

Metasys® System UL 864 9th Edition UUKL/ ORD-C100-13 UUKLC Standard Smoke Control Applications

Application Note

Code No. LIT-12011308

Software Release 5.2

Issued August 1, 2012

Supersedes November 27, 2008

Metasys® System UL 864 9th Edition UUKL/ ORD-C100-13 UUKLC Standard Smoke Control Applications Application Note

Document Introduction

IMPORTANT: Smoke control applications require extra care during installation, commissioning, and servicing. Make sure to read smoke control documentation and follow all procedures carefully to ensure compliance with the UL 864 9th Edition UUKL/ORD-C100-13 UUKLC Standard for Smoke Control.

Smoke control applications issue commands to controlled devices that pressurize or depressurize an area of a building to minimize the spread of smoke. The smoke control strategy is achieved with the Network Engine (NxE) application described in this document and with manual override of the smoke control logic provided by the Firefighter's Smoke Control Station (FSCS). The NxE application includes both Network Automation Engines (NAEs) and Network Control Engines (NCEs). This document describes the devices and logic used to implement a smoke control system. It also includes smoke control applications for three specific building types—single-story shopping mall, warehouse, and multi-story building.

Note: These application notes only present an example of three possible smoke control strategies. The details of applying the strategy vary, because every building is unique. These application notes can help you develop an appropriate application for your project.

Related Documentation

Table 1 lists related smoke control documentation.

Table 1: Related Documentation

FCSC Overview

FCSC and MS/TP Field Device Connections

Figure 1 shows the FCSC and MS/TP field device connections. The field controller in this example is an MS/TP controller. You can use any combination of controllers.

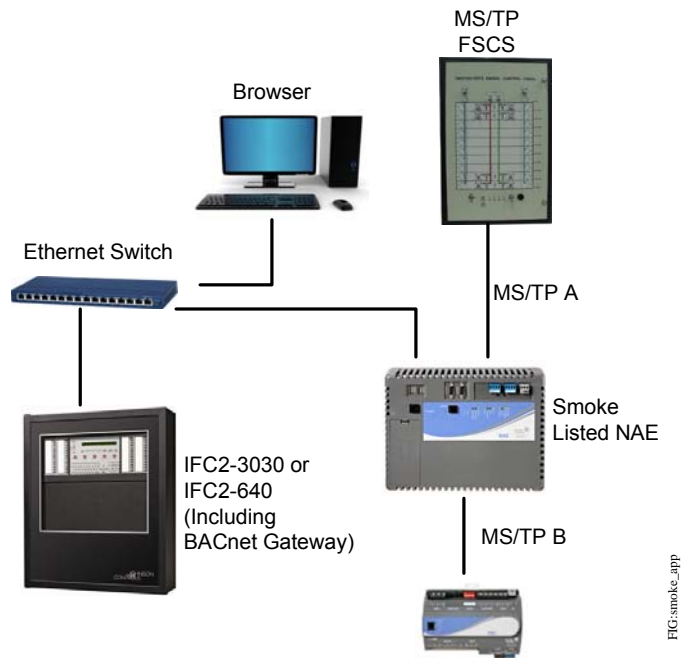

Figure 1: FCSC to MS/TP Field Device Connections

Smoke Control Priority Levels

All automatic smoke control commands are commanded at Priority 2. Firefighter manual overrides commanded from the Firefighter's Smoke Control Station (FCSC) panel to pressurize or depressurize zones are commanded at Priority 2. Firefighter manual overrides commanded from the FCSC panel to control individual fans and dampers are commanded at Priority 1. Weekly testing is commanded at Priority 7.

Automatic Smoke Control

Automatic Smoke Control depressurizes areas (zones) where smoke is detected. Pressurize and depressurize commands in automatic smoke control are commanded at Priority 2. Priority 2 commands are released when the smoke alarm is reset.

If a zone is under smoke control, the FSCS panel turns on status (LED) to indicate the current status of the fans, dampers and zone. Status LEDs for a fan show whether the fan is either On, Auto mode, Off, or in Trouble. Status LEDs for a damper or VAV indicate whether the damper is either Open, Auto mode, Closed, or in Trouble. Status LEDs for a zone indicate whether the zone is in Pressurize mode, Auto mode, Depressurize mode, or Purge mode. The Auto LED remains on while the point is in automatic smoke control.

The logic to check the status of fans and dampers for trouble is initiated when the zone goes into smoke control. If a fan does not reach its setpoint within 60 seconds, its Trouble LED is turned on. If a damper does not reach its setpoint within 75 seconds, its Trouble LED is turned on. After a commanded point goes into Trouble, the Automatic Command Retry logic repeats the command that failed every 60 seconds until the command is successful.

Manual Smoke Control

Manual smoke control logic is initiated when a firefighter turns the FSCS Panel Enable key from the Auto position to the Firefighter Control position and initiates a manual override of a fan, damper, VAV controller, or zone point from the Auto setting on the FSCS panel. This override turns off the Panel Enable switch Auto LED and turns on the Panel Enable switch Firefighter Control LED.

There are two levels of manual smoke control: Priority 2 and Priority 1. Priority 2 is the first level and is initiated when a firefighter, using the FSCS, puts a zone into manual smoke control by turning the zone knob to Pressurize, Depressurize, or Purge. All zone smoke control commands are commanded at Priority 2. Priority 2 commands are released when the firefighter returns the Zone knob back to Auto, or returns the Panel Enable key back to Auto.

Priority 1 is the second level and is initiated when a firefighter, using the FSCS, puts a point in manual smoke control by flipping either a fan toggle switch to On or Off, or a damper or VAV toggle switch to Open or Close. Individual points are commanded at Priority 1. Priority 1 commands are released when the firefighter either flips the fan, damper or VAV toggle switch back to Auto, or returns the Panel Enable key back to Auto.

Any point that is under manual smoke control activates the trouble-checking logic and turns on the Trouble LED for that point. If a fan does not reach its setpoint within 60 seconds after the NxE issues the command, its Trouble LED is turned on. If a damper does not reach its setpoint within 75 seconds after the NxE issues the command, its Trouble LED is turned on. If the Zone switch is set to either Pressurize, Depressurize, or Purge, and a fan does not reach its setpoint within 60 seconds after the NxE issues the command, or a damper does not reach its setpoint within 75 seconds after the NxE issues the command, the Trouble LED for the fan or damper that failed is turned on. After a commanded point goes into Trouble, the Automatic Command Retry logic repeats the command that failed every 60 seconds until the command is successful.

Auto Command Retry Logic

The Auto Command Retry logic is used for fans, dampers, and Variable Air Volume Modular Assembly (VMA) and VAV controllers. It does a comparison check between the commanded state and the actual device state, to verify that the command was successful. In the event a command to a fan, damper, or VAV fails, the reason may be that the MCO for the commanded device is on a remote smoke control NxE panel. The additional time required to communicate with the remote smoke control NxE might exceed the command response limit. Therefore, the command is resent every 60 seconds until the command is successful.

The Auto Command Retry logic is used when either a device MCO does not match command; a fan, damper, or VAV/VMA (Vxx) status does not match its commanded value; or a fan, damper, or VAV trouble input is active.

Fan Relay Supervision

If the project must meet Life Safety Code NFPA 101 requirements (where the fire system uses the HVAC system to sequence control or shutdown an HVAC fan), then fan relay supervision is required. Locate the auxiliary relay used to control the motor starter on the HVAC system fan within 3 feet of the motor starter. You must monitor (supervise) the wiring between the fan shutdown controller and the shutdown relay for integrity. To monitor, you can use electronic supervision or continuously powered shutdown relays that turn the fan off if power is lost to the relay circuit. In addition, proof of fan operation such as an airflow switch is required.

Response Times

Response times for individual components to achieve their intended state from the point of command should not exceed the following time periods: 60 seconds for fan operation at the intended state plus 90 seconds to annunciate, or 75 seconds for completion of damper travel plus 90 seconds to annunciate. See Figure 11 through Figure 88 for examples of response times and timing order.

Security Administration System

The Security Administration system authenticates and authorizes users of Metasys® system applications. The Security Administrator is a browser-based interface that manages all accounts. The Security Administrator creates User Accounts and Roles, and assigns access permissions to each user of the Metasys system.

Roles and User Accounts Overview

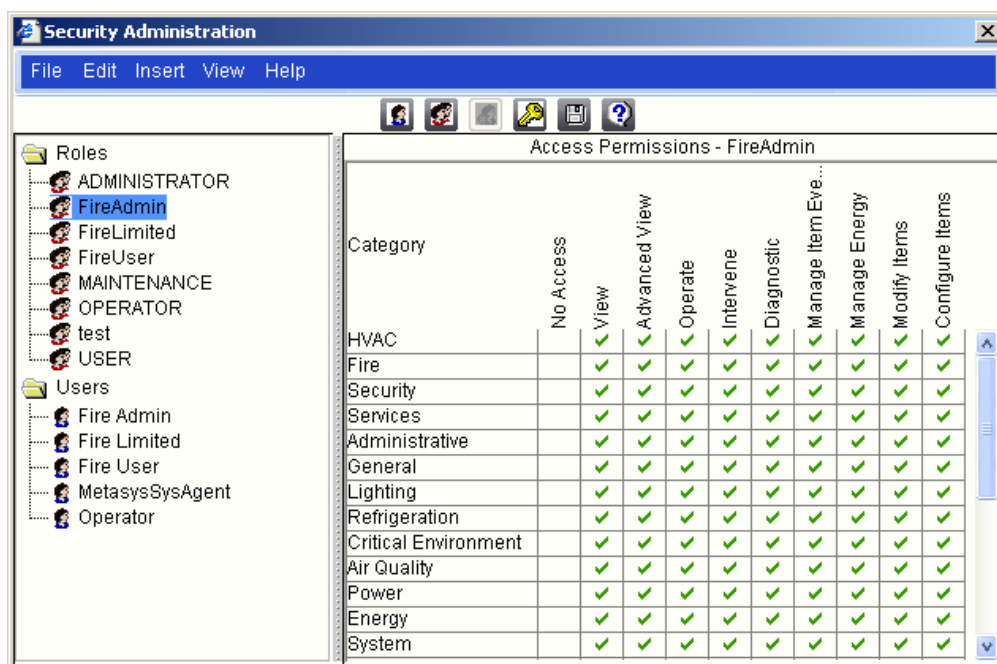

Security is based on User Accounts and Roles. Roles are groups of users with a specific function within the Metasys system. To access the system, an individual provides a user account and the correct password. Use letters, numbers, or symbols to create user account passwords.

Use the Login button from the logon prompt to send the user's credentials. A unique Session generates when the user's credentials match the logon requirements.

UUKL Smoke Control Security Administration Details

UUKL smoke control requires that only operators designated as fire operators be able to control the smoke control system. This designation required the creation of five new roles:

- **Administrator** - This is the highest level of control and allows site control of all HVAC and Fire features.
- **Fire Administrator** - This role is a fire manager level setting. It allows for full system control, including system modification or configuration.

Figure 2: Fire Administrator Access Permissions

- **Fire User** - This role is for most fire field technicians and allows system control and alarm acknowledgement, but not system modification or configuration.

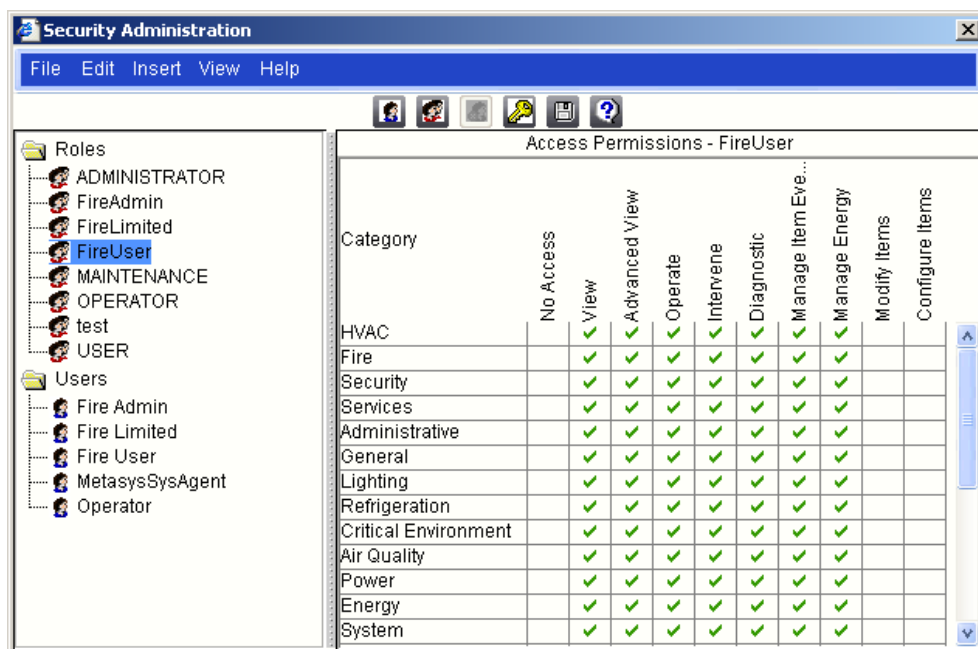

Figure 3: Fire User Access Permissions

- **Fire Limited** - This is the lowest of the permissions and only allows the operator to view fire/smoke control devices and alarms.

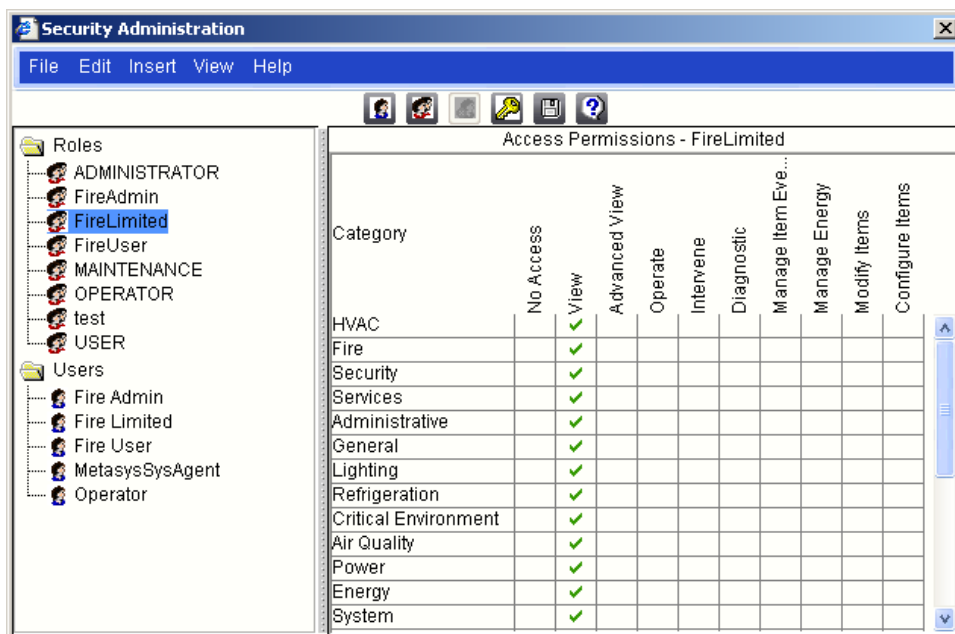

Figure 4: Fire Limited Access Permissions

Security Administration Detailed Procedures

Creating a New Role

To create a new role:

1. From the Security Administration menu bar, select Insert > New Role. The New Role dialog box appears.
2. Enter the information.
3. Click OK. The New Role appears in the tree.

Creating a New User Account

To create a new user account:

1. From the Security Administration menu bar, select Insert > New User. The User Properties tab appears.
2. Fill in the information.
3. Click OK. The New User appears in the tree.

Configuring a User Profile

To configure a user profile:

1. Select the user whom you wish to configure.
2. From the menu bar, select Edit > Properties. The User Properties tab appears.
3. Modify the desired user information.
4. Click OK.

Configuring Role Properties

To configure role properties:

1. Select the user whom you wish to configure.
2. From the menu bar, select Edit > Properties. The User Properties tab appears.
3. Select the Roles tab, then select an Available Role.
4. Click Add. The selected role appears in the Assigned Role list box.
5. Click OK.

Assigning System Access Permissions

To assign system access permissions:

1. Select the user whom you wish to assign system access permissions.
2. From the main menu, select Edit > System Access Permissions. The System Access Permission dialog box appears.
3. Select an available privilege.
4. Click Add, then click OK to assign the user's System Access Permissions.

Required Smoke Control Site Object and Smoke Control NxE Settings

Smoke Control Site Object - Default ADS Repository Setting

If a smoke control site has an Application and Data Server (ADS)/Extended Application and Data Server (ADX) on its network, then the smoke control site's **Default ADS Repository** setting **must** be set to 0.0.0.0.

Note: This setting prevents the smoke control NxE from forwarding alarms to the ADX once the smoke control NxE's alarm buffer is full. You must also make the same change in each smoke control NxE. See [Smoke Control NxE - ADS Repository Setting](#) for more information.

To configure the **Default ADS Repository** for the smoke control site object:

1. From the SCT, double-click the smoke control site object.
2. Select the Site View tab and click the Advanced option to display additional information (Figure 5).
3. Select Edit and scroll down to the Engineering Values section.
4. Set the Default ADS Repository value to 0.0.0.0, then click Save.

The screenshot shows a configuration window titled 'UUKLV9'. It has three tabs: 'Site View', 'Object Categories', and 'Snapshot Focus'. The 'Site View' tab is active. Below the tabs is an 'Edit' button and two radio buttons: 'Basic' (selected) and 'Advanced'. The 'Advanced' radio button is selected. Below the radio buttons is a table with two columns: 'Attribute' and 'Value'. The table is divided into sections: 'Object', 'Engineering Values', and 'Time'. The 'Default ADS Repository' attribute in the 'Engineering Values' section is highlighted with a red box and has the value '0.0.0.0'. Other attributes include 'Name' (UUKLV9), 'Description', 'Object Type' (Site), 'Object Category' (General), 'Site Director' (ADXUUKL1), 'Default ADS Connection Type' (LAN), 'Default ADS Priority Threshold' (255), 'Default ADS Delivery Time' (12:15 AM (HH:MM AM/PM)), 'Dynamic Broadcast Management' (True), 'Default Time Zone' ((GMT-06:00) Central Time (US & Canada)), 'Site Time Servers' (Listof[0]), 'Device Time Servers' (Listof[1]), 'Time Sync Period' (1 hour), 'Time Sync Method' (Windows), 'Multicast Group Address' (224.0.1.1), 'Multicast UDP Port' (123), 'Multicast TTL' (1), and 'Multicast Heartbeat Interval' (5 minutes).

Attribute	Value
Object	
Name	UUKLV9
Description	
Object Type	Site
Object Category	General
Site Director	ADXUUKL1
Engineering Values	
Default ADS Repository	0.0.0.0
Default ADS Connection Type	LAN
Default ADS Priority Threshold	255
Default ADS Delivery Time	12:15 AM (HH:MM AM/PM)
Dynamic Broadcast Management	True
Time	
Default Time Zone	(GMT-06:00) Central Time (US & Canada)
Site Time Servers	Listof[0]
Device Time Servers	Listof[1]
Time Sync Period	1 hour
Time Sync Method	Windows
Multicast Group Address	224.0.1.1
Multicast UDP Port	123
Multicast TTL	1
Multicast Heartbeat Interval	5 minutes

Figure 5: Smoke Control Site's Required Setting

Smoke Control NxE - ADS Repository Setting

If a smoke control site has an ADX/ADS on its network, the following communication setting **must** be made to **every** smoke control NxE in the smoke control site (Figure 6).

Note: This setting prevents the smoke control NxE from forwarding alarms to the ADX once the smoke control NxE's alarm buffer is full. You must also make the same change to the smoke control site object. See *Smoke Control Site Object - Default ADS Repository Setting* for more information.

To configure the ADS Repository for a smoke control NxE:

1. From the SCT, view the smoke control NxE device.
2. Select the Focus tab and click the Advanced option to display additional information.
3. Select Edit and scroll down to the Site section.
4. Set the ADS Repository value to 0.0.0.0, and click Save.

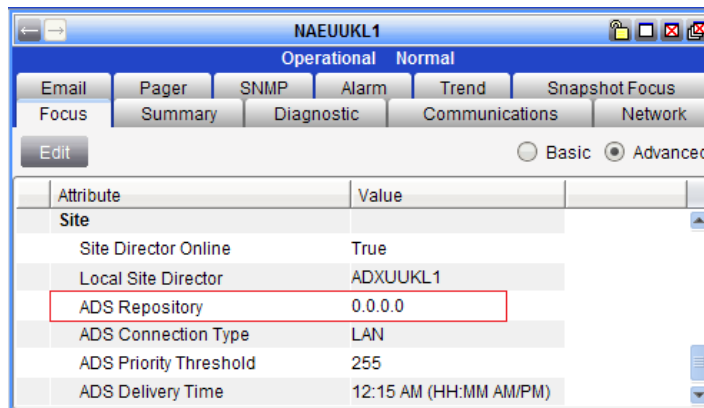

Figure 6: Smoke Control NxE's Required ADS Repository Setting

Smoke Control NxE - Alarm Event Action When Full Setting

Each smoke control NxE has an alarm repository buffer that stores alarms as they occur. When the NxE's alarm repository buffer gets full, the **Event Action When Full** setting determines what action to take. The **Event Action When Full** setting **must** be set to **STOP**, not Rollover, to prevent the NxE from overwriting the stored alarms that reported the initial initiating event. Figure 7 shows the NxE's Configuration Tab where the Event Action When Full setting is located.

Note: This is a required setting for all UL 864 9th Edition UUKL/ORD-C100-13 UUKLC smoke control NxEs.

To configure the Event Action When Full setting:

1. From the SCT, double-click the smoke control NxE device object.
2. Select the Configuration tab and click the Advanced option to display additional information.
3. Select Edit and scroll down to the Alarms section.
4. Set the Event Action When Full setting to Stop, then click Save.

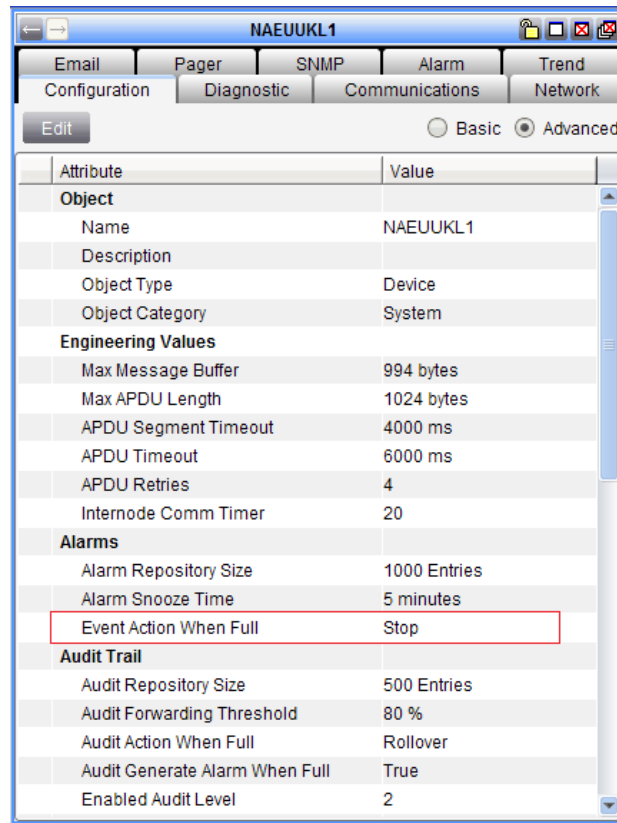

Figure 7: Smoke Control NxE Alarms - Event Action When Full Setting

Smoke Control NxE Alarm Buffer Operation

Alarm Buffering Within a Smoke Control NxE

The operation of the alarm buffer on any model smoke control NxE in this system responds as follows:

1. The NxE records alarms as normal until it reaches its high warning level limit (NAE55: 900 out of 1,000 alarms, NAE45/35 and NCE: 400 out of 500). An alarm pop-up then warns that the buffer is almost full and to reduce the number of buffered alarms.
2. When the alarm buffer of the NxE reaches its full limit, the NxE then overwrites the lowest priority alarm in its alarm buffer with the next new alarm having a higher priority. Alarms having equal priority values are not overwritten.

Note: Since smoke control alarms always have the highest priority, they are never overwritten.

3. Once all of the lowest priority alarms are overwritten in the NxE's alarm buffer, the NxE then stops recording alarms until the recorded alarms are acknowledged, evaluated, and discarded.

Event Priority

Event Priorities indicate the importance of the event message and determine when the event message is displayed. Displaying the priority of the event messages in the Event Viewer allows you to acknowledge event messages of higher importance before event messages of lower importance. The priority number associated with the event message falls within a range of 0–255. Event messages with a lower priority number are of a higher importance or are more critical than event messages with a higher priority number.

Table 2: Life Safety Group (Priority 0–39)

Priority	Recommended Use
0-4	Not used
5	Automatic Fire Alarm
8	Life Safety Process Alarm
11	Manual Fire Alarm
14	Other Higher Priority Life Safety
19	Medical Alarm
22	Hold Up and Duress Alarm
25	Panic Alarm

Assigning the Fire Object Category to Smoke Control Objects

You must assign every object used specifically for smoke control as a Fire object. This assignment limits the control of smoke control devices and points to authorized Fire operators.

WARNING: Risk of Serious Injury or Death.

Properly configure the software objects and define the fire objects (BACnet® Life Safety objects) as well as the appropriate user account roles and permissions. Failure to do so may allow these objects to be changed by unauthorized persons, which may compromise the safety of the system in the event of a fire or smoke control event.

Use the drop-down menu to assign the Fire object category (Figure 8).

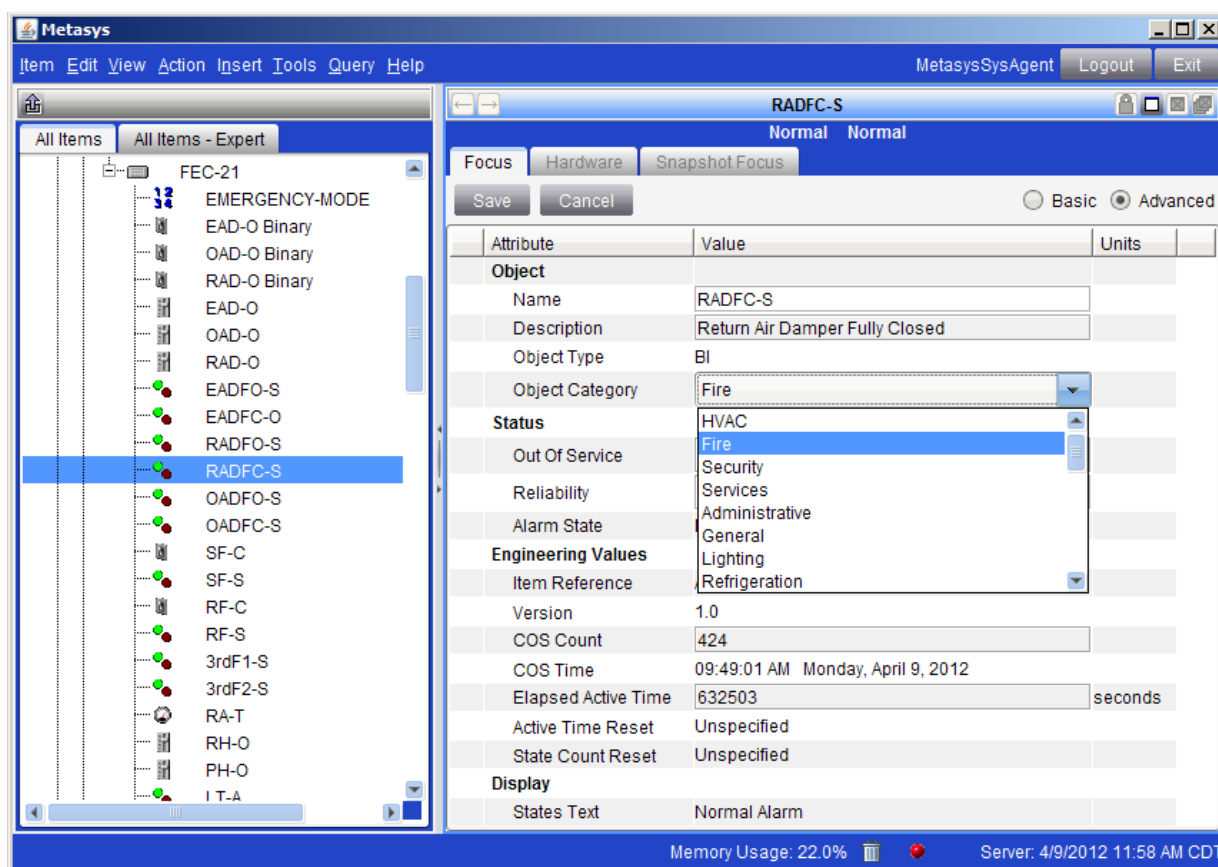

Figure 8: Assigning the Fire Object to Smoke Control Objects

Smoke Control Design Considerations

These Smoke Control NxE applications, as they exist in the Metasys System Smoke Control Library, comply with the UL 864 9th Edition UUKL/ORD-C100-13 UUKLC Smoke Listing. However, you are responsible for ensuring that the application complies with state and local regulations, and is approved by the Authority Having Jurisdiction (AHJ). You are also responsible for configuring all of the smoke control components, as well as the programming of those components, in order to comply with the UL 864 9th Edition UUKL/ORD-C100-13 UUKLC Smoke Control Listing as documented herein.

Smoke Control NxE Design Considerations

Keep the following design considerations in mind when designing a smoke control system:

- The smoke control NxE reports critical alarms based on the alarm condition. The alarm can only be cleared by resetting from the Intelligent Fire Controller (IFC) panel or the Manual Latched Alarm Reset point of the NxE.
- A **Programming In Progress** BACnet® Binary Value object (BV) point is required. You must set this point to true any time you are making changes to the Smoke Control system. Setting the point to true turns on the Programming In Progress LED on the FSCS to let a firefighter know that changes are being made and the system may not be fully functional. Turn off the point when changes are complete.
- A master reset interlock is required. The interlock is true if the reset on the IFC panel is pressed or the Manual Latched Alarm Reset point is set to True.
- You must define the hardware location for each object.
- You must name each object with a descriptive name that is unique in the system.

Smoke Control NxE Application

Metasys System Objects

This smoke control NxE application resides on the smoke control NxE and was created with the System Configuration Tool (SCT) to define the required Control System, Interlock, and Multiple Command objects. The Logic Connector Tool (LCT) is used to create the logic within the Control System object.

The LCT logic and configuration screens are organized into two sections: building type and FSCS. The building type section shows logic and configuration screens for pressurization and exhaust logic, lock alarms, latched alarms, and alarm lockout interlock settings for the building. The FSCS section shows the logic and configuration screens for each of the smoke control devices for which the FSCS controls and/or displays status. These devices include Exhaust Fan, Supply Fan, Zone Switch, VAV, Zone Smoke LED, and Firefighter Control.

Standard Smoke Control Application Examples

To help you in designing your smoke control system, this section shows several approved smoke control examples, which comply with UL/ULC Listings. Keep in mind that these are only examples. The mixture of components in your system can differ. Be sure that your smoke control system complies with all device and communication requirements and any local restrictions.

Smoke Control Application Overview

The smoke control Network Automation Engine (NxE) application provides smoke control for a building. The NxE FC Bus controllers provide field connections. The LCT application provides basic HVAC and automatic smoke control for the building. A smoke control NxE provides a connection to the FSCS, and the smoke control NxE application provides automatic smoke control and firefighter manual override for the smoke control system.

Smoke Control Application File Location

These Metasys system smoke control applications are located on the Metasys Branch Purchase Package (BPP) disk in the Metasys System Standard Smoke Control Applications directory.

Smoke Control Application Types

There are three different smoke control applications, with each application being designed for a specific building type.

Multi-Story Building

This smoke control application example uses a six-story building with dedicated stairwell and elevator fans. It incorporates floor above-floor below pressurization to achieve its smoke control. See Figure 120.

Warehouse

This smoke control application example uses a single-story warehouse and treats the warehouse as a single zone. You can configure multiple zones, but when a smoke control event occurs, even if it is only in one zone, all zones react as one and depressurize the warehouse. See Figure 9.

Single-Story Shopping Mall

This smoke control application example uses a single-story shopping mall with a two-zone (North and South) Mall Common area and three stores (zones) on each side of the common areas, for a total of six stores. When a smoke control event occurs, it depressurizes the smoke alarm zone and pressurizes all surrounding areas. See Figure 150.

FSCS Global Device Functions

Each fan switch, damper switch, Variable Air Volume (VAV) switch, and zone switch on the FSCS performs its same function, regardless of the smoke control application in which it is used. Command timing for each device type is also application independent.

FSCS Panel and Point Auto Discovery

The FSCS panel comes mounted in an enclosure along with an MS-FEU1610-0U MS/TP controller. The MS-FEU1610-0U is used as a communication interface between the FSCS and a smoke control NxE. The MS-FEU1610-0U connects to the FSCS using its SA bus and connects to the smoke control NxE using its FC bus.

The FSCS is pre-programmed with the point list provided when the panel is ordered. Once the FSCS is connected to the system, the panel and points can be Auto Discovered using the Insert drop-down menu of the NxE.

FSCS Panel Controls and Indicators

The example FSCS panel in Figure 9 shows Floors 4 through Floor 6 of a multi-story building. FSCS panels for a warehouse or a single-story shopping mall are different and are shown in their respective smoke control application sections. The FSCS is used in all three smoke control applications that are described in this document and is responsible for all Sonalert® logic.

Firefighters use the FSCS's toggle switches to manually control fans, dampers, and VAVs for each zone (one floor per zone, in this example). Each zone has a Zone Switch that, depending on its setting, controls dampers and fans to pressurize, depressurize, or purge a zone. A Trouble LED for each device illuminates when a fan, damper, or VAV fails to achieve its commanded state or an automatic smoke detector triggers smoke LEDs to illuminate. The LED value is set to 4 as described in Table 6, and the Sonalert sounds. Pressing the Silence button on the FSCS panel acknowledges the condition, silences the Sonalert, and changes the LED to a slow blink. The LED remains on slow blink until it is commanded off. The panel starts a timer and resounds the Sonalert within 24 hours if the LED is not turned off.

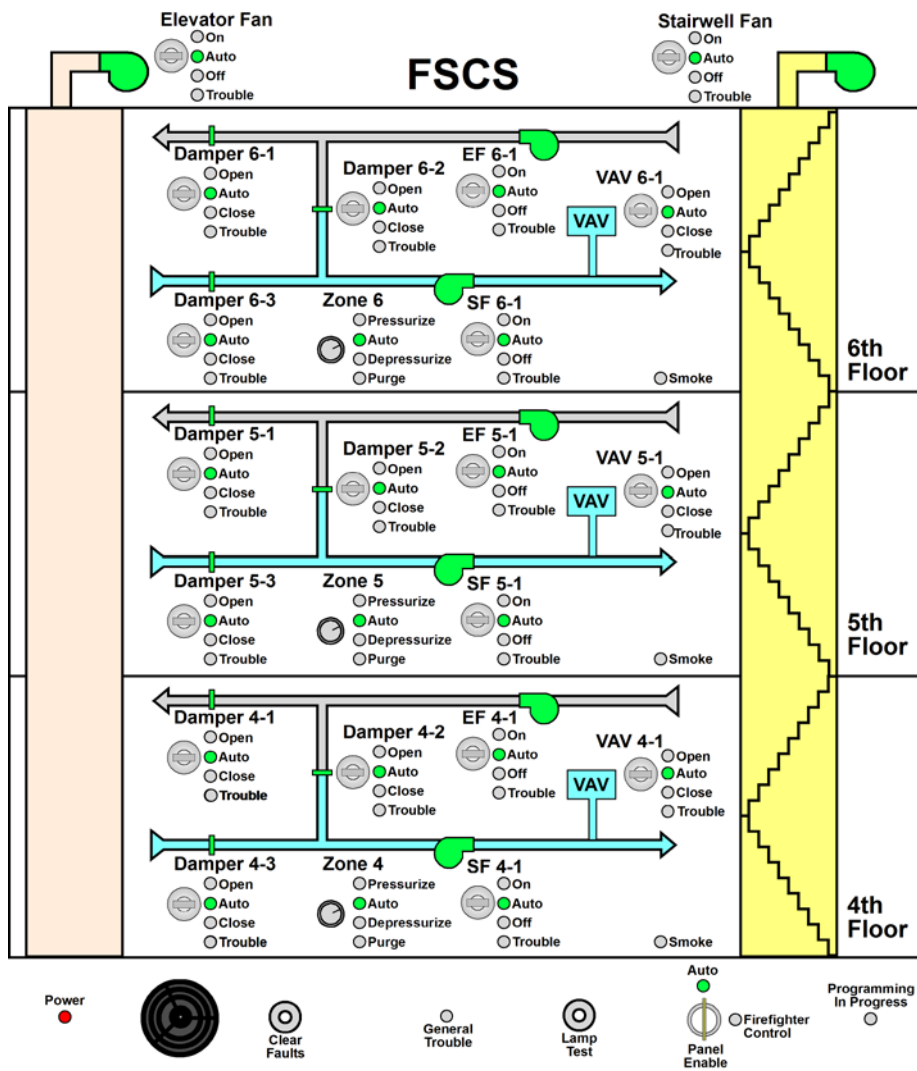

Figure 9: Example FSCS Panel (Warehouse)

The Sonalert sounds if the FSCS Panel Enable key is turned from the Firefighter Control position to the Auto position and all zone knobs and point toggle switches are not set to Auto. The FSCS still goes into Auto mode, but the Sonalert reminds the firefighter to set the manual smoke control switches to the Auto position.

The General Trouble LED illuminates to a fast blink if the FSCS panel loses communications with the NxS to which it is physically connected.

The Smoke LED for the zone illuminates when a smoke alarm is initiated by an automatic smoke detector in the zone.

You can set the Trouble LEDs on the FSCS panel to the following values shown in Table 6.

Table 6: FSCS Trouble LED Blink Conditions

FSCS Trouble LED Value	LED Blink Condition	Description
1	LED is off	Device or condition is inactive
2	LED is on continuously	Device or condition is active
3	LED slow blink	Acknowledged Condition
4	LED fast blink and Sonalert turned on	Unacknowledged Condition

FSCS General Trouble LED

The General Trouble LED (Figure 10) flashes at a fast blink whenever the FSCS panel loses communications with the NxE physically connected to the FSCS for more than 200 seconds. Figure 11 shows the communication timing for the General Trouble LED. The General Trouble LED also flashes at a fast blink if the FSCS Panel Enable key is turned from the Firefighter Control position to the Auto position and all zone knobs and point toggle switches are not set to Auto. The FSCS still goes into Auto mode, but the General Trouble LED reminds the firefighter to set the manual smoke control switches to the Auto position.

Figure 10: FSCS General Trouble LED

FSCS Sonalert

The FSCS panel is responsible for all Sonalert logic. A Trouble LED illuminates when a fan or damper fails to achieve its commanded state, and an automatic fire detection device triggers an alarm. The LED value is set to 3 (fast blink), as described in Table 6, and the Sonalert sounds. Pressing the Silence button on the FSCS panel silences the Sonalert and changes the Trouble LED to a value of 4 (slow blink). The Trouble LED remains on slow blink until it is commanded off. The panel starts a timer and resounds the Sonalert within 24 hours if the Trouble LED is not turned off.

The Sonalert sounds if the FSCS Panel Enable key is turned from the Firefighter Control position to the Auto position and all zone knobs and point toggle switches are not set to Auto. The FSCS still goes into Auto mode, but the Sonalert reminds the firefighter to set the manual smoke control switches to the Auto position.

Smoke Control Logic Programming Folders

Common Smoke Control Programming

The following folders contain programming that is common to all building types. Use this programming to construct a smoke control system that is consistent with the physical devices installed in the building. Automatic smoke control for each of the three building types is explained in its respective section.

Main Smoke Control Folder

Each smoke control application has a main folder that contains all subfolders required to program a smoke control system.

FSCS Folder

FSCS Folder, Tree and Objects

Figure 12 shows the FSCS Tree folder and its objects.

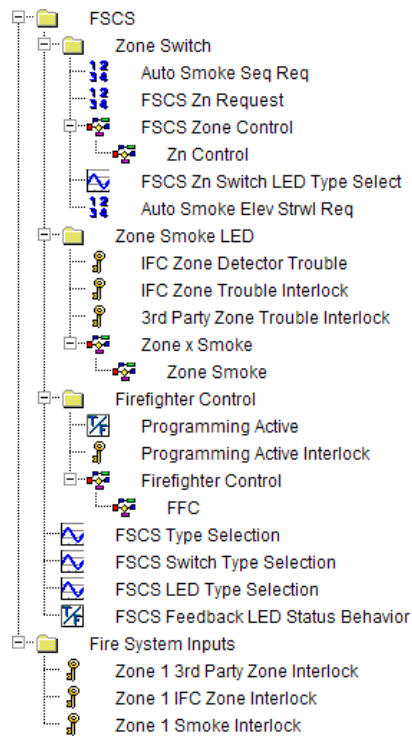

Figure 12: FSCS Objects

Zone Switch Folder

The Zone switch (Figure 13) is a four-position rotary switch with four LEDs. The four switch positions are Pressurize, Auto, Depressurize, and Purge, each with its associated LED.

ZONE 1

Figure 13: FSCS Zone Switch

Table 9: Zone Switch - 3-Position Rotary, 4 LEDs

Switch Position	Switch Setting	Associated With	LED	Description
1	Manual Pressurize	MS/TP banked LEDs	Pressurize	Illuminates the Pressurize LED when the switch is in position 1 and the associated feedback point is correct. Turns the Pressurize LED off when in any other position.
2	Auto		Auto	Illuminates the Auto LED when the switch is in position 2 and the associated feedback point is correct. Turns the Auto LED off when in any other position.
3	Manual Depressurize		Depressurize	Illuminates the Depressurize LED when switch is in position 3 and the associated feedback point is correct. Turns the Depressurize LED off when in any other position.
4	Manual Purge		Purge	Illuminates the Purge LED when switch is in position 4 and the associated feedback point is correct. Turns the Purge LED off when in any other position.

FSCS Logic

The FSCS Logic section contains logic and configuration screens for the FSCS Zone Switch and FSCS Zone Smoke LED.

The FSCS Zone Control Switch main logic controls smoke for its individual zone. See Figure 14.

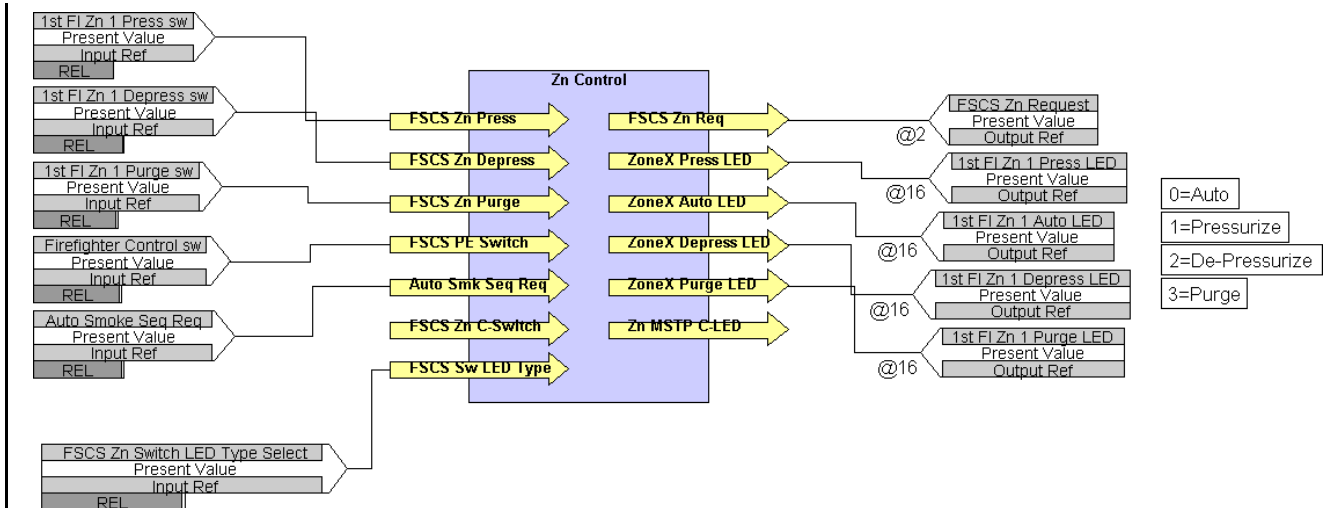

Figure 14: Zone 1 Control Switch Main Logic

- The Zone Control system block logic controls the FSCS Zone LEDs for the zone, depending on the Firefighter Control Key setting (Figure 15).
- The Zone Purge LED is illuminated if the pressurize and depressurize points in the field controller are true.
- The Zone Pressurize LED is illuminated if the field controller pressurize point is true and the depressurize point is false. The Zone Depressurize LED on the FSCS is illuminated if the field controller depressurize point is true and the pressurize point is false.
- The Zone Auto LED is illuminated only if the Zone Switch on the FSCS panel is not set to Pressurize, Depressurize, or Purge.
- The Zone Pressurize, Zone Depressurize, and Zone Purge settings on the FSCS panel are not functional unless the Firefighter Control Key has been turned to Firefighter Control.
- If the Firefighter Control Key is set to Auto, the FSCS Request is set to 0. If the Firefighter Control Key is set to Firefighter Control, the FSCS Request is set to the values shown in Table 10, depending on the position of the Zone switch.

Table 10: FSCS Zone1 Switch FSCS Request State Value

FSCS Zone 1 Switch Position	FSCS Request State Value	Smoke Control Action
Pressurize	1	Zone 1 Supply Fan On
Auto	0	Auto Smoke Control
Depressurize	2	Zone 1 Exhaust Fan On
Purge	3	Zone 1 Supply Fan On and Zone 1 Exhaust Fan On

Zone Switch Logic

Figure 19: FSCS Type Selection

Zone Smoke LED Folder

The FSCS's Zone Smoke LED is a single LED that illuminates when a trouble condition exists within its Zone (Figure 26). Each zone has a Smoke LED.

Figure 20: FSCS Smoke LED

Table 11: Smoke LED Alarm Sources

Alarm Source	LED Status
Smoke	Solid on when smoke is detected. Off when smoke alarm is reset.
Zone Disabled from IFC Panel	Flashes at fast rate when trouble exists. When acknowledged, flashes at slower rate. Off when trouble is cleared.
Detector Disabled from IFC Panel	
Panel Fault from IFC Panel	
Zone Trouble from IFC Panel	
Detector Trouble from IFC Panel	
Network Communication Trouble from IFC Panel	

The Zone Smoke block controls the Zone's Smoke LED on the FSCS (Figure 21).

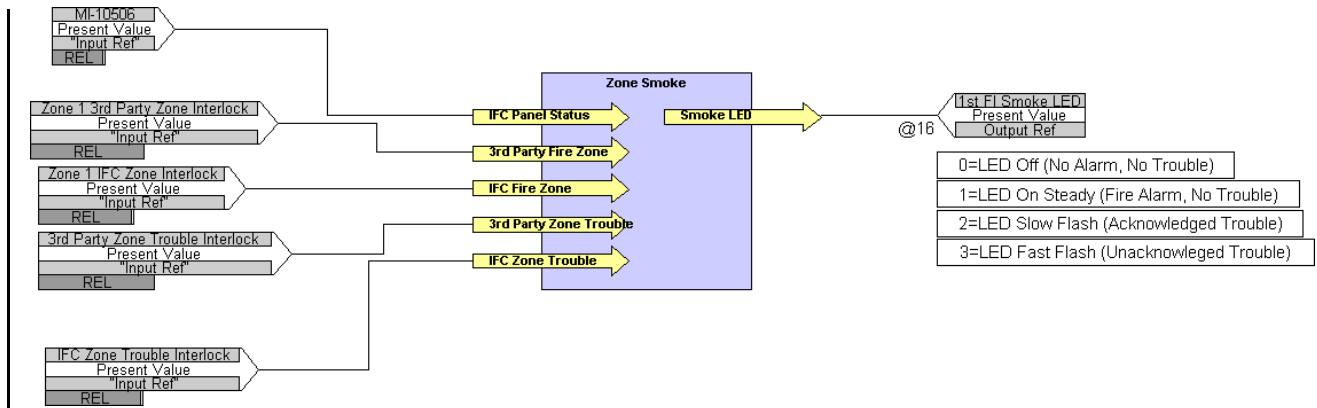

Figure 21: Zone Smoke LED Main Logic

Zone Smoke LED Inputs

Table 12: Zone Smoke LED Inputs

Zone Smoke LED Inputs	Zone Smoke Block Inputs	Zone Smoke Block Output	Output Value
3rd Party Zone Interlock	3rd Party Fire Zone	Smoke LED	0 = LED Off (No Alarm, No Trouble) 1 = LED On Steady (Fire Alarm, No trouble) 2 = LED Slow Flash (Acknowledged Trouble) 3 = LED Fast Flash (Unacknowledged Trouble)
IFC Zone Interlock	IFC Fire Zone		
Zone Trouble Interlock	3rd Party Zone Trouble		
Zone Trouble Interlock	IFC Zone Trouble		
IFC Panel Status	IFC Panel Status		

The Zone Smoke block logic (Figure 22) has the following settings:

- If the zone is in smoke control, turn the Smoke LED on continuously.
- If the panel status is bad, flash the Smoke LED.
- If the zone is not in smoke control, turn the Smoke LED off.

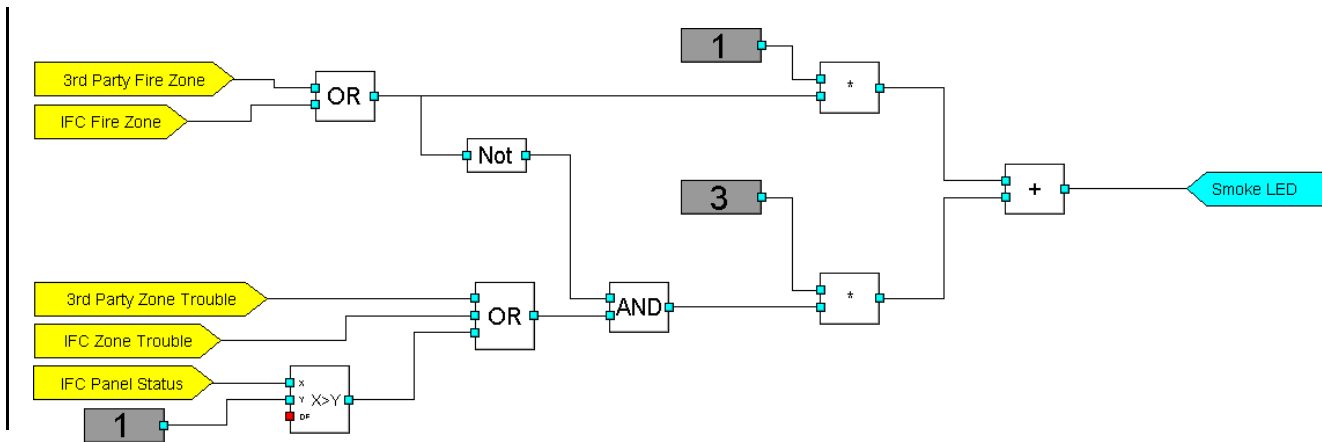

Figure 22: Zone Smoke Logic

Fire System Trouble

You must define either the **IFC Zone Detector Interlock**, **IFC Zone Trouble Interlock**, **3rd Party Zone Interlock**, or any combination of the three interlocks, as required by the fire system of the smoke control site.

IFC Zone Detector Trouble Interlock Definition

The IFC Zone Detector Trouble Interlock Definition contains a point for each detector in the zone (Figure 23). When a detector goes into alarm the FSCS Trouble LED for that zone illuminates.

Item	Attribute	Relation	Value	Differential
1 L001D001	Present Value	Equal	Fault	
2 L001D001	Reliability	Equal	Unreliable	
3 L001D001	Present Value	Equal	Disabled	
4 L001D001	Event State	Equal	Fault	

Figure 23: IFC Zone Detector Interlock Definition

IFC Zone Trouble Interlock Definition

The IFC Zone Trouble Interlock Definition contains a Present Value, Event State, Out of Service, and Reliability point for each zone in the building and a point for the IFC Zone Detector Trouble value. See Figure 24.

The screenshot shows a software window titled "IFC Zone Trouble Interlock". It has three tabs: "Configuration", "Interlock Definition", and "Action Tables". The "Interlock Definition" tab is active. Below the tabs is an "Edit" button. A "Logic:" dropdown menu is set to "Match Any (OR)". Below this is a table with 6 rows of configuration data. The table has columns: Item, Attribute, Relation, Value, and Differential. At the bottom of the window are "Delete" and "Add >>" buttons.

	Item	Attribute	Relation	Value	Differential
1	IFC Zone Detector Trouble	Present Value	Equal	True	
2	ZONE0000	Present Value	Equal	Fault	
3	ZONE0000	Reliability	Equal	Unreliable	
4	ZONE0000	Event State	Equal	Fault	
5	ZONE0000	Present Value	Equal	Disabled	
6	ZONE0000	Out Of Service	Equal	True	

Figure 24: IFC Zone Trouble Interlock Definition

3rd Party Zone Trouble Interlock Definition

The 3rd Party Zone Trouble Interlock Definition contains an optional, third-party, normally open (N.O.) contact input connection, and a point to monitor the field controller offline status (Figure 25). If the third-party point goes unreliable or the field controller monitoring the third-party point goes offline, the Zone LED illuminates.

	Item	3rdF1-S	3rdF2-S	Attribute	Relation	Value	Differential
1	3rdF1-S			Event State	Equal	Fault	
2	3rdF2-S			Event State	Equal	Fault	
3	3rdF1-S			Out Of Service	Equal	True

7	3rdF1-S			Status	Equal	Offline	
8	3rdF2-S			Status	Equal	Offline	
9	3rdF1-S			Event State	Equal	Fault	
10	3rdF2-S			Event State	Equal	Fault	
11	3rdF1-S			Out Of Service	Equal	True	
12	3rdF2-S			Out Of Service	Equal	True	
13	3rdF1-S			Reliability	Equal	Unreliable	
14	3rdF2-S			Reliability	Equal	Unreliable	
15	3rdF2-S			Status	Equal	Offline	
16	3rdF1-S			Status	Equal	Offline	

Figure 25: 3rd Party Zone Trouble Interlock Definition

Firefighter Control Folder

IMPORTANT: This folder is **only** found in the smoke control NxE that is directly connected to the FSCS.

The Firefighter Control switch is a two-position key switch on the FSCS. The two switch positions are Auto and Firefighter Control, each with its associated LED (Figure 26).

Figure 26: FSCS Firefighter Control Switch

Table 13: Firefighter Control Switch - 2-Position Key Switch, 2 LEDs

Switch Position	Switch Setting	Associated With	LED	Description
1	Auto	MS/TP banked switch	Auto	Illuminates the Auto LED when the switch is in position 1. Turns the Auto LED off when in any other position.
2	Firefighter Control		Firefighter Control	Illuminates the Firefighter Control LED when the switch is in position 2. Turns the Firefighter Control LED off when in any other position.

Note: The Sonalert alarm sounds if the FSCS Firefighter Control key is turned from the Firefighter Control position to the Auto position and all zone knobs and point toggle switches are not set to Auto. The FSCS still goes into Auto mode, but the Sonalert alarm reminds the firefighter to set the manual smoke control switches to the Auto position. The General Trouble LED also flashes at a fast blink if the FSCS Panel Enable key is turned from the Firefighter Control position to the Auto position and all zone knobs and point toggle switches are not set to Auto. The FSCS still goes into Auto mode, but the General Trouble LED reminds the firefighter to set the manual smoke control switches to the Auto position.

Firefighter Control Logic

The FSCS Fighter Control main logic turns the Firefighter Control Auto LED on if the Firefighter Control key is off. It turns the Firefighter Control LED on if the Firefighter Control Key is on. The Programming in Progress LED automatically flashes when you upload or download to any field controller or supervisory controller. If you edit the LCT while the system is live, manually command the Programming in Progress LED to Fast Flash. See Figure 27.

WDT Schedule Folder

The WDT Schedule folder contains the weekly test schedule for all dedicated smoke control equipment for this NxE.

To assign schedule day and times for the weekly dedicated test to run:

1. From the WDT Schedule, set the desired day and time for the test to run from the Weekly Schedule Display Mode.

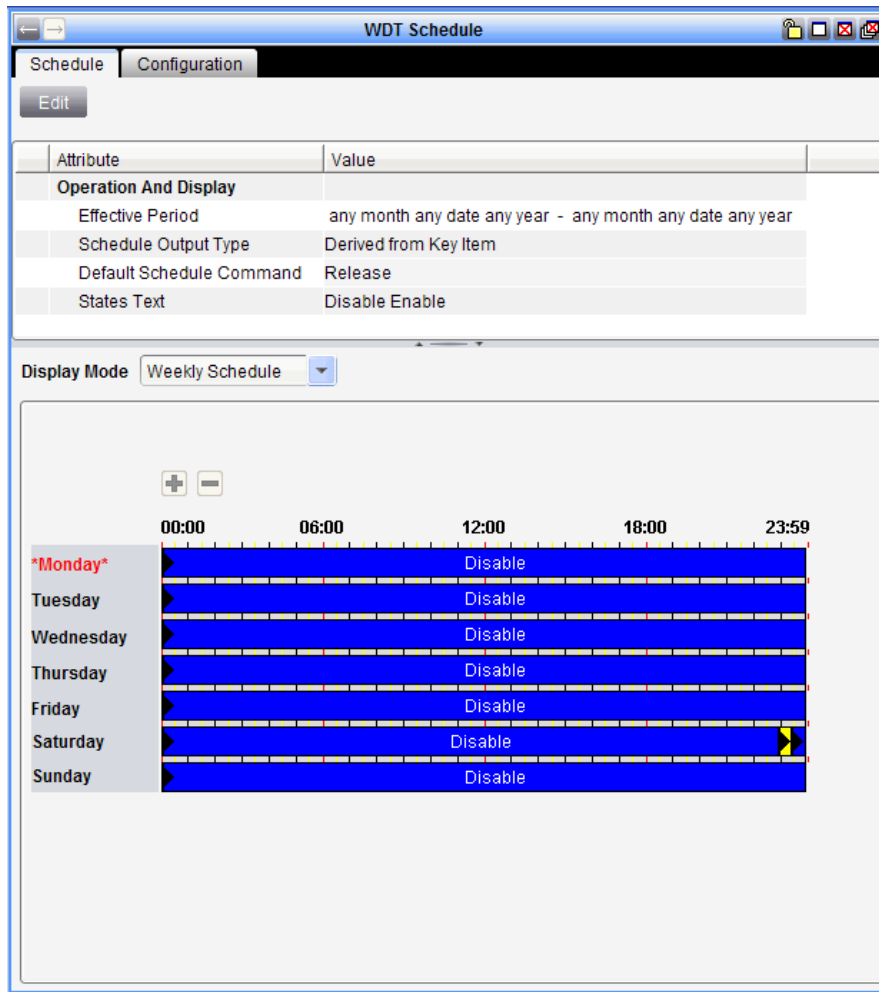

Figure 40: WDT Weekly Schedule

- From the Scheduled Items Display Mode, add the desired WDT Enable point for all dedicated smoke control equipment controlled by this NxE.

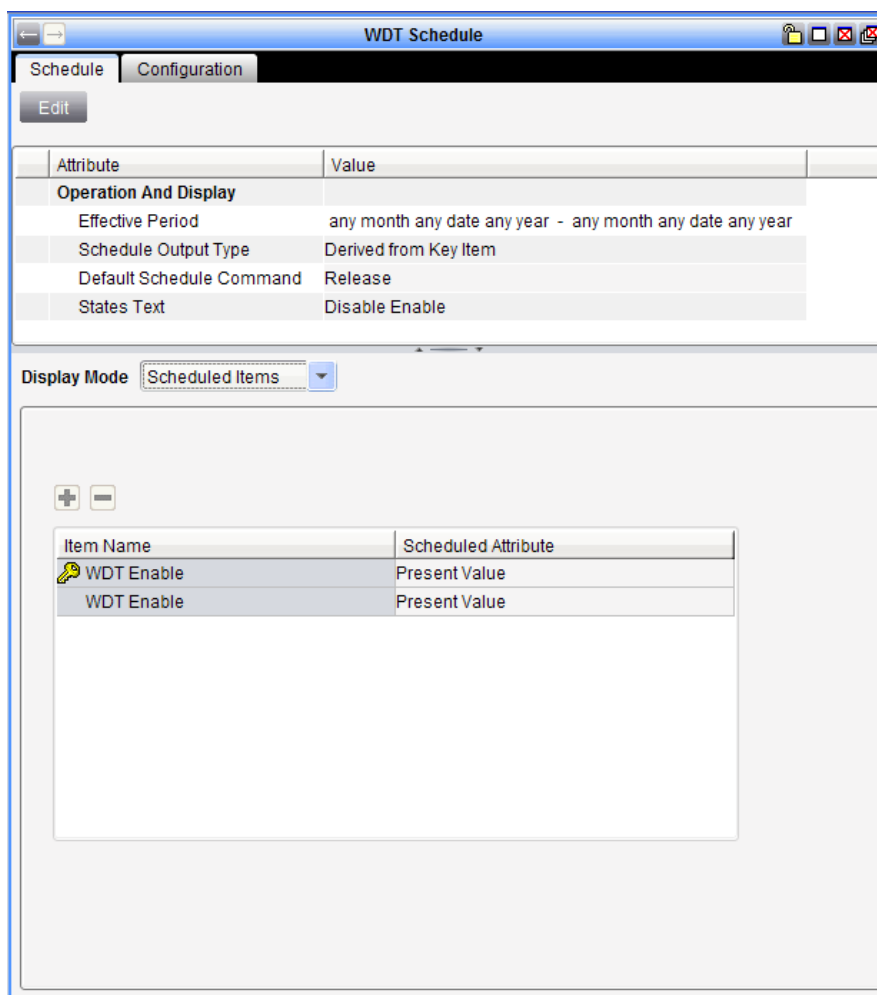

Figure 41: WDT Scheduled Items

AHU Folder

The AHU folder contains subfolders for the devices that physically define the AHU type.

AHUs configurations vary as required by the type of unit physically installed in the smoke control area. Use the fan, damper, and VMA logic folders to match the physical AHU configuration of the smoke area.

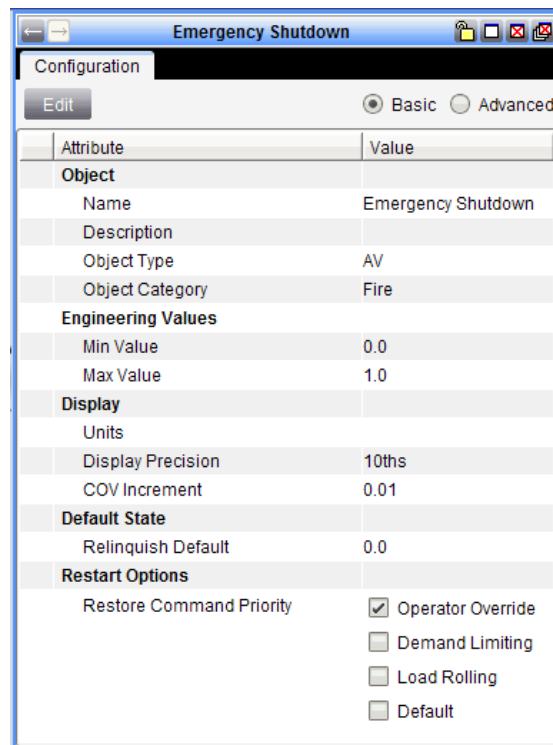

Figure 42: AHU Folder Tree

Emergency Shutdown Control

The Emergency Shutdown Control folder is one of the AHU subfolders.

The Emergency Shutdown status point is used by the fan, damper, and Vxx control logic to shutdown the AHU (Figure 43).

The screenshot shows a software window titled "Emergency Shutdown" with a "Configuration" tab and an "Edit" button. It features two radio buttons for "Basic" (selected) and "Advanced" views. The main area is a table with "Attribute" and "Value" columns, containing sections for Object details, Engineering Values, Display settings, Default State, and Restart Options.

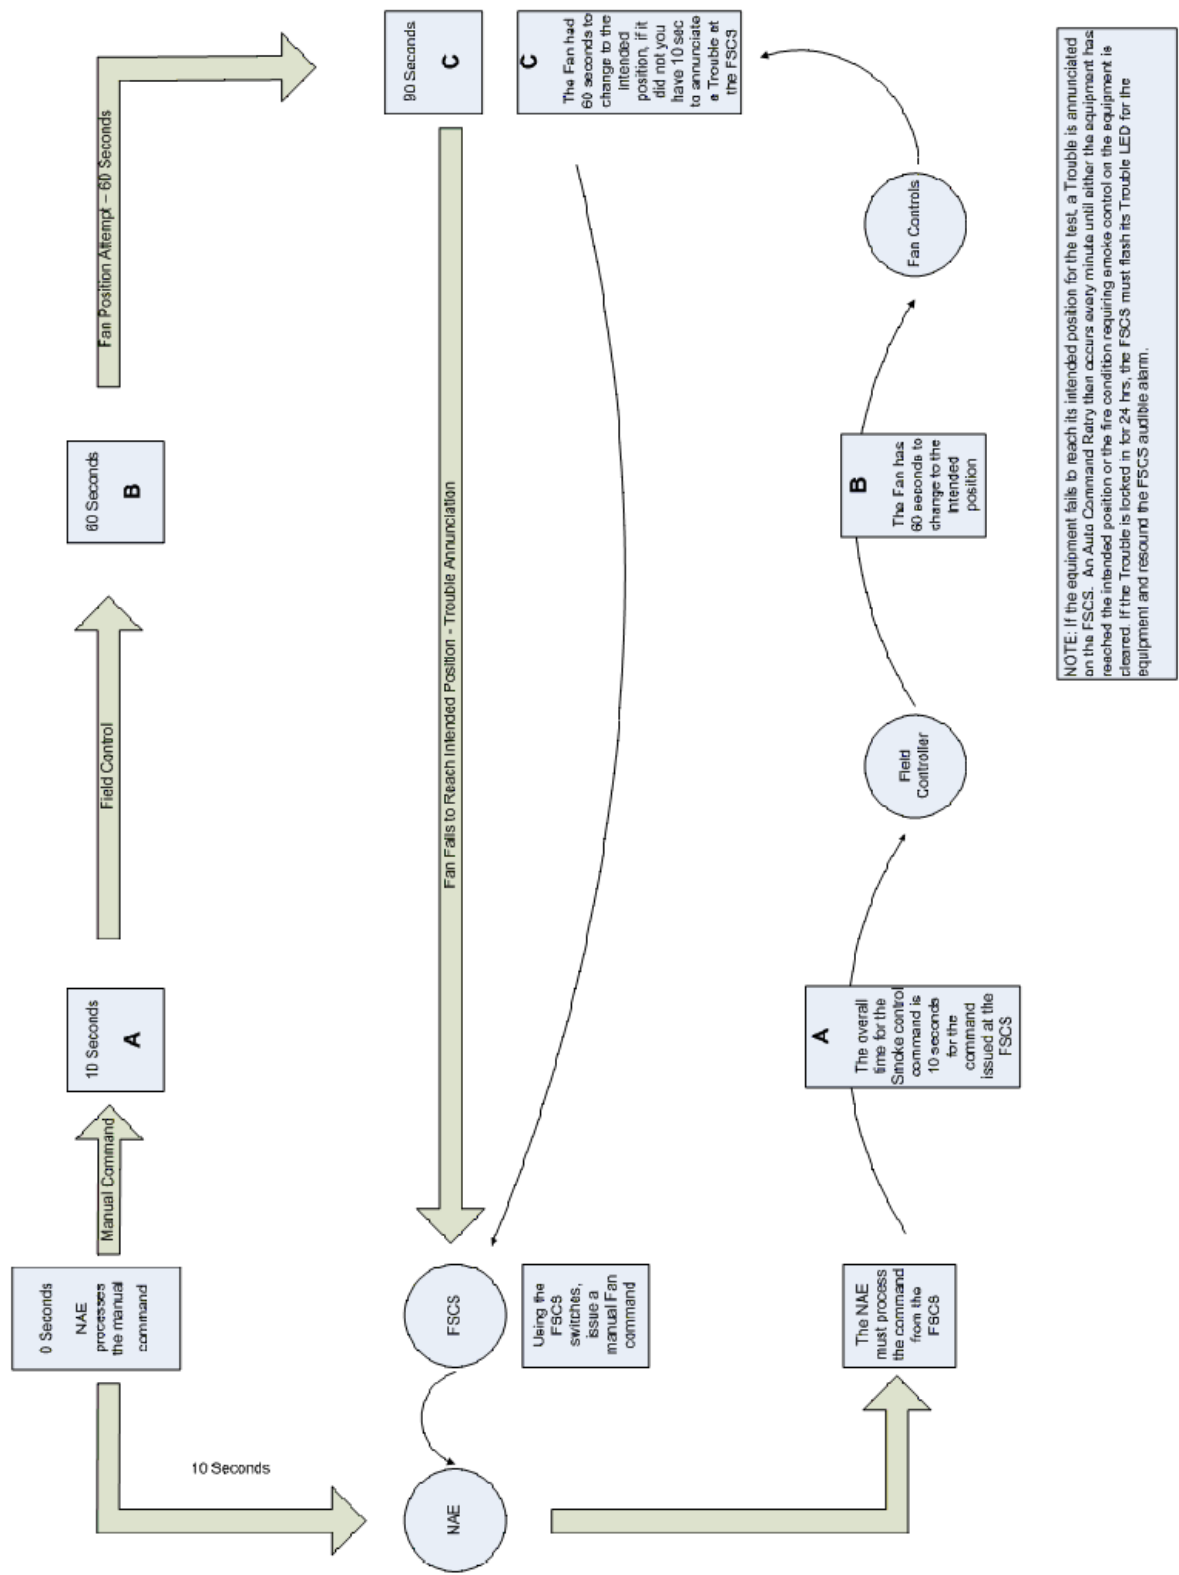

Figure 46: Manual Fan Command Timing

Automatic Fan Command Timing

Figure 47: Automatic Fan Command Timing

Fan Switch

The FSCS's Fan switch, used for supply and exhaust fans, is a three-position toggle switch with four LEDs (Figure 48). The three switch positions are On, Off, and Auto, each with its associated LED. The Trouble LED illuminates when trouble is present for the fan. Its flash rate shows its acknowledged/unacknowledged status.

SF 1-1

Figure 48: FSCS Fan Switch

Table 16: Fan Switch - 3-Position Toggle, 4 LEDs

Switch Position	Switch Setting	Associated With	LED	Description
1	Manual On	MS/TP banked LEDs	On	Illuminates the On LED when the switch is in position 1 and the associated feedback point is correct. Turns the On LED off when in any other position.
2	Auto		Auto	Illuminates the Auto LED when the switch is in position 2 and the associated feedback point is correct. Turns the Auto LED off when in any other position.
3	Manual Off		Off	Illuminates the Off LED when switch is in position 3 and the associated feedback point is correct. Turns the Off LED off when in any other position.
N/A	N/A	Single LED	Trouble	Flashes at a fast rate when Trouble exists. When acknowledged, flashes at a slower rate. Turns the Trouble LED off when the Zone's Trouble is cleared.

Fan Logic

The Fan main logic is shown in Figure 49. This logic is used for all fan types in all three smoke control application programs. Logic settings are used to program whether the fan is a Supply Fan, Exhaust Fan, Elevator Fan, or Stairwell Pressurization Fan. Additional program settings provide the specifics for each fan type and its use.

The FSCS Supply Fan 1 main logic consists of the fan inputs (Figure 50), Profile block (Figure 51), FSCS block (Figure 53), Trouble block (Figure 58), and the fan outputs that include the Fan Cmd MCO that commands the field controller points.

Fan Logic Inputs

Figure 50 shows fan logic inputs for **all** possible fan types, with exceptions noted to the right. For example, selecting an exhaust fan does not display any of the inputs associated with an elevator or stairwell fan.

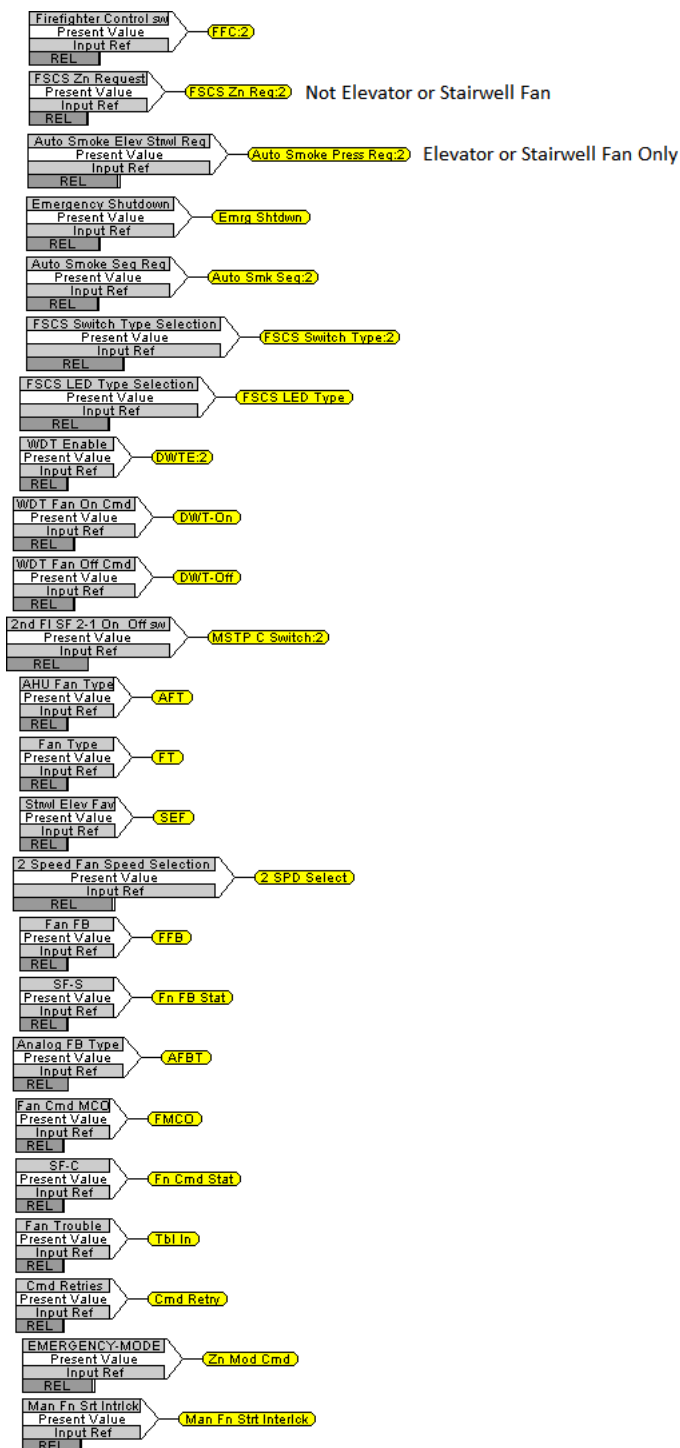

Figure 50: Fan Logic Inputs (Dry Contact Feedback)

Fan Input Connections List

Table 17 shows the Fan's inputs and their control system block connections.

IMPORTANT: Fans that are incorrectly configured prevent proper smoke control sequence operation.

Table 17: Fan Input Connections (Part 1 of 4)

Input Source	All Possible Fan Inputs	Label	Description	Control System Block	Control System Block Input

Fan Trouble Folder	Fan Trouble	Tbl In	Fan trouble condition met States: 0 = Normal 1 = Trouble condition	Trouble	Trouble Input
Fan Trouble Folder	CMD Retries	Cmd Retry	Accumulator for the number of command retries. Value clears when the command is satisfied or the condition requiring the command is no longer active.	Trouble	Cmd Retries In
Fan Field Controller	Emergency Mode	Zn Mode Cmd	Emergency HVAC command point inside the controller States: 0 = Normal 1 = Pressurize 2 = De-pressurize 3 = Purge 4 = Shutdown	Profile	Zn Mod Cmd
Fan FSCS Folder	Man Fn St Intrlck	Man Fn Strt Interlck	Any safety condition that either prevents the fan from starting or stops continuous fan operation. States: 0 = Fan start disabled 1 = Fan start enabled	FSCS	Man Fan Start Interlock1

1. All Selections must be configured during the initial fan programming. Set the point's default value to the same value as the desired setup value to ensure the selection is maintained in the event of an NxE restart. Archive and upload the NxE database to the SCT database to save all changes for the fan configuration to prevent overwriting desired values on a download to the NxE.

Fan Profile Block

Figure 51 shows the Fan Profile block with its inputs and outputs.

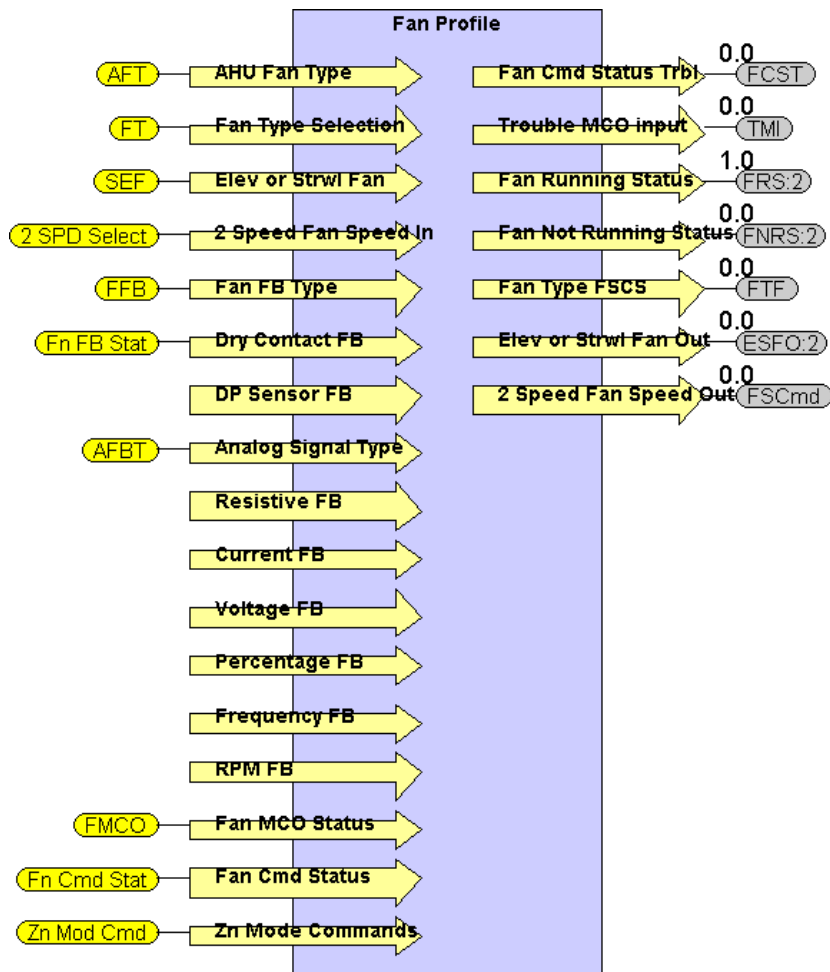

Figure 51: Fan Profile Block

Fan Profile Block Inputs

Table 18: Fan Profile Block Inputs (Part 1 of 2)

Fan Inputs	Label	Description
AHU Fan Type	AFT	Sets AHU Fan Type from the Fan Profile folder's AHU Fan Type point 0 = N/A 1 = Supply Fan (Default) 2 = Exhaust Fan
Fan Type Selection	FT	Sets the physical Fan Type from the Fan Profile folder's Fan Type point 0 = Constant Volume 1 = 2 Speed 2 = Variable Speed Drive
Elev or Strwl Fan	SEF	Sets the Fan, from the Fan Profile folder's Strwl Elev Fan point, as either an Elevator Fan or a Stairwell Fan 0 = N/A (Default) Fan is neither Elevator or Stairwell Pressurization Fan 1 = Elevator Fan 2 = Stairwell Fan
2 Speed Fan Speed In	2 SPD Select	Sets the speed of a 2 Speed Fan from the Fan Profile folder's 2 Speed Fan Speed Selection point, for a smoke event 0 = Slow Speed 1 = Fast Speed
Fan FB Type	FFB	Sets the Fan Feedback Type from the Fan Profile folder's Fan FB point 0 = Dry Contact 1 = Analog Signal 2 = DP Sensor
Dry Contact FB	Fn FB Stat	Status of the fan field controller's feedback point Fan Feedback Input active when Fan FB Type is set to Dry Contact 0 = Dry Contact (Default) CT Dry Contact, Aux Contact on Motor Starter, Flow Switch, DP Switch
DP Sensor FB	Fn FB Stat	Status of the fan field controller's feedback point Fan Feedback Input active when Fan FB is set to Differential Pressure 2 = Differential Pressure Switch Note: To change the On setpoint of the DP signal, change the constant for that signal input.
Analog Signal Type	AFBT	Fan Feedback Input active when Fan FB is set to Analog Signal 1 = Analog Feedback Sets Analog Signal Input Type when Fan FB is set to Analog Signal
Resistive FB	Fn FB Stat	Status of the fan field controller's feedback point Analog Signal Input - 0 = Resistive Feedback (Default) - Based on 0 to 135 ohm, nominal
Current FB	Fn FB Stat	Status of the fan field controller's feedback point Analog Signal Input - 1 = Current Feedback - Based on 4 to 20 mA, nominal
Voltage FB	Fn FB Stat	Status of the fan field controller's feedback point Analog Signal Input - 2 = Voltage Feedback - Based on 0 to 10 Volts, nominal
Percentage FB	Fn FB Stat	Status of the fan field controller's feedback point Analog Signal Input - 3 = Percentage Feedback - Based on 0 to 100%
Frequency FB	Fn FB Stat	Status of the fan field controller's feedback point Analog Signal Input - 4 = Frequency Feedback - Based on 0 to 60 Hz
RPM FB	Fn FB Stat	Status of the fan field controller's feedback point Analog Signal Input - 5 = RPM Feedback - Based on motor name plate data 3,600 RPM maximum

Table 18: Fan Profile Block Inputs (Part 2 of 2)

Fan Inputs	Label	Description
Fan MCO Status	FMCO	Fan MCO command from the Fan FSCS folder's Fan MCO point to field controller's fan point 0 = Auto 1 = On CV 2 = Off - CV or 2 Speed 3 = VFD 100% 4 = VFD 0% 5 = Emergency Shutdown 6 = Pressurize (Zone Switch) 7 = De-pressurize (Zone Switch) 8 = Purge (Zone Switch) 9 = Pressurize (Auto Smoke Seq) 10 = De-Pressurize (Auto Smoke Seq) 11 = 2 Speed Fan Slow 12 = 2 Speed Fan Fast 13 = WDT Fan On 14 = WDT Fan Off
Fan Cmd Status	Fn Cmd Stat	Status of the Fan field controller's command point
Zn Mode Commands	Zn Mod Cmd	Emergency HVAC command point of the fan field controller States: 0 = Normal 1 = Pressurize 2 = De-pressurize 3 = Purge 4 = Shutdown

Fan Profile Block Outputs

Table 19 shows the outputs for the Fan Profile block.

Table 19: Fan Profile Block Outputs

Fan Outputs	Label	Description	Control System Block	Control System Block Input
Fan Cmd Status Trbl	FCST	Decoded status of the fan command point in the field controller	Trouble	Fan Cmd
Trouble MCO Input	TMI	Decoded status of the Fan FSCS folder's Fan MCO point	Trouble	Fan MCO
Fan Running Status	FRS:2	Decoded status - True when the fan is running	FSCS Trouble	Fan On Status
Fan Not Running Status	FNRS:2	Decoded status - True when the fan is not running	FSCS Trouble	Fan Off Status
Fan Type FSCS	FTF	Selected value of the Fan Type input	Trouble	Fan Type
Elev or Strwl Fan Out	ESFO:2	Selected value of the Strwl - Elev Fan input	FSCS Trouble	Strwl or Elev Fan In
2 Speed Fan Speed Out	FSCmd	Selected value of the 2 Speed Fan Speed Selection input	FSCS	2 Speed Fan Speed

Fan Profile Block Logic

Figure 52 shows the Fan's Profile Block logic.

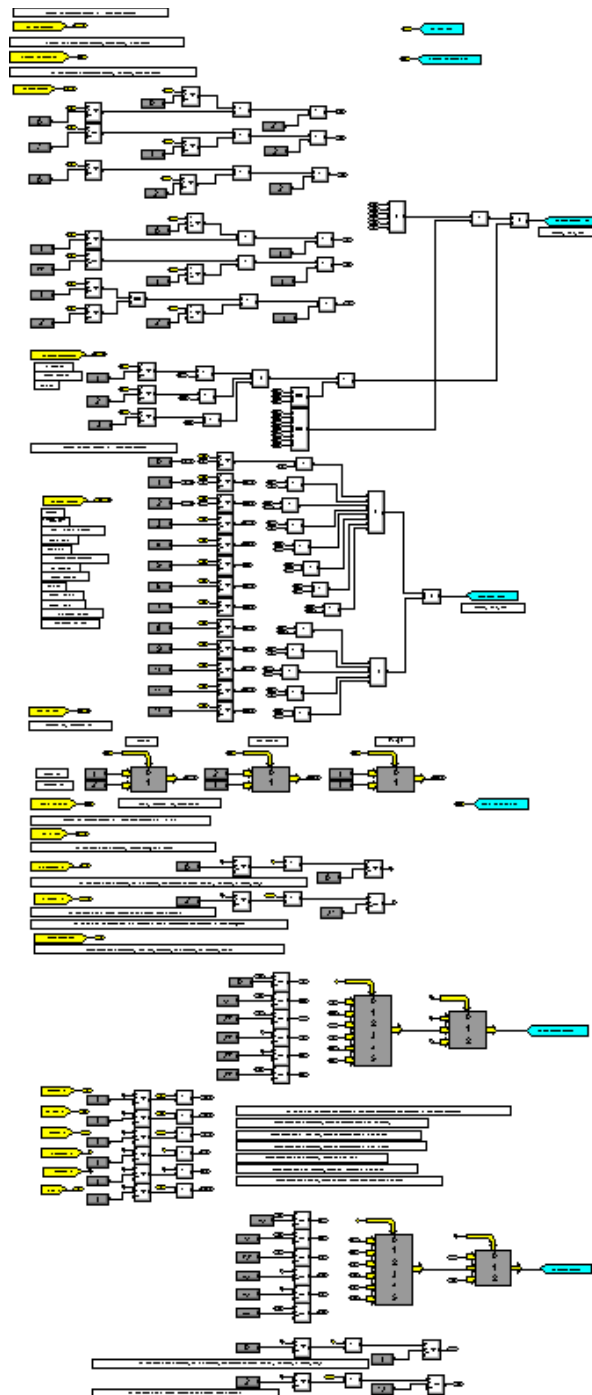

Figure 52: Fan Profile Block Logic

Fan FSCS Block

The Fan's FSCS control block controls the LEDs on the FSCS panel and commands the field controller (Figure 53).

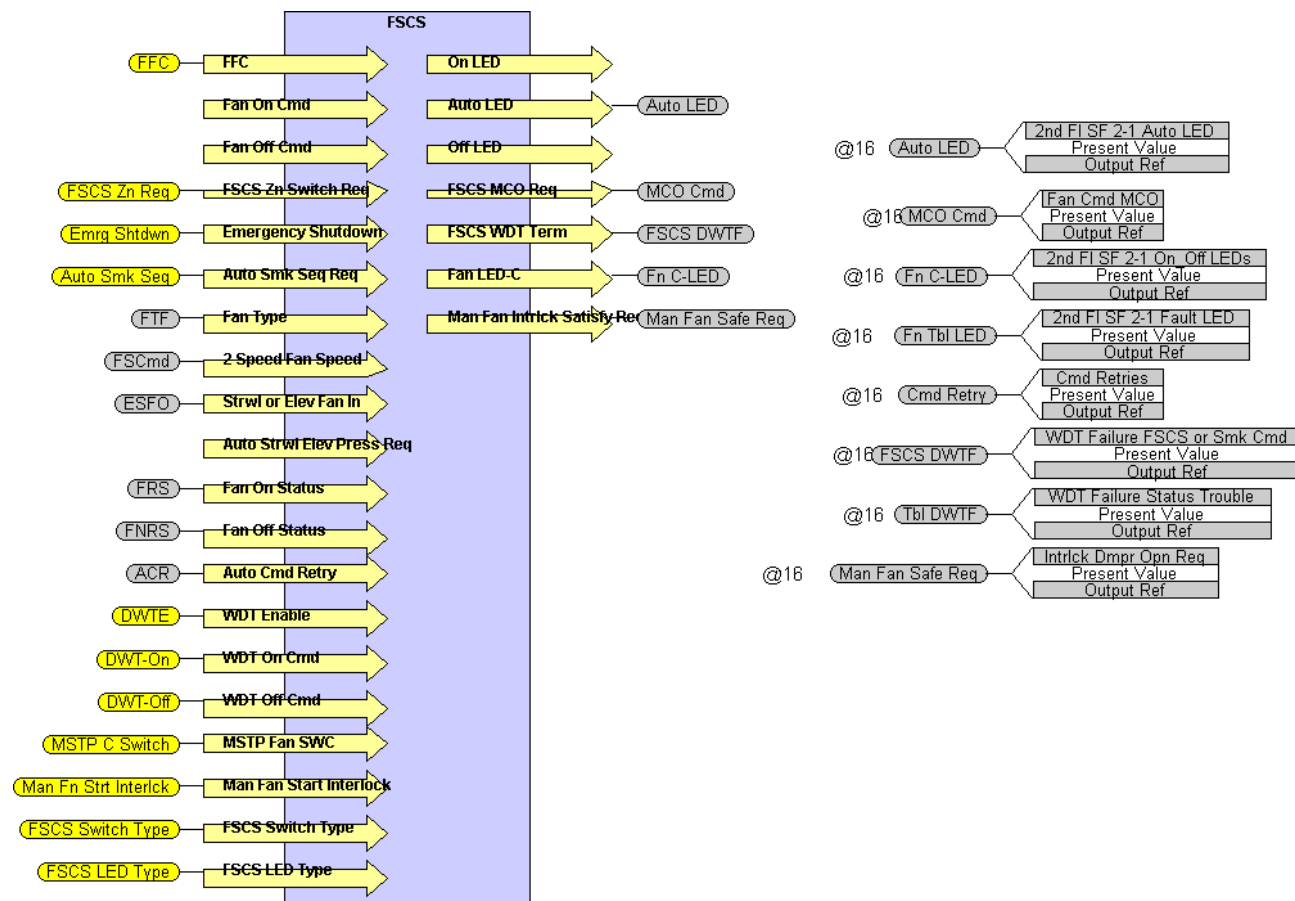

Figure 53: FSCS Control Block

The FSCS block logic is shown in Figure 54.

- The Fan On LED is turned on only if the FSCS is in Firefighter Control and the fan is on.
- The Fan Off LED is turned on only if the FSCS is in Firefighter Control and the fan is off.
- The Fan Auto LED is turned on only if the toggle switch is not in the On or Off setting.
- If the Firefighter Control Key is off, the FSCS Request is set to 0.

- If the Firefighter Control Key is on, the FSCS Request is set to the Table 20 values depending on the position of the Fan's toggle switch.

Table 20: Fan Toggle Switch FSCS Request Value

FSCS Fan Toggle Switch Position	FSCS Request State Value	Smoke Control Action
On	1	Depressurize
Auto	0	Auto
Off	2	Exhaust Fan Off

Fan FSCS Block Inputs

Table 21 shows the Fan's FSCS Block Inputs.

Table 21: Fan's FSCS Block Inputs (Part 1 of 2)

Inputs	Label	Description
FFC	FFC	Status of the FSCS MS/TP field controller's Firemans Key point
Fan On Cmd	FanOnCmd	This input is active when FSCS Switch Type Selection is set to selection 0 . The Actual status of the Fan FSCS binary input for the On Command.
Fan Off Cmd	FanOffCmd	This input is active when FSCS Switch Type Selection is set to selection 0 . The Actual status of the Fan FSCS binary input for the Off Command.
FSCS Zn Switch Req	FSCS Zn Req	Status of the FSCS Zone Switch folder's FSCS Zn Request point
Emergency Shutdown	Emerg Shtdwn	Status of the AHU Emergency Shutdown Control folder's Emergency Shutdown point
Auto Smk Seq Req	Auto Smk Seq	Status of the FSCS Zone Switch folder's Auto Smoke Seq Req point
Fan Type	FTF	Status of the Fan Profile Block's output - Fan Type FSCS
2 Speed Fan Speed	FSCmd	Status of the Fan Profile Block's output - 2 Speed Fan Speed Out
Strwl or Elev Fan In	ESFO	Status of the Fan Profile Block's output - Elev or Strwl Fan Out

Fan Trouble Block Outputs

Table 25 shows the Fan's Trouble Block's Outputs.

Table 25: Fan's Trouble Block Outputs

Outputs	Label	Description	Output
Trouble LED	Fn Tbl LED	FSCS's Trouble LED indication for the fan States: 0 = Off 1 = On 2 = Slow blink 3 = Fast blink	Commanded value of the Fan FSCS MS/TP field controller's Fan Trouble LED Indicator point
Auto Cmd Retry	ACR	When a fan command fails, this retries the command until the command succeeds or the condition that required the command is no longer active.	Commanded value of the Fan Trouble block's output - Auto Cmd Retry
Cmd Retries Out	Cmd Retry	Increments the value of the Accumulator for the number of command retries. Value clears when the command is satisfied or the condition requiring the command is no longer active.	Increments the value of the Fan Trouble folder's CMD Retries point
Trbl WDT Term	Tbl DWTF	Terminate the Weekly Dedicated Test States: 0 = No termination condition 1 = Condition met to terminate test	Commanded value of the Fan WDT folder's WDT Failure Status Trouble point

Fan Trouble Block Logic

The Fan Trouble Control block logic is shown in Figure 59. The Trouble LED is turned on if the fan is in smoke control and the fan has not reached its desired setpoint within 60 seconds. A fan is in smoke control if either the field controller is in pressurize or depressurize mode, or the Firefighter Control Key is on and the FSCS toggle switch is set to On or Off. If a fan does not reach its commanded state and goes into Trouble, the Auto Retry Command logic retries the command every 60 seconds.

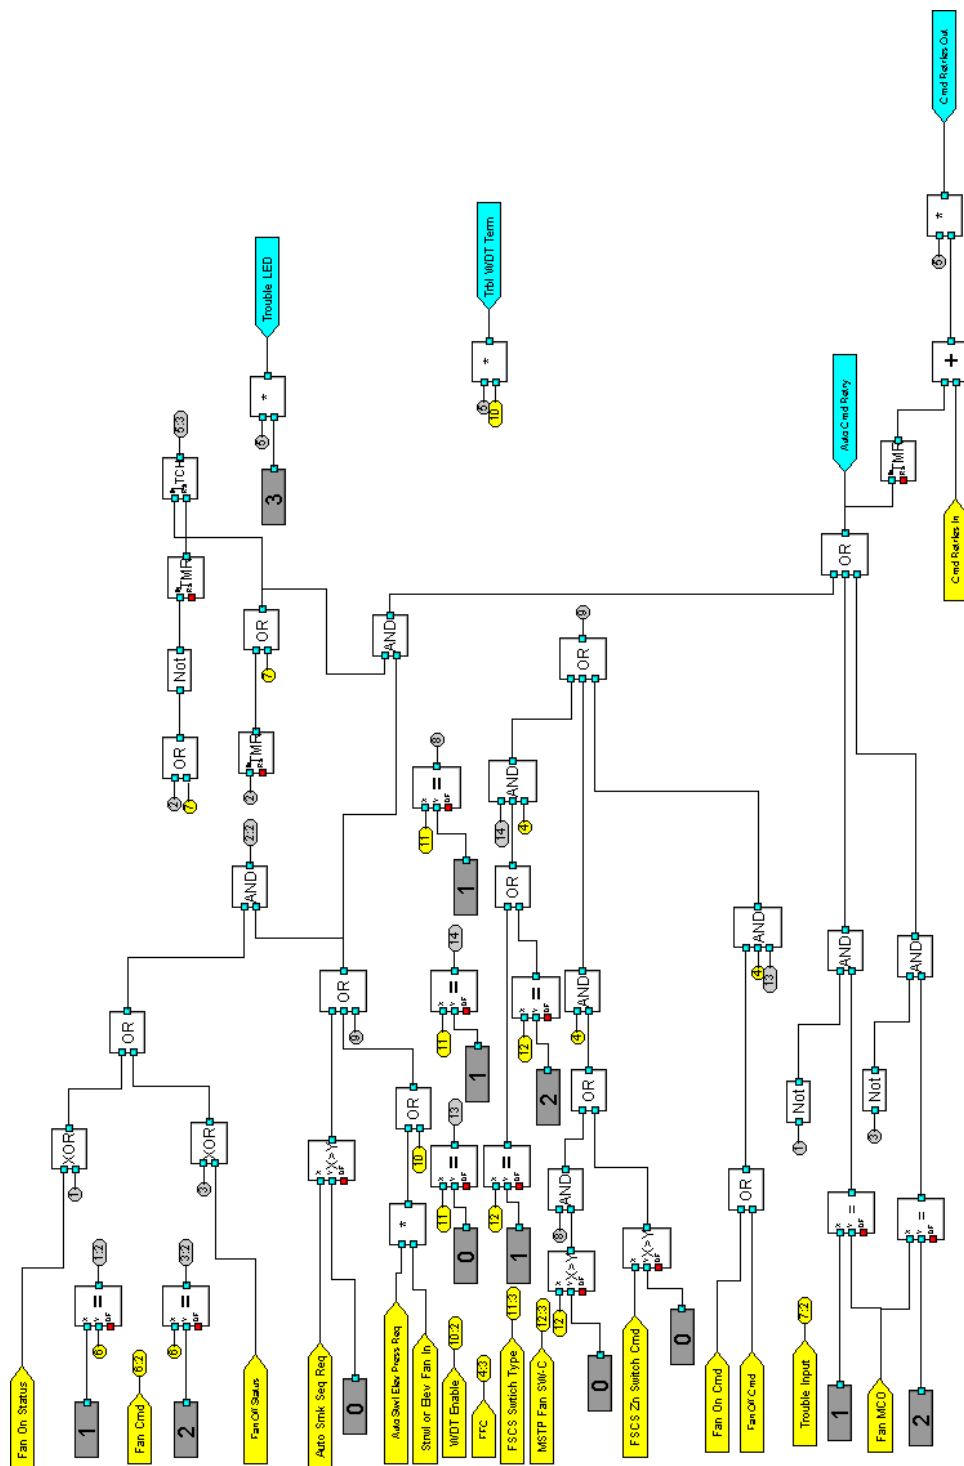

Figure 59: Fan Trouble Block Logic

The Fan Trouble Interlock Definition sets the values that, when reached, trigger an FSCS fan trouble alarm (Figure 60). The definition includes fan reliability and field controller offline status.

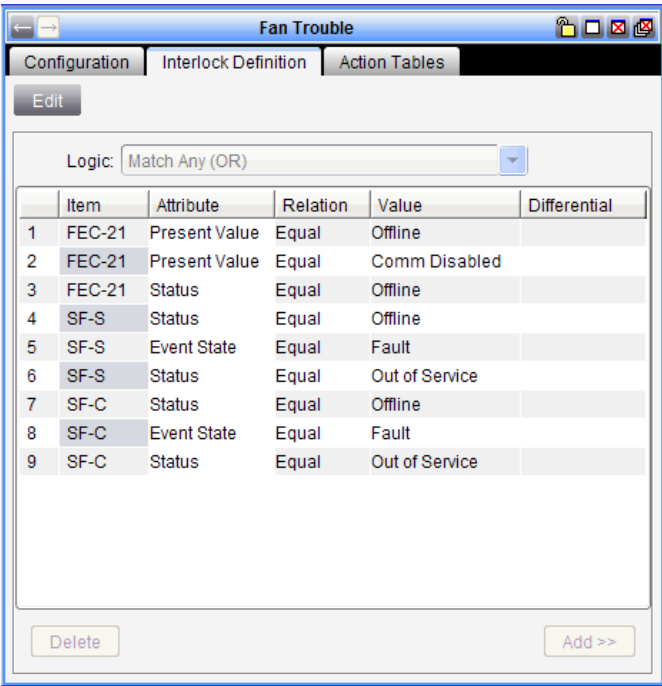

Figure 60: Fan Trouble Interlock Definition

Fan Outputs

Table 26 shows the Fan's outputs and their control system block connections.

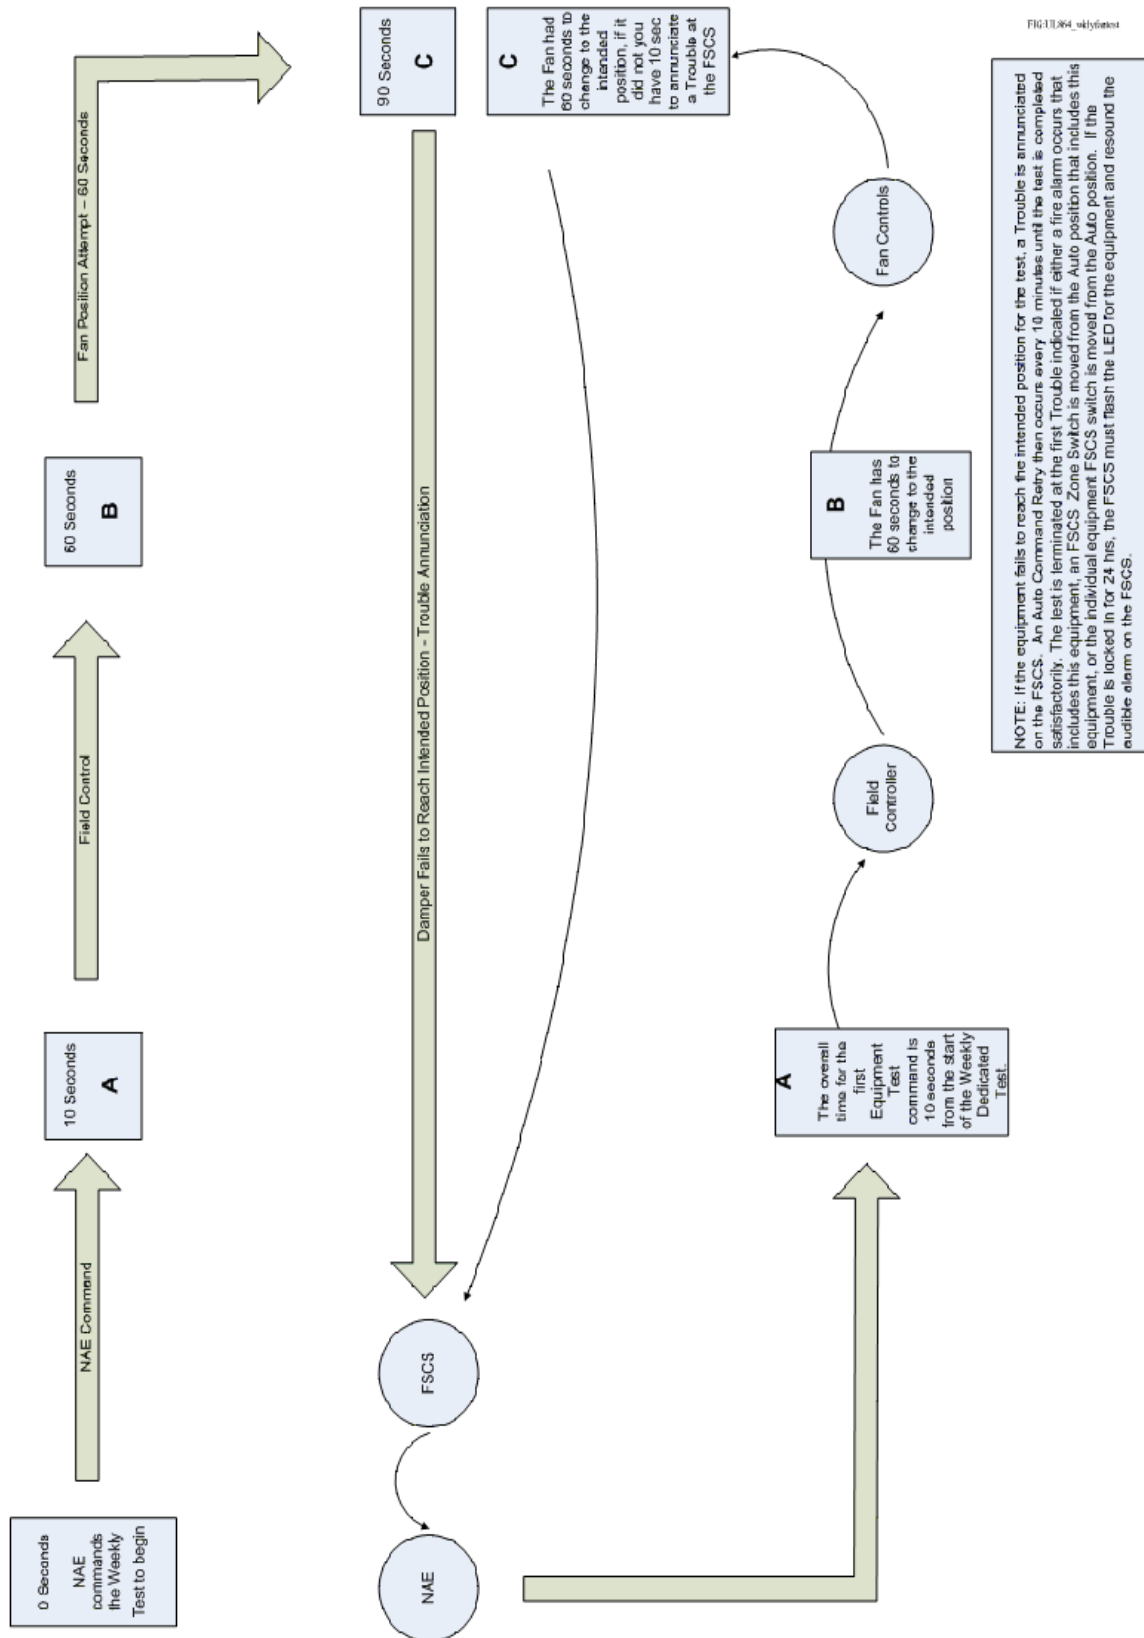

Table 26: Fan Output Connections (Part 1 of 2)

Control System Block	Control System Block Output	All Possible Fan Outputs	Label	Description	Output Destination
FSCS	Fan Auto LED	Fan Auto LED (can be indicator for any fan)	Auto LED	FSCS Auto LED indication for the fan States: 0 = Off 1 = On	Commanded value of the Fan FSCS MS/TP field controller's Fan Auto LED Indicator point
FSCS	FSCS MCO Req	Fan Cmd MCO	MCO Cmd	Fan MCO command to field controller States: 0 = Auto 1 = On CV 2 = Off - CV or 2 Speed 3 = VFD 100% 4 = VFD 0% 5 = Emergency Shutdown 6 = Pressurize 7 = De-pressurize 8 = Purge 9 = Pressurize (Auto Smoke Seq) 10 = De-pressurize (Auto Smoke Seq) 11 = 2 Speed Fan Slow 12 = 2 Speed Fan Fast 13 = WDT Fan On 14 = WDT Fan Off	Commanded value of the Fan FSCS folder's Fan Cmd MCO point
FSCS	Fan On Off LEDs	Fan On Off LED	Fn C-LED	FSCS LED indication for the fan States: 0 = On 1 = Off	Commanded value of the Fan FSCS MS/TP field controller's Fan Banked LED Indicator point
Trouble	Fan Fault LEDs	Fan Fault LED	Fn Tbl LED	Fan Trouble condition met States: 0 = Off 1 = On (Not used) 2 = Slow flash (acknowledged) 3 = Fast flash (Unacknowledged)	Commanded value of the Fan FSCS MS/TP field controller's Fan Trouble LED Indicator point
Trouble	Cmd Retries Out	Cmd Retries	Cmd Retry	Accumulator for the number of command retries. Value clears when the command is satisfied or the condition requiring the command is no longer active.	Commanded value of the Fan Trouble folder's Cmd Retries point

Table 26: Fan Output Connections (Part 2 of 2)

Control System Block	Control System Block Output	All Possible Fan Outputs	Label	Description	Output Destination
FSCS	FSCS WDT Term	WDT failure FSCS or Smk Cmd	FSCS DWTF	WDT termination condition met. FSCS manual command or a smoke event occurring during the Weekly Test States: 0 = Normal 1 = Termination	Commanded value of the Fan WDT folder's WDT Failure FSCS or Smoke point
Trouble	Trbl WDT Term	WDT Failure Status Trouble	Tbl DWTF	WDT termination condition met. Command does not match status during the Weekly Test States: 0 = Normal 1 = Termination	Commanded value of the Fan WDT folder's WDT Failure Status Trouble point
FSCS	Man Fan Intrlck Satisfy Req	Intrlck Dmpr Opn Req	Man Fn Safe Req	Interlocked damper open request prior to starting the fan. Damper must reach its Open setpoint before the fan can start. States: 0 = Normal 1 = Damper Open request	Commanded value of the Fan FSCS folder's Intrlck Dmpr Opn Req point

WDT Enable

This point, when added to the Weekly Dedicated Test Schedule, starts the Weekly Dedicated Test at its scheduled time. When the weekly dedicated test starts, an alarm message appears as shown in the Alarm Message Text of Figure 65.

The screenshot shows a software window titled "WDT Enable" with two tabs: "Configuration" and "Alarm". The "Configuration" tab is active. At the top, there is a "Select Item(s):" label above a text box containing "Present Value". To the right of this text box are "New" and "Delete" buttons. Below the text box is an "Edit" button. To the right of the "Edit" button are two radio buttons: "Basic" (selected) and "Advanced".

Below these controls is a table with two columns: "Attribute" and "Value".

FSCS Damper Switch

The FSCS's Damper switch is a three-position toggle switch with four LEDs (Figure 77). The three switch positions are Open, Auto, and Close, each with its associated LED. The Trouble LED illuminates when trouble is present for the damper. Its flash rate shows its acknowledged/unacknowledged status.

Damper 1-1

Figure 77: ADI FSCS Damper Switch

Table 27: Damper Switch - 3-Position Toggle, 4 LEDs

Switch Position	Switch Setting	Associated With	LED	Description
1	Manual Open	MS/TP banked LEDs	Open	Illuminates the Open LED when the switch is in position 1 and the associated feedback point is correct. Turns the Open LED off when in any other position.
2	Auto		Auto	Illuminates the Auto LED when the switch is in position 2 and the associated feedback point is correct. Turns the Auto LED off when in any other position.
3	Manual Close		Close	Illuminates the Close LED when switch is in position 3 and the associated feedback point is correct. Turns the Close LED off when in any other position.
N/A	N/A	Single LED	Trouble	Flashes at a fast rate when Trouble exists. When acknowledged, it flashes at a slower rate. Turns the Trouble LED off when the Zone's Trouble is cleared.

Damper Logic

The main damper logic (Figure 78) consists of the damper inputs (Figure 79), Profile Block (Figure 80), FSCS Block (Figure 82), Trouble Block (Figure 85), and damper outputs.

Figure 78: Damper Main Logic

Damper Logic Inputs

Figure 79 shows the damper logic inputs for all damper types.

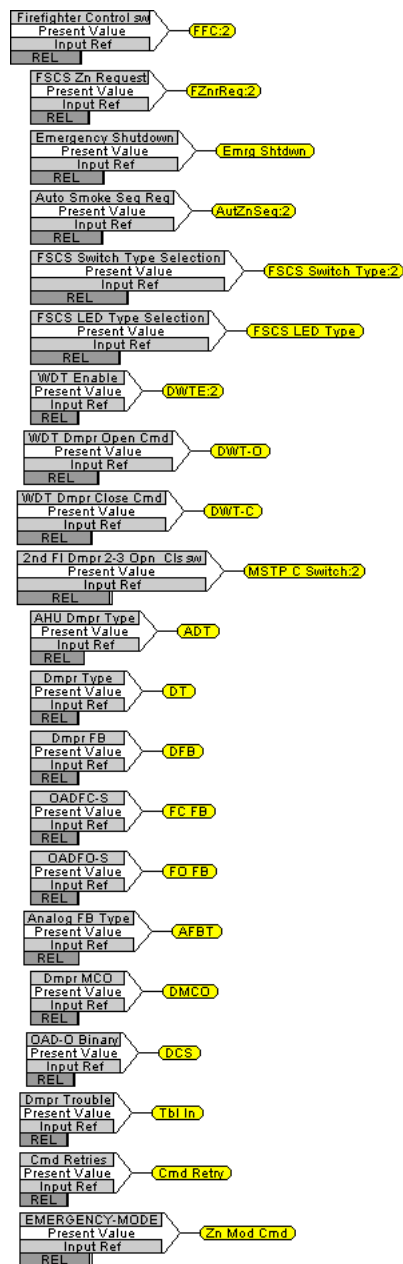

Figure 79: Damper Logic Inputs

Damper Input Connections List

IMPORTANT: Dampers that are incorrectly configured prevent proper smoke control sequence operation.

Damper FSCS Block Logic

Figure 83 shows the damper FSCS block logic.

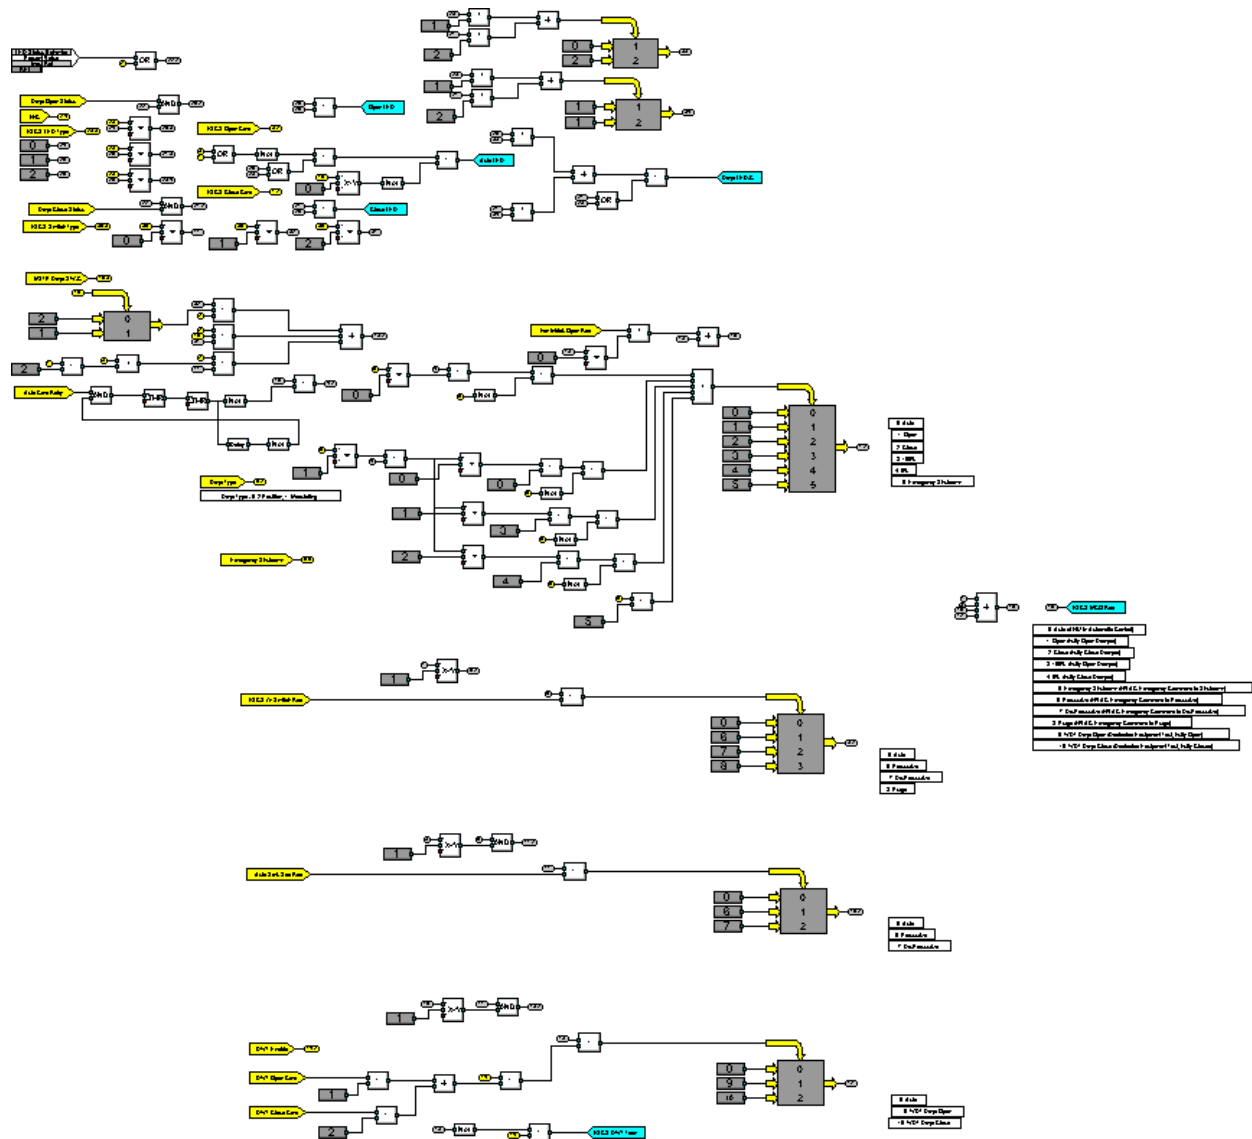

Figure 83: Damper FSCS Block Logic

Damper FSCS MCO Action Table

From the Damper Cmd MCO Action Table (Figure 84), program the command states (Table 34) to match your field equipment. Leave blank any states that are not applicable. All 11 states must remain, even though some states remain blank.

The screenshot shows a software window titled "Dmpr MCO" with two tabs: "Configuration" and "Action Tables". The "Action Tables" tab is active, and an "Edit" button is visible. Below the tabs, there are settings for "States Text", "Number of States" (13), and "Relinquish Default" (State 0). A checkbox for "All Commands Priority: 0 (No Priority)" is present, with a note to uncheck it for individual priorities.

The main content area displays three sections of action tables:

Actions for Condition: State 0

Item	Command	Priority	Delay
RAD-O Binary	Release Attribute: 85 Priority: 1		0 seconds
RAD-O Binary	Release Attribute: 85 Priority: 2		1 seconds
RAD-O Binary	Release Attribute: 85 Priority: 7		2 seconds
RAD-O Binary	Release All Attribute: 85		3 seconds
EMERGENCY-MODE	Release Attribute: 85 Priority: 1		4 seconds
EMERGENCY-MODE	Release All Attribute: 85		5 seconds
RAD-O Binary	Open	16 (Default)	7 seconds

Actions for Condition: State 1

Item	Command	Priority	Delay
RAD-O Binary	Open	1 (Manual Life Safety)	0 seconds

Actions for Condition: State 2

Item	Command	Priority	Delay
RAD-O Binary	Close	1 (Manual Life Safety)	0 seconds

Figure 84: Damper MCO Action Table

Table 34: Damper Commands

State	Description	State Damper Type
0	Auto command of the damper point	All damper types
1	Open command of the damper point (Damper fully open)	2-Position
2	Closed command of the damper point (Damper fully closed)	2-Position
3	100% command of the damper point (Damper fully open)	Modulating
4	0% command of the damper point (Damper fully closed)	Modulating
5	Shutdown state of the controller's HVAC Emergency point	All damper types
6	Pressurize state of the controller's HVAC Emergency point	All damper types
7	De-Pressurize state of the controller's HVAC Emergency point	All damper types
8	Purge state of the controller's HVAC Emergency point	All damper types
9	Open command of the damper point (Weekly Dedicated Test)	All damper types
10	Close command of the damper point (Weekly Dedicated Test)	All damper types

Damper Trouble Block

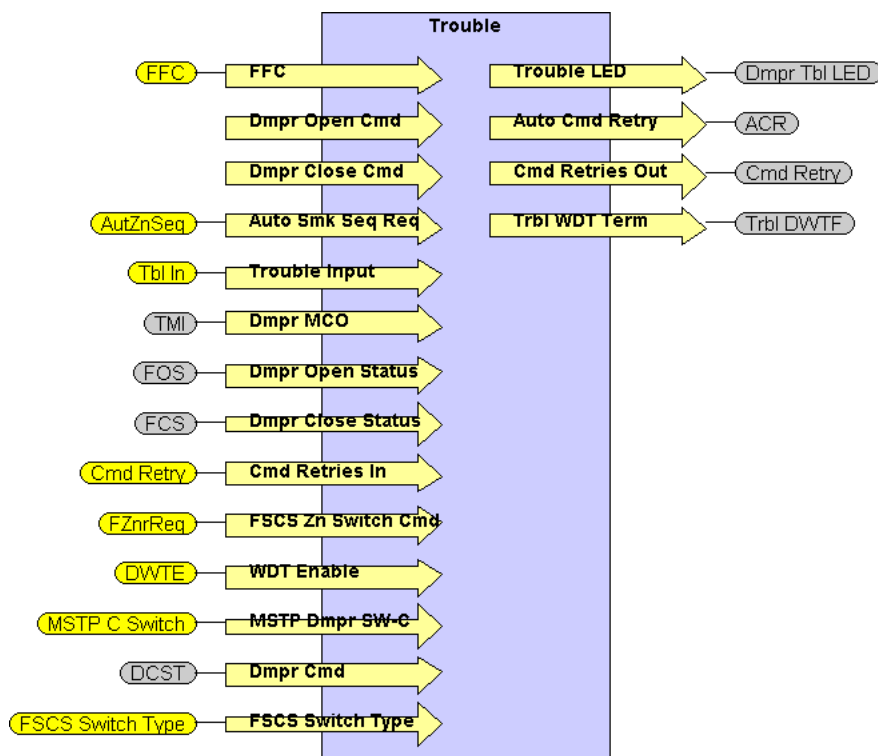

Figure 85: Damper Trouble Block

Damper Trouble Block Inputs

Table 35: Damper Trouble Block Inputs (Part 1 of 2)

Inputs	Label	Description
FFC	FFC	Status of the FSCS MS/TP field controller's Firemans Key
Damper Open Cmd	DmprOpnCmd	This input is active when the FSCS Switch Type Selection is set to selection 0 . The actual status of the damper FSCS binary input for the Open command.
Damper Close Cmd	DmprCloCmd	This input is active when the FSCS Switch Type Selection is set to selection 0 . The actual status of the damper FSCS binary input for the Close command.
Auto Smk Seq Req	AutZnSeq	Status of the FSCS Zone Switch folder's Auto Smoke Seq Req point
Trouble Input	Tbl In	Status of the Damper Trouble folder's Dmpr Trouble point
Dmpr MCO	TMI	Status of the Damper Profile Block's output - Trouble MCO Input
Dmpr Open Status	FOS	Status of the Damper Profile Block's output - Damper Fully Opened Status
Dmpr Close Status	FCS	Status of the Damper Profile Block's output - Damper Fully Closed Status
Cmd Retries In	Cmd Retry	Status of the Damper Trouble folder's Cmd Retries point

Table 35: Damper Trouble Block Inputs (Part 2 of 2)

WDT Enable

This point, when added to the Weekly Dedicated Test Schedule, starts the Weekly Dedicated Test at its scheduled time. When the weekly dedicated test starts, an alarm message appears as shown in the Alarm Message Text of Figure 92.

The screenshot shows a software window titled "WDT Enable" with two tabs: "Configuration" and "Alarm". The "Alarm" tab is active. At the top, there is a "Select Item(s):" section with a dropdown menu showing "Present Value", and buttons for "New", "Delete", and "Edit". Below this, there are radio buttons for "Basic" (selected) and "Advanced". The main area is a table with two columns: "Attribute" and "Value".

Figure 100: Damper WDT Failure Status Trouble Screen

Vxx (VMA/VAV) Folder

Vxx Device Commands

Since there can be multiple Vxx devices per zone, when a manual or automatic smoke control command is sent to a Vxx, **all** Vxx devices in that zone **must** respond to that command.

Vxx Objects

Figure 101 shows all objects associated with any Vxx type. The FSCS folder is shown since some of the Vxx's logic references these points.

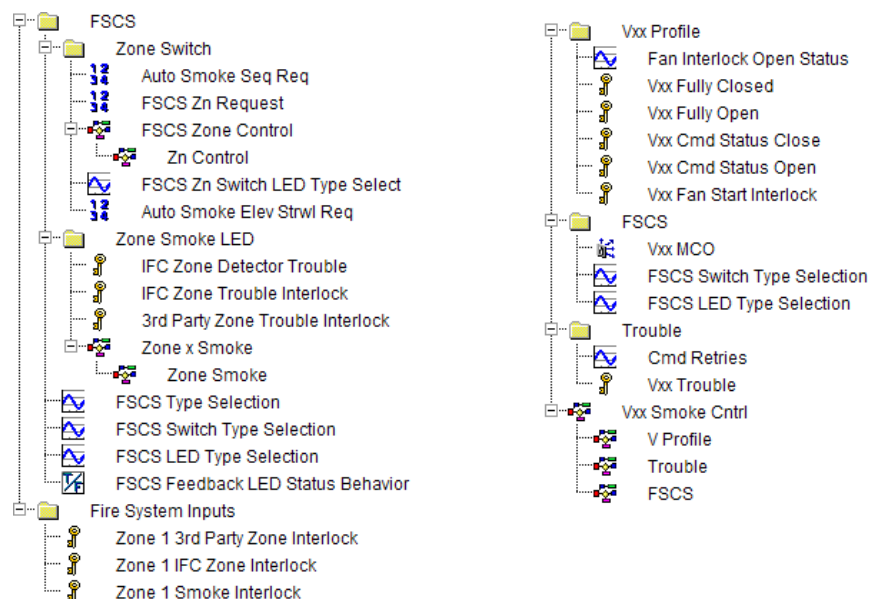

Figure 101: All Vxx Objects

FSCS VAV/VMA Switch

The FSCS's VAV/VMA switch (Figure 102) is a three-position toggle switch with four LEDs. The three switch positions are Open, Auto, and Close, each with its associated LED. The Trouble LED illuminates when trouble is present for the VAV/VMA. Its flash rate shows its acknowledged/unacknowledged status.

VAV 1-1

Figure 102: ADI FSCS VAV/VMA Switch

Table 38: VAV/VMA Switch - 3-Position Toggle, 4 LEDs

Switch Position	Switch Setting	Associated With	LED	Description
1	Manual Open	MS/TP banked LEDs	Open	Illuminates the Open LED when the switch is in position 1 and the associated feedback point is correct. Turns the Open LED off when in any other position.
2	Auto		Auto	Illuminates the Auto LED when the switch is in position 2 and the associated feedback point is correct. Turns the Auto LED off when in any other position.
3	Manual Close		Close	Illuminates the Close LED when switch is in position 3 and the associated feedback point is correct. Turns the Close LED off when in any other position.
N/A	N/A	Single LED	Trouble	Flashes at a fast rate when Trouble exists. When acknowledged, flashes at a slower rate. Turns the Trouble LED off when Trouble is cleared.

Vxx Logic

The Vxx's main logic (Figure 103) consists of the Vxx inputs (Figure 104), Profile Block (Figure 105), FSCS Block (Figure 113), Trouble Block (Figure 115), and the Vxx outputs.

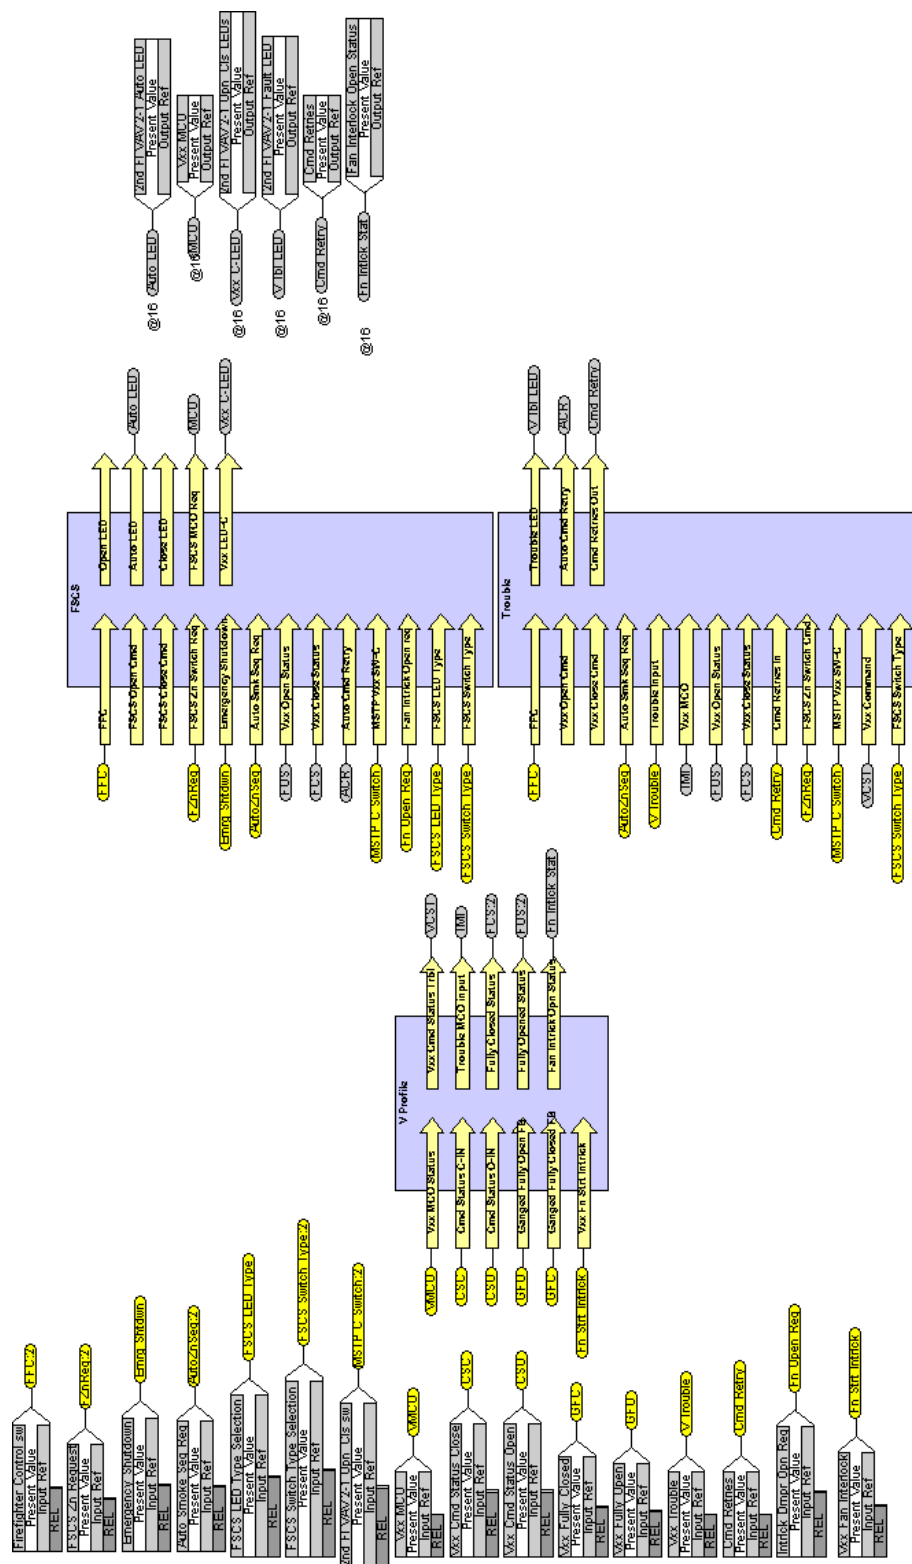

Figure 103: Vxx Main Logic

Vxx Logic Inputs

Figure 104 shows the Vxx's logic inputs for all Vxx devices.

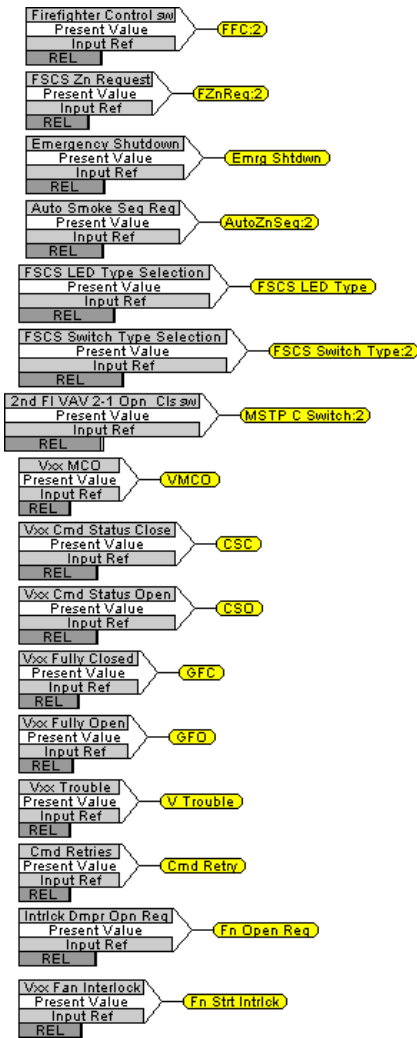

Figure 104: Vxx Logic Inputs (Dry Contact Feedback)

Vxx Input Connections List

Table 39 shows the Vxx's inputs and their system control block connections.

IMPORTANT: VAV/VMA's that are incorrectly configured prevent proper smoke control sequence operation.

1. All **Selections** must be configured during the initial Vxx programming. Set the point's default value to the same value as the desired setup value to ensure the selection is maintained in the event that the NxE restarts. Archive and upload the NxE database to the SCT database to save all changes for the Vxx configuration to prevent overwriting desired values on a download to the NxE.

Vxx Trouble Block Outputs

Table 46: Vxx Trouble Block Outputs

Outputs	Label	Description	Output
Trouble LED	V Tbl LED	FSCS's Trouble LED indication for the Vxx States: 0 = Off 1 = On 2 = Slow blink 3 = Fast blink	Commanded value of the Vxx FSCS MS/TP field controller's Vxx Trouble LED Indicator point
Auto Cmd Retry	ACR	When a Vxx command fails, this retries the command until the command succeeds or the condition that required the command is no longer active.	Commanded value of the Vxx Trouble block's output - Auto Cmd Retry
Cmd Retries Out	Cmd Retry	Increments the value of the Accumulator for the number of command retries. Value clears when the command is satisfied or the condition requiring the command is no longer active.	Increments the value of the Vxx Trouble folder's CMD Retries point

Vxx Trouble Logic

Figure 116 shows the Vxx Trouble block logic. The Trouble LED is turned on if the Vxx is in smoke control and the damper has not reached its desired setpoint within 75 seconds. A Vxx is in smoke control if either the field controller is in pressurize or depressurize mode, or the Firefighter Control Key is on and the FSCS Vxx toggle switch is set to Open or Close. If a Vxx does not reach its commanded state and goes into Trouble, the Auto Retry Command logic retries the command every 60 seconds.

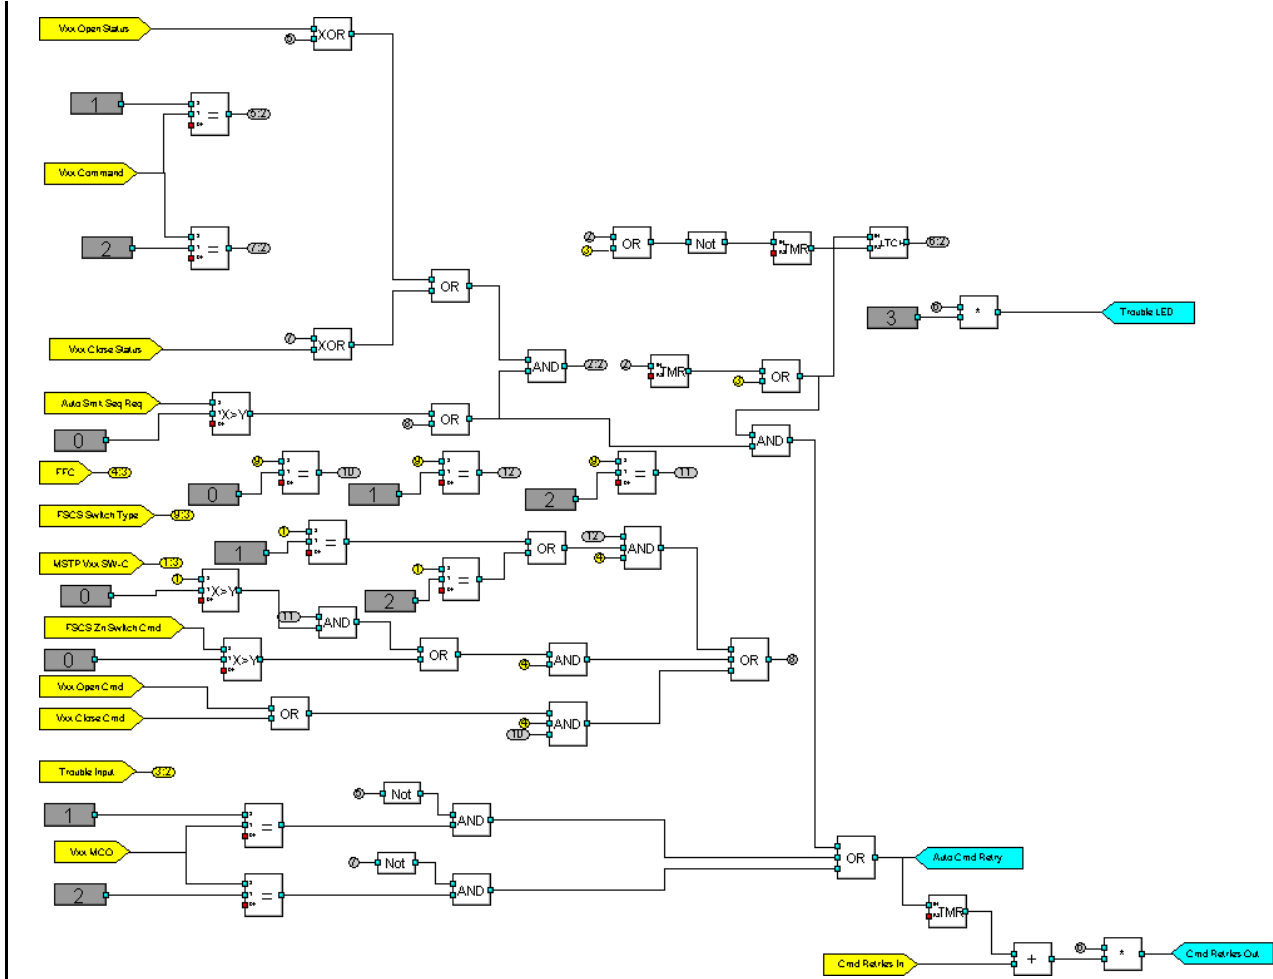

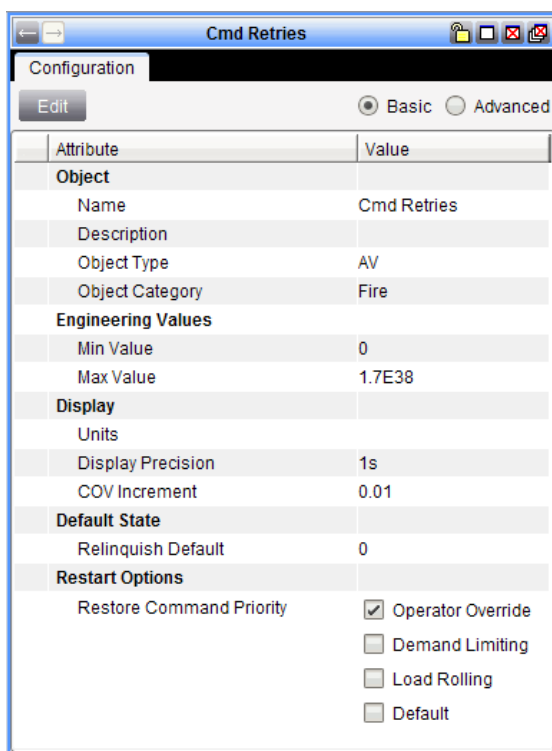

Figure 116: Vxx Trouble Control Block Logic

Cmd Retries

When a fan or damper trouble is locked in, the analog value sends the command every 60 seconds until the fan reaches its intended position or the smoke event is cleared and the logic is reset (Figure 117).

The screenshot shows a software window titled "Cmd Retries" with a "Configuration" tab. It features an "Edit" button and radio buttons for "Basic" (selected) and "Advanced" settings. The configuration is organized into several sections: "Object" (Name: Cmd Retries, Description: , Object Type: AV, Object Category: Fire), "Engineering Values" (Min Value: 0, Max Value: 1.7E38), "Display" (Units: , Display Precision: 1s, COV Increment: 0.01), "Default State" (Relinquish Default: 0), and "Restart Options" (Restore Command Priority: ☒ Operator Override, ☐ Demand Limiting, ☐ Load Rolling, ☐ Default).

Multi-Story Building Automatic Smoke Control

Figure 119 shows the FSCS and MS/TP field device connections. The field controllers in this example are MS/TP controllers. You can use any combination of controllers as required by the physical devices installed at the smoke control site.

Multi-Story Building Field Device Connections

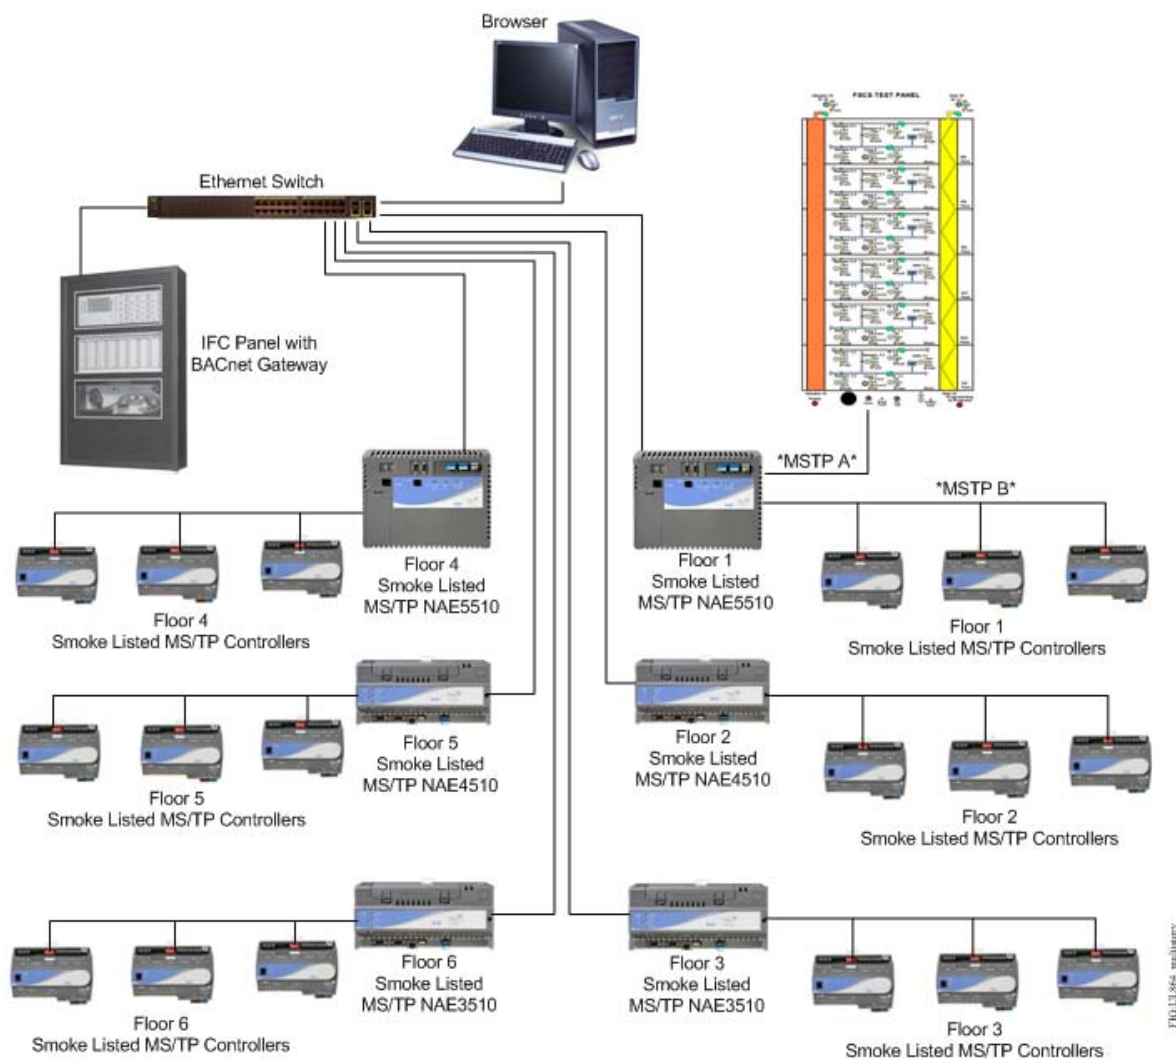

Figure 119: Multi-Story Building Field Device Connections

Building Overview

The building in this application is a six-story building with elevator and stairwell pressurization fans. For better detail visibility, only Floor 3 through Floor 6 are shown (Figure 120).

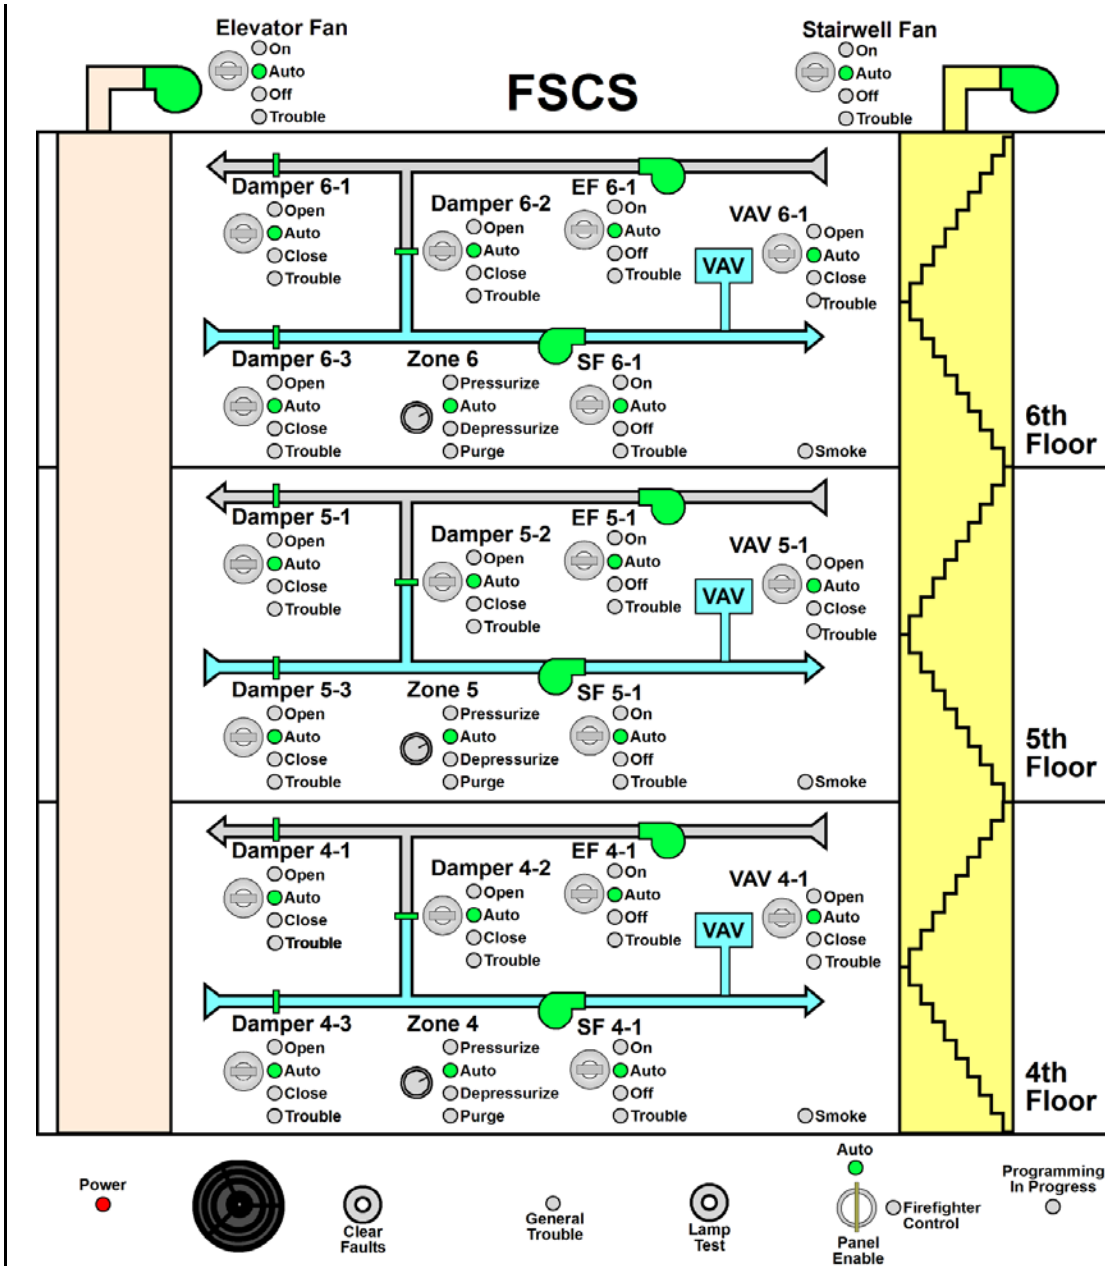

Figure 120: Multi-Story Building

Multi-Story Building Alarm Example

Figure 121 shows the floor above/floor below pressurization as a result of the auto smoke control being activated by a smoke detector on Floor 3.

A smoke alarm, detected by an automatic smoke detector on Floor 3, starts the process to depressurize Floor 3 and pressurize Floor 2 and Floor 4. The Elevator fan and Stairwell fan both turn on to pressurize the elevator shaft and stairwell. Subsequent alarms and subsequent action are locked out, except for manual override from the FSCS.

The system only returns to the pre-smoke control configuration when all automatic alarm/smoke control initiating devices return to the normal condition, and the manual override switches on the FSCS are returned to the Auto position.

Figure 121: Multi-Story Building Floor Above/Floor Below Pressurization (+)

Auto Smoke Control Folder

Figure 122 shows the Auto Smoke Control folder and tree for one floor of the Multi-Story Building.

**Figure 122: Multi-Story Building
Auto Smoke Control Folder and Tree**

Auto Smoke Control Logic

Auto Smoke Control for the Multi-Story Building application uses the FlrX Auto Smoke Seq Block and its inputs and outputs to implement its automatic smoke control. All six floors use the same logic except Floor 1, which adds a Floor Below latched alarm input point, and Floor 6, which adds a Floor Above latched alarm input point (Figure 123).

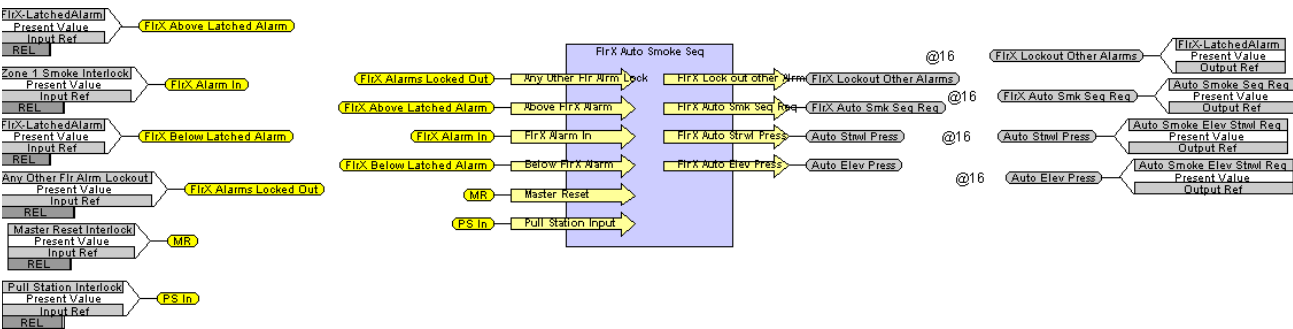

Figure 123: Automatic Smoke Control Main Logic

Auto Smoke Control Inputs

The **FlrX Below Latched Alarm** input only appears in the Floor 1 logic and the **FlrX Above Latched Alarm** input only appears in the Floor 6 logic

Figure 133: Manual Latched Alarm Reset Point

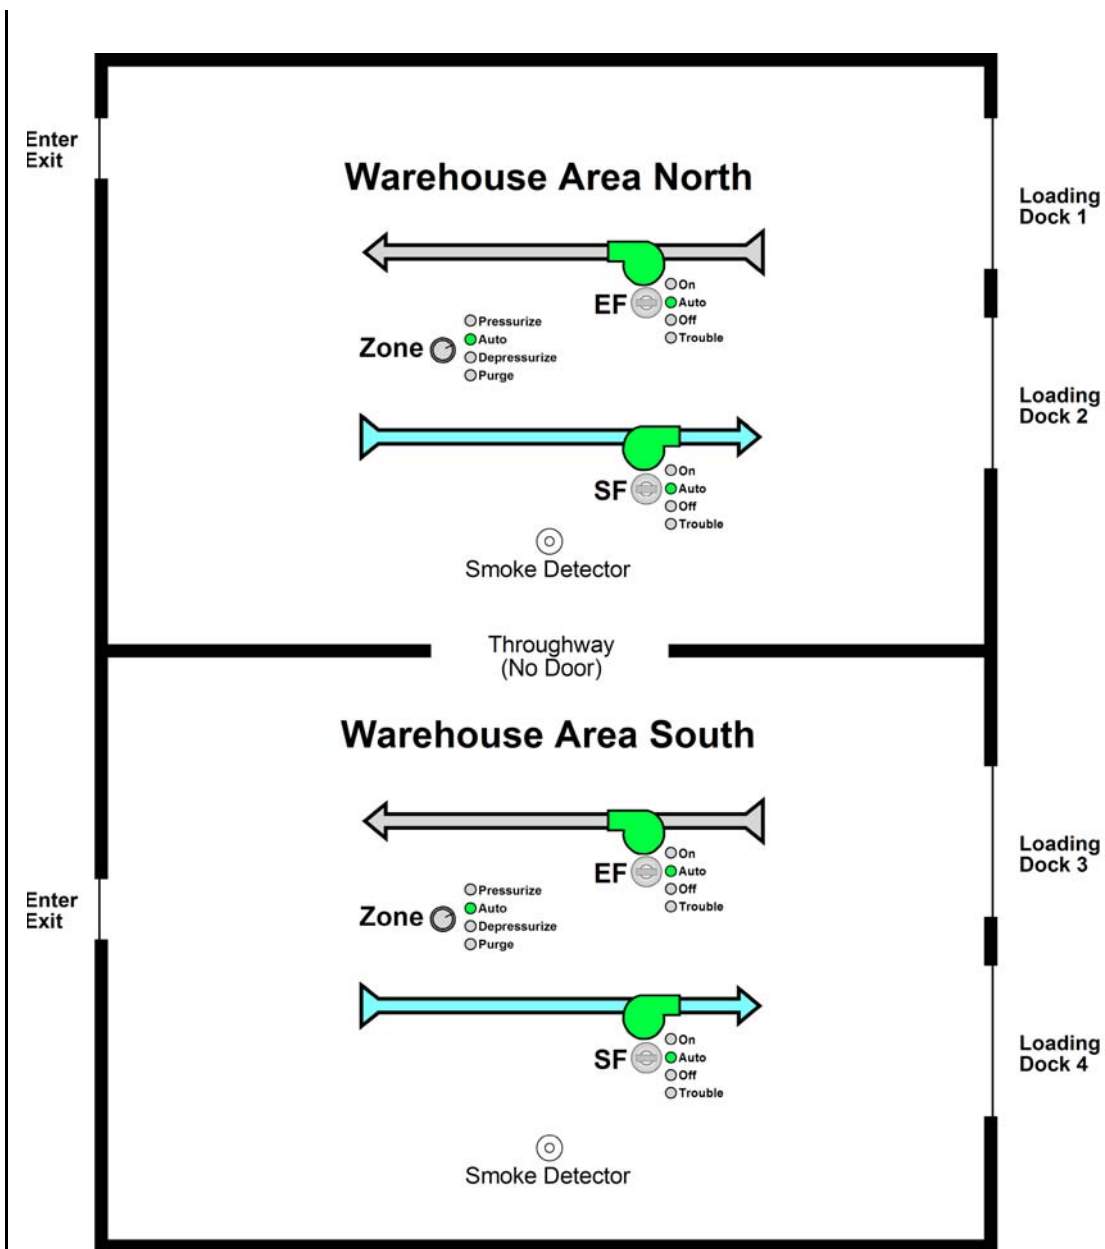

Figure 135: Single-Story Warehouse

Warehouse Smoke Alarm Example

A smoke alarm, detected by an automatic smoke detector in the South warehouse area (Figure 136), starts the Auto Smoke Control process to depressurize the warehouse. The warehouse North and warehouse South exhaust fans turn on and the warehouse North and South supply fans turn off. This operation creates a negative pressure in the warehouse. Subsequent alarms and actions are locked out, except for manual override from the FSCS.

The smoke control system only returns to its normal smoke control operation after all automatic alarm/smoke control initiating devices return to the normal condition, and the manual override switches on the FSCS are returned to the Auto position.

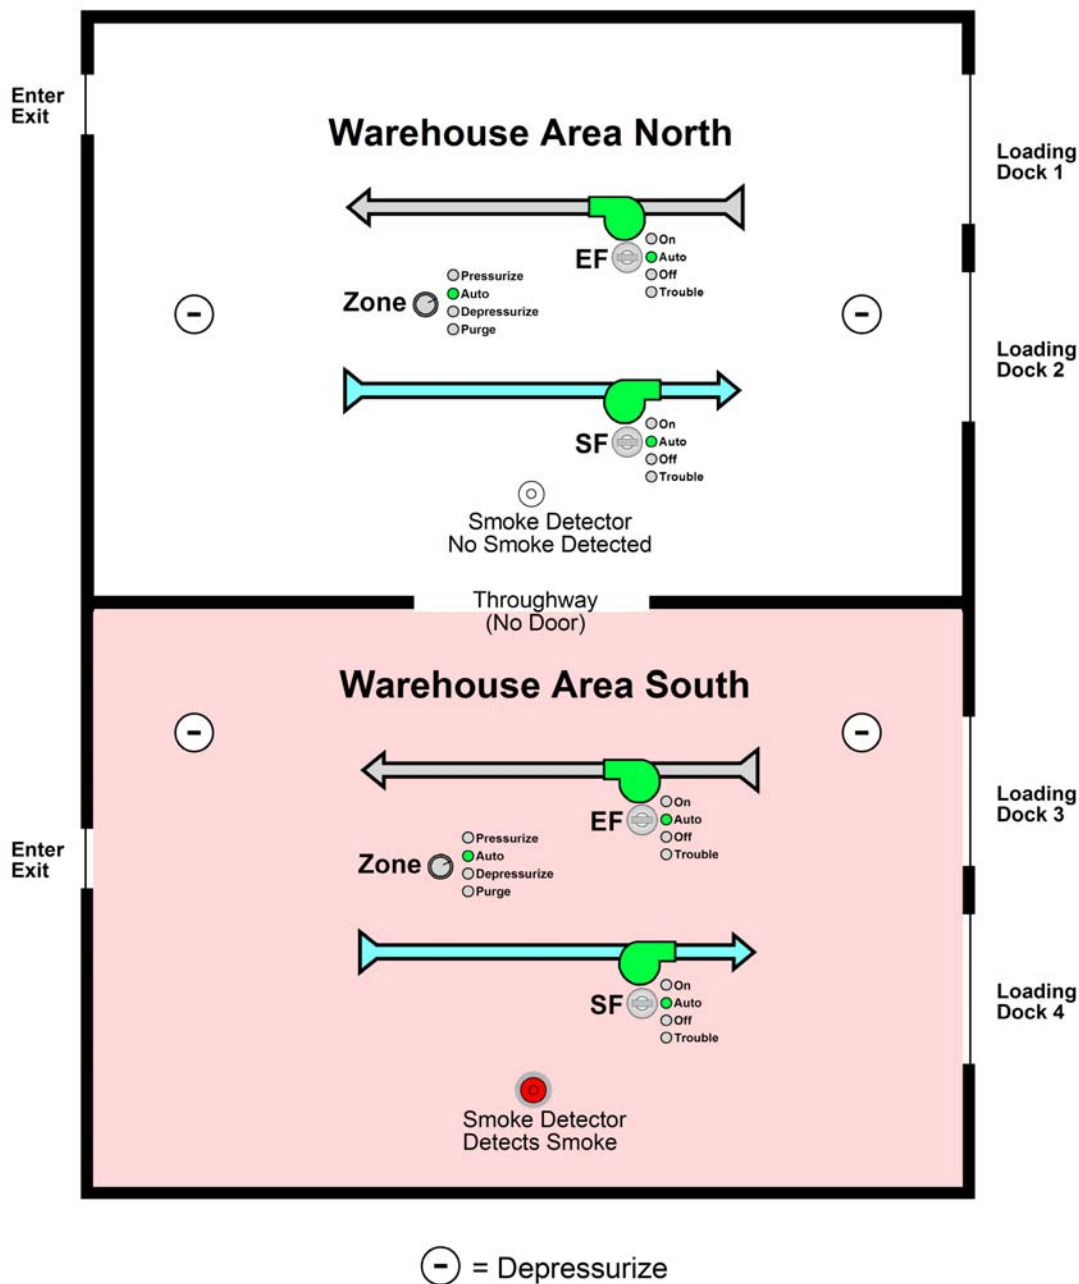

Figure 136: Smoke Detected in the Warehouse

This process has a manual reset, which re-enables alarm processing after **all** alarms have been cleared. The reset is issued using the smoke control NxE to command the manual reset input to On.

The manual reset sends a release command to all pressurization and exhaust outputs and the Sonalert® alarm. Then, turn off the manual reset to return the smoke control system to normal operation.

Auto Smoke Control Folder

Figure 137 shows the Auto Smoke Control folder and tree for the Warehouse.

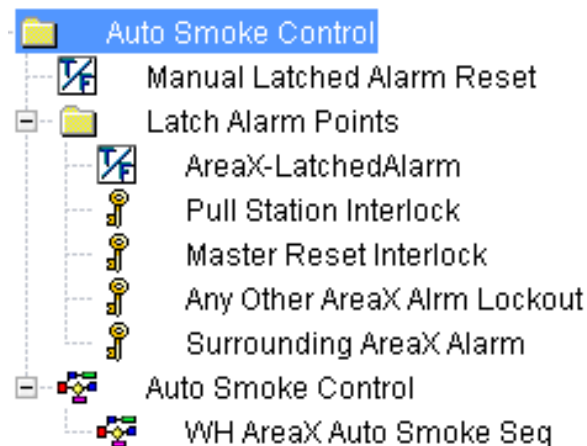

Figure 137: Warehouse Auto Smoke Control Folder and Tree

Auto Smoke Control Logic

Auto Smoke Control for the Warehouse uses the WH AreaX Auto Smoke Seq Block and its inputs and outputs (Figure 138) to implement its automatic smoke control. It evaluates inputs from the fire alarm panel and the master reset command from the FSCS to activate all exhaust fans and deactivate all supply fans when a smoke event occurs.

Figure 146: Master Reset Interlock Action Table

Any Other AreaX Alarm Lockout

The Any Other AreaX Alarm Lockout Interlock Definition (Figure 147) locks out all areas except for the area that initiated the first smoke alarm. This function is only used in a site where two or more **isolated** areas require different smoke control actions to protect a single building.

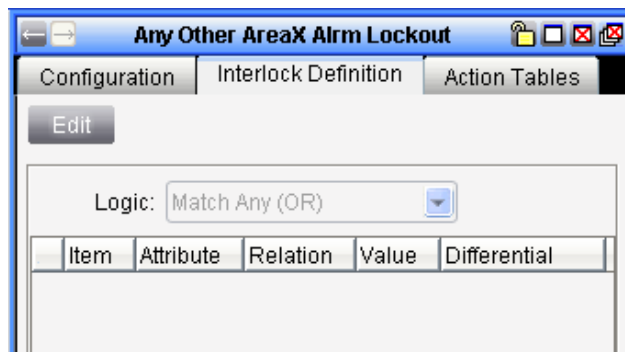

Figure 147: Any Other AreaX Alarm Lockout Interlock Definition

Surrounding AreaX Alarm Interlock Definition

The Surrounding AreaX Alarm Interlock Definition (Figure 148) locks out all areas except for the area that initiated the first smoke alarm. This function is only used in a site where two or more **isolated** areas require different smoke control actions to protect a single building.

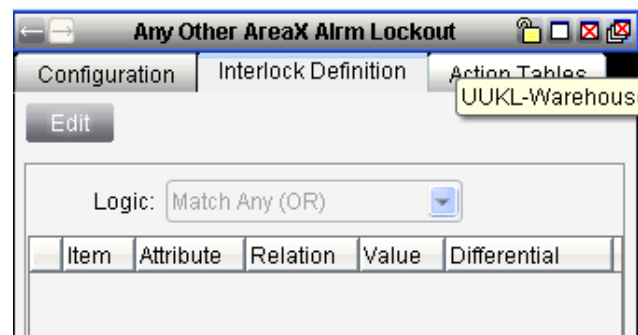

Figure 148: Surrounding AreaX Alarm Interlock Definition

Single-Story Mall Smoke Control Application

Figure 149 shows the FSCS and MS/TP field device connections. The field controllers in this example are MS/TP controllers. You can use any combination of controllers as required by the physical devices installed at the smoke control site.

Mall Field Device Connections

Figure 149 shows the Mall MS/TP field device connections.

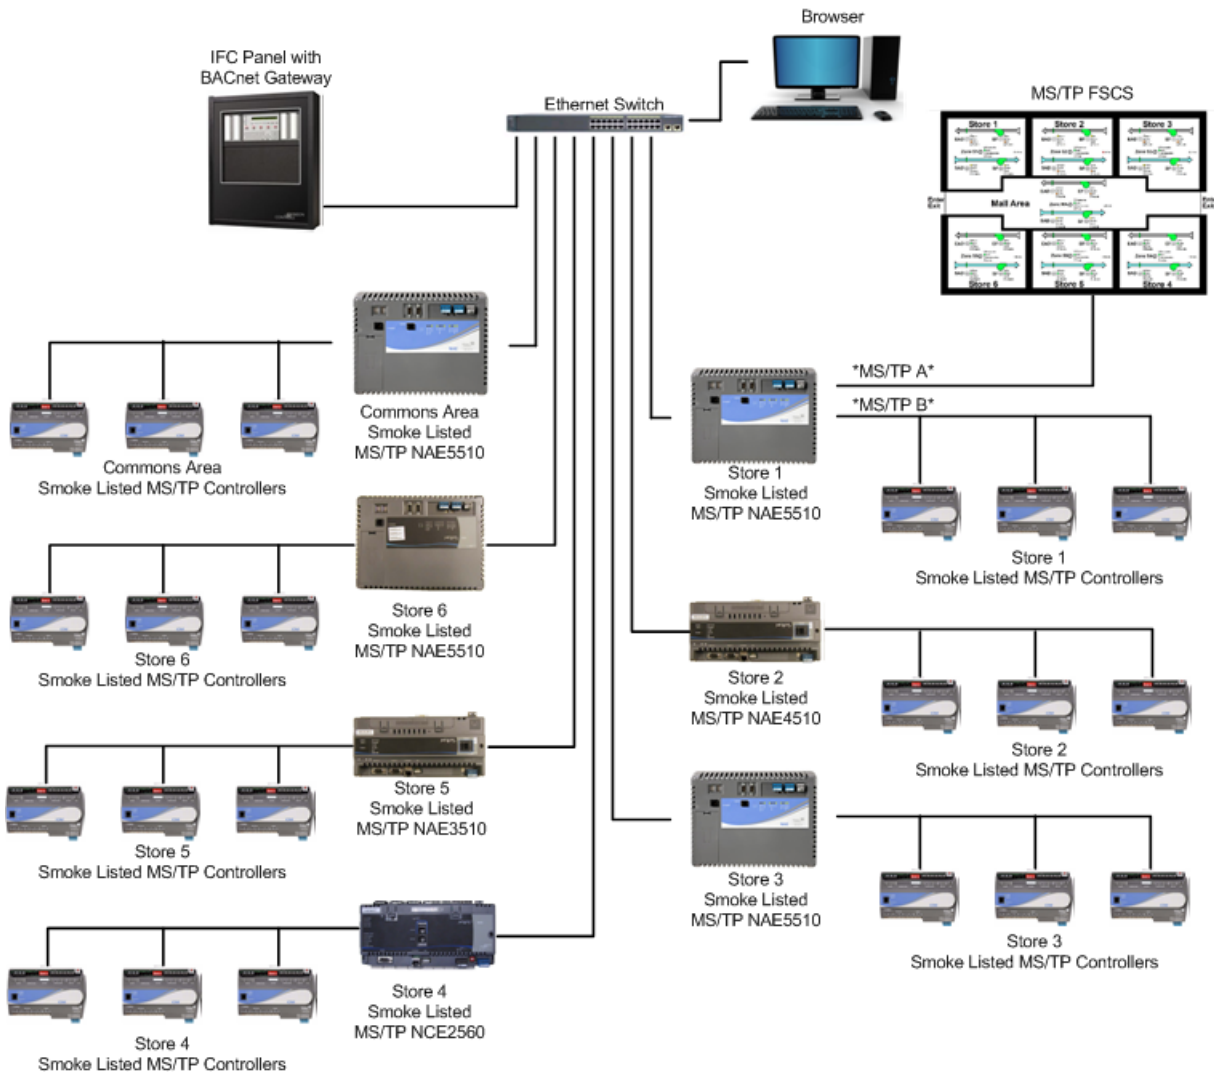

Figure 149: Mall MS/TP Field Device Connections

Building Overview

The single-story mall in this application example has a common area and six stores (Figure 150). The common area is treated as a single zone being controlled by a smoke detector, rooftop unit, and exhaust fan. Each store is treated as a single zone, with each store being controlled by its own smoke detector, rooftop unit, and exhaust fan.

IMPORTANT: The rooftop unit is only being used to demonstrate the Single-Story Mall application. Johnson Controls equipment is **not** suitable for use in a rooftop unit. It is rated for indoor, dry environments only.

Johnson Controls equipment can only control a rooftop if the controller is installed in an indoor, dry environment and wired to a rooftop unit.

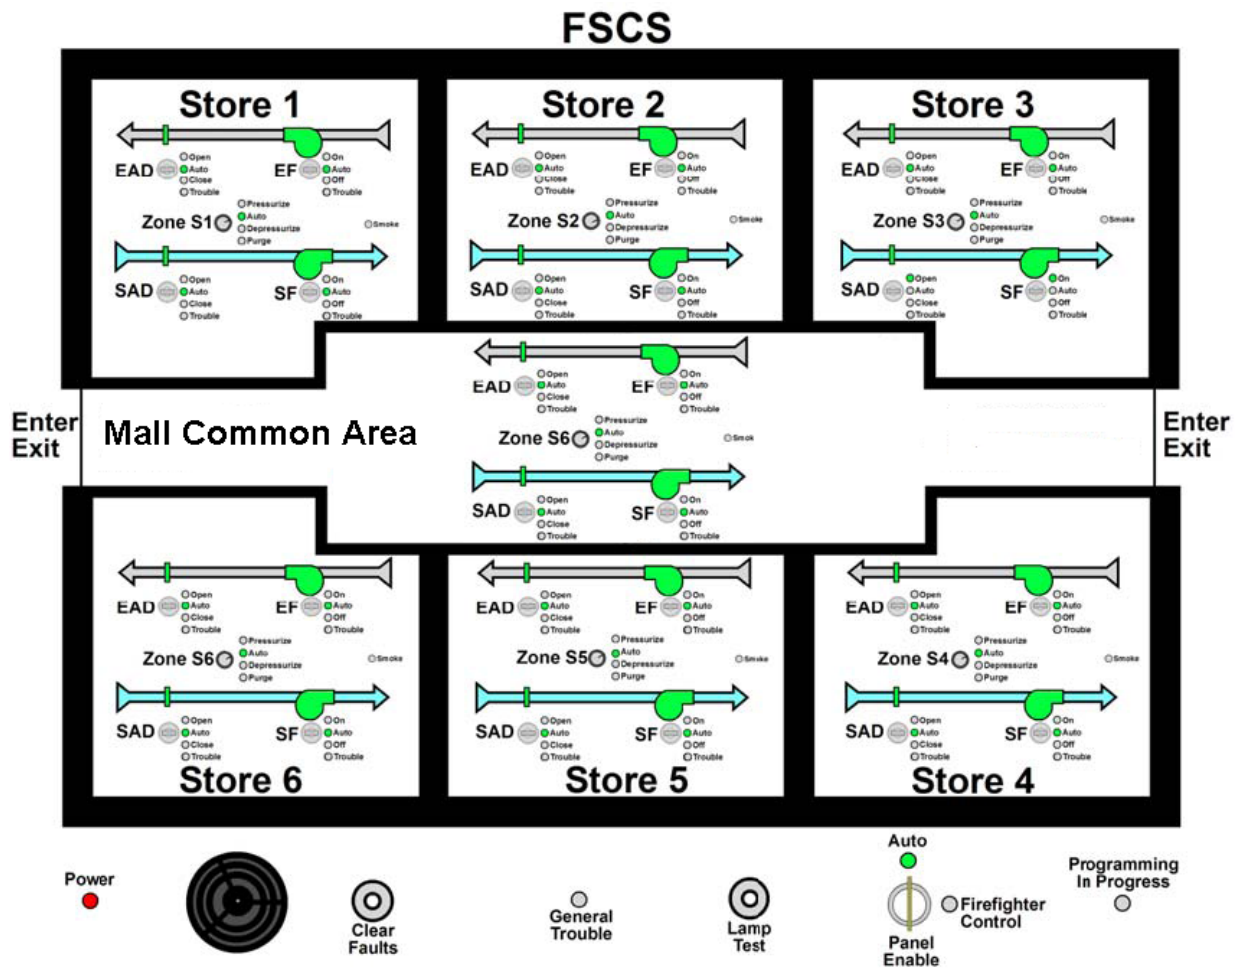

Figure 150: Mall FSCS

Mall Smoke Alarm Example

In this example, a smoke alarm is detected by an automatic smoke detector in the Mall Common area. This alarm starts the Auto Smoke Control process to depressurize the Mall Common Area. The North Common and South Common exhaust fans turn on and the North Common and South Common supply fans turn off. This operation creates a negative pressure in the Mall Common areas. At the same time, all stores surrounding the Mall Common areas are pressurized. Subsequent alarms and subsequent action is locked out, except for a manual override from the FSCS.

The system only returns to its pre-smoke control configuration when all automatic alarm/smoke control initiating devices return to their normal condition, and the manual override switches on the FSCS are returned to the Auto position. This process has a manual reset, which re-enables alarm processing after **all** alarms have been cleared. The reset is issued using the smoke control NxE to command the manual reset input to On or by resetting the fire system at the Fire Alarm panel.

The manual reset sends a release command to all pressurization and exhaust outputs.

Figure 151 shows a smoke alarm in the Mall Common Area. Whenever the Mall Common Area detects a smoke alarm, the area is depressurized and all surrounding stores are pressurized.

Figure 151: Single-Story Mall - Mall Common Area Alarm

Figure 152 shows a smoke alarm, detected by an automatic smoke detector in the Store 4 starts the Auto Smoke Control process to depressurize Store 4. The Store 4 exhaust fan turns on and the Store 4 supply fan turns off. This creates a negative pressure in Store 4. At the same time, all stores surrounding the Store common areas are pressurized. Subsequent alarms and subsequent action is locked out, except for a manual override from the FSCS.

The system only returns to its pre-smoke control configuration when all automatic alarm/smoke control initiating devices return to their normal condition, and the manual override switches on the FSCS are returned to the Auto position. This process has a manual reset, which re-enables alarm processing after **all** alarms have been cleared. The reset is issued using the smoke control NxE to command the manual reset input to On or by resetting the fire system at the Fire Alarm panel.

The manual reset sends a release command to all pressurization and exhaust outputs.

Figure 152 shows a smoke alarm in Store 4 which then depressurizes and the adjacent Store 5 and Mall Common Area pressurize.

Figure 152: Single-Story Mall - Store 4 Alarm

Auto Smoke Control Folder

Figure 153 shows the Auto Smoke Control folder and tree for the Mall.

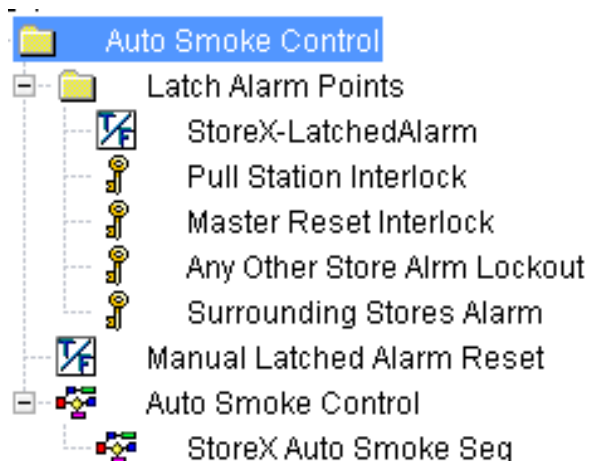

Figure 153: Mall Auto Smoke Control Folder and Tree

Auto Smoke Control Logic

Auto Smoke Control for the Mall uses the StoreX Auto Smoke Seq Block and its inputs and outputs to implement its automatic smoke control (Figure 154). It evaluates inputs from the fire alarm panel and the master reset command from the FSCS to activate all exhaust fans and deactivate all supply fans when a smoke event occurs.

Latch Alarms Folder

Pull Station Interlock

The Pull Station Interlock Definition (Figure 160) control is only used to turn on stairwell and elevator pressurization fans when there is an **enclosed** stairwell or **enclosed** elevator in the mall.

Note: Pullstations do not initiate the Auto Smoke Control process.

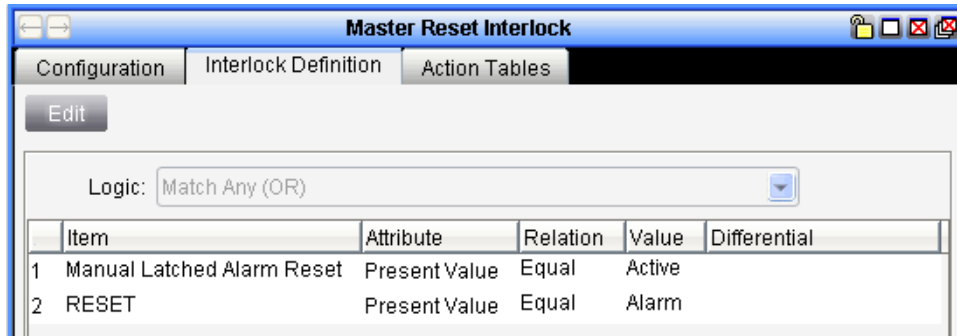

Figure 160: Pull Station Interlock Definition

Master Reset Interlock Definition

The Master Reset Interlock Definition (Figure 161) releases the locked alarms when commanded by the IFC fire panel Reset button or the **Manual Latched Alarm Reset** located in the Auto Smoke Control folder is commanded to active.

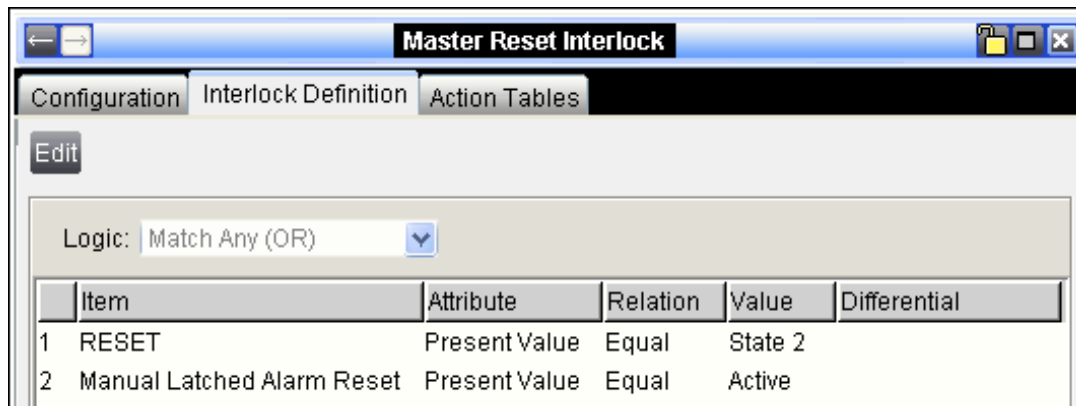

Figure 161: Master Reset Interlock Definition

Master Reset Interlock Action Table

The Master Reset Interlock Action Table (Figure 162) sets the Manual Latched Alarm Reset to inactive after 60 seconds, to allow the auto smoke control logic to return to normal operation.

The screenshot shows a software window titled "Master Reset Interlock". It has three tabs: "Configuration", "Interlock Definition", and "Action Tables", with "Action Tables" being the active tab. Below the tabs is an "Edit" button and a checkbox labeled "All Commands Priority:" which is checked. Next to it is a dropdown menu showing "16 (Default)". Below this is the text "(Uncheck to specify individual priorities)". The main area is titled "Actions for Condition: True" and contains a table with the following data:

Item	Command	Priority	Delay
Manual Latched Alarm Reset	Inactive	16 (Default)	60 seconds

Any Other Store Alarm Lockout

The Any Other Store Alarm Lockout Interlock Definition (Figure 163) locks out all stores except for the store or common area that initiated the first smoke alarm.

The screenshot shows a software window titled "Any Other Store Alarm Lockout". It has three tabs: "Configuration", "Interlock Definition", and "Action Tables", with "Interlock Definition" being the active tab. Below the tabs is an "Edit" button. The main area is titled "Logic:" and has a dropdown menu showing "Match Any (OR)". Below this is a table with the following data:

	Item	Attribute	Relation	Value	Dif...
1	StoreX-LatchedAlarm	Present Value	Equal	True	
2	StoreX-LatchedAlarm	Present Value	Equal	True	
3	StoreX-LatchedAlarm	Present Value	Equal	True	
4	StoreX-LatchedAlarm	Present Value	Equal	True	
5	StoreX-LatchedAlarm	Present Value	Equal	True	
6	StoreX-LatchedAlarm	Present Value	Equal	True	
7	StoreX-LatchedAlarm	Present Value	Equal	True
