Curriculum Burst 48: Lengths in a Trapezoid

By James Tanton, PhD, Mathematics, Princeton 1994; MAA Mathematician in Residence

In trapezoid $ABCD$, \overline{AB} and \overline{CD} are perpendicular to \overline{AD} , with $AB + CD = BC$, $AB < CD$ and $AD = 7$.
What is $AB \cdot CD$?

THE QUICK STATS:

MAA AMC GRADE LEVEL

This question is appropriate for the 10th grade level.

MATHEMATICAL TOPIC

Geometry

COMMON CORE STATE STANDARDS

- 7.G.B6** Solve real-world and mathematical problems involving area, volume and surface area of two- and three-dimensional objects composed of triangles, quadrilaterals, polygons, cubes, and right prisms.
- 8. G.B** Understand and apply the Pythagorean Theorem.

MATHEMATICAL PRACTICE STANDARDS

- MP1** Make sense of problems and persevere in solving them.
- MP2** Reason abstractly and quantitatively.
- MP3** Construct viable arguments and critique the reasoning of others.
- MP7** Look for and make use of structure.

PROBLEM SOLVING STRATEGY

ESSAY 2: [DO SOMETHING](#)

SOURCE

This is question # 24 from the 2001 MAA AMC 10 Competition.

THE PROBLEM-SOLVING PROCESS:

The appropriate start, as always, is ...

STEP 1: Read the question, have an emotional reaction to it, take a deep breath, and then reread the question.

This question feels hard to take in. It's about a trapezoid, and I know what that is - a four-sided figure with two sides parallel. But there are all these conditions about line segments. My suspicion is that this question will feel like a standard geometry problem from a textbook, once I can sort out what the question is!

I need to get started. It is clear I need to draw a picture.

Now " $ABCD$ is a trapezoid ..." means we have a trapezoid with vertices labeled A , B , C and D in a consistent clockwise or counterclockwise order. Here's a trapezoid:

but I am going to hold off labeling its vertices until I take in the information of the question.

" \overline{AB} and \overline{CD} are perpendicular to \overline{AD} "

Given the order $ABCD$, the three line segments mentioned here really are sides of the trapezoid (not diagonals or something strange). So I need two sides to be perpendicular to another side. I guess the picture has to be something like:

"...with $AB + CD = BC$, $AB < CD$ and $AD = 7$."

This looks confusing! Let me go through these statements slowly.

$AB + CD = BC$. Label the sides \overline{AB} and \overline{CD} as a and b . This is easier to read. Then we have:

(My picture is out of proportion. No matter.)

$AB < CD$: I lucked out. My picture has $a < b$.

$AD = 7$: That's fine.

Okay ... I've done something. What's next?

"What is $AB \cdot CD$?"

Hmm. In my picture this means we are being asked for the value of product ab . I have no idea how to get this value. Hmm again. I do feel compelled to draw a vertical line inside my picture. Let me do that.

Carrying on with my "do something" instinct I can't help but notice the right triangle. It has height 7, hypotenuse $a + b$, and base $b - a$. (Do see that?)

The Pythagorean Theorem says:

$$49 + (b - a)^2 = (a + b)^2.$$

What next? It feels compelling to work on this equation!

$$49 + a^2 - 2ab + b^2 = a^2 + 2ab + b^2$$

$$49 = 4ab$$

Whoa! $ab = 49 / 4$. This is the answer to the question!

Extension: Is it possible to determine a specific value for a (and hence b)? If not, find the range of possible values for a ? (Could a be close to zero? Could a equal a billion?)
