## 1. Introduction

This is the author's guide to $\mathrm{REVT}_{\mathrm{E}} \mathrm{X}$, a system for preparing journal submissions in both print and electronic form, which is implemented as a document class for the ${ }^{E T} T_{E} X$ document preparation system. An electronic document created in $\mathrm{REVT}_{\mathrm{E}} \mathrm{X}$ can be typeset in formats suitable for journal submission or for circulation by the author as a manuscript or reprint, but most importantly, it can be used for direct submission as an electronic manuscript, or compuscript.

### 1.1 Choosing REVTEX

You will want to use REVTEX to prepare a paper for submission to an academic journal, if:

- The journal or its society is a participant in the $\mathrm{REVT}_{\mathrm{E}} \mathrm{X}$ project.
- The journal has a compuscript submission program that is consistent with REVTEX.
- Your paper makes significant use of mathematical notation or is highly technical in nature.
- You are familiar with and use the $\mathrm{T}_{\mathrm{E} X}$ typesetting system, or the ${ }^{\text {ETT}} \mathrm{E} X$ document perparation system for $\mathrm{T}_{\mathrm{E}} \mathrm{X}$.
- Your document's intended use extends to electronic publishing.
- Your document is destined to be translated to XML or another descriptive markup system.
- You wish to get the most value from your time and effort as an author by focusing on the content and structure of your paper without undue concern for format details such as margins, fonts, and so on.
- You wish to typeset your document in a number of different formats depending on the requirements of the recipient.
- You wish to get the most value from your computer system in using it as a platform for document preparation.
Note that, although $\mathrm{LA}_{\mathrm{E}} \mathrm{X}$ is ultimately a required part of the REVTEX system, you do not need to be an expert user of ${ }^{\mathrm{E} T} \mathrm{~T}_{\mathrm{E}} \mathrm{X}$ in order to be an effective user of REVTEX.

If you adopt $\mathrm{REVT}_{\mathrm{E}} \mathrm{X}$, you should expect to benefit in the following ways:

- REVTEX provides all the markup elements needed for the preparation of your manuscript, so you will not need to develop special tags.
- REVTEX markup is designed to be acceptable for manuscript submission, so you will not need to be concerned about proper format for editorial offices (double spacing, margin requirements, etc.).
- REVTEX macros accommodate many presubmission distribution needs: you can, for example, assign preprint numbers to your manuscripts or easily change to single-spaced copy to save paper before submission to editorial offices.
- Since REVTEX macros are recognized by numerous physics organizations as a $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ standard for manuscript preparation, you can enjoy the benefits of electronic submission programs.
- REVTEX compuscript files can be used by a variety of publishers to create author proofs, giving you less proofreading, accelerated production schedules, or reduced cost-perpage.

### 1.2 Historical

The REVTEX system for $\mathrm{IAT}_{\mathrm{E}} X$, so named for the Physical Review journals, began its development in 1986, was first released in 1988, revised to version 2 in 1990, and to version 3.1 in 1996. In its earliest incarnations, it was both an authoring tool and a production tool and was based on EATEX2.09.
These earlier versions of $\mathrm{REVT}_{\mathrm{E}} \mathrm{X}$ were restrictive of what authors were allowed to do and were incompatible with packages that authors wanted to use. $\mathrm{REVT}_{\mathrm{E}} \mathrm{X} 3$ did not keep pace with the advances of the $\mathrm{LAT}_{\mathrm{E}} \mathrm{X}$ community and thus became inconvenient to work with.

### 1.3 Design Principles of REVTEX 4

REVTEX 4 is designed to bring REVTEX up to date and make it a more valuable tool for the production process of the American Physical Society and for authors who circulate their work on their own. This version of $\mathrm{REVT}_{\mathrm{E}} \mathrm{X}$ is a complete rewrite, with the following set of design goals:

- Make REVTEX fully compatible with $\operatorname{LAT}_{E} X 2 \varepsilon$; it is now a $\mathrm{LATEX}_{2}$ document class, similar in function to the standard article class.
- Relax the restrictions in REVTEX that had only been necessary for typesetting journal camera-ready copy.
- Rely on standard $\mathrm{LAT}_{E} X 2 \varepsilon$ packages for common tasks, e.g, graphicx, color, hyperref, and longtable.
- Add macros to support translation to SGML.
- Improve frontmatter macros for tagging author names and affiliations.
- Improve back matter macros for tagging references; actively promote the use of $\mathrm{BibT}_{\mathrm{E}} \mathrm{X}$.
- Provide a closer approximation of the pages of Physical Review and other journals so authors can use REVTEX to check their adherence to length requirements.
- Incorporate new features, such as hypertext, to make ${ }^{\text {REVTEX }}$ a desirable e-print format.

The improved tagging will to aid the peer-review and publication process from the moment a REVTEX paper is submitted.

### 1.4 Status of REVTEX 4

REVTEX $_{\mathrm{E}} 4$ is in beta testing. Papers that use REVTEX 4 are not yet eligible for the compuscript program (described in REVTEX Input Guide for REVTEX 3.1). The Americal Physical Society is making this beta release to get feedback on the features and to track down bugs. Please send any comments and bug reports concerning $\mathrm{REVT}_{\mathrm{E}} \mathrm{X} 4$ to mailto: revtex4@aps.org.

### 1.5 Documentation Roadmap

This manual applies to version 4 of the REVTEX document class for $\mathrm{LA}_{\mathrm{E}} X$. In this manual:

- We give a quickstart guide for experienced users in Section 2.
- We describe REVTEX's system requirements and explain how to get and use the REVTEX tools and documentation in Section 3.
- We give instructions on preparing a REVTEX compuscript (i.e., an instance of the revtex4 document class) in Section 4.
- We provide a reference manual to the REVTEX markup system and illustrate how it applies to scientific papers in Sections 5.1-5.3.
- We describe how to add other $\mathrm{LT}_{\mathrm{E}} \mathrm{X}$ packages to the REVTEX system, so you can exploit their capabilities in your document in Section 5.4.
- We give pointers for troubleshooting in Section 6.
- We describe the requirements of the compuscript program in Section 7.
- We detail your resources for help in Section 8.
- We list books on the use of $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ and $\mathrm{LT}_{\mathrm{E}} \mathrm{X}$ in the Bibliography.

The appendices to this manual contain reference information and information of interest to a restricted audience:

- In Appendix A, we summarize the differences in the markup between REVTEX 4 and the previous release, REVTEX 3.1.
- In Appendix B, we describe how to convert a REVTEX 3.1 document into a REVTEX 4 document.
- In Appendix C, we summarize the differences in the markup between $\mathrm{REVT}_{\mathrm{E}} \mathrm{X} 4$ and the standard $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ article class.
- In Appendix F, we list the special characters obtainable through REVTEX.
- In Appendix G, we summarize the REVTEX markup needed for a typical document.

## 2. Quick Start

This section is for readers impatient to create their first REVTEX 4 document. In order to jump right in, you must:

- Be familiar with $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ and, ideally, $\mathrm{BiBT}_{\mathrm{E}} \mathrm{X}$.
- Have available to you a working $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ installation, complete with $\mathrm{IAT}_{\mathrm{E}} \mathrm{X}, \mathrm{BiBT}_{\mathrm{E}} \mathrm{X}$, makeindex, previewer, printer, etc.
- Either have REVTEX installed, possess the distribution media, or have access to the Internet.
- Either have natbib installed or have access to CTAN.

Furthermore, to use the sophisticated length-checking capabilities of $\operatorname{REVT}_{\mathrm{E}} \mathrm{X}$, you must either possess the requisite fonts, or you must install whatever fonts are required.

To quickstart REVTEX, follow these steps:

1. Pick up the REVTEX document class for $\mathrm{LT}_{\mathrm{E}} \mathrm{X}$ and associated files: see http://publish.aps.org/ revtex4/.
2. Install the necessary components by putting all of the .cls, .sty, and .rtx files into a location within your filesystem where they will be available to $\mathrm{LT}_{\mathrm{E}} \mathrm{X}$.
Note: under the TDS, they would be placed into textmf / tex/latex/revtex.
3. Put all .bst files where they can be found by $\mathrm{BiBT}_{\mathrm{E}} \mathrm{X}$; under the TDS, this would be textmf/bibtex/bst/ revtex.
4. Make note of the . dvi and .pdf files in the distribution; they are the REVTEX online documentation. Please make yourself familiar with their contents.
If you wish to move these files into your documentation tree under the TDS, put them in texmf/doc/latex/ revtex.
5. The file template.aps is a boilerplate for creating a REVTEX document. Under the TDS, it belongs in texmf / doc/latex/revtex.
Clone this file under a new name, say mypaper.tex, in your personal area of your filesystem, and typeset that new file.
6. Alter the document to suit your purposes, using the sample markup and embedded comments as a guide.
7. Ensure that your installation has the natbib package installed, or intstall it yourself from ftp://ctan.tug.org/tex-archive/macros/ latex/contrib/supported/natbib.
8. You are on your way!

## 3. Getting Started With REVTEX

### 3.1 Site Preparation

To use REVTEX, you must have available to you a working $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ installation, complete with $\mathrm{EAT}_{\mathrm{E}} \mathrm{X}, \mathrm{BiBT}_{\mathrm{E}} \mathrm{X}$, makeindex, text editor, previewer, printer, and any ancillary applications needed to operate it. Most new computers sold today are capable of serving your authoring needs.

Commercial and shareware $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ distributions for most computers can be found through the $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ Users Group (http: //www.tug.org), in particular, the very powerful and convenient TEX Live CD-ROM (http: / /www.tug.org/ texlive) has runnable binaries for many UNIX flavors, Windows 9x and Windows 2000, and MacOS. All these distributions contain the $\mathrm{LT}_{\mathrm{E}} \mathrm{X}$ document preparation system upon which REVT $_{E} X$ is based.

Follow the installation instructions for your $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ software included with the distribution. Confirm your $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ installation by typesetting, previewing, and printing some sample documents. Then process the following short document to confirm that your system will run REVTEX:
\%This is la-test.tex
\NeedsTeXFormat \{LaTeX2e\}[1996/06/01]\%
\documentclass \{article\}
\begin \{document \} }
Hello, world!
\end \{document \} }

### 3.2 InSTALLATION OF REVTEX

REVTEX 4 is incorporated into many commercial and shareware $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ distributions, so you may find it unnecessary to install it. To determine if such is the case, create and typeset the rev-test. tex document below. If it compiles successfully, you have a working REVTEX and can skip the rest of this section.

The definitive distribution point for REVTEX 4 is http://publish.aps.org/revtex4/. It is also available on the Comprehensive $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ Archive Network, at ftp://ctan.tug.org/tex-archive/macros/
latex/contrib/supported/revtex.
Full installation instructions for $\mathrm{REVT}_{\mathrm{E}} \mathrm{X}$ are in the README file distributed with REVTEX.

To confirm the integrity of your REVTEX installation, create and typeset the following $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ document:
\%This is rev-test.tex
\documentclass \{revtex4\}
\begin\{document \} }
Hello, world!
\end \{document \} }
Note: if you encounter difficulties with $\mathrm{REVT}_{\mathrm{E}} \mathrm{X}$, the output from the la-test.tex job in section 3.1 and the above rev-test.tex can help diagnose installation problems.

### 3.3 Your First REVTEX Document

Let's create a REVTEX document that can ultimately be developed into a full-fledged journal submission.

1. Start by making a copy of the REVTEX-distributed file template.aps under a new name, such as mypaper.tex. Put this file into a portion of your filesystem where your own documents are stored.
2. Typeset and preview mypaper. tex and examine the formatted output. The document is almost devoid of content.
3. Open mypaper. tex in your text editor and locate the line
```
\title{}
```

Change this line so that it reads:

```
\title{%
    A Proposal for the
    Routing of Public Rail Service
}
```

4. Locate the line
\author $\}$
and change it to read:
\author\{Hedley Lamarr\}
(or insert your own name here).
5. Locate the line
\affiliation\{\}
and change it to read:
\affiliation\{\%
B. J. La Petomaine Institute, Rock Ridge AZ 12345
\}
(or insert your own institution here).
6. Locate the line
```
\section{}
```

and change it to read:

```
\section{%
    A Cautionary Note About Quicksand
}
```

(or insert your own title here). Likewise insert titles into the \subsection and \subsubsection commands on the following lines.
7. Follow the \subsubsection command with some general text of your own choosing.
8. Save the file and typeset it.
9. Congratulations, you have broken the ice with $\mathrm{REVT}_{\mathrm{E}} \mathrm{X}$.

## 4. Creating Your REVTEX Document

Your REVTEX document is a ${ }^{E} T_{E} \mathrm{X}$ document (specifically of the revtex class), and you create and process it like any other $\mathrm{EAT}_{\mathrm{E}} X$ document.

This section takes you through the steps of creating a REVTE $_{\mathrm{E}} X$ document in enough detail to allow you to create a full journal submission.

If you are familiar with earlier versions of $\mathrm{REVT}_{\mathrm{E}} X$, please read Appendices A and B, which show how to convert from that version. If you are familiar with the $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ article class, upon which $\mathrm{REVT}_{\mathrm{E}} \mathrm{X}$ is based, you can get a quick overview of REVTEX's distinctive features by reading Appendix C. If you are unfamiliar with $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$, you are advised to obtain and refer to the manual, the ${ }^{E T} E_{E} X$ User's Guide \& Reference Manual[2].

### 4.1 Class options

Your document consists of preamble and body, the latter delimited by \begin \{document\} and \end\{document \} } statements, and the former consisting of all statements preceding the \end } \{ document \} .

Start your document with a basic shell as follows:
class[<options>]\{revtex4\}\usepackage\{<package>\}\begin\{document\}}<content>\end\{document\}}Thedocumentclassisrevtex4;class<options>areseparatedbycommasandincludeeqsecnum(tonumberequationsbysection),preprint(togetdouble-spacedoutputforsubmissionpurposes),tightenlines(togetsinglespacedoutputwiththepreprintstyle),andamsfontsandamssymb(seeSec.4.13).Thereareclassoptionsforspecificsocieties,calledthesocietysubstyle,suchasapsforageneraAmericanPhysicalSociety,aipfortheAMericanInstituteofPhysics,osafortheOpticalSocietyofAmerica,andsegfortheSocietyofExplorationGeophysicists.Thereareclassoptionsforspecificjournals,calledthejournalsubstyle.ThoserelatingtotheAPSarepra,prb,prc,prd,pre,prl,prstab,andrmpforPhysicalReviewA,B,C,D,E,Letters,SpecialTopicsAcceleratorsandBeams,andReviewsofModernPhysics,respectively.undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

Under the aps society substyle, the journal substyle pra is the default. The prb journal substyle gives superscript reference citations, as is the style for Physical Review B. The prl substyle yields the slightly different line spacing of Letters (use for accurate length estimates). Other than this, there are no substantial differences in the APS journal options.

The floats class option enables LATEX $_{\mathrm{E}} \mathrm{X}$-style floating figures and tables. Alternatively, the endfloats class option
automatically moves the figures and tables to the end of the formatted document. The twocolumn class option typesets the document in a two-column layout for your convenience in creating a reprint format.

Please refer to the file apssamp.tex for an example of how to invoke these options. Numerous other class options are available; please see Section 5.1 for details.

The document preamble can have any number of agestatements;seeSection5.4forinformationaboutREVTEX'scompatibilitywithotherETEXpackages.undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

### 4.2 FRONT MATTER

The document body begins with the frontmatter statements, all of which absorb data for use by the \maketitle command that ends the frontmatter. Continue your document with a \maketitle command, preceding that command with frontmatter statements as described below.
\begin } \{ document \} \title\{〈title〉\}
\author $\{$ <author>\}
<frontmatter> \maketitle
Enter the title with the \titlecommand:

## short title $\{<$ title text> \}

If your document's title is sufficiently long, you may need to provide a truncated title for the purposes of the page running header; enter that as the optional argument to the \title command.

## Author and Affiliation

Next enter the authors and affiliations. For an article with a single author, give the \author and \affiliation commands, for example:

```
\author{Jackson P. Jones}
\affiliation{321 Main Street, Everville,
    Illinois 12345-6789}
```

For multiple authors at a single institution, put each author into a separate \author command, and follow with the \affiliation statement:
\author\{Jackson P. Jones\}

\author\{Joan Q. Johnson\}
\affiliation\{321 Main Street, Everville, Illinois 12345-6789\}

This arrangement is called an author group; it has one or more \author commands followed by one or more \affiliation commands (each author is understood to be affiliated with all of the specified affiliations).

Your frontmatter itself may have more than one author group; this is how you accomodate a mixture of authors and affiliations.
For each individual author, you may give any combination of \email, \homepage, \thanks, or \altaffiliation statements:

```
\author{Jackson P. Jones}
    \email{JackP@Jones.org}
    \email{JPJ@ev.il.us}
    \homepage{www.jones.org}
    \thanks{Work supported by Jenny Jones}
    \altaffiliation{Everville Institute}
\affiliation{321 Main Street, Everville,
        Illinois 12345-6789}
```

These author attributes are formatted either as title page footnotes or in the title block itself, depending on the requirements of the journal substyle.

Complex arrangements of authors and affiliations are possible with REVTEX; see Appendix D for more details.

## Other Front Matter

Enter the \date\{<date>\} command to have the date printed on the manuscript. Using \today will cause $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ to insert the current date whenever the file is run:

```
\date{\today}
```

Next enter your abstract in the abstract environment:

```
\begin{abstract}
In this paper we show the result of...
\end{abstract}
```

The final element of the frontmatter data is the \pacs \{<pacs numbers>\} command.
$\backslash \operatorname{pacs}\{23.23 .+x, 56.65 . \mathrm{Dy}\}$
The \maketitle command must be entered last of all. Note: If you omit this command, your formatted output will have no title block at all. Furthermore, certain features, such as the ability to refer symbolically to the first page of your document (via \ref \{<FirstPage> \}), will not work properly in a document lacking a title block.

```
\maketitle
```

Please see Section 5.2 for more information about frontmatter commands, and the author/affiliation commands in particular.

### 4.3 SECTION HEADINGS

Section headings are input as in $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$. The output is similar, with a few extra features.
Four levels of headings are available in $\mathrm{REVT}_{\mathrm{E}} \mathrm{X}$ :

```
\section[<short title>] {<title text> }
\subsection{<title text>}
\subsubsection{<title text>}
\paragraph {<title text> }
```

Provide the < short title> if needed for the sake of the running header (required only by some journal substyles).
Use the starred form of the command to suppress the automatic numbering; e.g.,

## \section*\{Introduction\}

To label a section heading for cross referencing use the \label \{<key>\} command after the heading; e.g.,

\section \{Introduction\}

\label\{sec:intro\}
In the some journal substyles, such as those of the APS, all text in the \section command is automatically set uppercase. If a lowercase letter is needed, use \lowercase\{x\}. For example, to use "He" for helium in a $\backslash$ section $\{<$ title text〉\} command, type $\mathrm{H} \backslash$ lowercase $\{\mathrm{e}\}$ in $\{<$ title text> \}.
The \appendix command signals that all following sections are appendices, so \section \{<title text>\} after \appendix will set $\{<$ title text $>\}$ as an appendix heading (an empty $\{<$ title text $>\}$ is permitted). For a single appendix, use a \section* \{<title text>\} command to suppress the appendix letter in the section heading.

Use $\backslash$ protect $\backslash \backslash$ to force a line break in a section heading. (Fragile commands must be protected in section headings and captions, and $\backslash \backslash$ is a fragile command.)

### 4.4 General Text

Paragraphs always end with a blank input line. Because $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ automatically calculates linebreaks and word hyphenation in a paragraph, you should not force linebreaks or hyphenation in your document. Of course, you nonehteless continue to explicitly hyphenate, e.g., "author-prepared copy."
Use directional quotes for quotation marks around quoted text ('`xxx''), not straight double quotes ("xxx"). (For opening quotes, this is two octal 140 (hexadecimal 60) characters; for closing quotes, this is two octal 047 (hexadecimal 27) characters.)

You can control the width of the text across the page in twocolumn layout: the widetext environment will set the text across the full width of the typing area. This may be needed to set very long equations. See Section 4.7. The widetext environment has no effect on the output if you have invoked the preprint class option. The preprint style is a uniform width throughout.

Don't use \vspace, \smallskip, \bigskip, or any other vertical motion commands. Likewise, horizontal motion commands like $\backslash$ hspace, should be avoided.

LATEX's standard $\backslash$ foot note command is available in REVTEX. Your target journal, however, may effectively invoke the endnotes class option; these notes will then be placed at the end of the bibliography element.

Note that in such a case, the argument of the $\backslash$ foot note command is a moving argument in the sense of the ${ } A T_{E} X$ User's Guide \& Reference Manual, Appendix C.1.3: any fragile command within that argument must be preceded by a \protect command.

### 4.5 MATH IN TEXT

REVTEX uses the $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ markup \$ for math, e.g.,
the quantity $a^{z}$
is obtained from the input
the quantity \$a^\{z\}\$
Within math mode, use ^ \{ <math>\} for superscripts (and _ \{<math>\} for subscripts), as you see in the source for this guide. If you omit the braces after the ${ }^{\wedge}, \mathrm{T}_{\mathrm{E}} \mathrm{X}$ will superscript the next token (generally a single character or command), but it is safest to use explicit braces \{\}.

As with text, your math should not require vertical or horzontal motion commands, because $\mathrm{T}_{\mathrm{E}} X$ calculates math spacing itself automatically. In particular, please do not insert explicit spacing around relations (e.g., $=$ ) or operators (e.g., + ). These suggestions notwithstanding, some fine-tuning of math is required in specific cases, see Chapter 18 in the TEXbook[1].

### 4.6 TEXT IN MATH

There are times when you need to insert text into math, but there are more and less satisfactory ways of doing so.

The $\backslash r m$ command only switches to Roman font for math letters. It does not, for example, let you print a normal text hyphen: $\$\{\backslash \mathrm{rm} \mathrm{e}-\mathrm{p}\} \$$ gives "e-p". Using an $\backslash \operatorname{mbox}\{\langle$ text $>\}$ will give you normal text, including a hyphen, but will not scale correctly in superscripts: $\$ x_{-}\{\backslash \operatorname{mbox}\{e-p\}\} \$$ gives " $x_{e-p " .}$

The \text\{<text>\} command is the preferred method of setting text within math mode. It gives you regular text and scales correctly in superscripts: $\$ y=x$ lext $\{$ for $\} x_{-}\{$text $\{e-p\}\} \$$ gives $" y=x$ for $x_{\mathrm{e}-\mathrm{p}} "$.

To use the xtcommand,youmustloadtheamsmathpackage:includea\usepackage\{amsmath\}commandinyourdocumentpreamble.undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

### 4.7 DISPLAYED EQUATIONS

Equations are set centered in the column width or flush left depending on the selected journal substyle.

For the simplest type of displayed equation, a numbered, one-line equation, use the equation environment. REVTEX takes care of the equation number-the number will be set below the equation if necessary. Use $\backslash[\ldots$ ] for a single, one-line unnumbered display equation.

Use the eqnarray environment when more than one consecutive equation occurs, putting each equation in a separate row of the environment, and using $\backslash$ nonumberbefore the row end $(\backslash \backslash)$ to suppress the equation number where necessary. If the equations are related to each other, align each on the respective relation operator (such as $=$ ).

When an equation is broken over lines or is continued over multiple relation operators, it is called a multi-line or continued equation, respectively; here, too, use the eqnarray environment.
For a continued equation, align each row on the relation operator just as with multiple equations, and use the
\nonumber command to suppress auto-numbering on broken lines. Also, use the starred form of the row end ( $\backslash \backslash *$ ) to prevent a pagebreak at that juncture.

Short displayed equations that can appear together on a single line separated by $\backslash$ qquad space, may be placed in a single equation environment.

In two-column mode, if an equation needs to be broken into many lines, for ease of reading set it in a wide column using the widetext environment. Then return to the normal text width as soon as possible. However short pieces of paragraph text and/or math between nearly contiguous wide equations should be incorporated into the surrounding wide sections.

In apssamp.tex, we illustrate how to obtain each of the above effects.

## Numbering displayed equations

The REVTEX macro package allows two methods for numbering equations: you can allow REVTEX to automatically number for you, or you can assign your own equation numbers.

For automatically numbered single-line and multi-line equations, use the equation and eqnarray environments as described above. For unnumbered single-line equations, use the $\backslash[\ldots$ \] construction. The command $\backslash$ nonumber will suppress the numbering on a single line of an eqnarray. For a multi-line equation with no equation numbers at all, use the eqnarray* environment.

If you wish a series of equations to be a lettered sequence, e.g., (3a), (3b), and (3c), put the respective equation or eqnarray environment within the subequations environment. You must load the amsmath package for this capability; include the statement mble.undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

Use the command g$\{<$number>\}toproduceanidiosyncraticequationnumber:($1^{\prime}$),forexample.Numbersassignedby$\backslashtag$arecompletelyindependentofREVTEX'sautomaticnumbering.Thepackageamsmathisrequiredifyouusethe$\backslash$tagcommand:putthestatement\usepackage\{amsmath\}inyourdocumentpreamble.undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

To have REVTEX number equations by section, use the eqsecnum class option in your document preamble.
See apssamp.tex for examples.

## Cross-referencing displayed equations

To refer to a numbered equation, use the $\backslash$ label $\{\langle k e y\rangle\}$ and \ref \{<key>\} commands. The \label\{<key>\} command is used within the referenced equation (on the desired line of the eqnarray, if a multi-line equation):

## input:

```
\begin{equation}
    A=B \label{pauli}
\end{equation}
    ... It follows from Eq.~ (\ref{pauli})
```

that this is the case ...
\begin\{eqnarray\} }
A \& $=\& B$, \label $\{$ pauli2 $\} \backslash \backslash$
$A^{\prime} \&=\& B^{\prime}$
\end\{eqnarray\} }
output:

$$
\begin{equation*}
A=B \tag{1}
\end{equation*}
$$

... It follows from Eq. (1) that this is the case ...

$$
\begin{align*}
A & =B  \tag{2}\\
A^{\prime} & =B^{\prime} \tag{3}
\end{align*}
$$

Please note the parentheses surrounding the \ref command. these are not provided automatically; you must incorporate them into your electronic document if you want them.

Numbers produced with \tag can also be crossreferenced: follow the \tag command with a $\backslash$ label command.

Using a \label after \begin\{subequations\} will } allow you to reference the general number of the equations in the subequations environment. For example, if

```
\begin{subequations}
    \label{allequations} % notice location
    \begin{eqnarray}
    E&=&mc^2,\label{equationa}
\\
    E&=&mc^2,\label {equationb}
\\
    E&=&mc^2,\label{equationc}
    \end{eqnarray}
\end{subequations}
```

gives the output

$$
\begin{align*}
& E=m c^{2}  \tag{4a}\\
& E=m c^{2}  \tag{4b}\\
& E=m c^{2} \tag{4c}
\end{align*}
$$

then Eq. ~ ( $\backslash$ ref $\{$ allequations \}) gives "Eq. (4)".
Note: incorrect cross-referencing will result if $\backslash$ label is used in an unnumbered single-line equation (i.e., within the $\backslash[$ and $\backslash]$ commands), or if \label is used on a line of an eqnarray that is not being numbered (i.e., a line that has a \nonumber).

Please see Sec. 4.12 for further information about crossreferencing.

### 4.8 Special characters

If you intend to submit your document to a compuscript program, it would be best to avoid the use of specially defined characters; instead choose symbols from those shown in the ${ }{ }^{2} E_{E} X$ User's Guide \& Reference Manual or in Section F. These characters are supported by the software that converts your REVTEX document to SGML or other format.

See Appendix F for a list of standard $\mathrm{EATE}_{\mathrm{E}} \mathrm{X}$ symbols, a list of symbols available when the ams fonts and amssymb options are used, and a list of extra symbols made available by REVTEX $^{2}$.

### 4.9 Citations and References

References are cited in text using the \cite\{<key>\} command and are listed in the bibliography using the $\backslash$ bibitem $\{<k e y>\}$ command. Put the list of references after the main body of the paper using one of two alternative methods.

If you are using $\operatorname{BIBT}_{\mathrm{E}} X$, give the command

## \bibliography \{<bib files>\}

where <bib files> is a comma-separated list of BibTEX bibliography database files, each with a .bib extension. See Section 4.9 for further instructions on using $\mathrm{BIBT}_{\mathrm{E}} \mathrm{X}$.

Alternatively, you may use an explict thebibliography environment:
\begin\{thebibliography\} \{\} }
\bibitem[Tal(1982)]\{tal82\}
Y. Tal and L. J. Bartolotti,
J. Chem. Phys. $\{\backslash \mathrm{bf} 76\}, 4056$ (1982).
\end\{thebibliography\} }
In either case output looks like:

## References

${ }^{\dagger}$ REVTEX 3.1 portions by APS; V4 notes by David Carlisle (mailto:david@carlisle.demon.co.uk), March 31, 1999; V4 guide by Arthur Ogawa (mailto:ogawa@ teleport.com)
[1] Y. Tal and L. J. Bartolotti, J. Chem. Phys. 76, 4056 (1982).
The \bibitem command's optional argument specifies information that is used to cite the reference when using author/year citation style. The required argument, here tal 82 is a tag. If you compile your thebibliography environment by hand, you can chose the tag for each bibliographic entry as any string of letters and numbers. If using BibT $_{E} X$, the tag must match that of the desired entry in your bibliographic database.

You use the tag in the \cite command to indicate which reference you want to cite. For example,

## input:

As has been noted previously~ \cite\{tal82\}.
output:
As has been noted previously [1].
In journal substyles using superscript reference citations, such as Physical Review B, you need an alternative command to get on-line citations; the command \onlinecite\{<key>\} is available for this purpose. For example, Ref. ~ \onlinecite\{tal82\} will give the output "Ref. 1".

When the citation constitutes part of the grammar of the sentence, you use the \textcite $\{<k e y\rangle\}$ command, for example, \textcite\{tal82\} has shown will give the output "Tal [1] has shown".

A \cite command with multiple keys is formatted with consecutive reference numbers collapsed; e.g., [1,2,3,5,7,8,9] will be output as [ $1-3,5,7-9$ ]. If you need to split the list over more than one line, use a \% character immediately following a comma; thereby ensuring that the list will be processed correctly.
. . . as shown in \cite\{a,b,c,d,e,f,\%
$g, h, i, j, k, l, m, n, o, p, q, r, s, t, u, v, w, x, y, z\}$
Note the $\%$ inserted after the comma on the first line, which avoids unwanted spaces.

## Using $\operatorname{Bib} T_{E} X$

The BIBTEX application is an adjunct to $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ that aids in the preparation of your bibliography.
To use BibTEX with REVTEX, you must select an appropriate journal substyle, optionally specify your own bibliography style (if you do not, REVTEX selects one based on your journal substyle), issue the $\backslash$ bibliography command as described above, give \cite\{<key>\} commands (using as $\langle k e y\rangle$ that of the desired entry in your bibliographic database), and of course prepare your .bib bibliographic databases. In this section, we use the \cite command to stand also for \textcite and \onlinecite.

- Selecting a journal substyle automatically invokes the necessary \bibliographystyle command with the appropriate argument. For instance, for APS journals in general, this argument is apsrev, but is apsrmp in the particular case of the rmp (Reviews of Modern Physics) journal substyle. Your selected jounal substyle must do likewise.
- You may accept the bibliography style automatically selected by the journal substyle. Alternatively, you can issue the \bibliographystyle command explicitly, thereby specifying the bibliography style for your document. Note that unlike standard LETEX, your \bibliographystyle command must appear before the $\backslash$ begin $\{$ document \} statement in order for it to take effect.
- As explained above, the \bibliography command performs double duty by specifying both the location within your document where the list of references is to appear, and the set of BIBTEX bibliography database files to be used when $\mathrm{BIBT}_{\mathrm{E}} \mathrm{X}$ prepares your . bbl file.
- Each \cite command in your document automatically records its citation key in your document's . aux file, for later use by BibTEX.
- An appropriate bibliographic database is required as well. You may have created one of your own, or you may have
access to one of the compiled databases, depending on your field of research.

With the above requirements met, you carry out the following steps: (we take the name of your document to be myfile.tex)

1. Process your document once under REVTEX as specified elsewhere in this guide, and ignore any $\mathrm{LA}_{\mathrm{E}} \mathrm{X}$ reports of undefined citations. $\mathrm{LT}_{\mathrm{E}} \mathrm{X}$ compiles a list of needed references in the myfile. aux file from each instance of a \cite command in your document.
2. Run BibTEX on the myfile.aux file, thereby creating the myfile.bbl file. To run BibTEX on a commandline operating system, you might give a shell command like bibtex myfile.
3. Process your document a second time under REVTEX, still ignoring any $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ reports of undefined citations. $\mathrm{EAT}_{\mathrm{E}} \mathrm{X}$ typesets the bibliography and, for each \bibitem statement therein, records the meaning of each reference key in the . aux file for use when the key is cited.
4. Process your document a third time under REVTEX. This time a reports of an undefined citation indicates that you have either failed to correctly enter the citation key in your \cite command that matches the key in the .bib file, or that the .bib file lacks any entry with that key.
5. Repair any problems and repeat the whole process from step 1.
6. If you have no reports of undefined citations, your BibTEX work is complete.

For more information on using BibTEX with $\mathrm{LAT}_{\mathrm{E}} \mathrm{X}$, see Sections 4.3.1 and C.11.3 of the $E T_{E} X$ User's Guide \& Reference Manual[2], Section 13.2 of [3], or the online BibTEX manual http://ctan.tug.org/tex-archive/ biblio/bibtex/distribs/doc/btxdoc.tex.

## References by Hand

If you are not using BibTEX, please bear in mind the following when preparing your $\backslash$ bibitems.

- The \bibitem[<bib text>] \{<key>\} command begins each reference item.
- References should be listed in the reference section in the order in which they are first cited in the text if using numerical citations, in alphabetical order if using author/year citations.
- Numerical references are automatically numbered by REVTEX in the order in which they occur in the reference section.
- The <key> in \bibitem\{<key>\} is a tag; you can choose any string of letters and numbers to associate with the reference. This tag is used with the \cite\{<key>\} command when citing the reference.
- The <bib text> in \bibitem[<bib text>] is only used in the case of author/year citations; it should have the structure
\bibitem [ < short-name> (<year>) <long-name>]
where <short-name> is the author name used in a parenthetical citation, <long-name> that used in a textual citation, and <year> is the year.
- If you wish to prepare a bibliography that can serve as the basis for a document using either author/year or numerical citations, then prepare it for the former. If you later choose a journal substyle using numerical citations you need make no changes to your bibliography.

## The reftest Tool

$\mathrm{REVT}_{\mathrm{E}} \mathrm{X}$ includes a tool for authors who prepare their bibliographies by hand, called reftest.tex. It will check to make sure that you have (1) no uncited references, (2) no undefined citations, and (3) your references are in the same order as your citations. Using reftest, an author can put the citations in the correct order once, after writing the paper, by using the correct order reported by reftest.tex.

This process only works if you use LATEX's \bibitem \{<key>\} and \cite \{<key>\} mechanisms.
To check the references for the file myfile.tex,

1. Run myfile.tex through LATEX as usual, thereby creating an up-to-date auxiliary file myfile.aux. (reftest.tex uses that file to analyze your references.)
2. Run $\mathrm{LAT}_{\mathrm{E}} \mathrm{X}$ on reftest. tex: it prompts for the name of the file you wish to check. Answer myfile at the prompt (not myfile.tex or myfile.aux).
3. Note messages on your console and in the log file (reftest.log) that tell you of any problems. Correct them.
4. Preview or print the file reftest. dvi to see the correct order of your references. Note that this information does not appear in the log file.

### 4.10 Figures and Artwork

Figures are part of the compuscript and should be input using the figure environment as illustrated below; $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ will label and automatically number the captions FIG. 1, FIG. 2, etc., or in whatever format required by the chosen journal substyle. Note how the \label\{<key>\} command is used to cross-reference figures in text. The \label $\{\langle k e y\rangle\}$ command should be inserted inside or after the figure caption, before the end of the figure environment.

## input:

```
\begin{figure}
    \caption{Text of first caption.}
    \label{fig1}
\end{figure}
\begin{figure}
    \caption{%
        This is the second caption:
        comparison of the differential cross
        sections for the subprocess
        $qg -> qggg$ of our
        approximation (dotted line)}
    \label{fig2}
\end{figure}
output:
```

FIG. 1: Text of first caption.

FIG. 2: This is the second caption: comparison of the differential cross sections for the subprocess $q g \rightarrow q g g g$ of our approximation (dotted line)

Figures are cited in text with the use of the $\backslash r e f\{\langle k e y>\}$ command:
input:

```
    ...It can be seen from Fig.~\ref{fig1}
that the data are inconsistent...
```

## output:

...It can be seen from Fig. 1 that the data are inconsistent...
Further information on cross-referencing can be found in Sec. 4.12.

## Artwork

Use the standard LATEX  }

\caption \{<title text>\}
\label \{<key> \}
\end\{figure\} }
For more information on the enhancements of the graphicx package, see [4] or ftp://ctan.tug. org/tex-archive/macros/latex/required/ graphics/grfguide.ps.

## Figure Placement

As with tables (cf. Section 4.11), figures float to the top or bottom of the page if not otherwise specified, using the standard ${ }^{\text {ETE }} \mathrm{EX}$ float placement mechanism. Initially, you should put each figure environment immediately following its first reference in the text; this will usually result in satisfactory placement on the page. Use the optional argument of the figure environment to make adjustments to your float placement

```
\begin{figure}[<placement>]
\end{figure}
```

where <placement> can be any combination of htbp!, signifying "here", "top", "bottom", "page", and "as soon as possible". For more details about float placement, please study the instructions in the $A T_{E} X$ User's Guide \& Reference Manual, Appendix C.9.1.

### 4.11 Tables and Alignments

Tables are part of the compuscript and should be input using the table environment as detailed below; $\mathrm{LATEX}_{\mathrm{E}}$ will label and number the captions TABLE 1, TABLE 2, etc. or in whatever format required by the chosen journal substyle.

Each table must begin with \begin\{table\}, } end with \end\{table\}, and have a caption (using } the \caption $\{\langle$ text $\rangle$ \} command). The optional \label\{<key>\} command follows the \caption and is used for cross-referencing. Use the $\backslash r e f\{\langle k e y\rangle\}$ command to cite tables in text.
The content of the table environment should be a tabular \{<preamble〉\} environment. Please refer to Section 3.6.3 and Appendix C.10.2 of the ${ }^{E} T_{E} X$ User's Guide \& Reference Manual for more details about the tabular environment.

Use the commands \toprule, \colrule, and \botrule to structure your tabular into the column heads (those rows between \toprule and \colrule) and the alignment body (those rows between \colrule and \botrule). Follow current journal style concerning placement of other table rules.

## input:

```
\begin{table}
    \begin{tabular}{ll}
    \toprule
    Column 1&Column 2\\
    \colrule
    Cell 1&Cell 2\\
    \botrule
    \end{tabular}
    \caption{Text of table caption.}
    \label{tab1}
\end{table}
```

output:

Column 1 Column 2
Cell 1 Cell 2
TABLE I: Text of table caption.

## Some special table considerations

- Use the correct number of descriptive column headings.
- Numerical columns should align on the decimal point (or decimal points if more than one is is present). The column specifier d, should be used for simple numeric data with a single decimal point. Material without a decimal point is simply set in math mode, centered.

To use the d column specifier, you must load the dcolumn package; put dcolumn\}inyourdocumentpreamble.Theentryofadcolumnistypesetinmathmode;donoteinsertany$\$$mathshiftcharactersintoadcolumn.Iftextisrequiredinthecolumn,use\textor$\backslash$mboxasappropriate.Ifmultipledecimalpointsarepresentthenthelastisusedforalignment.Toescapefromthedcolumnuse\multicolumnasusual.Seeapssamp.texforexamples.undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

- Use \$ delimiters for all math in a table; do not put a displayed equation in a table.
- Footnotes in a table are labeled $a, b, c$, etc.; use the $\mathrm{LAT}_{\mathrm{E}} \mathrm{X}$ $\backslash$ footnote command. See apssamp.tex for examples and explanations of use.
- Use the \squeezetable command with tables that do not otherwise fit on the page: placing this command before your \begin\{tabular\} statement makes the fonts in } the body of the tabular smaller, allowing larger tables to fit onto the page.

## Table Placement

Like figures (cf. Section 4.10), tables float to the top or bottom of the page if not otherwise specified, using the standard LATEX float placement mechanism. Initially, you should put each table environment immediately following its first reference in the text; this will usually result in satisfactory placement on the page. Use the optional argument of the table environment to make adjustments to your float placement

```
\begin{table}[<placement>]
\end{table}
```

where <placement> can be any combination of htbp!, signifying "here", "top", "bottom", "page", and "as soon as possible". For more details about float placement, please study the instructions in the $E T_{E} X$ User's Guide \& Reference Manual, Appendix C.9.1.

Invoking the REVTEX preprint class option changes LATEX's float behavior: all tables are automatically printed at the end of your document. This arrangement may be required by your journal's compuscript program.

### 4.12 Cross-REferencing

REVTEX has built-in features for labeling and crossreferencing section headings, equations, tables, and figures. This section contains a simplified explanation of crossreferencing features. The format for using these features with section headings, equations, tables, and figures is discussed in the appropriate section.

Cross-referencing depends upon the use of "tags," which are defined by the user. The \label \{<key>\} command is used to identify tags for REVTEX. Tags are strings of characters that serve to label section headings, equations, tables, and figures, so that you don't need to know what number REVTEX has assigned to the item in order to talk about it in text.

You will need to process your file through REVTEX twice to ensure that the tags have been properly linked to appropriate numbers. If you add any tags in subsequent editing sessions, you will need to repeat this process: $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ will display a warning message in the $\log$ file that ends with . . . Rerun to get cross-references right. If you see that message, run the file through REVTEX again.
If the error message persists, please check your labels; you may have labelled more than one object with the same <key>.
Another LATEX warning is There were undefined references, which signifies that you have used a key in a \ref without ever using it in a \label statement. If you encounter this message after running your document through ETEX twice, search your document for the < key> in question: it must appear as the argument of a $\backslash$ label command.

REVTEX performs autonumbering exactly as in standard LATEX: when you process your file for the first time, $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ creates an auxiliary file (with the .aux extension) that records the value of each <key>. Each subsequent run retrieves the proper number from the auxiliary file and updates the auxiliary file. At the end of each run, any change in the value of a <key> produces a IATEX warning message.

### 4.13 FONTS

REVTEX has been set up to give good results on standard LETEX installations, but we cannot guarantee that you will be able to access all the font options-memory and font restrictions vary in $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ implementations and computers.

## Bold symbols in math

If you require bold symbols in math, particularly in superscripts or subscripts, use the athrm{bm}\{\langle\)symbol>\}command.YoumusthavetheAMSfontsinstalledandinvoketheamsfontsclassoption.Youmustalsoloadthebmpackage:placethecommand\usepackage$\{bm\}$inyourdocumentpreamble.undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

The $\backslash \mathrm{bm}$ command makes the symbol bold in math mode, and it ensures that it is the correct size, even in superscripts. If the correct font in the correct size is not available, then you get $\left\{<\right.$ symbol> \} at the correct size in lightface and $\mathrm{IAT}_{\mathrm{E}} \mathrm{X}$ will issue a warning that says No \boldmath typeface in this size. You can also use $\backslash$ bm to get bold greek characters-upper- and lowercase-and other symbols.

The following will come out bold with $\backslash$ bm: normal math italic letters, numbers, Greek letters (uppercase and lowercase), small bracketing and operators, and \mathcal.

Note that $\backslash$ bm $\{<$ math > \} is a fragile command.

## Extra typefaces in math: amsfonts option

In addition to the extra bold capabilities you get in math with the amsfonts option, you also gain access to the Fraktur and Blackboard Bold typefaces. You select these with normal font-switching commands: $\$\left\{\begin{array}{l}\text { mathfrak }\{G\}\} \$ \text { gives }\end{array}\right.$ a Fraktur " $\mathfrak{G}$ " and $\$\{\backslash$ mathbb $\{Z\}\} \$$ gives a Blackboard Bold " $\mathbb{Z}$ ". Fraktur will become bold in a $\backslash \mathrm{bm}$; there is no bold version of Blackboard Bold.

## Extra symbols in math: amssymb option

Many new symbols are available to you if you have the AMS fonts installed. The amssymb class option gives you all the font capabilities of the amsfonts class option and further defines the commands to get the symbols shown in Appendix F, which contains examples of the symbols and for instructions on use. These characters will scale correctly in superscripts and heads.

## AMS fonts

The AMS fonts, developed by the American Mathematical Society, are available free of charge at ftp://ctan. tug.org/fonts/amsfonts. Most ETEX installations incorporate the AMS fonts in many formats, including ATMcompatible Type 1 PostScript fonts. There are two class options for accessing the AMS fonts: amsfonts and amssymb.

The amsfonts option defines the \mathfrak and $\backslash$ mathbb commands to switch to the Fraktur and Blackboard Bold fonts, respectively. Fraktur characters will come out bold in a $\backslash \mathrm{bm}$, Blackboard Bold will not. The amsfonts option also adds support for bold math letters and symbols in smaller sizes and in superscripts when a $\backslash \mathrm{bm}\{<$ symbol>\} is used. For example, $\$^{\wedge}\{\backslash \mathrm{bm}\{\backslash \mathrm{pi}\}\} \$$ gives a bold lowercase pi in the superscript position: ${ }^{\pi}$.
amssymb gives the capabilities of the amsfonts option and additionally defines many new characters for use in math.

REVTEX does not support the use of the extra Euler fonts (the AMS fonts starting with eur or eus) or the Cyrillic fonts (the AMS fonts starting with w).

## 5. A REVT ${ }_{\mathbf{E}} \mathbf{X}$ Command Reference

This section is a systematic reference to all REVTEXspecifc commands. Please see the $\Delta T_{E} X$ User's Guide \& Reference Manual for complete information about LATEX commands.

### 5.1 Document Class Declaration and Options

All REVTEX documents must start with the declaration:
\documentclass[<options>] \{revtex4\}
There are numerous options, as listed below.

## The Document Substyle

Among your document class options will be exactly one substyle, an option specifying the society or the journal to which your article will be submitted. One such society is the American Physical Society, hence the document class option aps signifies that your article is to be submitted to one of the APS journals. Alternatively, you can specify a particular journal. Select a substyle from the following list:

```
substyle Journal
aps American Physical Society
pra Physical Review A
prb Physical Review B
prc Physical Review C
prd Physical Review D
pre Physical Review E
prl Physical Review Letters
prstab Physical Review Special Topics-Accelerators and Beams
rmp Reviews of Modern Physics
```

Another possible society is the OSA, selected with the osa substyle; currently unimplemented.
If you invoke a class option that $\mathrm{REVT}_{\mathrm{E}} \mathrm{X}$ does not otherwise know about, it looks for a journal substyle with the corresponding name (with a . rtx extension). If no such substyle file exists, that option is made available as a global class option for other packages to use as appropriate.

You should examine your log file for any messages of the sort:

```
LaTeX Warning: Unused global option(s):
```

to see what options you have invoke that are not defined or ever used. If you see on that list the name of a journal substyle, you will know that the corresponding .rtx file was not found.

Correct the situation by installing the indicated .rtx file in a location on your file system where $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ can find it. Under the TDS, it would be placed into textmf/tex/latex/ revtex.

You may select a type size from among the following. Note that selecting a type size is optional; your selected journal has a default type size.

10pt The default size.
11pt Alternative size for author drafts.
12 pt The default size in the preprint option described below.

## Media Size Options

The media size options of the standard $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ classes are available. Note that selecting the media size does not affect the text area of your formatted article.

## AMS Font Options

You may specify one of the following two options:
amsfonts Load the AMS font package. (Equivalent to putting nts\}inthedocumentpreamble.)noamsfontsDon'tloadtheAMSfontspackage(evenifajournaloptionloadsamsfontsbydefault).undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

You may specify one of the following two options:
amssymb Load the AMS symbols package. (Equivalent to putting mb\}inthedocumentpreamble.)noamssymbDon'tloadtheAMSsymbolspackage(evenifajournaloptionloadsamssymbbydefault).undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

## Author and Address Options

The following four options, all relating to how the authors and affiliations are formatted in the title block, are mutually exclusive. You may have only one of them in effect at one time.
groupedaddress List each group of authors with shared addresses separately, followed by the addresses. Each shared address will only be typeset once and all authors that share an address will be typeset in the same group.
unsortedaddress List the authors in exactly the order specified even if this means typesetting some addresses more than once.
runinaddress List authors similarly to groupedaddress, except that the authors are formatted in a paragraph instead of on separate lines.
supercriptaddress List all authors in a single list. Author addresses are indicated by superscript markers which index into a numbered list of addresses typeset after the author list.

Note that your chosen journal substyle will make a default choice of one of the above four options, and you may override this choice in your document.

## One- or Two-Column Layout

twocolumn Selects two-column layout. Unlike the option in the standard classes, the columns on the final page will be balanced.
onecolumn A single column across the full page width will be used. This is the default for the preprint option.

## Preprint and Other Options

preprint Sets the article in single column at 12 pt with enlarged interline spacing and makes minor layout changes. This option is intended for use when the formatted document is to be copyedited, and it is activated by default.
galley Sets the article in a single, narrow column approximating the format of journal article. In galley format, the widetext environment sets its content using the full page width (over twice the width of general text). This formatting option is one of two ways to gauge the length of a journal article; the other is lengthcheck.
tightenlines If used in conjunction with the above options, this produces normal single spaced documents.
draft This option marks overset lines (Overfull \hbox in paragraph), as in the standard classes.
showpacs and noshowpacs These options determine whether the Physics and Astronomy Classification Scheme data appear in the formatted output.
final This item is the opposite of draft.
lengthcheck This class option specifies that the formatted document should approach as closely as possible the formatting of an actual journal article, thereby facilitating performance of a length check. Note that particular font requirements may be in effect for this option.
byrevtex Using the byrevtex class option signifies that you want the "Typeset by REVTEX" tagline to appear on your output. In the aps substyles, it will appear at the foot of the title page.

## Footnote and Bibliography Options

bibnotes Instead of putting remarks (\thanks, \email, \homepage, and \altaffiliation) associated with authors as footnotes on the title page, put them at the beginning of the bibliography as unnumbered entries.
nobibnotes Nullifies the effect of the bibnotes option. If the journal substyle effectively invokes that option by default, you can invoke nobibnotes to override that choice.
footinbib Put all footnotes as numbered entries at the end of the bibliography. (Footnotes in the frontmatter are controlled independently by the bibnotes option.)
nofootinbib Nullifies the effect of the footinbib option. If the journal substyle effectively invokes that option by default, you can invoke nofootinbib to override that choice.
superbib Number the entries in the bibliography with superscripts rather than with numbers in square brackets. (this is, e.g., the style of Phys. Rev. B.)

## Equation numbers

eqsecnum Number equations within sections.
fleqn Typeset equations flush left.

## Section Numbering Option

The secnumarabic class option specifies that you want the sectioning commands to have arabic numbering.

## Floats Option

The endfloats option specifies that floating elements such as figures and tables are to be set at the end of the formatted document (end floats).

Specifying the floats option means normal LATEX float behavior and will override those journals which would by default have end floats.
If you specify neither option, then the selection will be made by the journal substyle; usually floats.

These options are described in more detail below.

## Title Page Options

It should not be necessary to use these options in your document, because the journal substyle sets them as appropriate.
titlepage Start a new page after typesetting the title block.
notitlepage Typeset the title block above the body of the text.

## Formatting for Duplex Printing

The options twoside (the default) and oneside work as in standard $\mathrm{LAT}_{\mathrm{E}} \mathrm{X}$ classes.

## Hypertext Option

Use the option hyperref if you want your formatted document to have hypertext capabilities. This option implies the use of the hyperref package, available from ftp://ctan.tug.org/macros/latex/ contrib/supported/hyperref, which is automatically loaded.

## Job Macro Package

You can create a "job macro package" for your document that will be read in automatically every time your document is processed. Thus, if your job is a file called myarticle.tex, then the file myarticle.rty will be read in just the same as if you had placed a followingyour\documentclassstatement.undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

Within your .rty file, you can define and use control sequence names that contain the @ character, and you can override any of the definitions or assignments made by the REVTEX document class or the selected journal substyle. That is, you have the power to make a mess.

If you choose to have a job macro package, be sure to read the $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ guide to document classes (clsguide.tex) or read up on the subject of packages and classes in $\operatorname{The~}^{\Delta T_{E} X}$ Companion [3] or a similar book.

The file template.rty contains a template for creating your own job macro package.
Example Here is a code fragment suitable for inclusion in your job macro package that defines the sectioning counters to produce arabic numbers instead of the default roman numbers, and which numbers the sectioning commands to the level of \subparagraph.
$\backslash d e f \backslash$ thesection $\{\%$
\arabic\{section\}\}\%
$\backslash$ def $\backslash$ thesubsection $\{\%$
\arabic\{subsection\}\}。
$\backslash$ def $\backslash$ thesubsubsection $\{\%$
\arabic\{subsubsection\}\}\%
\def $\backslash$ theparagraph \{\%
\arabic\{paragraph\}\}\%
\def $\backslash$ thesubparagraph\{\%
\theparagraph.\arabic\{subparagraph\}\}\%
\setcounter\{secnumdepth\} 5 \}\%

### 5.2 Frontmatter Commands

As in the standard classes, the frontmatter is specified by a sequence of declarations that gather information (data com-
mands). The \maketitle command then uses this information to typeset the title block.

## Data Commands

Title \title [<short title>] \{<title>\} The optional short title will be used in running heads. If it is not specified, then it defaults to the same value as title.
Keywords \keywords\{<keyword list>\} A commaseparated list of keywords (as used by subject review or abstract publications).
PACS \pacs \{<PACS numbers>\} PACS Subject classification numbers. You must specify $\backslash p a c s$ before the $\backslash$ maketitle command.
Abstract \begin \{abstract \}abstract } \backslash end \{abstract \} The abstract is considered part of the frontmatter, and thus the abstract environment must come before the \maketitle command in the source file.
Dates and Numbers The following commands specify the volume, issue, year, and electronic identifier of the article, as well as the dates received, revised, accepted, and published.
With the exception of the IATEX standard \date command, these commands are more likely to be used by journal staff than by the author of the document. The argument of each should be in the final typeset form; the class does not parse these arguments.

```
\volumeyear{< year>}
\volumenumber{<number>}
\issuenumber {<number>}
\eid{<identifier>}
\date [<text>] {<date>}
\received[<text>] {<date>}
\revised[<text>] {<date>}
\accepted[<text>] {<date> }
\published[<text>] {<date> }
```

In the latter five commands, [ <text>] signifies an alternative value for the text that is produced just before the date, e.g., in the case of \received, it might be "Received". You can use the optional argument to override the value chosen by the journal substyle.

LATEX will calculate page numbering from information taken from the previous run's . aux file, if not otherwise specified:

```
\startpage{<number>}
```

\endpage $\{\langle$ number> \}

## Preprint command

\preprint $\{<$ text>\} has no effect unless the preprint option has been specified, in which case it adds identifying text to the page headline.

## Author/Affiliation Data Commands

The most significant new feature in REVTEX 4 concerns the commands used for specifying author names, affiliations, and other author-related information. They are designed to better mark up the information (e.g., \email rather than \thanks) for use in the editorial and production processes.

These data are organized into one or more "author groups", each comprised of one or more authors followed by one or more affiliations: the given authors are understood to share all of the given affiliations. Furthermore each author can possess any number of email, homepage, alternative affiliation, and general thanks.
Following an author group is an optional collaboration specification, which is taken to apply to all of the preceding author groups up to the most recent collaboration specification. A collaboration, like an individual author, can have any number of email, homepage, alternative affiliation, and general thanks.
Author \author \{<author name> \} Contrary to the usage of the \author commands in standard ${ }^{\mathrm{E}} \mathrm{T}_{\mathrm{E}} \mathrm{X}$ classes, each author should be specified in a separate \author command.

You may assist your journal in dealing with unusual names by specifying the author's first name, or, independently, surname:

```
\author{
\firstname{<first-name>}
\surname {< surname> }
}
```

Either one or both may be used. For example:

```
\author{Andrew \surname{Lloyd Weber}}
\author{\firstname{Yo yo} Ma}
```

Note: The command \and used in the standard $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ classes is not supported by this class, and simply generates an error message.
The \author command may be followed by any combination of author data commands specifying email address, general URL, alternative affiliation, and "thanks". These commands are all implicitly subsidiary to the immediately preceding \author command and may be repeated, if so desired, to give, e.g., multiple email addresses.
Email \email $[$ text $]\{\langle$ email address>\} Specify the electronic mail address of the immediately preceding \author. The <text> phrase is prepended to the email address. Only the actual address should appear in the argument; the mailto: is understood.

Homepage $\backslash$ homepage[text $]\langle U R L\rangle\}$ Specify a URL for the immediately preceding \author. This acts in the same way as \email, and may refer to a WWW homepage of an author.

## Alternative Address

\altaffiliation [<comment>] \{<address>\}
Specify an alternative address for the immediately preceding \author. This command produces a footnote with text
constructed from the two arguments, so the <comment> argument will be something like "Currently at" or "Work undertaken while visiting" or other explanatory text to be placed in front of the address in the footnote.

## Thanks \thanks[text] \{<Extra remarks>\}

In the standard classes $\backslash$ thanks is used inside the argument of \author, but in this class \thanks must follow the \author command.

Email addresses, URL's, and alternate affiliations should be typeset with the appropriate command above and not with the \thanks command. The latter should only be used when the other, more specific, choices are not appropriate.

## Affiliation

## \affiliation\{<affiliation> \}

The affiliation (or address) of an author (or group of authors) is specified using this command. All authors given since the previous \affiliation command (or the start of the document) will be taken as being at this address.

Some journal classes distinguish between "affiliation", which is usually just the name of the department or institution where the work was undertaken, and "address", which is a full postal address. Currently REVTEX does not make this distinction.

If the supercriptaddress option is invoked, affiliations will be numbered in the order they appear in the source file. This order is effectively determined by the order in which the authors are listed, and may not be the desired ordering.

To control the numbering, you may give the \affiliation commands before any authors are specified. This forces the numbering to follow the order of the listed \affiliation commands. The addresses can then be re-specified after the relevant authors. In any case, if an address is specified more than once it is only allocated one number, and, except with the unsortedaddress option, it will be typeset once.

## Collaboration

\collaboration\{<collaboration>\} Specify a collaboration applying to all prior author groups up to the most recent \collaboration.

This command will work only in the superscriptaddress mode. The collaboration name will be typeset within parentheses following the list of authors and can have \email, \homepage, \altaffiliation, and \thankscommands associated with it. The \collaboration command should be followed by a $\backslash$ noaffiliation command.

See Appendix D for examples and more details about author/affiliation data commands.

## Table of Contents

As with standard $\mathrm{EAT}_{\mathrm{E}} \mathrm{X}$, you use the \tableofcontents command to mark the place in your document where the table of contents is to appear, typically immediately after the $\backslash$ maket it le command.

Note that you will have to typeset your document at least three times before the information in the contents is valid:
twice to obtain a contents of the correct number of lines and a third time for the pagination therein to be valid.

If using the rmp journal substyle, you see proper indentation on the contents only after the third typesetting run.

### 5.3 Body Commands

Bibliographies with $\operatorname{Bib} T_{E} X$

REVTEX facilitates using $\mathrm{BibT}_{\mathrm{E}} \mathrm{X}$ for compiling the bibliography. During the editorial and production processes, it is useful to be able to extract the bibliographic information to check it against definitive databases. This will allow us to catch errors early in the life of the manuscript and to add hyperlinks so that referees can locate electronic versions of cited papers.

## Reference component tagging

## \bibinfo \{<label> \} \{<text>\}

The extra tagging is achieved by using a $\backslash$ bibinfo command that takes a <label> argument to identify what is being tagged. The labels correspond, for the most part, to the field names in a .bib file. For instance, the author of a cited paper would be tagged with \bibinfo \{<author>\} and the journal would be tagged with \bibinfo \{<journal>\}. The text argument contains the corresponding string from the $\mathrm{BIBT}_{\mathrm{E}} \mathrm{X}$ file (suitably processed by BIBTEX of course).

The \bibinfo command does not affect the typesetting of the information; rather, it is purely informative. Authors may choose to add the $\backslash$ bibinfo commands by hand, but this rapidly becomes tedious. To avoid the tedium, we have created a new REVTEX BibTEX file, apsrev.bst. This style file will automatically add the correct $\backslash$ bibinfo tagging. Futhermore, the style file has been expanded to handle items like URLs and e-prints which now frequently appear in citations. Authors can now add this information to their .bib files in a standard manner.

For more details on the BibTEX style files, please see the manual revbib.tex, included with the REVTEX 4 distribution.
Limitations in $\operatorname{BibT}_{\mathbf{E}} \mathbf{X}$ The advantages of $\mathrm{BibT}_{\mathrm{E}} \mathrm{X}$ notwithstanding, there are certain common constructions you cannot readily achieve through its use: multiple references and references with lead-in text. The following thebibliography environment illustrates each.

```
\begin \{thebibliography\} \{ \} }
\bibitem[Weinberg and Tomozawa(1966)] \{Tom66\}
    S. Weinberg,
        \prl\{ \bf 17\}, 616 (1966);
    Y. Tomozawa,
        Nuovo Cimento A \(\{\backslash \mathrm{bf} 46\}, 707\) (1966).
\bibitem[Moravcsik and Noyes (1961) ] \{Mor61\}
    For early developments, see:
    M.J. Moravcsik and H.P. Noyes,
    Ann. Rev. Nucl. Sci.
            \(\{\backslash b f 11\}, 95\) (1961).
\end\{thebibliography\} }
```

The first item gives two citations under a single $\backslash$ bibitem, i.e., a multiple reference. The second gives a reference preceded by lead-in text. In both cases you can achieve the effect only by manually editing the . bbl file. The author of $\mathrm{BibT}_{\mathrm{E}} X$ is Oren Patashnick.

## Acknowledgments

If your document has an acknowledgments section, use the acknowledgments environment as its container. Depending on the journal substyle, this element may be formatted as an unnumbered section.

## Float processing

Environments such as figure and table (and potentially other similar environments defined by loaded packages or journal options) may be positioned using LATEX's standard float placement algorithm (the default), or they may be held back (using an external file) and set at the end of the document (end floats).

You invoke the commands \printtables and \printfigures at the end of the document, where you wish the tables and figures to be printed. (Similar to the standard $\backslash$ printindex command). The *-form of the respective command begins the figures or table on a new page.

When floats are positioned in the document body by the float placement system, these two commands are silently ignored, so it is always safe to use them and to switch between different journal styles that may change the behavior of the formatter.

If the \printtables command is missing, the tables will be printed at the end of the document. Likewise, if \printfigures is missing, the figures will be printed at the end of the document. Therefore it is safe to omit these commands as long as you are satisfied with REVTEX's default choices.

If you wish greater control over when the end floats are produced, give the \printfigures and \printtables commands at the exact location (and in the desired order) you please. You may also use the $*$-form of the respective command to force a pagebreak.

We recommend that you use explicit \begin\{table\} } \}and \end\{table\} markup in your document (likewise } with longtable and figure). Moreover, if you use the endfloats option, or if your chosen journal substyle makes this selection, then you must use this explicit markup scheme. In particular, please do not follow the practice of defining typing shortcuts for table and figure environments, like

```
\def\bt {\begin{table} }% Incompatible!
\def\et {\end{table}}%
```

Such commands will be incompatible with generating end floats.

The following commands affect the table environment. They do not apply to tables set directly in the text with a tabular environment not enclosed in a table. They do however apply to longtable environments if that environment (from the longtable package) is used.

By default, tables are set in a smaller size than the text body ( $\backslash$ small). The $\backslash$ squeezetable declaration makes them smaller (\scriptsize).

In general you can locally redefine \tabbodyfont to be whatever you like. ( $\backslash$ Huge $\backslash$ color $\{$ magenta \} ... ?)
$\backslash$ footnote works in table environments, producing the text at the end of the table, not at the bottom of the page (as if the body of the environment were enclosed in a minipage environment, which is essentially how this feature is implemented).
Using the tabular environment $\operatorname{REVT}_{\mathrm{E}} \mathrm{X}$ introduces three commands to help structure your alignments, \toprule, $\backslash$ colrule, and $\backslash$ botrule; use these commands after the row end ( $\backslash \backslash$ ), similar to $\backslash$ hline.

The \toprule command starts off your tabular, and all table rows down to the \colrule are understood to comprise the table column heads. The \botrule command comes last in your tabular, and all table rows below the \colrule command are understood to comprise the table body.

## Using the longtable package

The REVT ${ }_{E}$ X document class is specifically designed to be compatible with the longtable package. If any of your tables is so long as to require setting on multiple pages, you are advised to use that package and its longt able environment.

To load the longtable package, insert a kage\{longtable\}commandinyourdocumentpreamble.Formoredocumentationonthelongtableenvironmentandonthepackageoptionsofthelongtablepackage,pleaseseethedocumentationthereofatftp://ctan.tug.org/macros/latex/required/tools/longtable.dtxorrefertotheLTEXCompanion.undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

Note that the longtable package does not allow use of the longtable environment on multicolumn pages. If you prefer to see this limitation lifted, please correspond directly with mailto:bugs@latex-project.org.

## $R_{E V T}^{E} X 4$ symbols and the revsymb package

Symbols made available in earlier versions of REVTEX are defined in a separate package, revsymb, so that they may be used with other classes. (This might be useful if, say, copying text from a REVTEX document to a set of slides being produced with a class such as slides, seminar or foiltex.)

The following are defined in this package: \lambdabar, \openone, \corresponds, \succsim, \precsim, \lesssim, \vereq, \gtrsim, \tensor, \overstar,
\overdots, \overcirc, \loarrow, \roarrow. See Section 3 for examples.

## Bold Math

The Bold Math (bm) package is now the basis for creating bold symbols in math mode. The command \bm \{<symbol>\} makes \{<symbol> \} bold in math mode, ensuring that it is the correct size, even in superscripts. If the correct font in the correct size is not available then you get $\{\langle$ symbol> \} at the correct size in lightface and IATEX $2 \varepsilon$ will issue a warning that says "No boldmath typeface in this size...".

## widetext environment

Text that is too wide to fit the narrow measure of the two-column or galley layouts may be placed in a widetext environment by using \begin\{widetext\} } and \end\{widetext \}. }

In two-column mode, this will temporarily return to onecolumn mode, balancing the text before the environment into two short columns, and returning to two-column mode after the environment has finished.
In galley mode widetext increases the measure allowing the text to extend into the (otherwise empty) space at the righthand side of the page.

In one-column mode the environment has no effect.

### 5.4 Using LAT $\mathbf{E}^{\mathbf{X}}$ PACKAGES WITh REVT $\mathbf{E}_{\mathbf{E}} \mathbf{X}$

${ }^{\text {LATEX }}$ X users often employ add-in software packages in order to use higher-level markup than is available with the standard LeTEX document classes, or to achieve particular formatting within their document.

Such packages are available, for instance, on CTAN at ftp://ctan.tug.org/tex-archive/macros/
latex/required/ and at ftp://ctan.tug.org/ tex-archive/macros/latex/contrib/ or may be available on your distribution media, such as the $\mathrm{T}_{\mathrm{E}} \mathrm{L}$ Live CD-ROM http://www.tug.org/texlive.

Some of these packages are automatically loaded by $\mathrm{REVT}_{\mathrm{E}} \mathrm{X}$ when you select certain class options; these are "required" packages (see Section 5.4). They will either be distributed with REVTEX or will be a required part of your ${ }^{E} T_{E} X$ distribution.

Others are declared to be "compatible" with REVT $_{\mathrm{E}} \mathrm{X}$ (see Section 5.4); we anticipate your need to use these packages, have tested REVTEX's compatibility with them, and are committed to maintaining compatibility.

Still others are declared to be "deprecated," see Section 5.4; their use with $\mathrm{REVT}_{\mathrm{E}} \mathrm{X}$ is discouraged. A package may be included in this category because it establishes markup that is incompatible with the electronic submissions scheme of the

APS, or because its definitions are incompatible with those of REVTE $_{E} X$ (they "break" REVTEX).

The customary way to load a package is through the ecommand;simplyinvokethiscommandjustafteryour\documentclassstatement.Forinstance,ifyouwishtoloadthelongtablepackage,yourdocumentpreamblemightlooklike:\documentclass\{revtex\}\usepackage\{longtable\}RequiredpackagesareautomaticallyloadedbyREVTEXonanas-neededbasisanddonotneedanexplicit\usepackagestatementinyourdocument.undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

## Required Packages

In order to use some of the advanced functions in REVTEX 4, you will have to install certain $\mathrm{ET}_{\mathrm{E}} \mathrm{X} 2 \varepsilon$ packages. Most of these packages are standard in any $\mathrm{LT}_{\mathrm{E}} \mathrm{X} 2 \varepsilon$ distribution, but some are not. If you have problems obtaining any of these packages, please contact REVTEX support for help.
natbib The natbib package, available at ftp: //ctan.tug.org/tex-archive/macros/latex/ contrib/supported/natbib/, provides the general framework for citations and references within REVTEX, regardless of the journal substyle.

You must obtain and install the natbib package in order to run $\mathrm{REVT}_{\mathrm{E}} \mathrm{X}$. Please refer to the package's installation instructions.

Note that natbib is loaded by REVTEX thrm{E}}\)itself,soyoudonotneedtoputa\usepackage\{natbib\}statementinyourdocumentpreamble.graphics/graphicxGraphicsinclusionshouldusethe$\mathrm{LAT}_{\mathrm{E}}\mathrm{X}$graphicxpackagesandthestandardLATEXcommandinyourdocumentpreamble.undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

## Compatible Packages

Of the many packages available for use with $\mathrm{IAT}_{\mathrm{E}} \mathrm{X}$, only a small subset are tested for compatibility with $\mathrm{REVT}_{\mathrm{E}} \mathrm{X}$, and they are documented in this section. If you encounter a bug stemming from the use of one of these packages in conjunction with any of the APS journals, please contact REVTEX support.
AMS packages REVTEX is compatible with and depends upon the AMS packages amsfonts, amssymb, and amsmath.
array, dcolumn The array and dcolumn packages are part of $E^{2} T_{E} X$ 's required suite of packages. $\mathrm{REVT}_{\mathrm{E}} \mathrm{X}$ appears to be compatible with these packages.

## longtable

longtable.sty is used for large tables that will span more than one page and must be loaded using the undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

## hyperref

hyperref.sty is a package by Sebastian Rahtz that is used for putting hypertext links into $\mathrm{EAT}_{\mathrm{E}} \mathrm{X} 2_{\varepsilon}$ documents. REVTEX 4 has hooks to allow e-mail addresses and URL's to become hyperlinks.

## bm (Bold Math)

bm is used for creating bold symbols in math mode. It is loaded by using the ndandisdistributedwithREVTEX4.ftnrightTheftnrightpackagemakesadjustmentsto${}^{\text{LATEX'sfootnoteplacementsuchthatinatwo-columnpage}}$grid,allfootnotesareplacedatthebottomoftheright-handcolumn.undefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefinedundefined

We know of no reason why this package should be incompatible with $\mathrm{REVT}_{\mathrm{E}} \mathrm{X}$, however extensive testing has not been done at this time.

## Deprecated Packages

Because the APS does not have control over the functions of packages, it cannot commit to making REVTEX work with all available packages. Furthermore, some packages may establish markup conventions that do not work well with the electronic submissions scheme of the APS. Therefore, the use of certain packages may be deprecated.
multicol The multicol package, part of $\mathrm{LT}_{\mathrm{E}} \mathrm{X}$ 's required packages, lets you format your document in a multiplecolumn page grid. Although REVTEX provides native support for a two-column page grid, your requirements may for some reason make it necessary to use multicol. If so, please be advised that this package does not allow your single-column floats to be placed: you will have to make them all full-pagewidth floats (e.g., figure* instead of figure).

At present we know of no other packages in this category.

## 6. Troubleshooting and Other Questions

This section is intended to help authors with problems and common questions that arise when using REVTEX.
Question: How do I get lowercase letters in the \section \{<title text>\} command?
In the APS journal substyles, text in the \section $\{$ <title text>\} command is automatically set uppercase. For a lowercase letter use \lowercase $\{x\}$. For example, to use "He" for helium in a \section\{<title text>\} command, type $\mathrm{H} \backslash$ lowercase $\{\mathrm{e}\}$ in $\{<$ title text>\}. This also works in math mode: \$\lowercase\{e\}^2\$ in a $\backslash$ section $\left\{<\right.$ title text>\} command will output $e^{2}$.
Problem: I am getting error messages from my \section \{<title text>\}, \subsection \{<title text>\}, \subsubsection \{<title text>\},
\footnote\{<text>\}, or \caption\{<text>\} commands, and I can't understand why!

You may have a so-called "fragile" command in a section heading or caption. This is solved in $\mathrm{IAT}_{\mathrm{E}} \mathrm{X}$ by immediately preceding the fragile command with $\backslash$ protect. Some common fragile commands include:

```
\footnote \footnotemark \footnotetext
\nocite
\(\) \ [ \] \\
```

as well as any command with an optional argument. Moreover, \verb must never appear in the argument of any command.

If you have one of these commands, or another fragile command (check $H T_{E} X$ User's Guide \& Reference Manual), precede it with \protect and try running the file again. For example, if you have

\section\{The result: <br>Results in an error!

change it to

\section\{The result:\protect <br>This is OK.\}\%

Problem: I have tables that do not fit into the preprint width.
Try putting the \squeezetable command right after the $\backslash$ begin $\{$ table command. This will reduce the size of the type in the body of the table, thus allowing more data to fit.
Problem: $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ (or my device driver) runs out of font space.
Try removing the ams fonts and amssymb class options. $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ implementations vary, and some implementations will be unable to provide the resources needed to run these options.
Problem: $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ runs out of string space (pool_size is too small).

Remove the amssymb class option. It defines hundreds of symbol names. Some $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ implementations will be unable to provide the resources needed to run this option.
Problem: (a) The text immediately following an equation is "outdented". That is, indented into the margin. (b) I get a missing error in the references, but the input is OK. If I let $\mathrm{T}_{\mathrm{E}} \mathrm{X}$ run through, the output is OK , too.

REVTEX is having a bad interaction with an older version of $\mathrm{EAT}_{\mathrm{E}} \mathrm{X}$. Upgrading to a newer $\mathrm{EAT}_{\mathrm{E}} \mathrm{X}$ has cured these problems in the past.
Problem: One (or more) of my equations is being crossreferenced incorrectly.
Make sure that you have run $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ at least twice since the equation numbering was last disturbed by an input change. Also note that incorrect cross-referencing will result if \label \{<key>\} is used in an unnumbered single line equation (i.e., within the $\backslash[$ and $\backslash$ ] commands), or if $\backslash$ label $\{<k e y>\}$ is used on a line of an eqnarray that is not being numbered (i.e., a line that has a $\backslash$ nonumber).
Problem: I get a $\mathrm{AT}_{\mathrm{E}} \mathrm{X}$ message at the end of the run that tells me that the references may have changed, no matter how many times I run $\mathrm{IAT}_{\mathrm{E}} \mathrm{X}$.
Make sure that you have not used the same tag to label two different things. This will produce this effect, but will also produce a warning during the run and is therefore easy to detect. Also make sure that you have not used the same tag for
two different $\backslash$ bibitems. That is, make sure that two different \bibitem \{<key>\} commands do not use the same text for $\{<k e y>\}$. You will probably not get a warning for this, so this a more subtle error.

## 7. The Compuscript Program

The bright promise of REVTEX is, of course, that your electronic document can qualify for the compuscript program of a participating journal. This manual does not attempt to cover any aspects of such programs except to encourage you to ensure that your document's markup is of the highest quality.

You may obtain further information about the compuscript program of the American Physical Society at http:// publish.aps.org/ESUB/, the American Institute of Physics at http://www.aip.org, the Optical Society of America at http://www.osa.org, the Society of Explo\%ration Geologists at http: / /www. seg.org.

## 8. CONTACT InFormation

Should you find any bugs, problems or inconsistencies, contact REVTEX support at mailto: revtex4@aps.org. Please try to include information on what you were doing at the time and if possible, a small sample document that manifests the problem.

## Appendix A: Differences From REVTEX 3.1

If you are already an experienced user of REVTEX version 3.1 under $\mathrm{ET}_{\mathrm{E}} \mathrm{X} 2 \varepsilon$, and have installed REVTEX 4, you can immediately start using the new system. Please take note of the following differences

## 1 Platform Required

REVTEX 4 works solely with IATEX $^{2}$; it is not useable as a LATEX2.09 package. Furthermore, REVTEX 4 requires an up-to-date IATEX installation (1996/06/01 or later); its use under older versions is not supported.

## 2 Markup Differences

Documentation of REVTEX 3.1 (ftp://aps.org/ revtex/manend.tex) mentions a number of commands particular to that document style (that is, extensions to the LATEX article style). Some of these commands have changed, as noted in Table II, and new extensions to the $\mathrm{EAT}_{\mathrm{E}} \mathrm{X} 2 \varepsilon$ article class have been introduced with REVTEX 4. Furthermore, REVTEX 4 uses certain $\mathrm{EATE}_{\mathrm{E}} \mathrm{X}$ commands in a different way than in the article class. These are also noted in Section C.

In any case, simply making the transition from using the article document style under $\mathrm{LAT}_{\mathrm{E}} \mathrm{X} 2.09$ to using the article document class under $\mathrm{ET}_{\mathrm{E}} \mathrm{X} 2 \varepsilon$ mandates changes to your legacy document. You are responsible for such required changes; see Appendix D of the ${ }^{A T} T_{E} X$ User's Guide \& Reference Manual for details.

## Appendix B: Converting a REVTEX 3.1 Document to REVTEX 4

To convert a REVTEX 3 document to one compatible with REVTEX 4, carry out the following actions:

- Change \documentstyle\{revtex\} to \documentclass\{revtex4\}, and run the document under $\mathrm{EAT}_{\mathrm{E}} \mathrm{X} 2 \varepsilon$ instead of $\mathrm{ET}_{\mathrm{E}} \mathrm{X} 2.09$.
- If your document used the preprint option, you must invoke both the preprint and endfloats options.
- Replace the \draft command with the draft class option.
- Replace the \tighten command with the tightenlines class option.
- For each \author command, split the multiple authors into individual \author commands. Remove any instances of $\backslash$ and.
- Use \affiliation instead of \address.
- Move \maketitle downstream of all \pacs commands and downstream of any abstract environment instance.
- Convert quasitable to longtable, and load the longtable package.
- If your document used the \widetext and \narrowtext commands, change these to instances of the widetext environment. Usually, the \begin\{widetext\} statement will replace the } \widetext command, and the \end\{widetext\} } statement replaces the matching \narrowtext command.
Note in this connection that due to a curious feature of ${ }^{\text {ATHEX }_{E} \mathrm{X}}$ itself, REVTEX 4 having a widetext environment means that it also has a definition for the \widetext command, even though the latter cammand is not intended to be used in your document. Therefore, it is particularly important that you remove all \widetext commands from your REVTEX 3 document when converting to REVTEX 4.
- Remove all obsolete commands: \FL, \FR, \narrowtext, and \mediumtext (see Table II).
- Replace \case with \frac. If you need the fraction to be set in text style despite being in a display equation, use the construction \textstyle\frac. Note that \frac does not support the syntax \case1/2.
- Replace \slantfrac with \frac.
- Change \frak to \mathfrak \{<char>\} and \Bbb to $\backslash$ mathbb \{<char> \}, and invoke one of the class options amsfonts or amssymb.
- Replace environment mathletters with environment subequations and load the amsmath package.
- Replace \eqnum with \tag and load the amsmath package.
- Replace $\backslash \mathrm{bbox}$ with $\backslash \mathrm{bm}$ and load the bm package.
- If using the \text command, load the amsmath package.
- If using the d column specifier in tabular environments, load the dcolumn package, and be aware that the content of each cell in the column is implicitly in math mode: remove any \$ math shift characters appearing in a d column.
- Replace \tablenote with \footnote, \tablenotemark with [^0], and \tablenotetext with \footnotetext.
- Replace \begin\{references\} with }
\begin\{thebibliography\} \{\}; }
\end \{references \} }
with
\end\{thebibliography\}. }

## Appendix C: Differences between REVTEX 4 and the standard lated article class

If you are familiar with the standard $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$ article document class, you will find that REVTEX provides a familiar environment in which to prepare your article. However, REVTEX is different from the article class, as noted here.

In some respects, REVTEX simply extends the article class the same way many users do: it incorporates packages from among the $\mathrm{IAT}_{\mathrm{E}} \mathrm{X}$ required suite of packages, such as the AMS-authored packages amsfonts, amssymb, and amsmath. These packages introduce the ability to typeset many math symbols not otherwise available to LATEX. The amsmath package provides the subequations environment and the the $\backslash$ tag command.

Other packages from the the required suite of $\mathrm{EAT}_{\mathrm{E}} \mathrm{X}$ packages include bm, which gives access to bold math through the $\backslash$ bm command; and longtable, which lets you create tables that can break over pages.
In other respects, REVTEX simply extends the article class. It defines new class options, such as the many journal substyles, and defines its own new math symbols, such as \tensor, and it defines new commands, such as

| REVTEX 3.1 command | REVTEX 4 replacement |
| :---: | :---: |
| \documentstyle[<options>] \{revtex\} | \documentclass [<options>] \{revtex4\} |
| option aps | is now the default |
| options aps, osa, seg | the society is now implied by the selection of the journal |
| option manuscript | preprint |
| \tighten preamble command | tightenlines class option |
| $\backslash$ draft preamble command | draft class option |
| \title | \title can take an optional argument signifying an alternative title |
| \author | \author \{<name> \} may appear multiple times; each signifies a new author name. \lastname \{ <surname>\} lets you mark up the author's surname |
|  | $\backslash$ firstname \{<firstname>\} lets you mark up the author's first name |
|  | $\backslash$ homepage \{ $\langle U R L\rangle$ \} gives a URL for the above author |
|  | \email \{<email>\} gives an email address for the above author |
| \and | obsolete, remove this command |
| $\backslash$ \address | \affiliation \{<institution>\} gives the affiliation for the group of authors above |
|  | \affiliation [<note>] lets you specify a footnote to this institution |
|  | \noaffiliation signifies that the above authors have no affiliation |
| $\backslash a l t a d d r e s s$ | \altaffiliation; applies to a single \author |
| \preprint | $\backslash$ preprint \{<number>\} can appear multiple times, and must precede \maketitle |
| $\backslash \mathrm{pacs}$ | $\backslash$ pacs must precede $\backslash$ maketitle |
| abstract environment | abstract environment must precede \maketitle |
| $\backslash$ maketitle | $\backslash$ maketitle must follow all frontmatter data commands |
| \narrowtext | obsolete, remove this command |
| $\backslash$ mediumtext | obsolete, remove this command |
| $\backslash$ widetext | obsolete, replace with widetext environment |
| $\backslash \mathrm{FL}$ | obsolete, remove this command |
| $\backslash \mathrm{FR}$ | obsolete, remove this command |
| \eqnum | replace with \tag, load amsmath |
| mathletters | replace with subequations, load amsmath |
| quasitable environment | replace with longtable, load longtable |
| references environment | replace with thebibliography \{\} |
| \case | replace with \textstyle\frac |
| \slantfrac | replace with $\backslash$ frac |
| \tablenote | replace with \footnote |
| \tablenotemark | replace with \footnotemark |
| \tablenotetext | replace with $\backslash$ footnotetext |

TABLE II: Differences between REVTEX 3.1 and REVTEX 4 markup
\bibinfo, that let you mark up your document in a way that enhances its value as an electronic document.

However, using REVTEX will also force you to relearn certain commands and environments, such as the new markup rules for your frontmatter and bibliography. In these incompatible extensions to the standard article class, REVTEX either gives you a somewhat more convenient way of marking up your paper, or gives you the ability to do something that is not provided for in the standard article class.

- The document class declaration is different: the document class is revtex 4 .

There is a class option for each APS journal (they are collectively called "journal substyles"): pra, prb, prc, prd, pre, prl, prstab, and rmp for Physical Review $A, B$, C, D, E, Letters, Special Topics-Accelerators and Beams, and Reviews of Modern Physics, respectively. The chosen journal substyle may in turn make default selections of a number of class options; an explicit document class option always overrides this.

New class options are eqsecnum (number equations by section), preprint (double-spaced output for submission purposes), tightenlines (single-spaced output with the preprint option), and amsfonts and amssymb (extra font capabilities, see Sec. 4.13)

The prb option gives superscript reference citations, as is the style for Physical Review B. The prl option yields a slightly different line spacing, giving more accurate PRL length estimates. Apart than this, there are no substantial differences between the substyles for Physical Review $A_{-}$ E.

The floats class option enables $\mathrm{ET}_{\mathrm{E}} \mathrm{X}$-style floating figures and tables. The endfloats option causes floating elements to be formatted at the end of the document.

The twocolumn class option causes the document to be formatted in a two-column layout; onecolumn in a onecolumn layout.

- The frontmatter is different in REVTEX; a simple one might look like (cf. template.aps)

```
\documentclass[draft,pra,aps]{revtex4}
\begin{document}
\title{Title here}
\author{Author(s) here}
    \affiliation{Address(es) here}
\author{Another author(s) here}
    \affiliation{Another address(es) here}
\date{\today}
\begin{abstract}
Abstract here.
lend{abstract}
\pacs{PACS numbers here}
\maketitle
```

Note the \affiliation\{<text>\}, and \pacs\{<pacs number>\} commands are new, and
the \maketitle command follows the abstract. Also, each author appears in a separate \author command; the \and command is not used. See Sec. 4.2 for details.

- Figures and tables are input the same as in LATEX, however, with the endfloats option they are automatically moved to the end of the document; see Sections 5.1 and 5.3 for more details.
- The \text $\{<$ text > \} command formats <text> in text mode within math. In particular, you get hyphens instead of minus signs. Used in a superscript, you get the correct size. See Sec. 4.6.
- Using a \label\{<key>\} within the \begin\{subequations\} environment allows you } to reference the general number of the equations in the subequations environment. For example:

```
\begin{subequations}
    \label{alleqs} % observe location
    \begin{eqnarray}
        E & = &mc^{2},\label{eqa}\\
        c^{2}& = &a`{2} + b^{2},\label{eqb}\\
        E & = &m(a^{2} + b^{2}),\label{eqc}
    \end{eqnarray}
\end{subequations}
```

gives the output

$$
\begin{align*}
E & =m c^{2}  \tag{Cla}\\
c^{2} & =a^{2}+b^{2}  \tag{C1b}\\
E & =m\left(a^{2}+b^{2}\right) \tag{C1c}
\end{align*}
$$

```
and Eq.\ (\ref{alleqs}) gives "Eq. (C1)".
```

- Using d in a tabular specification creates a column centered on the decimal points of the entries. See Sec. 4.11 for details; see apssamp.tex for examples.
- These additional diacritics are available: \tensor (double-headed overarrow), \overdots (triple overdots), \overstar (star), \overcirc (circle), \loarrow (left-going overarrow), and \roarrow (right-going overarrow). They scale correctly in superscripts. See Appendix F for examples.
- Style files for use with BibTEX are bundled with the various journal substyles. The journal substyle automatically issues the needed \bibliographystyle command.
- If you wish to specify your own bibliography style, you do so with the \bibliographystyle command, but unlike standard $\mathrm{EAT}_{\mathrm{E}} \mathrm{X}$, you must give this command before the \begin \{document \} statement. }
- For hand-prepared bibliographies, reftest.tex checks that your document has (1) no uncited bibitems, (2) no undefined citations, and (3) its \bibitems in the same order as its citations. See Sec. 4.9.

The American Physical Society intends for REVTEX to be as compatible as possible with $\mathrm{EATEX}_{\mathrm{E}}$ and with packages that can be used with LATEX. Please let us know of any LATEX commands incompatible with REVTEX, or of any packages useable with the $\mathrm{LT}_{\mathrm{E}} \mathrm{X}$ article class that are incompatible with REVTEX.

## Appendix D: Specifying Authors and Affiliations

This section provides more detail on how to specify authors and affiliations for your document, and shows how to obtain various title block formatting effects with the class options.

The following examples exhibit a representative cross section of frontmatter blocks. They are taken from actual journal papers; the journal involved is indicated.
[to come]

## Appendix E: Adding New Journal Styles

Earlier versions of REVTEX provided formatting for a large group of societies and journals. REVTEX 4 establishes a new, open architecture for adding journal substyles.

To add a new journal substyle to REVTEX: Create a file with a .rtx extension and put into it whatever macro definitions or parameter assignments are required. To use the journal substyle, your document should invoke a corresponding document class option, causing your .rtx file to be read in.

For instance, in the case of a fictitious publication called the "Journal of Irreproducible Results", you could create a file called jir.rtx and invoke that substyle via a $\backslash$ documentclass statement like
\documentclass[jir]\{revtex4\}
To create a useful substyle .rtx file, you might want to use as a model the American Physical Society substyle aps .rtx. Notes:

- Journal substyles should ideally not create new markup syntax. All document-level environments and commands should be defined in REVTEX itself.
If your journal requires markup (compuscript structure) that goes beyond that supplied by $\operatorname{REVT}_{\mathrm{E}} \mathrm{X}$, please contact the maintainers of REVTEX.
- The file aps.rtx has specific code at the beginning that insists on being run under REVTEX; your substyle should do likewise.
- Your journal substyle, like aps.rtx, is read in after all of the code of the revtex.cls; it can depend on all of the definitions in that file to be in effect, and can redefine them as needed.

TABLE III: Text accents with letter a.

```
\`{a}á\'{a} â \^{a} ä\"{a}
\~{a} \overline{a}\={a} à \.{a} \breve{a}\u{a}
\v{a} a̋ \H{a} aa`\t{aa} a̧ \c{a}
\d{a} a \b{a}
```

TABLE IV: Math accents with letter a.

| $\hat{a} \backslash \operatorname{hat}\{a\}$ | $\check{a} \backslash \operatorname{check}\{a\} \dot{a} \backslash \operatorname{dot}\{a\}$ | $\ddot{a} \backslash \operatorname{ddot}\{a\}$ |  |
| :--- | :--- | :--- | :--- |
| $\breve{a} \backslash \operatorname{breve}\{a\}$ | $\tilde{a} \backslash \operatorname{tilde}\{a\} \dot{a} \backslash \operatorname{lgrave}\{a\}$ | $\dot{a} \backslash \operatorname{acute}\{a\}$ |  |
| $\bar{a} \backslash \operatorname{bar}\{a\}$ | $\vec{a} \backslash \operatorname{vec}\{a\}$ |  |  |

- Your journal substyle, like aps.rtx, can invoke certain formatting options, but may do so only if the document's options do not specify a preference: the document's options must override any choices made by the journal substyle.
- In some cases, journal-specifc code is sufficiently extensive that it is useful to break it out into a separate file, as in the case of rmp.rtx. This file has code that insists that it run under aps.rtx; your journal-specific substyle should do likewise.
- Hint: If your journal style has no head above the abstract, you can simply define the procedure \frontmatter@abstractheading to do nothing:
\def $\backslash$ frontmatter@abstractheading\{\}\%
- If the journal involved has a compuscript program whose requirements bear on documents prepared according to your journal substyle, the documentation for your substyle should include those requirements (or a pointer to them).

## Appendix F: Character Set Listing

This appendix provides tables showing all of the special characters and mathematical symbols that are available within REVTEX. Some of these symbols require the AMS fonts to be available.

If you are preparing a paper for submission to a journal, you should check that journal's preferences in using special symbols. Typically, a journal will prefer that you use a symbol command taken from the following lists and will deprecate your inventing new command names.

## 1 LaTEXNotations

Standard ETEXSymbols $^{\text {E }}$

Tables III through XIV show the standard symbols for LATEX users.

Negated relations can sometimes be constructed with \not. For example,

```
If $x \not< y$ then $x \not\leq z$.
```

TABLE V: Special symbols; any mode.
$\dagger$ \dagger § \S © \copyright
$\ddagger$ \ddagger $\mathbb{1} \backslash \mathrm{P} £ \backslash$ pounds

TABLE VI: Other special (foreign) symbols; text mode.

```

TABLE XIV：Miscellaneous symbols；used in math mode．

| $\sum \sum \backslash$ sum | $\Pi \prod$ \prod | ШU <br> \coprod |
| :---: | :---: | :---: |
| $\iint$ \int | $\oint \oint$ loint | $\biguplus$ \biguplus |
| $\cap$ \bigcap | $\cup \bigcup$ \bigcup | $\sqcup \bigsqcup \backslash$ igssqcup |
| $\odot \bigcirc$ \bigodot | $\otimes$ \bigotimes | $\oplus \bigoplus \backslash$ bigoplus |
| V \ \bigvee | $\wedge \bigwedge$ \bigwedge |  |

Use the \mathcal command for script（calligraphic）let－ ters（note the $\mathcal{L}$ ）：
$\backslash$ mathcal $\left.\{\mathrm{L}\} \_\{\text {mathrm\｛int }\}\right\}=\operatorname{ef} \mathrm{F}^{\wedge}\{3\} \_\{\backslash \mathrm{pi}\}$
$B^{\wedge}\{0\}(r, t) \backslash e p s i l o n ~ \backslash s i n(\backslash O m e g a t)$
$\backslash \exp (\backslash e t a t)$,
gives

$$
\mathcal{L}_{\text {int }}=e F_{\pi}^{3} r^{2} B^{0}(r, t) \varepsilon \sin (\Omega t) \exp (\eta t),
$$

Only uppercase letters are available in the \mathcal font．
You can switch to sans serif letters by using the \mathsf command（note the M ）：

```
R(\mathcal{Q} -\mathcal{Q}_{0})
=
R_{0} \exp\left(-\frac{1}{2}\Delta \mathcal{Q
\cdot \Delta \mathcal{Q}\right).
gives
```

$$
R\left(Q-Q_{0}\right)=R_{0} \exp \left(-\frac{1}{2} \Delta Q \cdot \mathrm{M} \cdot \Delta Q\right)
$$

Both uppercase and lowercase letters are available with $\backslash m a t h s f$ ．

## Other notations

The \overline command puts a horizontal line above its argument in math mode：

$$
\text { \$\overline\{x\}+\overline\{y\}\$ }
$$

gives

$$
\bar{x}+\bar{y}
$$

There is an analogous \underline command that works in text or math mode：

The equation \underline\｛is\} \$\underline\{x+y\}. gives

$$
\text { The equation } \underline{\text { is }} \underline{x+y} \text {. }
$$

Horizontal braces are put above or below an expression with the \overbrace and \underbrace commands：

```
\[
\underbrace{a_{1} + \overbrace{a_{2}+a_{3}} +
\]
gives
```

$$
\underbrace{a_{1}+\overbrace{a_{2}+a_{3}}+a_{4}}
$$

and in displayed math，a subscript or a superscript puts a label on the brace：
\［
\underbrace\｛
a＿\｛1\} + \overbrace\{a_\{2\}+\cdots+a_\{n-1\}\}^\{n-2
＋a＿\｛n\}
\}_\{n\}
$r \hat{Y}\{2\}$
gives

$$
\underbrace{a_{1}+\overbrace{a_{2}+\cdots+a_{n-1}}^{n-2}+a_{n}}_{n}
$$

Wide versions of the \hat and \tilde commands are available．They are called \widehat and \widetilde， respectively．Here is an example：
\［
\widehat $\{a\}+\backslash$ widehat $\{a b\}+$ \widehat $\{a b c\}+\backslash v$
$\{Q\}$ \cdot \mathsf\｛M\}
gives

$$
\widehat{a}+\widehat{a b}+\widehat{a b c}+\widehat{a b c d}
$$

## 2 AMS FONTS NOTATIONS

The AMS fonts are fonts that were developed by the Amer－ ican Mathematical Society and are now made available free of charge by the AMS．The METAFONT source files for these fonts are freely available，as are precompiled ．pk files and ATM－compatible Type 1 PostScript fonts．There are two class options that can be used to invoke the AMS fonts：ams fonts and amssymb．Not distributed with $\operatorname{REVT}_{\mathrm{E}} \mathrm{X}$ are the files amsfonts．sty and amssymb．sty of the $\mathcal{A} \mathcal{M} \mathcal{S}$－ ET EX distribution．

## Using the ams fonts option

The amsfonts class option will give you access to the $\backslash$ mathfrak and \mathbb fonts and will also use the extra

TABLE XV: Extra lowercase Greek letters available with amssymb option selected.
$\digamma$ \digamma $\varkappa$ \varkappa

TABLE XVI: Extra Hebrew letters available with amssymb selected.

> \beth I \gimel
> \daleth

Computer Modern fonts from the AMS in order to provide better access to bold math characters at smaller sizes and in super- and subscripts.
AMS fonts typefaces. With the AMS fonts installed and in use through either the amsfonts or amssymb class option, the \mathfrak and \mathbb commands are available. The command \mathfrak switches to the AMS Fraktur font, while $\backslash$ math.bb switches to the so-called "Blackboard Bold" font. Only uppercase letters are available in Blackboard Bold, and there is no bold version of the font. Fraktur has both uppercase and lowercase letters and will become bold in a $\backslash$ bbox.

Here are the letters "ABCDE" from \mathfrak: $\mathfrak{A B C D E}$. And here are the letters "RIZN" from \mathbb: $\mathbb{R I Z} \mathbb{N}$.

Here is some math with superscripts and $\backslash$ mathfrak. It demonstrates the output of $\backslash \mathrm{bm}\{$ < symbol>\}.

Normal: $\mathfrak{E}=m c^{2 \pi}, \quad \backslash \mathrm{bm}: \mathfrak{E}=m c^{2 \pi}$

## Using the amssymb option

The ams symb class option gives all the font capabilities of the amsfonts option. It also defines names for many extra symbols that are present in the AMS fonts. The names are the same as those the AMS uses. These symbols and their names are shown below, given that you have the AMS fonts installed and the ams symb option selected.
Please be aware that no bold versions are available for any of the characters in this subsection.

## 3 REVTEX NOTATIONS

An openface numeral " 1 " is available; it does not change size in superscripts. Here is an example: $\$ \backslash$ openone $\$$ gives 11.

Bold large bracketing is also available. The normal commands \Biggl,\Bigl,..., when used with an extra "b" on the end of the command, come out bold:

```
\ [
\Biggl(\biggl(\Bigl(\bigl(
(x)
\bigr)\Bigr)\biggr)\Biggr)
\]
```

\]

gives

$$
(((((x)))))
$$

The commands \lesssim, \gtrsim give the output $\lesssim, \gtrsim$, even without the amssymb class option. (The commands \alt, \agt, respectively, may also be used.) These commands will be fragile if you are not using the amssymb option.
Some extra diacritics have been provided. They scale correctly in superscripts. Some examples follow. \$ $\backslash$ tensor $\{x\} \$$ gives $\overleftrightarrow{x}$. \$\overstar $\{\mathrm{x}\} \$$ gives $\stackrel{*}{x}$. $\$ \backslash o v e r d o t s\{x\} \$$ gives $\dddot{x}$. \$ $\backslash$ overcirc $\{x\} \$$ gives $\stackrel{\circ}{x}$. $\$ \backslash$ loarrow $\{x\} \$$ gives $\overleftarrow{x}$. \$ $\backslash$ roarrow $\{x\} \$$ gives $\vec{x}$. These commands all work correctly in superscripts.
\corresponds produces the symbol $\triangleq$ math mode, $\backslash$ precsim produces $\precsim$ in math mode, and $\backslash$ succsim produces $\succsim$ in math mode. The AMS fonts will be used for these symbols if you have them, but are not necessary.
$\backslash$ lambdabar produces "lambda-bar" in math mode: $\lambda$.

## Appendix G: Markup List

In the following pages are brief descriptions of some necessary commands. Those commands that are unique to REVTEX are noted with (R). Please consult the ${ }^{\Delta T} T_{E} X$ User's Guide \& Reference Manual if you have further questions regarding LATEX commands.

If commands have arguments, they are so noted with [<text>], or $\{<$ key> \}, as the case may be. The commands are in order of their likely occurrence in a document.

## \documentclass[<options>] \{revtex4\}

[<options〉] is a comma-separated list of option names; see Sections 4.1 and 5.1 for complete option lists and explanations.
You usually select a journal substyle option, e.g., aps.
Use the preprint option to force formatted output to the "preprint" style, suitable for copyediting. Otherwise, the chosen journal substyle selects a default.
If output is in the preprint style, you can select the tightenlines class option to force single line spacing.
To number equations by section, use the eqsecnum option.

Use the showpacs option to produce the PACS numbers.
\begin\{document\} Begins the body of the REVTEX } document.
\preprint $\{<$ text > \} When appearing within the front matter of a document, places <text> at the top right corner of the first page in preprint style. Used for site-specific preprint numbers. (R)

\title [<short title>] \{<title text>\} <title text> is the title of the paper; <short title> optionally specifies a title suitable for the page running head. The title should be broken with the $\backslash$ protect $\backslash \backslash$ command.

\author $\{$ 〈name> \} <name> represents an author name.
\affiliation\{<text>\} <text> represents an author's address (institution). The address should be broken with $\ \backslash$ if necessary. (R)

\date $\{$ <date> \} lets you specify a date to be formatted in the title block.
\begin \{abstract \} }
...
Signals the beginning and end of the
\end\{abstract \} } abstract, respectively.
\pacs \{<pacs number> \} <pacs number> represents valid PACS numbers. Invoke the showpacs option to have < pacs number> printed. (R)
$\backslash$ maketitle Prints the material contained in the \title\{<title text>\}, \author\{<name>\}, \affiliation\{<text>\} and \date\{<date>\} commands.
\begin\{widetext \} }
...
Sets all enclosed text on the full page
\end\{widetext \} } width; only effective in a two-column layout. (R)

\section \{<title text>\} <title text> represents a primary heading. Fragile commands should be preceded by \protect.

\subsection \{<title text>\} <title text> represents a secondary heading. Fragile commands should be preceded by \protect.
