Contents

Preface
Notations

Chapter 1: Introduction
1.1 Introduction to material modeling
1.2 Complexity of material response in engineering
1.3 Classification of modeling of material response
1.3.1 Empirical models
1.3.2 Micromechanical models
1.3.3 Phenomenological models
1.4 Limitations of the continuum hypothesis
1.5 Focus of this book

Chapter 2: Preliminary Concepts
2.1 Introduction
2.2 Coordinate frame and system
2.3 Tensors
2.3.1 Tensors of different orders
2.3.2 Notations for tensors
2.4 Derivative operators
Summary
Exercise problems

Chapter 3: Continuum Mechanics Concepts
3.1 Introduction
3.2 Kinematics
3.2.1 Transformations
3.2.1.1 Transformation of line elements
3.2.1.2 Transformation of volume elements
3.2.1.3 Transformation of area elements
3.2.2 Important types of motions
3.2.2.1 Isochoric deformations
3.2.2.2 Rigid body motion
3.2.2.3 Homogeneous deformations
3.2.3 Decomposition of deformation gradient
3.2.3.1 Polar decomposition theorem
3.2.3.2 Stretches
3.2.4 Strain measures
3.2.4.1 Displacements
3.2.4.2 Infinitismal strains
3.2.5 Motions
3.2.5.1 Velocity gradient
3.2.6 Relative deformation gradient
3.2.7 Time derivatives viewed from different coordinates

3.2.7.1 Co-rotational derivatives
3.2.7.2 Convected derivatives
3.3 Balance laws
3.3.1 Transport theorem
3.3.2 Balance of mass
3.3.3 Balance of linear momentum
3.3.4 Balance of angular momentum
3.3.5 Work energy identity
3.3.6 Thermodynamic principles
3.3.6.1 First law of thermodynamics
3.3.6.2 Second law of thermodynamics
3.3.6.3 Alternate energy measures in thermodynamics
3.3.7 Referential description of balance laws
3.3.7.1 Relations between variables in deformed and undeformed configurations
3.3.7.2 Statement of the balance laws in reference configuration
3.3.8 Indeterminate nature of the balance laws
3.3.9 A note on multiphase and multi-component materials
3.3.9.1 Chemical potential
3.4 Constitutive relations
3.4.1 Transformations
3.4.1.1 Euclidean transformations
3.4.1.2 Galilean transformations
3.4.2 Objectivity of mathematical quantities
3.4.3 Invariance of motions and balance equations
3.4.4 Invariance of constitutive relations
3.4.4.1 Frame invariance in a thermoelastic material
3.4.4.2 Constitutive relations for thermoelastic materials
3.4.4.3 Frame invariance and constitutive relations for a thermoviscous fluid
3.4.5 Frame invariance of derivatives
Summary
Exercise problems

Chapter 4: Linear Mechanical Models of Material Deformation
4.1 Introduction
4.2 Linear elastic solid models
4.2.1 Small strain assumption of linear elasticity
4.2.2 Classes of elastic constants
4.2.2.1 General anisotropic linear elastic solid
4.2.2.2 Materials with single plane of elastic symmetry
4.2.2.3 Materials with two planes of elastic symmetry
4.2.2.4 Materials with symmetry about an axis of rotation
4.2.2.5 Isotropic materials
4.3 Linear viscous fluid models
4.3.1 General anisotropic viscous fluid

4.3.2 Isotropic viscous fluid
4.4 Viscoelastic models
4.4.1 Useful definitions for description of viscoelastic behaviour
4.4.1.1 Creep compliance and relaxation modulus
4.4.1.2 Phase lag, storage modulus and loss modulus
4.4.2 Simplistic models of viscoelasticity
4.4.2.1 Maxwell model
4.4.2.2 Kelvin-Voigt model
4.4.2.3 Mechanical analogs for viscoelastic models
4.4.3 Time temperature superposition
Summary
Exercise problems

Chapter 5: Nonlinear Models for Fluids
5.1 Introduction
5.2 Nonlinear response of fluids
5.2.1 Useful definitions for non-Newtonian fluids
5.2.1.1 Steady shear
5.2.1.2 Normal stresses
5.2.1.3 Material functions in extensional flow
5.2.2 Classification of different models
5.3 Nonlinear viscous fluid models
5.3.1 Power law model
5.3.2 Cross model
5.4 Nonlinear viscoelastic models
5.4.1 Differential-type viscoelastic models
5.4.2 Integral -type viscoelastic models
5.5 Case study: rheological behaviour of asphalt
5.5.1 Material Description
5.5.2 Experimental methods
5.5.3 Constitutive models for asphalt
5.5.3.1 Nonlinear viscous models
5.5.3.2 Linear viscoelastic models
5.5.3.3 Nonlinear viscoelastic models
Summary
Exercise problems

Chapter 6: Nonlinear Models for Solids
6.1 Introduction
6.2 Nonlinear elastic material response
6.2.1 Hyper-elastic material models
6.2.2 Nonlinear hyper-elastic models for finite deformation
6.2.2.1 Network models of rubber elasticity
6.2.2.2 Mooney-Rivlin model for rubber elasticity
6.2.2.3 Ogden’s model for rubber elasticity
6.2.2.4 Nonlinear hyper-elastic models in infinitismal deformation

6.2.3 Cauchy elastic models
6.2.3.1 First order Cauchy elastic models
6.2.3.2 Second order Cauchy elastic models
6.2.4 Use of nonlinear elastic models
6.3 Non-linear inelastic models
6.3.1 Hypo-elastic material models
6.4 Plasticity models
6.4.1 Typical response of a plastically deforming material
6.4.2 Models for monotonic plastic deformation
6.4.3 Models for incremental plastic deformation
6.4.4 Material response under cyclic loading
6.4.5 Generalized description of plasticity models
6.5 Case study of cyclic deformation of soft clayey soils
6.5.1 Material description
6.5.2 Experimental characterization
6.5.3 Constitutive model development for monotonic and cyclic behavior
6.5.4 Comparison of model predictions with experimental results
Summary
Exercise problems

Chapter 7: **Coupled Field Response of Special Materials**
7.1 Introduction
7.1.1 Field variables associated with coupled field interactions
7.2 Electromechanical fields
7.2.1 Basic definitions of variables associated with electric fields
7.2.2 Balance laws in electricity - Maxwell's equations
7.2.3 Modifications to mechanical balance laws in the presence of electric fields
7.2.4 General constitutive relations associated with electromechanical fields
7.2.5 Linear constitutive relations associated with electromechanical fields
7.2.6 Biased piezoelectric (Tiersten's) model
7.3 Thermo-mechanical fields
7.3.1 Response of shape memory materials
7.3.1.1 Response of shape memory alloys
7.3.1.2 Response of shape memory polymers
7.3.2 Microstructural changes in shape memory materials
7.3.2.1 Microstructural changes associated with shape memory alloys
7.3.2.2 Microstructural changes associated with shape memory polymer**s**
7.3.3 Constitutive modeling of shape memory materials
7.3.3.1 Constitutive models for shape memory alloys
7.3.3.2 Constitutive models for shape memory polymers
Summary
Exercise problems

Chapter 8: Concluding Remarks

- 8.1 Introduction
- 8.2 Features of models summarized in this book
- 8.3 Current approaches for constitutive modeling
- 8.4 Numerical simulation of system response using continuum models
- 8.5 Observations on system response
- 8.6 Challenges for the future
