

High Resolution Microendoscopy (HRME): A Low-Cost Point-of-Care Diagnostic for Cervical Cancer Prevention

Kathleen M. Schmeler
Department of Gynecologic Oncology
MD Anderson Cancer Center

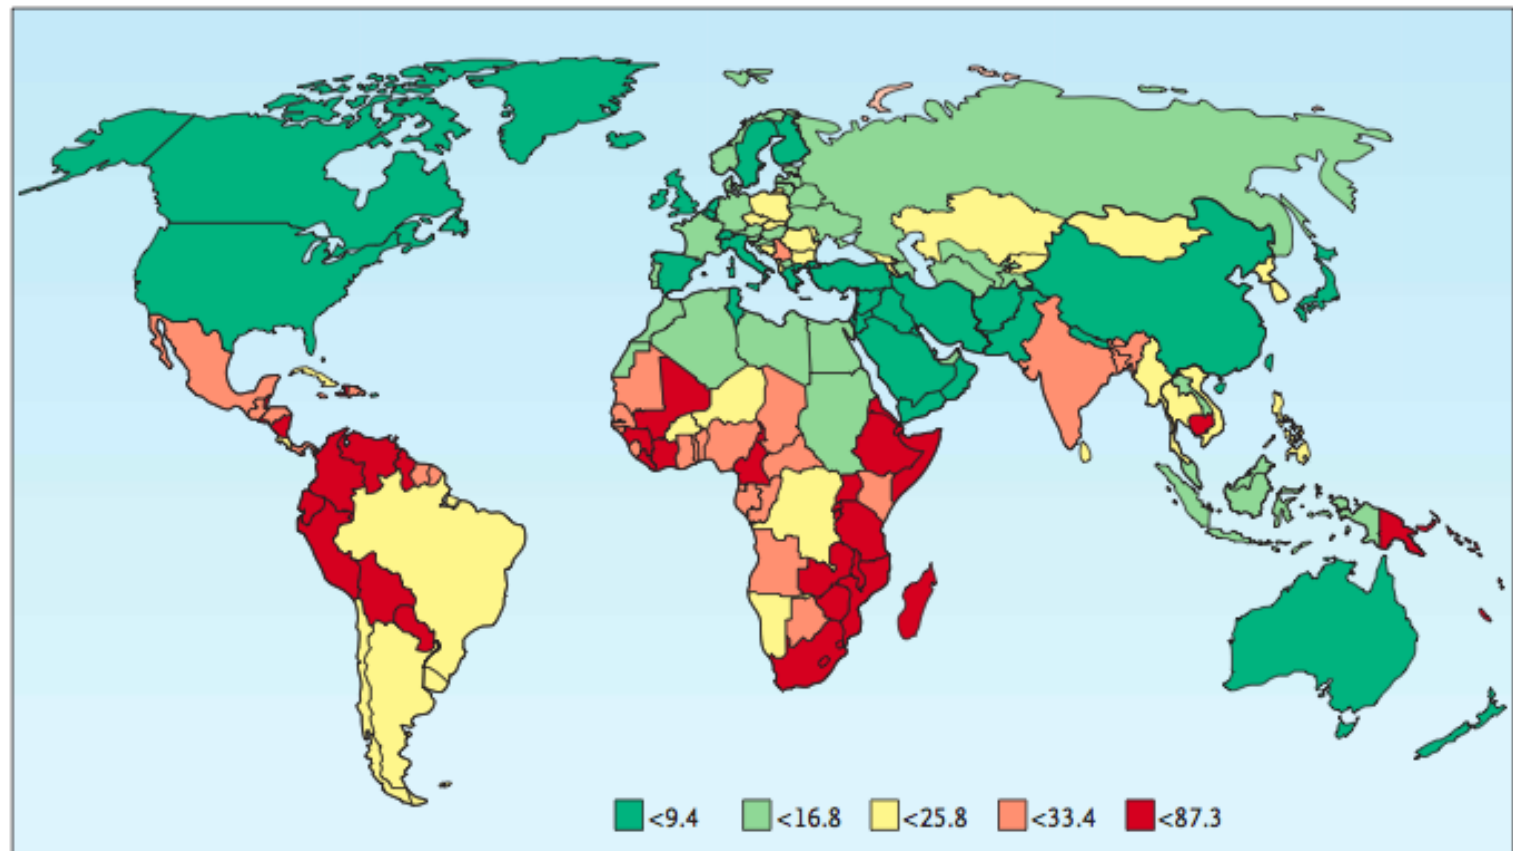

Cervical Cancer is Preventable

- **Known Etiology:**
 - Human Papillomavirus (HPV)
- **Prevention:**
 - HPV Vaccination
- **Screening:**
 - Pap Test, HPV DNA Testing, VIA
- **Treatable Pre-Invasive Phase:**
 - Cervical Cone/LEEP/Cryotherapy
 - Takes ~10y to progress from pre-invasive disease to cancer

Dr. Harald zur Hausen
Nobel Prize, 2008

Inequity of Cervical Cancer

Incidence of Cervical Cancer Worldwide.

Numbers indicate cases per 100,000 population.

85% of cervical cancer cases occur in the developing world

Cervical Cancer Prevention in USA

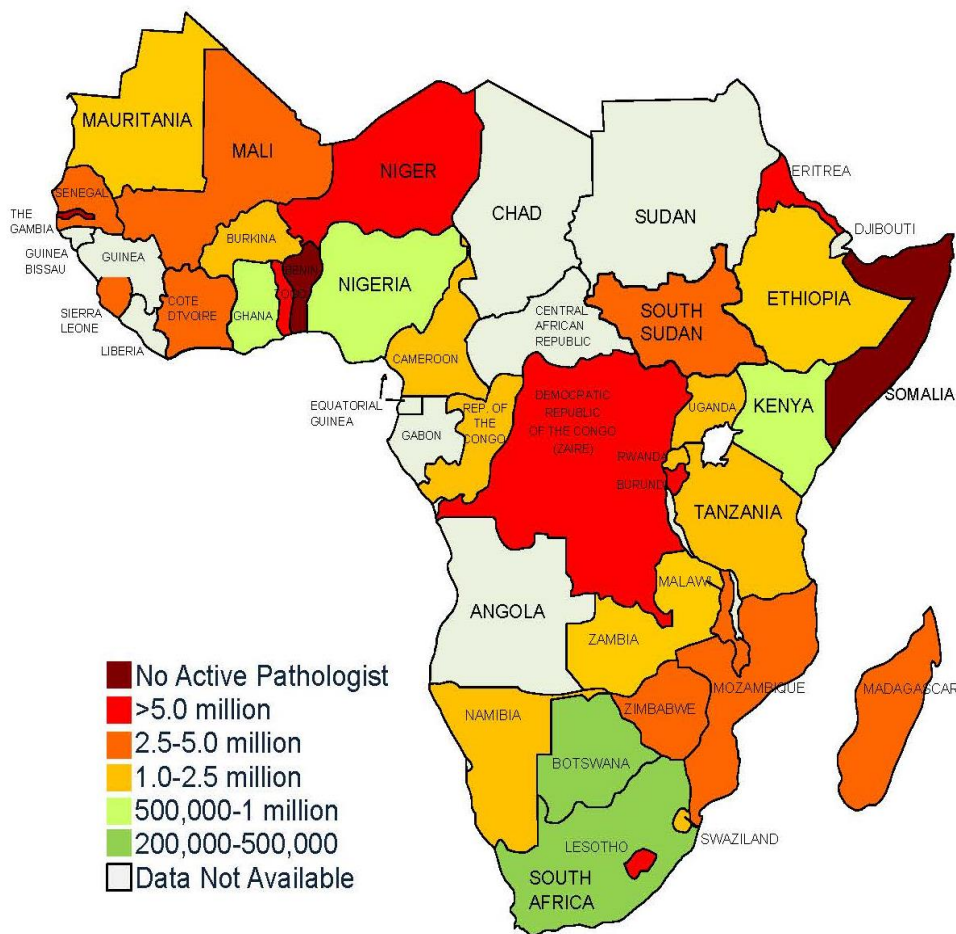

Three Clinical Visits:

1. Pap test +/- HPV testing
2. Colposcopy with cervical biopsies if abnormal Pap
3. If significant precancerous lesions (<5%) - conization/LEEP/cryotherapy
 - Removal or ablation of precancerous lesion

**** Pathology/lab services required at each step**

**** Not feasible in low resource settings**

Availability of Pathologist

Number of People per Pathologist:

- UK: 15,108*
- US: 19,232**

*Royal College of Pathologists, 2012

**Anatomic and Clinical Pathologists, AAMC, 2007

High-Resolution Microendoscope (HRME)

- **Novel cervical visualization technique**
- **Developed by Dr. Rebecca Richards-Kortum and team at Rice University**
- **Assesses morphologic features typically evaluated by pathologists in-vivo in real-time:**
 - **N/C ratio, nuclear size, atypia, pleomorphism**
- **Eliminates the need for colposcopy, cervical biopsies and pathology services**

HRME

- Proflavine (topical contrast agent that stains nuclei) is placed on cervix
- A fiber-optic probe is applied
- Fluorescence from the proflavine-stained epithelium is transmitted back to the HRME
- Image is displayed on a computer screen in real-time allowing for “See & Treat”

HRME - Normal vs. CIN2/3

Reducing Size and Cost

Pilot Study – Barretos, Brazil

- **Prospective study of 59 consecutive patients undergoing colposcopy for an abnormal Pap test**
- **HRME images obtained for all lesions noted on colposcopy and normal appearing areas**
- **Abnormal appearing areas were biopsied and reviewed by two independent, blinded pathologists as well as a US-based study pathologist**

Barretos Cancer Hospital; 59 women referred for abnml Pap

Normal

Inflammation

CIN 1

CIN 2

CIN 3

Cancer

Pilot Study – Barretos, Brazil

- The N/C ratio, mean nuclear area and eccentricity were calculated from HRME images
- A diagnostic algorithm was developed to distinguish high-grade lesions (CIN2/3 and cancer) from less severe lesions (CIN1/benign)
- Performance was compared to histologic diagnosis

HRME - Objective Interpretation

HRME - Objective Interpretation

Pilot Study – Barretos, Brazil

- A total of 79 acetowhite lesions were noted in 46 patients
- Biopsies were performed of all lesions
- Adequate HRME images were obtained in 59 of these lesions (75%)

Pilot Study – Barretos, Brazil

Diagnosis	Histology	HRME = CIN 2+
Normal	9 (15%)	22%
CIN 1	16 (27%)	31%
CIN 2	12 (20%)	83%
CIN 3	19 (32%)	95%
Cancer	3 (5%)	100%

Conclusions

- **Pilot study demonstrated HRME accurately diagnose of CIN2+**
- **HRME imaging may provide a low-cost, accurate, point-of-care alternative to colposcopy and directed cervical biopsies**
- **Further evaluation in large prospective studies:**
 - **Houston, Texas-Mexico border, El Salvador, mobile units in rural Brazil**

UH2 – Low Cost Technology Program

- Incorporate HRME in a mobile diagnostic and treatment unit
- Pilot study of 200 women
- Compare rates of treatment completion for screen+ women (mobile unit in their local area vs. traveling to a central facility)

Colposcopy/HRME/Cryo Unit
