

An Introduction to L^AT_EX

John Hamer
John.Hamer@glasgow.ac.uk

7 June 2019

What, how, where?

- ▶ \LaTeX is a *fine typesetting system*. You write your document (paper, report, essay, thesis, poster, book, letter, ...) in the \LaTeX format using a *text editor*. The \LaTeX program converts this into PDF.
- ▶ Use the \LaTeX format to describe the *structure* of your document: title, sections and subsections, lists, etc. \LaTeX has extensive built-in knowledge on how best to lay things out on the page. It hyphenates words, justifies lines of text, adjusts spacing between paragraphs, etc.
- ▶ Online: www.overleaf.com (basic version free, but requires registering)
- ▶ MSWindows users can download MikTeX (www.miktex.org). GNU Linux users have T \E X Live (<http://www.tug.org/texlive>). MacOS users have MacT \E X (<http://www.tug.org/mactex>). All are free.

Why?

Why not just use MSWord? MSWord is much easier to learn, and some publishers and co-authors insist on MSWord documents.

- ▶ Some publishers and co-authors insist on \LaTeX .
- ▶ \LaTeX produces better looking output.
- ▶ Longer documents are easier to write in \LaTeX : you can move tables and figures around and cross references keep up, \LaTeX has great bibliography tools, section numbering “just happens”.
- ▶ \LaTeX is one of the best systems in existence for typesetting mathematics.
- ▶ \LaTeX is built on top of \TeX —one of the most stable and reliable programs ever written.

Getting started

- ▶ Run `miktex-portable.cmd`.
- ▶ Find the the MikTeX icon in the notification area of the Windows Taskbar, and right-click to open T_EXworks.
- ▶ Type in the following sample document:

```
\documentclass{article}  
\begin{document}  
  Hello! This is my first \LaTeX{} document.  
\end{document}
```

- ▶ Pay careful attention to the backslash and curly brace characters!
- ▶ Then, press the green arrow.

Things you need to know

\LaTeX attaches a special meaning to certain characters, in particular:

- ▶ `$` — used to delimit mathematical formula¹
- ▶ `\` — starts a \LaTeX command.
- ▶ `&` — separates columns in a table.
- ▶ `{` and `}` — delimit arguments to a \LaTeX command.
- ▶ `%` — start of a comment: \LaTeX ignores the rest of the line.
- ▶ `~` — a non-breaking space.
- ▶ `"` — use `` `` and `' '` for double-quotes.
- ▶ `_`, `^` — used in mathematical formula.

Usually, preceeding the character with a backslash (`\`) removes the special meaning (but for `"` use `\textbackslash`).

¹Chosen as a joke by Donald Knuth, the author of \TeX : typesetters charged more for mathematics!

Document structure

A \LaTeX document is organised in two parts: a *prelude* that specifies the type of document, loads any optional packages and other setup actions; and a *body* that contains the text of the document. The end of the prelude is marked by a `\begin{document}` line.

```
\documentclass{article}  
...optional packages and setup actions appear here  
\begin{document}
```

```
...the text of the document appears here  
\end{document}
```

The document must end with a line `\end{document}`. Anything after this line is ignored.

Sectioning

Edit your document to include some sections; e.g.

```
\documentclass{article}
\usepackage{lipsum}
\title{My First Document}
\author{I forgot to put my name here}
\date{\today}
\begin{document}
```

```
\maketitle
\section{Introduction}
\lipsum[1-2]
\section{Background}
\lipsum[3-5]
\section{Conclusions}
\lipsum[6]
\end{document}
```

Lists

Use the `\begin{itemize}`, `\item` and `\end{itemize}` commands to make a bullet list:

```
\begin{itemize}
\item A bullet list.
\item Each item starts with \textbackslash item.
\end{itemize}
```

```
\begin{enumerate}
\item A numbered list.
\item \LaTeX{} does all the numbering.
\end{enumerate}
```

Emphasis, bolding

- ▶ The text style commands take a single argument, enclosed in curly braces immediately after the command name.
- ▶ The `\emph` command puts text in *italics*.
- ▶ `\textbf` puts its argument in **bold** font.
- ▶ There is also `\textsc` (SMALL CAPS), `\textsl` (*slanted*), `\texttt` (teletype) and `\textnormal`.
- ▶ E.g.

This paragraph illustrates the use of `\emph{emphasis}`, `\textbf{bold}`, `\textsl{slanted}` and `\texttt{fixed width}`. Some combinations are `\emph{\textbf{available}}`, but not `\textsc{\emph{all}}`.

Changing font size

- ▶ \LaTeX generally takes care of the font size for you.
- ▶ If you *really* need to, the commands to change the text size (in order) are: `\tiny`, `\scriptsize`, `\footnotesize`, `\small`, `\normalsize`, `\large`, `\Large`, `\LARGE`, `\huge` and `\Huge`.
- ▶ These commands differ from the text style commands by being *modal*; i.e. they don't take an argument, and text size is changed for all following text in the current block.

```
{\LARGE A curly brace starts a block.}  
Font size is normal now.
```

Cross referencing

- ▶ Sections, figures, formula, etc. can be given mnemonic names (“labels”) that you can use to refer to elsewhere in your document.
- ▶ Define the label using `\label{your mnemonic name}`
- ▶ Add a reference to the label using `\ref{your mnemonic name}`

E.g.

```
\section{Introduction}\label{sec:intro}  
...  
as discussed in Section~\ref{sec:intro}.
```

Figures and tables

- ▶ These are “floating” blocks that may appear in a different place from the surrounding text.
- ▶ Some journals want floats at the end, otherwise there are rules regarding how many floats can appear on one page.
- ▶ Figures and tables require a caption and a label. Figure numbers are generated by \LaTeX .

```
\begin{figure}  
  \centering  
(The actual figure will go here)  
  \caption{My fabulous figure}  
  \label{fig:fabulous}  
\end{figure}
```

Image figures

- ▶ \LaTeX can include bitmap image files (PNG, JPG, etc.), or “vector graphics” images (e.g. PDF).
- ▶ Images are kept in separate files, and do not appear directly in the \LaTeX source.

```
\documentclass{article}
\usepackage{graphicx}
```

```
\begin{figure}
  \centering
  \includegraphics{name-of-my-figure-file.png}
  \caption{My fabulous figure}
  \label{fig:fabulous}
\end{figure}
```

Image manipulation

- ▶ You can specify the size you would like the image to be scaled. This is usually done relative to the page size:
`\includegraphics[width=.8\textwidth]`
`{name-of-my-figure-file.png}`
- ▶ Not a general image processing system, but you can rotate, crop the image, etc.

Mathematics

The square root of two is typeset $\sqrt{2}$.

- ▶ Try: $\sqrt{a^2 + b^2}$
- ▶ $\int \zeta^2(x) \, dx$
- ▶ $\lim_{x \rightarrow a} \frac{f(x) - f(a)}{x - a}$ and compare with

```
\[  
\lim_{x \rightarrow a} \frac{f(x) - f(a)}{x - a}  
\]
```

Tabular layout

- ▶ Use the tabular environment for tables

```
\begin{tabular}{lr}  
  Name & Email \\  
  John & john.hamer@glasgow.ac.uk \\  
  ...  
\end{tabular}
```

- ▶ The {lr} means two columns, the first left-aligned and the second right-aligned.
- ▶ Can add horizontal rules to separate the column headers:

```
\begin{tabular}{lr}  
\hline \textbf{Name} & \textbf{Email} \\  
\hline John & john.hamer@glasgow.ac.uk \\  
  ... \\  
\hline  
\end{tabular}
```

Spanning columns

`\multicolumn` is used to place text over several columns, or to change the alignment of a particular cell.

```
\begin{tabular}{llr}
  \multicolumn{2}{c}{\textbf{Name}}
  & \multicolumn{1}{c}{\textbf{Email}} \\
  \multicolumn{1}{c}{\emph{First}}
  & \multicolumn{1}{c}{\emph{Last}} \\
\hline
  John & Hamer & john.hamer@glasgow.ac.uk \\
  ...
\end{tabular}
```

Bibliography

- ▶ \LaTeX is typically used in combination with a system called Bib \TeX .
- ▶ Bib \TeX extracts and formats entries from a database of books and articles.
- ▶ Entries in the database look like:

```
@article{greenwade:TUGBoat:14.3,  
  author   = "George D. Greenwade",  
  title    = "The {C}omprehensive {T}ex {A}rchive {S}ystem  
  year     = 1993,  
  journal  = {TUGBoat},  
  volume   = 14,  
  number   = 3,  
  pages    = "342--351"  
}
```

The L^AT_EX side

- ▶ Every BibT_EX reference requires a sort name you can refer to in your L^AT_EX source.
- ▶ E.g. “In `\cite{greenwade:TUGBoat:14.3}`, ...”.
- ▶ You need to tell L^AT_EX which referencing style to use; e.g.

```
\bibliographystyle{alpha}
```

- ▶ And where you'd like your bibliography to appear (along with the file containing your references):

```
\bibliography{my-ref-file-name}
```

- ▶ Run L^AT_EX once, so it knows which references you have used. Then (separately) run BibT_EX, then run L^AT_EX again.

Formatting a thesis

- ▶ Several \LaTeX styles exist; e.g.
<https://github.com/impleri/glasgow-thesis>
- ▶ Download `glasgow-thesis.sty`
- ▶ Change the document class to `report`, and load `glasgow-thesis`:

```
\documentclass[a4paper,12pt]{report}  
\usepackage{glasgow-thesis}
```

- ▶ Set the additional required fields for the title page; e.g.

```
\qualifications{M.A, University of Glasgow \\  
  B.A., University of Glasgow}  
\degree{Doctor of Philosophy}  
\school{Engineering}  
\college{Sciences}
```

Formatting a thesis (cont.)

- Change page numbering to roman for the title page and abstract:

```
\pagenumbering{roman}  
\maketitle  
\begin{abstract}  
  \lipsum[1-3]  
\end{abstract}  
\tableofcontents  
\clearpage  
\setcounter{page}{0}  
\pagenumbering{arabic}
```

Formatting a thesis (cont.)

- ▶ Since this is now a report (rather than an article), the major sectioning unit is the chapter:

```
\chapter{Introduction}  
\lipsum[4-12]
```

```
\chapter{Background}  
\lipsum[13-21]
```

```
\chapter{Conclusions}  
\lipsum[22-25]
```
