AT A GLANCE/ PHARMACY CALCULATIONS RATIO STRENGTHS

## Calculating the amount of substance in a concentration expressed as a ratio strength

## Example 1

How much sodium chloride is contained in 200 mL of a 1 part in $500 \mathrm{w} / \mathrm{v}$ concentration?

## Method

Step 1: A part strength is a fraction.

$$
\text { Thus, } 1 \text { part in } 500=\frac{1}{500}
$$

Step 2: By multiplication

$$
\frac{1}{500} \times 200 m L=\mathbf{0 . 4 g} \cdot \sqrt{ } \sqrt{ }
$$

*Remember, this is a w/v concentration.

## Example 2

How much glucose is contained in 0.3L of a 1 part in $20 \mathrm{v} / \mathrm{v}$ concentration?

Method
Step 1: By multiplication

$$
\frac{1}{20} \times 300 m L=15 m L
$$

*Remember, this is a $\mathrm{v} / \mathrm{v}$ concentration.

## Example 3

How much chloroform will be needed to make up 150 mL of a 1 part in $400 \mathrm{v} / \mathrm{v}$ concentration?

## Method

Step 1: By multiplication

$$
\frac{1}{400} \times 150 m L=0.375 m L
$$

## Example 4

How much sulphate is contained in 2.5 L of a 5 ppm concentration?

## Method

Step 1: By multiplication

$$
\frac{5}{1,000,000} \times 2500 \mathrm{~mL}=\mathbf{1 2 . 5 m g}
$$
