

Lecture 10 – Ajax and jQuery

INLS 760
Web Databases
Spring 2013
Rob Capra

AJAX

What is AJAX?

1. The “original” Ajax... is in Agamemnon’s army
2. Another Ajax... is “stronger than dirt”
3. Asynchronous JavaScript and XML

Where can I get Ajax?

1. Homer’s Iliad
2. Try the grocery store
3. There is nothing to “get” support is built-in to modern browsers. Ajax is a programming technique.

What does AJAX do?

- Traditional use of HTTP causes pages to be reloaded when data is exchanged
- AJAX uses JavaScript's XMLHttpRequest method to exchange data with the server without reloading the current page.
 - This enables quick, small transactions
 - Client can communicate more often with the server
 - More flexible user-interfaces can be built
 - Web applications can look/act more like desktop apps

Digging Deeper

- Traditional HTTP communication
 - User clicks a link or presses a form button
 - Client browser makes an HTTP request using either GET or POST
 - Server processes request and sends a response
 - Browser loads the response in a new web page

Digging Deeper

- AJAX
 - JavaScript event fires
 - calls user defined JavaScript function
 - Client browser makes a request using XMLHttpRequest
 - Client sets a handler to process the response when it arrives
 - This communication is asynchronous, so response could arrive whenever
 - When the response arrives, a client handler does something
 - For example, update just a PART of the page

“Real-World” Example

- Google Suggest

Simple Example – Client Side

```
<form name="myForm">  
    Name: <input type="text"  
              onkeyup="ajaxFunction();" name="username" />  
    Time: <input type="text" name="time" />  
</form>
```

This example code is from
http://www.w3schools.com/ajax/ajax_browsers.asp

Client Side – Browser Check

```
function ajaxFunction() {  
    var xmlhttp;  
    try {  
        // Firefox, Opera 8.0+, Safari  
        xmlhttp=new XMLHttpRequest();  
    } catch (e) {  
        alert("Your browser does not support our brand of  
AJAX!");  
        return false;  
    }  
}
```

lect10/ajaxff.php

Client Side – Handle Response

```
xmlHttp.onreadystatechange=function ()  
{  
    if(xmlHttp.readyState==4)← 4 = completed  
    {  
        // Get data from the server  
        document.myForm.time.value =  
            xmlHttp.responseText; True means handle  
        } asynchronous  
    }  
    // Ask the server for some data  
    xmlHttp.open ("GET","time.php",true);  
    xmlHttp.send(null);  
} // close the ajax function
```

Simple Example – Server Side

lect10/time.php

```
<?php  
    header ("Cache-Control: no-cache, must-revalidate") ;  
  
    // Date in the past  
    header ("Expires: Mon, 26 Jul 1997 05:00:00 GMT") ;  
  
    echo date('h:i:s') ;  
?>
```

Ajax Tutorials

- W3schools
 - <http://www.w3schools.com/ajax/default.asp>
- Tizag
 - <http://www.tizag.com/ajaxTutorial/index.php>
- IBM developerWorks
 - <http://www.ibm.com/developerworks/web/library/wa-ajaxintro1.html>
 - http://www-128.ibm.com/developerworks/views/web/libraryview.jsp?search_by=Mastering+Ajax

Ajax + MySQL

- Search interface
- Develop together in class
 - lect10/ajax-db.html

ajax libraries

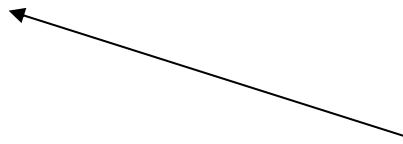

- Many developers use ajax libraries
 - jQuery
 - Prototype
 - script.aculo.us
 - many others

ajax in jQuery

```
<body>
<h1>jQuery ajax test</h1>
<table border="1" width="100%">
<tr>
    <td width="30%">
        <div id="fred">
            fred<br>
            <button onclick='lucy();'>Click me!</button>
        </div>
    </td>
    <td width="70%">
        <div id="ethel">
            ethel<br>
        </div>
    </td>
</tr>
</table>
</body>
</HTML>
```

lect10/twodiv.html
(part 2)

lucy() is defined in
<head>, see part 1

ajax in jQuery

```
<HTML>
<head>
<script type="text/javascript"
    src="http://ajax.googleapis.com/ajax/libs/jquery/1.4.2/jquery.min.js">
</script>
<script type="text/javascript">
    function lucy() {
        $.ajax({
            type: "POST",
            dataType: "html",
            url: "twodiv.php",
            success: function(data) {
                $("#ethel").append(data);
                $("#ethel").append("<br>");
            }
        });
    }
</script>
</head>
```

lect10/twodiv.html
(part 1)

ajax call to server

"anonymous" function
to be executed on ajax
success; data returned
from server is put into
"data"

jQuery syntax for
appending data
onto a specific div

ajax in jQuery

```
<HTML>
<head>
<script type="text/javascript"
        src="http://ajax.googleapis.com/ajax/libs/jquery/1.4.2/jquery.min.js">
</script>
<script type="text/javascript">
    function lucy() {
        $.ajax({
            type: "POST",
            dataType: "html",
            url: "twodiv.php",
            success: function(data) {
                $("#ethel").append(data);
                $("#ethel").append("<br>");
            }
        });
    }
</script>
</head>
```

```
<body>
<h1>jQuery ajax test</h1>
<table border="1" width="100%">
<tr>
    <td width="30%">
        <div id="fred">
            fred<br>
            <button
onclick='lucy();'>Click
me!</button>
        </div>
    </td>
    <td width="70%">
        <div id="ethel">
            ethel<br>
        </div>
    </td>
</tr>
</table>
</body>
</HTML>
```
