{-}$ |  |  |

## ORGANIC CHEMISTRY

Note: For conciseness the following symbols are used:
$R=\mathrm{H}$ atom or saturated hydrocarbon group
$R^{\prime}=$ hydrocarbon group only
$X=$ halogen
$n=$ an integer
I. GENERAL CLASSES OF COMPOUNDS
A. The straight and branched chain types of compounds

Type or Name

1. Alkane or paraffin
(also saturated hydrocarbons)
2. Alkene or olefin
(unsaturated
hydrocarbons)
3. Alkyne
4. Alcohol
5. Ether
6. Aldehyde
7. Ketone
8. Carboxylic Acid
9. Grignard reagent
10. Acyl halide

General Formula

$\mathrm{R}^{\prime}-\mathrm{O}-\mathrm{R}^{\prime}$

Type or Name
11. Anhydride
12. Ester

13. Amide

14. Amine (base)
15. Nitrile
B. Cyclic Compounds

## 1. Cycloparaffin

2. Cycloalkene

3. Aromatic

4. Naphthalenic

II. PERTINENT NOTES
A. Markovnikov's (Markownikoff's) Rule for the addition of acids to acids to olefins: the negative group of the acid adds to the carbon atom having the fewest hydrogen atoms.
B. Mechanisms

1. Free radical (unshared electron)

2. Carbonium ion (deficient in electrons) (positive charge)
$\mathrm{R}: \mathrm{C}^{+}$ (carbon with six electrons)
3. Carbanion
(excess of electrons)
(negative charge) R
$\mathrm{R}: \mathrm{C}^{-}$
R (carbon with eight electrons)

## PHYSICAL CHEMISTRY

1. Amagat's Law of Partial Volumes-The volume of a mixture of gases is equal to the sum of the partial volumes of each component gas. The partial volume of a component gas is the volume which that component would occupy at the same temperature and pressure.
2. Boiling Point Elevation $\left(\Delta T_{b}\right)$ —The following equations hold for a dilute solution of a nonionic nonvolatile solute.

$$
\begin{aligned}
\Delta T_{b} & =K_{b} m \\
K_{b} & =\frac{R\left(T_{b p}\right)^{2} M_{a}}{\Delta H_{v}(1000)}
\end{aligned}
$$

where $\Delta H_{v}=$ molal heat of vaporization
$K_{b}=$ molal boiling point elevation constant
$\mathrm{m}=$ molality
$M_{a}=$ solvent molecular weight

$$
\begin{aligned}
R= & \text { ideal-gas constant } \\
T_{b p}= & \text { solvent boiling point, absolute tem- } \\
& \text { perature }
\end{aligned}
$$

3. Clausius Equation

$$
\frac{d p}{d T}=\frac{\Delta H_{m}}{(V-v) \mathrm{T}}
$$

where

$$
\begin{aligned}
p & =\text { pressure } \\
T & =\text { absolute temperature } \\
\Delta H_{m} & =\text { molal heat of vaporization } \\
V & =\text { molar vapor volume } \\
v & =\text { molal liquid volume }
\end{aligned}
$$

4. Clausius-Clapeyron Equation-Where the volume of liquid can be ignored (or $v=0$ ) and where the ideal-gas law holds (or $V=R T / p$ ) the Clausius equation becomes

$$
\frac{d(\ln p)}{d T}=\frac{1}{p} \frac{d p}{d T}=\frac{\Delta H_{m}}{R T^{2}}
$$

and with $\Delta H_{m}=$ constant, integration yields

$$
\ln \frac{p_{2}}{p_{1}}=\frac{\Delta H_{m}}{R}\left[\frac{T_{2}-T_{1}}{T_{1} T_{2}}\right]
$$

The symbols are the same as in sections 2 and 3 above.
5. Dalton's Law of Partial Pressures-The pressure of a mixture of gases is equal to the sum of the partial pressures of each component gas. The partial pressure of a component gas is the pressure which that component would exert if it alone occupied the volume at the same temperature.
6. Faraday's Laws

First Law: The mass of a substance reacting at the electrodes is directly proportional to the quantity of electricity passed through the solution.

Second Law: The masses of different substances produced during electrolysis are directly proportional to their equivalent weights; 96,496 coulombs of electricity $=1$ faraday $=$ electricity to yield 1 gram equivalent of any substance.
7. Freezing Point Depression $\left(\Delta T_{f}\right)$-The following equations hold for a dilute solution of a nonionic solute in which the solid phase is pure solvent.

$$
\begin{aligned}
\Delta T_{f} & =K_{f} m \\
K_{f} & =\frac{R\left(T_{f p}\right)^{2} M_{a}}{\Delta H_{f}(1000)}
\end{aligned}
$$

where $\Delta H_{f}=$ molal heat of fusion of solvent
$K_{f}=$ molal freezing point lowering constant
$m=$ molality
$M_{a}=$ solvent molecular weight
$R=$ ideal-gas constant
$T_{f p}=$ solvent freezing point, absolute temperature
8. Gibbs Phase Rule-At equilibrium the number of independent variables $(F)$ required to specify the system is equal to the number of components ( $C$ ) minus the number of phases $(P)$ plus two, or symbolically $F=C-P+2$. This form
of the phase rule applies to non-reactive systems.
9. Graham's Law of Diffusion-The rate of diffusion of a gas is inversely proportional to the square root of its density.
10. Henry's Law-At a constant temperature, the concentration of a gas dissolved in a liquid is directly proportional to the partial pressure of the gas above the liquid.

## 11. Raoult's Law

$$
p_{a}=x_{a} P_{a}
$$

where $p_{a}=$ partial pressure of component A in vapor

$$
\begin{aligned}
& x_{a}=\text { mole fraction of } A \text { in liquid solution } \\
& P_{a}=\text { vapor pressure of pure liquid } A
\end{aligned}
$$

12. van't Hoff Reaction Isochore

$$
\frac{d(\ln K)}{d T}=\frac{\Delta H}{R T^{2}} \text { at constant pressure }
$$

where $\Delta H=$ heat of reaction

$$
\begin{aligned}
K & =\text { reaction equilibrium constant } \\
R & =\text { ideal-gas constant } \\
T & =\text { absolute temperature }
\end{aligned}
$$

If $\Delta H$ is constant,

$$
\ln \left(\frac{K_{2}}{K_{1}}\right)=\frac{\Delta H}{R}\left[\frac{T_{2}-T_{1}}{T_{1} T_{2}}\right]
$$

13. Molar Humidity-moles vapor/mole vaporfree gas

$$
Y=\frac{y_{a}}{1-y_{a}}=\frac{p_{a}}{P-p_{a}}
$$

Humidity—pounds vapor/pound vapor-free gas

$$
Y^{\prime}=Y \frac{M_{a}}{M_{b}}
$$

Relative Saturation-ratio of partial pressure of vapor to partial pressure of vapor at saturation (vapor pressure)

$$
H_{r}=100 \frac{p_{a}}{P_{a}}
$$

Percentage of Saturation-ratio of vapor concentration to vapor concentration at saturation (ratio of molar humidity to saturated molar humidity)

$$
H_{p}=100 \frac{Y}{Y_{\mathrm{sat}}}=100 \frac{p_{a}\left(P-P_{a}\right)}{P_{a}\left(P-p_{a}\right)}
$$

where $\quad p_{a}=$ partial pressure of component A in gas
$P_{a}=$ vapor pressure of pure liquid A
$P=$ total pressure
$M_{a}=$ molecular weight of A
$M_{b}=$ molecular weight of B
$y_{a}=$ mole fraction of $a$ gas

## FLUID FLOW

I. DEFINITIONS AND GENERAL EQUATIONS

Mass velocity

$$
G=\bar{V} \rho
$$

Simple manometer equation

$$
P_{a}-P_{b}=R_{m} \frac{g}{g_{c}}\left(\rho_{a}-\rho_{b}\right)
$$

Hagen-Poiseuille equation (laminar flow in long horizontal tube)

$$
P_{a}-P_{b}=\frac{32 L \bar{V} \mu}{g_{c} D^{2}}
$$

Average velocity, $\bar{V}$

$$
\bar{V}=\frac{q, \text { volumetric flow rate }}{s, \text { cross-sectional area }}
$$

Reynolds number, $N_{R e}$

$$
N_{R e}=\frac{D \bar{V} \rho}{\mu}=\frac{D \bar{V}}{\nu}
$$

Mechanical energy balance

$$
\frac{P_{a}}{\rho_{a}}+\frac{g}{g_{c}} Z_{a}+\frac{\bar{V}_{a}^{2}}{2 g_{c} \alpha_{a}}-W_{s}=\frac{P_{b}}{\rho_{b}}+\frac{g}{g_{c}} Z_{b}+\frac{\bar{V}_{b}^{2}}{2 g_{c} \alpha_{b}}+H_{f}
$$

where $\quad \alpha \simeq 1$ for turbulent flow $\left(N_{R e}>4,000\right)$

$$
\alpha=0.5 \text { for laminar flow }\left(N_{R e}<2,100\right)
$$

Hydraulic radius

$$
r_{H}=\frac{s, \text { cross-sectional area }}{L_{p}, \text { the wetted perimeter }}
$$

Equivalent diameter, $D_{e}$

$$
D_{e}=4 \text { (hydraulic radius, } r_{H} \text { ) }
$$

## II. FRICTION

Skin friction

$$
H_{f s}=\frac{2 f L \bar{V}^{2}}{D g_{c}}
$$

Fanning friction factor, $f$ (flow in smooth pipes)

$$
\begin{aligned}
& \text { laminar } \quad f=\frac{16 \mu}{D V \rho}=\frac{16}{N_{R e}} \\
& \text { turbulent } \frac{1}{f^{.5}}=4.0 \log \left(N_{R e} f^{.5}\right)-0.4
\end{aligned}
$$

Friction of valves and fittings (Add to length of pipe to get total equivalent length.)

Fittings and Valves

45-degree elbows 15
90-degree elbows (standard radius) 32
90-degree square elbows 60
180-degree close return bends 75
T's (used as elbow, entering run) 60
T's (used as elbow, entering branch) 90
Couplings
Unions
Gate valves (open)
Negligible

Globe valves (open)
Negligible

Angle valves (open)
7

Angle valves (open) 170

Friction loss from sudden expansion of cross section

$$
H_{f e}=\frac{\bar{V}_{a}^{2}}{2 g_{c}}\left(1-\frac{s_{a}}{s_{b}}\right)^{2}
$$

Friction loss from sudden contraction of cross section

$$
H_{f c}=\frac{K_{c} \bar{V}_{b}^{2}}{2 g_{c}}
$$

Values of $K_{c}$ are given on page 6-18, Perry's Chemical Engineers' Handbook, 7th ed., Don W. Green, ed., McGraw-Hill Book Co., New York, NY, 1997.

## III. MEASUREMENT OF FLOWING FLUIDS

Venturi meter

$$
\sqrt{V_{b}^{\mathrm{s}}-V_{a}^{2}}=C_{v} \sqrt{\frac{2 g_{c}\left(p_{a}-p_{b}\right)}{\rho}}\left(\begin{array}{l}
\text { of meter })
\end{array}\right.
$$

Orifice meter, design equation $\left(N_{R e}>20,000\right)$

$$
\bar{V}_{o}=\frac{0.61}{\sqrt{1-\beta^{4}}} \sqrt{\frac{2 g_{c}\left(p_{a}-p_{b}\right)}{\rho}}
$$

Pilot tube (manometer measures $p_{s}-P$ )

$$
V=C_{p} \sqrt{\frac{2 g_{c}\left(p_{s}-P\right)}{\rho}}
$$

## IV. SYMBOLS USED

$C_{u}, C_{p}=$ coefficients of velocity
$D=$ diameter
$g=$ acceleration of gravity $=32.2 \mathrm{ft} / \mathrm{s}^{2}=9.81 \mathrm{~m} / \mathrm{s}^{2}$
$g_{c}=$ Newton's conversion factor $=32.2 \mathrm{ft}-\mathrm{lb}_{m} /\left(\mathrm{lb}_{f}-\mathrm{s}^{2}\right)$ $=1 \mathrm{~m}-\mathrm{kg} /\left(\mathrm{N}-\mathrm{s}^{2}\right)$
$H_{f}=$ head loss due to friction
$H_{f s}=$ head loss due to skin friction
$H_{f c}=$ head loss due to contraction of cross section

$$
\begin{aligned}
H_{f e} & =\text { head loss due to expansion of cross section } \\
K_{e} & =\text { expansion loss coefficient } \\
K_{c} & =\text { contraction loss coefficient } \\
L & =\text { length of pipe } \\
P & =\text { pressure } \\
P_{a} & =\text { upstream pressure } \\
P_{b} & =\text { downstream pressure } \\
p_{a}, p_{b} & =\text { pressure in arms of manometer } \\
p_{s} & =\text { static pressure } \\
R_{m} & =\text { manometer reading } \\
s & =\text { cross-sectional area } \\
V & =\text { velocity } \\
\bar{V} & =\text { average velocity } \\
V_{a} & =\text { upstream velocity } \\
V_{b} & =\text { downstream velocity } \\
W_{s} & =\text { shaft work done by pump } \\
Z & =\text { elevation } \\
\alpha & =\text { kinetic energy correction factor } \\
\beta & =\text { ratio of diameter of orifice to diameter of } \\
& \text { pipe } \\
\rho & =\text { fluid density, lb }{ }_{m} / \mathrm{ft}^{3} \\
\rho_{a} & =\text { density of manometer fluid } \\
\rho_{b} & =\text { density of fluid above manometer } \\
\nu & =\text { kinematic viscosity }=\mu / \rho \\
\mu & =\text { viscosity }
\end{aligned}
$$

## HEAT TRANSFER

## I. CONDUCTION

Fourier's Law (constant $k$ )
steady state

$$
q=\frac{-k A \Delta T}{\Delta x}=\frac{-\Delta T}{R}
$$

unsteady state

$$
\frac{\partial T}{\partial t}=\frac{k}{\rho C_{p}} x \frac{\partial^{2} T}{\partial x^{2}}
$$

Resistance in Series

$$
\begin{aligned}
q & =\frac{\Delta T}{\frac{x_{A}}{k_{A} A}+\frac{x_{B}}{k_{B} A}+\frac{x_{C}}{k_{C} A}+\cdots} \\
& =\frac{\Delta T}{R_{A}+R_{B}+R_{C}+\cdots}
\end{aligned}
$$

Radial Heat Flow Through a Cylinder

$$
q=\frac{k\left(2 \pi r_{m}\right) L \Delta T}{\left(r_{o}-r_{i}\right)}=\frac{k A_{m} \Delta T}{\Delta r}
$$

where $A_{m}=$ logarithmic mean area normal to heat flow
$r_{m}=$ logarithmic mean radius
$r_{m}=\left(r_{o}-r_{i}\right) / \ln \left[r_{o} / r_{i}\right]$

## II. CONVECTION

$$
q=h A \Delta T
$$

where $\quad h=k^{\prime} / \Delta x^{\prime}$, heat transfer coefficient
$k^{\prime}=$ thermal conductivity of the fluid
$\Delta x^{\prime}=$ thickness of the laminar film
III. COMBINED CONDUCTION AND CONVECTION

$$
q=U A_{\mathrm{avg}}(\Delta T)
$$

where $\quad U=$ overall heat transfer coefficient
$\Delta T=$ overall temperature difference

$$
\frac{1}{U}=\frac{A_{r}}{U A_{r}}=\frac{1}{h_{i} \frac{A_{i}}{A_{r}}}+\frac{x_{m}}{k_{m} \frac{A_{m}}{A_{r}}}+\frac{1}{h_{o} \frac{A_{o}}{A_{r}}}+\frac{1}{h_{F i} \frac{A_{i}}{A_{r}}}+\frac{1}{h_{F o} \frac{A_{o}}{A_{r}}}
$$

where $A_{r}=$ reference area, usually the area of the solid through which heat is being conducted $h_{F i}, h_{F o}=$ inside and outside fouling factors
IV. RADIATION

$$
q_{12}=\sigma A F\left(T_{1}^{4}-T_{2}^{4}\right)
$$

where $\quad q_{12}=$ net radiation between surfaces 1 and 2, Btu/hr

$$
\begin{aligned}
T_{1}, T_{2}= & \text { absolute temperature of surfaces } 1, \\
& 2,{ }^{\circ} R .
\end{aligned}
$$

$A=$ area of either surface, sq ft
$\sigma=$ Stefan-Boltzman Constant $=1.712 \times$ $10^{-9} \mathrm{Btu} / \mathrm{hr}-\mathrm{sq} \mathrm{ft}-{ }^{\circ} R^{4}$
$F=$ geometric view factor

## V. EMPIRICAL, DIMENSIONLESS CORRELATION

Turbulent Flow in Clean Smooth Pipes

$$
\frac{h_{i} D}{k}=0.023\left(N_{R e}\right)^{0.8}\left(N_{P r}\right)^{0.33}\left(\mu / \mu_{w}\right)^{0.14}\left[1+(D / L)^{0.7}\right]
$$

where $\quad N_{R e}=$ the Reynolds Number $=D G / \mu$

$$
N_{P r}=\text { the Prandtl Number }=C_{p} \mu / k
$$

Laminar Flow in Clean Smooth Pipes

$$
\frac{h_{i} D}{k}=1.86\left(N_{R e}\right)^{0.33}\left(N_{P r}\right)^{0.33}\left(\mu / \mu_{w}\right)^{0.14}(D / L)^{0.33}
$$

where the Reynolds and Prandtl Numbers are as defined for turbulence
VI. HEAT TRANSFER TO AND FROM FLUIDS FLOWING NORMAL TO A SINGLE TUBE

$$
\frac{h_{o} D_{o}}{k_{f}}=0.35+0.56\left(N_{R e}\right)^{0.52}
$$

where $\quad N_{R e}=$ the Reynolds Number $=D_{o} G / \mu_{f}$
The subscript $f$ calls attention to the fact that the correlation is based on the mean film temperature, $T_{f}$, which is defined as the arithmetic mean of the average fluid temperature and the wall temperature.
VII. HEAT TRANSFER TO AND FROM FLUIDS FLOWING PERPENDICULAR TO TUBE BANKS

$$
\frac{h_{\text {avg }} D_{o}}{k_{f}}=b\left(N_{R e}\right)^{n} \quad(b \text { and } n \text { depend on geometry })
$$

where $\quad N_{R e}=$ the Reynolds Number $=D G_{\max } / \mu_{f}$
VIII. HEAT TRANSFER FROM CONDENSING VAPORS

Vertical Tubes

$$
h_{\mathrm{avg}}=1.13\left[\frac{k_{f}^{3} \rho_{f}^{2} g \lambda}{\Delta T_{o} L \mu_{f}}\right]^{0.25}
$$

Horizontal Tubes

$$
h_{\mathrm{avg}}=0.725\left[\frac{k_{f}^{3} \rho_{f}^{2} g \lambda}{\Delta T_{o} D_{o} \mu_{f}}\right]^{0.25}
$$

IX. NOTATION

$$
\begin{aligned}
A= & \text { area, sq. } \mathrm{ft} . \\
b= & \text { empirical constant } \\
C_{p}= & \text { specific heat at constant pressure, Btu/lb- }{ }^{\circ} \mathrm{F} \\
D= & \text { diameter, } \mathrm{ft} \\
G= & \text { mass velocity, } \mathrm{lb}_{m} / \mathrm{sq} \mathrm{ft}-\mathrm{sec} \\
G_{\max }= & \text { mass velocity through minimum cross section in } \\
& \text { tube bundle } \\
g= & \text { acceleration of gravity, } 32.2 \mathrm{ft} / \mathrm{sec}^{2} \\
h= & \text { heat transfer coefficient, } \mathrm{Btu} / \mathrm{sq}^{\mathrm{ft}} \mathrm{-hr}-\mathrm{F} \\
k= & \text { thermal conductivity, } \left.\mathrm{Btu} / \mathrm{sq} \mathrm{ft}-{ }^{\circ} \mathrm{F} / \mathrm{ft}\right)-\mathrm{hr} \\
L= & \text { length of tube or cylinder, } \mathrm{ft} \\
q= & \text { heat flow per unit of time, Btu/hr } \\
R= & \text { resistance } \\
r= & \text { radius, } \mathrm{ft} \\
T= & \text { temperature, }{ }^{\circ} \mathrm{F} \\
t= & \text { time, hr } \\
U= & \text { over-all heat transfer coefficient, Btu/sq ft- } \\
& \text { hr }{ }^{\circ} \mathrm{F} \\
x= & \text { distance in direction of heat flow; thickness of } \\
& \text { layer, } \mathrm{ft} \\
\lambda= & \text { latent heat of condensation or vaporization, } \\
& \text { Btu/lb } \\
\mu= & \text { viscosity, lb }{ }_{m} / \mathrm{ft}-\text { sec } \\
\rho= & \text { density, } \mathrm{lb}_{m} / \mathrm{ft}^{3}
\end{aligned}
$$

Subscripts

$$
\begin{aligned}
\text { avg } & =\text { average } \\
f & =\text { film } \\
i & =\text { inside } \\
o & =\text { outside } \\
r & =\text { reference }
\end{aligned}
$$

$$
\begin{aligned}
w & =\text { wall } \\
m & =\text { mean or } \log \text { mean }
\end{aligned}
$$

## DISTILLATION

I. FLASH (OR EQUILIBRIUM) DISTILLATION

$$
\begin{array}{ll}
F z_{F}=y V+x L & (\text { component material balance }) \\
F=V+L & \text { (over-all material balance) }
\end{array}
$$

II. DIFFERENTIAL (SIMPLE OR RAYLEIGH) DISTILLATION

$$
\ln \frac{W}{W_{o}}=\int_{x_{o}}^{x} \frac{d x}{y-x}
$$

When the relative volatility $\alpha$ is constant $y=\alpha x /$ $[1+(\alpha-1) x]$ can be substituted to give

$$
\ln \frac{W}{W_{o}}=\frac{1}{(\alpha-1)} \ln \left[\frac{x\left(1-x_{o}\right)}{x_{o}(1-x)}\right]+\ln \left[\frac{1-x_{o}}{1-x}\right]
$$

For binary system following Raoult's Law

$$
\alpha=\frac{(y / x)_{a}}{(y / x)_{b}}=\frac{p_{a}}{p_{b}}
$$

where $\quad p_{i}=$ partial pressure of component $i$
III. CONTINUOUS DISTILLATION (BINARY SYSTEM) WHERE CONSTANT MOLAL OVERFLOW IS ASSUMED

Total Material Balance

$$
\begin{gathered}
F=D+B \\
F z_{F}=D x_{D}+B x_{B}
\end{gathered}
$$

## Operating Lines

1. Rectifying Section

Total material: $V_{n+1}=L_{n}+D$
Component $A$ : $V_{n+1} y_{n+1}=L_{n} x_{n}+D x_{D}$

$$
y_{n+1}=\frac{L_{n}}{L_{n}+D} x_{n}+\frac{D x_{D}}{L_{n}+D}
$$

2. Stripping Section

Total material: $L_{m}=V_{m+1}+B$
Component $A$ : $L_{m+1} x_{m}=V_{m+1} y_{m+1}+B x_{B}$

$$
y_{m+1}=\frac{L_{m}}{L_{m}-B} x_{m}-\frac{B x_{B}}{L_{m}-B}
$$

3. Reflux Ratio

Ratio of reflux to overhead product

$$
R_{D}=\frac{L}{D}=\frac{V-D}{D}
$$

4. Feed Condition Line

Type of Feed
Superheated vapor
Saturated vapor
Liquid and vapor
Saturated liquid
Cold liquid

Slope of feed line

+ (downward to left)
0 (horizontal)
- (upward to left)
$\infty$ (vertical)
+ (upward to right)

5. Murphree Plate Efficiency

$$
E_{M E}=\frac{y_{n}-y_{n+1}}{y_{n}^{*}-y_{n+1}}
$$

where

$$
\begin{aligned}
y_{n}= & \text { concentration of vapor above plate } \\
& n \\
y_{n+1}= & \text { concentration of vapor entering from } \\
& \text { plate below } n \\
y_{n}^{*}= & \text { concentration of vapor in equilibrium } \\
& \text { with liquid leaving plate } n
\end{aligned}
$$

## IV. NOTATION

$\alpha=$ relative volatility
$B=$ moles of bottoms product
$D=$ moles of overhead product
$F=$ moles of feed
$L=$ molar liquid downflow
$R_{D}=$ ratio of reflux to overhead product
$V=$ molar vapor upflow
$W=$ weight in still pot
$x=$ mole fraction of the more volatile component in the liquid phase
$y=$ mole fraction of the more volatile component in the vapor phase
$z_{D}=$ mole fraction of the more volatile component in the feed

Subscripts
$B=$ bottoms product
$D=$ overhead product
$F=$ feed
$m=$ any plate in stripping section of column
$m+1=$ plate below plate $m$
$n=$ any plate in stripping section of column
$n+1=$ plate below plate $n$
$o=$ original charge in still pot

## MASS TRANSFER

I. DIFFUSION

1. Molecular Diffusion

$$
\frac{N_{A}}{A}=\frac{p_{A}}{P}\left[\frac{N_{A}}{A}+\frac{N_{B}}{A}\right]-\frac{D}{R T} \frac{\partial p_{A}}{\partial z}
$$

2. Unidirectional Diffusion of a Gas $A$ Through a Second Stagnant Gas $B\left(N_{B}=0\right)$

$$
\frac{N_{A}}{A}=\frac{-D P}{R T\left(p_{B}\right)_{l m}} \times \frac{\left(p_{A_{2}}-p_{A_{1}}\right)}{x_{2}-x_{1}}
$$

in which $\left(p_{B}\right)_{l m}$ is the log mean of $p_{B_{2}}$ and $p_{B_{1}}$
3. Equimolar Countercurrent Diffusion $\left(N_{B}=-N_{A}\right)$ (gases)

$$
\frac{N_{A}}{A}=\frac{-D}{R T} \times \frac{\left(p_{A_{2}}-p_{A_{1}}\right)}{z_{2}-z_{1}}
$$

4. Unsteady State Diffusion

$$
\frac{\partial p_{A}}{\partial t}=D \frac{\partial^{2} p_{A}}{\partial z^{2}}
$$

## II. CONVECTION

1. Two-Film Theory

$$
\begin{aligned}
\frac{N_{A}}{A} & =k_{G}\left(p_{A G}-p_{A i}\right)=k_{L}\left(C_{A i}-C_{A L}\right) \\
& =k_{G}\left(p_{A G}-p_{A}\right)=k_{L}\left(C_{A}-C_{A L}\right)
\end{aligned}
$$

2. Overall Coefficients

$$
\begin{aligned}
& \frac{1}{K_{G}}=\frac{1}{k_{G}}+\frac{H}{k_{L}} \\
& \frac{1}{K_{L}}=\frac{1}{H k_{G}}+\frac{1}{k_{L}}
\end{aligned}
$$

3. Transfer Unit

HTU—height of a transfer unit

$$
\begin{aligned}
H_{T G} & =\frac{G}{K_{G} a} \\
H_{T L} & =\frac{L}{K_{L} a}
\end{aligned}
$$

NTU—number of transfer units

$$
\begin{aligned}
& N_{T G}=\int_{y_{1}}^{y_{2}} \frac{d y}{y_{*}-y}+\frac{1}{2} \ln \frac{1-y_{2}}{1-y_{1}} \\
& N_{T L}=\int_{x_{1}}^{x_{2}} \frac{d x}{x-x_{*}}+\frac{1}{2} \ln \frac{1-x_{1}}{1-x_{2}}
\end{aligned}
$$

For dilute solutions (straight operating and equilibrium line)

$$
\begin{gathered}
N_{T G}=\frac{y_{1}-y_{2}}{\left(y-y_{*}\right)_{l m}} \\
Z=N_{T G} H_{T G}=N_{T L} H_{T L}=\text { tower height }
\end{gathered}
$$

4. Dimensionless Group Equation (Sherwood)

$$
\left(N_{S h}\right)=0.023\left(N_{R e}\right)^{0.8}\left(N_{S c}\right)^{1 / 3}
$$

$$
0.5 f=j_{H}=j_{D}
$$

where $f=$ Fanning friction factor

$$
\begin{aligned}
& j_{H}=\frac{h}{C_{p} G}\left[\frac{C_{p} \mu}{k}\right]^{0.667}\left[\frac{\mu_{w}}{\mu}\right]^{0.14} \\
& j_{M}=\frac{k_{c}}{G}\left(N_{S c}\right)^{0.667}
\end{aligned}
$$

IV. NOTATION

$$
\begin{aligned}
A & =\text { area perpendicular to direction of diffusion } \\
a & =\text { interfacial area per unit volume } \\
C & =\text { concentration in liquid phase } \\
d & =\text { tube diameter } \\
D & =\text { molecular diffusivity } \\
G & =\text { gas mass velocity, mass/(time)(area) } \\
H & =\text { Henry's Law constant, } p_{i}=H C_{i} \\
h & =\text { heat transfer coefficient } \\
k & =\text { film coefficient of mass transfer } \\
K & =\text { overall coefficient of mass transfer } \\
L & =\text { liquid mass velocity, mass/(time)(area) } \\
N & =\text { moles of a substance per unit time } \\
p & =\text { partial pressure } \\
P & =\text { total pressure } \\
R & =\text { gas constant } \\
N_{R e} & =\text { Reynolds number }=d u \rho / \mu \\
N_{S c} & =\text { Schmidt number }=\mu / \rho D \\
N_{S h} & =\text { Sherwood number }=k d / D \\
t & =\text { time } \\
T & =\text { absolute temperature } \\
u & =\text { velocity }
\end{aligned}
$$

## $l m=$ logarithm mean average

## Greek Letters

$\rho=$ density
$\mu=$ viscosity

Subscripts
$A, B=$ components of mixture
$G=$ gas phase
$L=$ liquid phase
$i=$ interface
$x=$ mole fraction of liquid
$y=$ mole fraction of gas
$z=$ length in direction of travel

* $=$ equilibrium concentration

## THERMODYNAMICS

I. DEFINITIONS

System-an arbitrarily chosen portion of space which is under consideration.
A. Closed system-one in which matter does not pass through its boundaries.
B. Open system-one in which matter flows across its boundaries.
C. Isolated system-one in which there is no interchange of energy or matter with the surroundings.

Boundaries-the envelope separating the system from the surroundings.
Universe-a system and its surroundings.

Total energy, $E$-the sum of the various forms of energy of the system: e.g., $U$, internal energy; $E_{k}$, kinetic energy; $E_{p}$, potential energy; Hence,

$$
E=U+E_{p}+E_{k}+\cdots
$$

## II. FIRST LAW

In an isolated system $\quad \Delta E=E_{2}-E_{1}=0$
In a closed system $\quad \Delta E=Q-W$
In an open system $\Delta E+\Sigma\left(H+E_{p}+E_{k}\right)=Q-W$
where the summed terms refer to leaving ( + ) and entering (-) streams
In a steady state open system

$$
\Delta E_{\text {system }}=0
$$

Hence for the entering and leaving streams

$$
\Delta H+\Delta E_{k}+\Delta E_{p}=Q-W
$$

## III. SECOND LAW

For any real process the total entropy of the universe always increases

$$
\Delta S_{\text {system }}+\Delta S_{\text {surroundings }}>0
$$

IV. THERMODYNAMIC FUNCTIONS: DEFINITIONS AND RELATIONSHIPS

Definition of entropy

$$
\Delta S=\int \frac{d Q_{\mathrm{rev}}}{T}
$$

From First and Second Laws, with changes in $E_{k}$,
$E_{p}$, and composition negligible,

$$
d U=d Q_{\mathrm{rev}}-P d V=T d S-P d V
$$

Also

$$
\begin{gathered}
d H=d U+d(P V)=T d S+V d P \\
d G=d H-d(T S)=-S d T+V d P \\
d A=d U-d(T S)=-S d T-P d V \\
C_{p}=(\partial H / \partial T)_{p} ; C_{v}=(\partial U / \partial T)_{v} ; \gamma=\left(C_{p} / C_{v}\right)
\end{gathered}
$$

$P, V, T, S, U, H, G, A$ are state functions. $Q$ and $W$ are path functions and have no total derivatives.

## V. PERFECT-GAS RELATIONSHIPS

For any path: $\Delta H=\int_{T_{1}}^{T_{2}} C_{p} d T$ or $(\partial H / \partial P)_{T}=0$
For any path: $\Delta U=\int_{T_{1}}^{T_{2}} C_{v} d T$ or $(\partial U / \partial V)_{T}=0$
For monoatomic gas: $C_{p}=2.5 R$ and $C_{v}=1.5 R$
For diatomic gas: $C_{p}=3.5 R$ and $C_{v}=2.5 R$
Adiabatic ( $Q=0$ ) and reversible path for system with $\Delta E_{p}=\Delta E_{k}=0$.

$$
\begin{gathered}
\left(P_{2} / P_{1}\right)=\left(V_{1} / V_{2}\right)^{\gamma}=\left(T_{2} / T_{1}\right)^{\gamma /(\gamma-1)} \\
W_{\text {nonflow }}=\Delta U=\frac{-R T_{1}}{\gamma-1}\left[\left(\frac{P_{2}}{P_{1}}\right)^{(\gamma-1) / \gamma}-1\right] \text { (per mole) } \\
W_{\text {flow }}=\Delta H=\gamma\left[W_{\text {nonflow }}\right] \text { (per mole) }
\end{gathered}
$$

Isothermal path, flow or nonflow

$$
\frac{P_{2}}{P_{1}}=\frac{V_{1}}{V_{2}}
$$

$$
W=R T \ln \frac{V_{2}}{V_{1}}=R T \ln \frac{P_{1}}{P_{2}} \quad(\text { per mole })
$$

## VI. CRITERIA FOR EQUILIBRIUM CHANGE

For system and surroundings: $d S_{\text {universe }}=0$
For system alone: $d G=0$ when $P, T=$ constant

$$
d A=0 \text { when } V, T=\mathrm{constant}
$$

VII. CHEMICAL THERMODYNAMICS
A. Fugacity $(f)$ and Activity (a)

$$
\Delta G=R T \ln \left(f_{2} / f_{1}\right)=\int_{1}^{2} V d P \quad(\text { per mole })
$$

(constant-temperature path)
and the limit of $f / P$ as $P$ approaches $0=1.00$

$$
a=f / f_{0}
$$

B. Equilibrium

Standard free energy at temperature $T$ for the reaction

$$
\begin{gathered}
a A+b B \rightleftharpoons r R+s S \\
\Delta G^{\circ}=r G_{R}^{\circ}+s G_{S}^{\circ}-a G_{A}^{\circ}-b G_{B}^{\circ} \\
\\
=R T \ln \frac{a_{R}^{r} a_{S}^{s}}{a_{A}^{a} a_{B}^{b}}=-R T \ln K_{a}
\end{gathered}
$$

C. Cells

At standard conditions

$$
\Delta G^{\circ}=-\epsilon^{\circ} n F=-R T \ln K_{a}
$$

At actual conditions

$$
G=\epsilon n F=\epsilon^{\circ} n F-R T \ln \frac{a_{R}^{r} a_{S}^{s}}{a_{A}^{a} a_{B}^{b}}
$$

VIII. NOTATION

$$
\begin{aligned}
& A=U-T S, \text { Helmholtz work function } \\
& a=\text { activity } \\
& C=\text { heat capacity } \\
& E=\text { total energy of the system } \\
& E_{k}=\text { kinetic energy of the system } \\
& E_{p}=\text { potential energy of the system } \\
& \epsilon=\text { reversible voltage of cell } \\
& F=\text { faradays per equivalent } \\
& f=\text { fugacity } \\
& G=H-T S, \text { Gibbs free energy } \\
& g_{c}=\text { Newton's conversion factor } \\
& H=U+P V, \text { enthalpy } \\
& h=\text { enthalpy per pound } \\
& K=\text { equilibrium constant for the reaction as writ- } \\
& \text { ten }
\end{aligned}
$$

$K_{a}=$ equilibrium constant in terms of activity
$K_{f}=$ equilibrium constant in terms of fugacity
$K_{p}=$ equilibrium constant in terms of partial pressure
$n=$ number of equivalents for the reaction as written
$P=$ pressure
$Q=$ heat, defined as positive when absorbed by system
$R=$ gas constant
$S=$ entropy
$T=$ absolute temperature
$U=$ internal energy of the system
$u=$ velocity
$V=$ volume
$v=$ specific volume
$W=$ work, defined as positive when done by system on surroundings
$\Delta=$ final state minus initial state
$\gamma=\left(C_{p} / C_{v}\right)$

Superscript
${ }^{\circ}=$ standard state

## KINETICS AND REACTOR DESIGN

I. RATE OR REACTION

The rate of reaction of any component A based on unit volume of fluid is

$$
r_{A}=\frac{1}{V} \frac{d N_{a}}{d t}
$$

and where density remains unchanged

$$
r_{A}=\frac{d C_{A}}{d t}
$$

Frequently, the rate can be described as a temperaturedependent term times a concentration-dependent term, or

$$
r_{A}=k(\mathrm{~T}) f\left(C_{A}, C_{B} \ldots\right)
$$

A. Order, Molecularity, Elementary Reactions

Where the rate can be expressed as

$$
-r_{A}=k C_{A}^{a} C_{B}^{b} \ldots
$$

the reaction is ath order with respect to A and nth order overall; $n=a+b+\cdots$
NOTE: $a, b, \ldots$ are empirically observed and are not necessarily equal to the stoichiometric coefficients. In the special case where $a, b, \ldots$ are the stoichiometric coefficients, the reaction is elementary: unimolecular ( $n=1$ ), bimolecular ( $n=2$ ), trimolecular ( $n=3$ )
B. Rate Constant $k$ and Temperature Dependency of a Reaction

$$
k=(\text { conc })^{1-n}(\text { time })^{-1}
$$

From Arrhenius's Law the variation with temperature is

$$
k=k_{o} e^{-E / R T} \text { or } \ln \frac{k_{2}}{k_{1}}=\frac{E}{R}\left[\frac{1}{T_{1}}-\frac{1}{T_{2}}\right]
$$

where $E$ is the activation energy of the reaction
II. HOMOGENEOUS, CONSTANT FLUID DENSITY, BATCH KINETICS
A. Irreversible First-order Reaction

For the reaction $A \rightarrow$ products, with rate

$$
-\frac{d C_{A}}{d t}=k C_{A} \text { or } \frac{d X_{A}}{d t}=k\left(1-X_{A}\right)
$$

the integrated form is

$$
-\ln \frac{C_{A}}{C_{A 0}}=-\ln \left(1-X_{A}\right)=k t
$$

B. Irreversible Second-order Reaction

For the reaction $A+B \rightarrow$ products, with rate

$$
-\frac{d C_{A}}{d t}=k C_{A} C_{B}
$$

When $M=C_{B 0} / C_{A 0} \neq 1$, the integrated form is

$$
\ln \frac{C_{B} C_{A 0}}{C_{B 0} C_{A}}=\ln \frac{M-X_{A}}{M\left(1-X_{A}\right)}=\left(C_{B 0}-C_{A 0}\right) k t
$$

When $C_{A 0}=C_{B 0}$, the integrated form is

$$
\frac{1}{C_{A}}-\frac{1}{C_{A 0}}=\frac{1}{C_{A 0}} \frac{X_{A}}{1-X_{A}}=k t
$$

C. Irreversible nth-order Reaction

For the reaction with rate

$$
-\frac{d C_{A}}{d t}=k C_{A}^{n}
$$

the integrated form for $n \neq 1$ is

$$
C_{A}^{1-n}-C_{A 0}^{1-n}=(n-1) k t
$$

D. Reversible First-order Reaction

For the reaction $A \underset{2}{\stackrel{1}{\rightleftharpoons}} R, K=k_{1} / k_{2}$ with rate

$$
-\frac{d C_{A}}{d t}=\frac{d C_{R}}{d t}=k_{1} C_{A}-k_{2} C_{R}
$$

the integrated form is

$$
-\ln \frac{X_{A e}-X_{A}}{X_{A e}}=-\ln \frac{C_{A}-C_{A e}}{C_{A 0}-C_{A e}}=\left(k_{1}+k_{2}\right) t
$$

E. Integration of Rate in General

For the reaction with rate

$$
\begin{gathered}
-r_{A}=-\frac{d C_{A}}{d t}=k f\left(C_{A}, C_{B}, \ldots\right), \\
t=C_{A 0} \int_{0}^{X_{A}} \frac{d X_{A}}{\left(-r_{A}\right)}=\int_{C_{A 0}}^{C_{A}} \frac{d C_{A}}{k f\left(C_{A}, C_{B}, \ldots\right)}
\end{gathered}
$$

which is to be solved analytically or graphically.

## III. BATCH REACTION WITH CHANGING FLUID DENSITY

Where density change is proportional to the fractional conversion of any reactant $A$ (isothermal systems),

$$
\frac{C_{A}}{C_{A 0}}=\frac{1-X_{A}}{1+\epsilon_{A} X_{A}}
$$

where

$$
\epsilon_{A}=\frac{V_{X_{A=1}}-V_{X_{A=0}}}{V_{X_{A=0}}}
$$

The rate for any reactant $A$ is then

$$
-r_{a}=-\frac{1}{V} \frac{d N_{A}}{d t}=\frac{C_{A 0}}{\left(1+\epsilon_{A} X_{A}\right)} \frac{d X_{A}}{d t}=k f\left(C_{A}, C_{B}, \ldots\right)
$$

Integrating in the general case

$$
t=C_{A 0} \int_{0}^{X_{A}} \frac{d X_{A}}{\left(1+\epsilon_{A} X_{A}\right)\left(-r_{A}\right)}
$$

IV. FLOW REACTORS

## A. Capacity Measures

Space time: $\tau=$ time required to process one reactor volume of entering feed $=$ mean residence time

$$
\tau=\frac{V}{v}=\frac{V C_{A 0}}{F_{A 0}} \text { (units of time) }
$$

B. Design Equation for Plug Flow (Ideal Tubular) Reactor

In general

$$
\tau=C_{A 0} \int_{0}^{X_{A}} \frac{d X_{A}}{\left(-r_{A}\right)} \text { or } \frac{V}{F_{A 0}}=\int_{0}^{X_{A}} \frac{d X_{A}}{\left(-r_{A}\right)}
$$

For irreversible first-order reactions (isothermal)

$$
-k \tau=\left(1+\epsilon_{A}\right) \ln \left(1-X_{A}\right)+\epsilon_{A} X_{A}
$$

For reversible first-order reactions $A \underset{2}{\stackrel{1}{\rightleftharpoons}} r R$
(isothermal)

$$
-k_{1} \tau=\frac{\epsilon_{A} X_{A}}{N}+\frac{N+\epsilon_{A}}{N^{2}} \ln \left(1-N X_{A}\right)
$$

where

$$
N=1+\frac{k_{2}}{k_{2}}\left(1+\epsilon_{A}\right)
$$

C. Design Equation for Back-Mix (Ideal Stirred

Tank) Reactor

$$
\tau=\frac{C_{A 0} X_{A}}{\left(-r_{A}\right)} \text { or } \frac{V}{F_{A 0}}=\frac{X_{A}}{\left(-r_{A}\right)}
$$

For a first-order reaction in $j$ equal-sized backmix reactors in series

$$
\frac{C_{A} \text { entering }}{C_{A} \text { leaving }}=(1+k \tau \text { per reactor })^{j}
$$

## D. NOTATION

$$
A, B, R, \text { etc. }=\text { substance } A, \text { etc. }
$$

$$
\begin{aligned}
a, b, \ldots= & \text { exponents on concentration term of } \\
& \text { empirical rate expression }
\end{aligned}
$$

$$
C_{A}=\text { concentration of } A, \text { moles } A / \text { volume }
$$

$$
C_{A 0}=\text { initial concentration of } A, \text { moles } A /
$$ volume

$F_{A 0}=$ feed rate of $A$ or flow rate of $A$ entering the reactor, moles $A /$ time
$K=$ equilibrium constant
$k=$ reaction rate constant, $\left(\right.$ conc $\left.^{1-n}\right)\left(\right.$ time $\left.^{-1}\right)$
$n=$ order of reaction
$N_{A}=$ moles of $A$
$r_{A}=$ rate of reaction of any comoponent $A$, moles $A$ formed/time-volume
$T=$ temperature
$t=$ time
$V=$ volume of fluid in batch reactor, volume of fluid in a flow reactor, or reactor volume

$$
\begin{aligned}
v= & \text { volumetric feed rate, volume of feed } / \\
& \text { time }
\end{aligned}
$$

## $X_{A}=$ fraction of reactant $A$ converted, dimensionless

## Greek Symbols

$\epsilon_{A}=$ measure of density change with reaction, dimensionless
$\tau=$ space time based on entering feed, time
Subscripts
$e=$ equilibrium value

## CONVERSION FACTORS

Acceleration

$$
\begin{aligned}
1 \mathrm{ft} / \mathrm{s}^{2} & =0.3048 \mathrm{~m} / \mathrm{s}^{2} \\
& =0.6318(\mathrm{mile} / \mathrm{hr}) / \mathrm{sec} \\

## CHEMICAL PROCESS SAFETY

Contributed by Joe Louvar
I. COMMON DEFINITIONS: GENERAL CONCEPTS

Chemical Process Safety-The application of technology and management practices a) to prevent accidents in plants, and/or b) to reduce the potential for accidents.
Process Safety Management-An OSHA regulation that emphasizes the management of safety within plants. This is an especially important and effective regulation that has 14 elements: 1) Employee Participation, 2) Process Safety Information, 3) Operating Procedures, 4) Process Hazards Analysis, 5) Mechanical Integrity, 6) Management of Change, 7) Incident Investigation, 8) Hot Work Permits, 9) Employee Training 10) PreStartup Review, 11) Emergency Planning, 12) Contractors, 13) Audits, and 14) Trade Secretes.
Safety Technology—Design features and control features to reduce the potential for accidents.
Safety Design Features - a) Inerting to control the concentration of a flammable gas to below the LFL, b) grounding and bonding to prevent static electricity charging and discharging (spark) and potential fire, c) installing relief valves to prevent vessel ruptures, d) installing double block and bleeds to prevent the backup of reactive chemicals into a monomer storage tank, e) installing an explosion suppression system to prevent dust explosions, f) installing containment systems to catch the release from relief valves, etc.
Safety Control Features-a) Monitoring the temperature and pressure to prevent abnormal conditions, b) adding reactor safeguards to prevent runaway reactions, c) adding redundant controls to decrease the frequency of accidents, d) adding more reliable instruments to reduce the frequency of plant accidents, etc.

## II. COMMON DEFINITIONS: TERMS

Auto Ignition Temperature (AIT)—A fixed temperature above which a flammable mixture is capable of extracting enough energy from the environment to self-ignite.
Boiling Liquid Expanding Vapor Explosion (BLEVE)-A BLEVE occurs when a vessel ruptures which contains a liquid at a temperature above its atmosphericpressure boiling point. It is the explosive vaporization of a large fraction of the vessel contents; possibly followed by the combustion or explosion of the vaporized cloud if it is combustible (similar to a rocket).
Deflagration-An explosion with a flame front moving in the unburned gas at a speed below the speed of sound ( $1250 \mathrm{ft} / \mathrm{s}$ ).
Detonation-An explosion with a shock wave moving at a speed greater than the speed of sound in the unreacted medium.
Flash Point (FP)—The FP of a liquid is the lowest temperature at which it gives off enough vapor to form an ignitable mixture with air.
Flammability Limits (LFL and UFL)—A gas mixture will not burn when the composition is lower than the lower flammable limit (LFL). The mixture is also not combustible when the composition is above the upper flammability limit (UFL).
Flammability Limits of Mixtures-They are computed with the following equations:

$$
\begin{aligned}
& L F L_{\mathrm{MIXTURE}}=\frac{1}{\sum\left(\frac{y_{i}}{L F L_{i}}\right)} \\
& U F L_{\mathrm{MIXTURE}}=\frac{1}{\sum\left(\frac{y_{i}}{U F L_{i}}\right)}
\end{aligned}
$$

Lower Flammability Limit in the Presence of Mists$L F L_{\text {MISTS }} \approx 0.1 \times L F L_{\text {THEORETICAL }}$
Mechanical Explosion-An explosion due to the sudden failure of a vessel containing a nonreactive gas at a high pressure.
Minimum Oxygen Concentration (MOC)—A mixture of gas will not burn if the oxygen concentration is below the minimum oxygen concentration.
Minimum Oxygen Concentration (MOC)—It is estimated using the following equation:

$$
M O C=(L F L \%) \times\left(\frac{\text { Moles } \cdot \text { of } \cdot \text { Oxygen }}{\text { Moles } \cdot \text { of } \cdot \text { Fuel }}\right)
$$

Overpressure-The pressure on an object as a result of an impacting shock wave.
Relief Valve-A device that relieves the pressure within a vessel when the pressure approaches the maximum allowable working pressure (MAWP). All vessels have reliefs.
Risk-This is the product of the frequency and the consequence of an accident scenario.

## BIOCHEMICAL ENGINEERING

Contributed by David Murhammer
I. COMMON DEFINITIONS: GENERAL CONCEPTS

Aerobes-Organisms whose growth requires the presence of air or oxygen.
Anabolism-Metabolism involved with the biosynthesis of cellular components.
Anaerobes-Organisms that grow in the absence of air or oxygen.
Biochemical Engineering-The extension of chemical engineering principles to biological systems with the goal of producing useful products.

Bioreactor-A vessel used for biological processes. Examples include growing microorganisms and animal cells for the production of useful products.
Biotechnology-The use or development of methods of direct genetic manipulation for a socially desirable goal. Examples include the production of a particular chemical, production of better plants or seeds, and gene therapy.
Catabolism-Metabolism involved with the breakdown of materials for the production of intermediates and energy.
Enzyme-A catalytic protein (and in some cases RNA) produced by living cells.
Eukaryote-A cell or organism with a membrane-bound nucleus and well-developed organelles. Examples include yeast, animals, and plants.
Prokaryote-A cell lacking a true nucleus. Examples include bacteria and blue-green algae.
Virus-A noncellular entity that consists minimally of protein and DNA or RNA and that can replicate only after entry into specific types of living cells.

## II. COMMON DEFINITIONS: TERMS

Antibiotics-Substances of microbial origin that in very small amounts have antimicrobial activity.
Antibodies-Glycoprotein molecules produced by Blymphocytes in higher organisms in response to the introduction of a foreign material (antigen). These molecules react with antigens with great specificity.
Attachment Dependent-Cells whose growth requires attachment to a surface. Also referred to as AnchorageDependent.
Batch Culture-A culture that once supplied with raw materials is run to completion.

Chemostat-A bioreactor in which the continuous addition of fresh medium and removal of effluent results in constant nutrient, product, and cell concentrations when operated under steady state conditions.
Death Phase-The portion of the growth curve in culture in which there is a net decline in the number of viable (live) cells.
Exponential (Log) Growth Phase-A period of growth in a culture in which the number of cells or cell mass increases exponentially, i.e., the growth rate is proportional to the population density:

$$
\frac{d X}{d t}=\mu X
$$

where $X=$ cell number (cells $/ \mathrm{mL}$ ) or cell biomass $(\mathrm{mg} / \mathrm{mL}), t$ is time, and $\mu$ is the specific growth rate $\left(\mathrm{h}^{-1}\right)$.
Fed-Batch Culture-A culture to which nutrients are periodically added during the operation of the culture.
Growth Yield-Yield of biomass based on substrate (e.g., glucose or oxygen) utilization:

$$
Y_{X / S}=-\frac{d X}{d S}
$$

where $Y_{X / S}$ is the yield coefficient of biomass (X) based on Substrate ( S ) and is usually given in terms of either (gm biomass/gm or mole substrate) or (cell number/gm or mole substrate).
$\mathrm{K}_{L}$ a-Volumetric mass transfer coefficient usually measured in $\mathrm{h}^{-1}$ and often used to compare the efficiencies of bioreactors in supplying oxygen. The resulting oxygen transfer rate is then given by

$$
\frac{d C_{L}}{d t}=K_{L} a\left(C^{*}-C_{L}\right)
$$

where $C_{L}$ is the dissolved oxygen concentration within the bioreactor, $t$ in time, and $C^{*}$ is the equilibrium dissolved oxygen concentration (i.e., solubility) under the specified conditions.
Lag Phase-The portion of the growth curve between inoculation and the beginning of cell growth.
Media Sterilization-Removal of undesired microorganisms from the media through filtration or heat to prevent their growth during the course of a bioreactor run.
Michaelis-Menton Kinetics-Common type of enzyme kinetics given by

$$
v=\frac{v_{\max }[S]}{K_{M}+[S]},
$$

where $v$ is the reaction rate, $v_{\text {max }}$ is the maximum reaction rate, $K_{M}$ is the Michaelis Constant and is equal to the substrate concentration at $v=1 / 2 v_{\max }$, and $[S]$ is the substrate concentration.
Perfusion Culture-A bioreactor in which cells are retained, medium is added continuously or semicontinuously, and spent medium containing toxic metabolites is removed.
Population Doubling Time (PDT)—The time required for the viable cell population to double. This term is commonly used for animal cell cultures, and is related to the specific growth rate ( $\mu$ ) by

$$
P D T=\frac{\ln (2)}{\mu}
$$

Power Number $\left(N_{p}\right)$ —A dimensionless number commonly used to determine the amount of power introduced to the bioreactor as a result of agitation. The

Power Number is given by

$$
N_{P}=\frac{P}{\rho N^{3} D^{5}}
$$

where $P$ is the power input, $\rho$ is the density of the solution being agitated, $N$ is the rotational speed of the impeller, and $D$ is the impeller diameter.
Monod Equation-An equation commonly used to model the effect of the rate-limiting substrate concentration on the specific growth rate. This equation is given by

$$
\mu=\frac{\mu_{m}[S]}{K_{s}+[S]},
$$

where $\mu$ is the specific growth rate, $\mu_{m}$ is the maximum specific growth rate when $[S] \gg K_{s},[S]$ is the substrate concentration, and $K_{s}$ is the saturation constant or half-velocity constant and is equal to the substrate concentration when $\mu=1 / 2 \mu_{m}$.
Stationary Phase-Phase in growth curve following the exponential growth phase in which there is no net growth. This phase is commonly associated with nutrient depletion.
