In general, when converting from base units ( $\mathrm{m}, \mathrm{l}, \mathrm{g}$, etc) or derived units ( $\mathrm{m}^{2}, \mathrm{~m}^{3}, \mathrm{~m} / \mathrm{s}, \mathrm{Hz}, \mathrm{N}, \mathrm{J}, \mathrm{V}$, etc) to a multiple greater (kilo, mega, giga, or tera) than the base or derived unit- then divide by the factor. For example: $10 \mathrm{~m}=10 / 1000 \mathrm{~km}=1 / 100 \mathrm{~km}=.01 \mathrm{~km}$.

When converting from base units or derived units to a multiple smaller (centi, milli, micro, nano) than the base or derived unit- then multiply by the factor. For example: $10 \mathrm{~m}=10 \times 100 \mathrm{~cm}=1000 \mathrm{~cm}$.
