

## RHOMBUS USING ADOBE ILLUSTRATOR CS5

HOW TO DRAW A GOLDEN AND REGULAR RHOMBUS WITH ADOBE

## ILLUSTRATOR CS5

One method for drawing a Golden Rhombus (Rhomb or Diamond) using Adobe Illustrator [version CS 5 Illustrator v. 15.0.2] is described in this note.

## RHOMBUS USING ADOBE ILLUSTRATOR CS5

HOW TO DRAW A GOLDEN AND REGULAR RHOMBUS WITH ADOBE ILLUSTRATOR CS5

## INTRODUCTION

I needed to draw a Golden Rhombus (a rhombus with a p/q ratio of 1.618, we will see what $p$ and $q$ are below) and another rhombus with a $p / q$ ratio of 1.7321 for a scientific presentation. I couldn't find a quick solution when I searched the Internet (ca Jan 2015) and so tried couple of methods. The note below describes one such attempt in making a rhombus using Adobe Illustrator CS5. Please note the procedure might be different for other versions of Illustrator.

A regular rhombus is defined with the following characteristics [Plane Geometry for College Students, William C. Stone, Allyn \& Bacon, Inc., 1958]:

- All sides are equal
- The diagonals are perpendicular to each other
- The diagonals bisect its angles
- Has all the properties of a parallelogram

In addition, rhombus is very similar to a square and square rotated 45 degrees is occasionally called a diamond which is nothing but a rhombus.

The rhombus or rhomb has the following size definitions [Wolfram Math World; http://mathworld.wolfram.com/Rhombus.html]

Where $p$ is the long diagonal, $q$ is the short diagonal, $a$ is the side and $\theta$ is the angle between one of the sides and the long diagonal, and $2 \theta$ would be between two sides with the long diagonal bisecting it.

## DRAWING A GOLDEN RHOMBUS

As I noted above a square can be considered a special case of a rhombus (just as circle can be considered a special case of an ellipse), so I thought of starting my experiment with a square.

I started Adobe Illustrator CS5 and opened a New Document (File $>\mathrm{Ctrl}+\mathrm{N}$ ) and accepted the default size (300 pt 250 pt) for the New Document. Then from the main palette I selected the Rectangle Tool (M) and clicked in the New Document. The Rectangle Tool window opened with Options. I input 100 pt for both Width and Height creating a square with default Stroke size of 1 pt.

FIGURE 1 CREATE A SQUARE USING CS5

Somasundaram's Computer Notes
Then, from the Main Menu I selected the following: Object>Transform>Rotate and this opened a new Rotate window with Angle input. I input $45^{\circ}$ and accepted it. The square now rotated $45^{\circ}$ and looked more like a diamond (aka rhombus).

FIGURE 2 MAKE IT A DIAMOND

Somasundaram's Computer Notes
Then, again from the Main Menu I now selected the following: Object>Transform>Scale ..., and this opened a new Scale window with Uniform, Non-uniform, Options and Preview inputs. Since I wanted to have different lengths for the diagonals, I selected Non-uniform scaling option. Since I didn't want my Strokes \& Effects to be scaled, I didn't select Strokes \& Effects, under Options (I had selected this, the Stroke thickness would scale up or down). I did select Preview so that I can see the actions of my selections even before I commit to it.

Here, for the Non-uniform I input for the Horizontal, 161.8 and for the Vertical, 100.0. This yielded me a rhombus shown below:

## CONFIRMING A GOLDEN RHOMBUS

Now that I have drawn a Golden Rhombus with a p/q ratio of 1.16180, I needed confirm whether I have it correct. So, I selected a Line Segment from the Main Palette Tool ( $)$ and clicked on the left side of the Golden Rhombus and drew a line across the long diagonal and length was 228.81 pt and then I drew a line on top of the left top side of the already created rhombus, I could see the "Info" for the line segment indicated the length was 134.5 pt and the angle was $32^{\circ}$. These are the values what I had expected.

FIGURE 5 GOLDEND RHOMB SIDE CONFIRMATION
To confirm it further, I drew a line from the top apex of the rhombus to the long diagonal and its length was 70.71 pt with $270^{\circ}$ angle. Once I again I had expected.

To confirm it further, I drew a 20 pt line segment and then drew another 23.65 pt line segment with $31.717^{\circ}$ angle in between them (the Golden Angle) and grouped them together with their left most position intersecting with each other. Then I placed this newly grouped object on top of the Golden Rhombus. They perfectly matched indicating the correct angle indicating what I had obtained is indeed a Golden Rhombus.

Next step is making a regular Rhombus. I followed all the instruction outlined above except for the amount of Non-uniform scaling. I wanted to create a rhomb with isosceles triangle. So I calculated the $p / q$ ratio to be equal to 1.7321 (which is square root of $3 ; \sqrt{3}=1.73205$ ). So, I created a square with 100 pt sides and rotated it $45^{\circ}$. Then, did the non-uniform scaling with horizontal value of 173.2 pt and vertical value 100.0 pt . This resulted in a rhombus with isosceles triangles on the side and is shown below.

FIGURE 8 RHOMBUS WITH ISOSCELES TRIANGLE

Here are both superimposed one on top of the other with some important angles shown.
