Consider two arbitrarily chosen horizontal lines. A trapezoid $\mathrm{T}_{\mathrm{i}}$ between these lines has two vertices situated on the upper line and the other two vertices on the lower line (see figure below). We will denote by $\mathrm{a}_{\mathrm{i}}, \mathrm{b}_{\mathrm{i}}, \mathrm{c}_{\mathrm{i}}$ and $\mathrm{d}_{\mathrm{i}}$ the upper left, upper right, lower left and respectively lower right vertices of the trapezoid $\mathrm{T}_{\mathrm{i}}$. A subset S of trapezoids is called independent if no two trapezoids from S intersect.

## Task

Determine the cardinality of the largest independent set of trapezoids (the largest set means the set with most elements). Also find the count of different independent sets with maximum cardinality. Find this count modulo 30013.

## Description of input

The first line of input contains one integer N - the number of trapezoids. Each of the next N lines contains four integers $\mathrm{a}_{\mathrm{i}}, \mathrm{b}_{\mathrm{i}}, \mathrm{c}_{\mathrm{i}}$ and $\mathrm{d}_{\mathrm{i}}$. No two trapezoids have a common vertex (corner).

## Description of output

The only line of output should contain two numbers separated by space: firstly, the cardinality of the largest independent set; secondly, the count of different independent sets with maximum cardinality modulo 30013.

## Constraints

- $1 \leq N \leq 100000$
- $1 \leq a_{i}, b_{i}, c_{i}, d_{i} \leq 1000000000$
- If only the first number in the output is correct you will get $40 \%$ of the test score.
- $\mathbf{4 0 \%}$ of the tests will have $\mathbf{N} \leq 5000$

## Example
