#### Abstract

In this paper we prove that a star of $K_{n}$ and a cycle of $n$ copies of $K_{n}$ are cordial. We also get condition for maximum value of $e_{f}(1)-e_{f}(0)$ and highest negative value of $e_{f}(1)-e_{f}(0)$ in $K_{n}$, where $f$ is the binary vertex labeling function on the vertex set of $K_{n}$.

Keywords: complete graph, binary vertex labeling, star of a graph and cycle of a graph
AMS subject classification number: 05C78

## 1. Introduction

Let $G=(V, E)$ be a simple, undirected finite graph with $|V|=p$ vertices and $|E|=q$ edges. For all basic terminology and standard notations we follow Harary (1972). Here are some of the definitions which are useful in this paper.
Definition 1.1 If the vertices of the graph are assigned values subject to certain conditions then it is known as graph labeling.
Definition 1.2 A function $f: V \rightarrow\{0,1\}$ is called binary vertex labeling of a graph $G$ and $f(v)$ is called label of the vertex $v$ of $G$ under $f$.
For an edge $e=(u, v)$, the induced function $f^{*}: E \rightarrow\{0,1\}$ defined as $f^{*}(e)=|f(u)-f(v)|$. Let $v_{f}(0), v_{f}(1)$ be number of vertices of $G$ having labels 0 and 1 respectively under $f$ and let $e_{f}(0), e_{f}(1)$ be number of edges of $G$ having labels 0 and 1 respectively under $f^{*}$.
A binary vertex labeling $f$ of a graph $G$ is called cordial labeling if $\left|v_{f}(0)-v_{f}(1)\right| \leq 1$ and $\left|e_{f}(0)-e_{f}(1)\right| \leq 1$. A graph which admits cordial labeling is called cordial graph.
Definition 1.3 A graph obtained by replacing each vertex of star $K_{1, n}$ by a connected graph $G$ of $n$ vertices is called star of $G$ and we shall denote it by $G^{\star}$. The graph $G$ which replaced at the center of $K_{1, n}$ we call it as central copy of $G^{\star}$.
Above definition was introduced by Vaidya et al. (2008, p. 54-64).
Definition 1.4 For a cycle $C_{n}$, each vertex of $C_{n}$ is replace by connected graphs $G_{1}, G_{2}, \ldots, G_{n}$ is known as cycle of graphs and we shall denote it by $C\left(G_{1}, G_{2}, \ldots, G_{n}\right)$. If we replace each vertices by a graph $G$ i.e. $G_{1}=G, G_{2}=G$, $\ldots G_{n}=G$, such cycle of a graph $G$, we shall denote it by $C(n \cdot G)$.
Gallian (2013) survey provide vast amount of literature on different type of graph labeling. Labeled graph has many diversified applications. The cordial labeling introduced by Cahit (1987, p. 201-207) is a weaker version of graceful labeling,also he proved that $K_{n}$ is cordial if and only if $n \leq 3$. After this, many researchers have studied cordial graphs.
Kaneria and Vaidya (2010, p. 38-46) discussed cordiality of graphs in different context. They introduced the index
of cordiality for a graph $G$ and proved that the index of cordiality for $K_{t^{2}}(t \in N)$ is precisely 2 . They also raised the following conjecture.
Conjecture 1.5 For any $n \in N, K_{n}^{\star}$ is cordial.
Kaneria et al. (2014, p. 173-178, IJMR) introduced cycle of graphs and proved that cycle of cycles and cycle of complete bipartite graphs are cordial.
In this paper we prove that $K_{n}^{\star}$ (the star of the complete graph), $C\left(n \cdot K_{n}\right)$ (cycle of $n$ copies of the complete graph) are cordial.
1.6 Discussion on cordiality of $K_{n}$ : Let $f$ be a binary vertex labeling on $K_{n}$. We know that if $f^{-1}(0)=v_{f}(0)=l$ then $f^{-1}(1)=v_{f}(1)=n-l$ and in this case $e_{f}(0)={ }^{l} C_{2}+{ }^{n-l} C_{2}, e_{f}(1)=l(n-l)$ holds for $K_{n}$. If we take $v_{f}(1)=l$ then $v_{f}(0)=n-l$, while $e_{f}(0)={ }^{l} C_{2}+{ }^{n-l} C_{2}, e_{f}(1)=l(n-l)$ would remains same for $K_{n}$. Moreover we observe that $K_{n}, e_{f}(0)$ and $e_{f}(1)$ depends on the value of $v_{f}(0)$ and $v_{f}(1)$. Particularly these values are $e_{f}(1)=v_{f}(0) \cdot v_{f}(1)$ and $e_{f}(0)=\frac{n}{2}(n-1)-e_{f}(1)$. Using this fact Kaneria and Vaidya (2010, p. 38-46) proved that $K_{n} \cup K_{n}$ is a cordial graph, when $n=t^{2}$, for some $t \in N-\{1\}$. They also proved star of $K_{n}$ is cordial, when $n=t^{2}+2$ or $t^{2}$ or $t^{2}-2$, for some $t \in N-\{1\}$.

## 2. Main Results

Theorem 2.1 Let $n$ be an even positive integer and $f$ be a binary vertex labeling on the vertex set of $K_{n}$. If $v_{f}(0)=v_{f}(1)$ in $K_{n}$ then $e_{f}(1)-e_{f}(0)$ has maximum value $\frac{n}{2}$.
Proof. Let $n=2 m$, for some $m \in N$.
Take $v_{f}(0)=v_{f}(1)=m$. In this case $e_{f}(1)=v_{f}(0) v_{f}(1)=m^{2}$ and

$$
\begin{aligned}
e_{f}(0)=\left|E\left(K_{n}\right)\right| & -e_{f}(1)=\frac{n}{2}(n-1)-m^{2}=m(2 m-1)-m^{2}=m^{2}-m \\
& \Rightarrow e_{f}(1)-e_{f}(0)=m^{2}-\left(m^{2}-m\right)=m
\end{aligned}
$$

If we take $v_{f}(0)=m+k, v_{f}(1)=m-k$ or $v_{f}(0)=m-k, v_{f}(1)=m+k$, for some $k(1 \leq k \leq m)$ then $e_{f}(1)=$ $m^{2}-k^{2}<m^{2}$ and

$$
\begin{aligned}
& e_{f}(0)=2 m^{2}-m-\left(m^{2}-k^{2}\right)=m^{2}-m+k^{2} \\
& \Rightarrow e_{f}(1)-e_{f}(0)=m-2 k^{2}<m, \text { as } k>0
\end{aligned}
$$

Thus $e_{f}(1)-e_{f}(0)$ has maximum value $m=\frac{n}{2}$ in $K_{n}$, when $v_{f}(1)=v_{f}(0)$.
Theorem 2.2 Let $n$ be an odd positive integer and $f$ be a binary vertex labeling on the vertex set of $K_{n}$. If $\left|v_{f}(0)-v_{f}(1)\right|=1$ in $K_{n}$, then $e_{f}(1)-e_{f}(0)$ has maximum value $\frac{n-1}{2}$.
Proof. Let $n=2 m-1$, for some $m \in N$.
Take $v_{f}(0)=m-1, v_{f}(1)=m$ or $v_{f}(0)=m, v_{f}(1)=m-1$. In this case

$$
\begin{gathered}
e_{f}(1)=m^{2}-m \text { and } e_{f}(0)=m^{2}-2 m+1 \\
\Rightarrow e_{f}(1)-e_{f}(0)=m-1=\frac{n-1}{2}
\end{gathered}
$$

If we take $\left\{v_{f}(1), v_{f}(0)\right\}=\{(m-1-k),(m+k)\}$, for some $k(1 \leq k \leq m-1)$, then

$$
\begin{gathered}
e_{f}(1)=m^{2}-m-\left(k^{2}+k\right)<m^{2}-m \text { as } k>0 \\
e_{f}(0)=m^{2}-2 m+\left(k^{2}+k+1\right) \\
\Rightarrow e_{f}(1)-e_{f}(0)=m-1-2\left(k^{2}+k\right)<m-1 \text { as } k>0
\end{gathered}
$$

Thus $e_{f}(1)-e_{f}(0)$ has maximum value $m-1=\frac{n-1}{2}$, when $\left|v_{f}(1)-v_{f}(0)\right|=1$.
Remark 2.3 Let $f$ be a binary vertex labeling on the vertex set of $K_{n}$. Then in Theorem 2.1 and 2.2, we proved that $e_{f}(1)-e_{f}(0)$ has maximum value

$$
\begin{array}{ll}
\frac{n}{2}, & \text { when } n \text { is even and } v_{f}(1)=v_{f}(0) \\
\frac{n-1}{2}, & \text { when } n \text { is odd and }\left|v_{f}(1)-v_{f}(0)\right|=1
\end{array}
$$

We shall denote this maximum value for $e_{f}(1)-e_{f}(0)$ by $d_{1}$. i.e.

$$
\begin{aligned}
d_{1} & =\frac{n}{2}, & & \text { when } n \text { is even and } v_{f}(1)=v_{f}(0) ; \\
& =\frac{n-1}{2}, & & \text { when } n \text { is odd and }\left|v_{f}(1)-v_{f}(0)\right|=1 .
\end{aligned}
$$

We also see that in Theorem 2.1, if we take $\left\{v_{f}(1), v_{f}(0)\right\}=\left\{\frac{n}{2}-k, \frac{n}{2}+k\right\}$ in $K_{n}$, for some $k\left(1 \leq k \leq \frac{n}{2}\right)$, we shall have $e_{f}(1)-e_{f}(0)=\frac{n}{2}-2 k^{2}$, when $n$ is even as well as in Theorem 2.2, if we take $\left\{v_{f}(1), v_{f}(0)\right\}=\left\{\frac{n-1}{2}-k, \frac{n+1}{2}+k\right\}$ in $K_{n}$, for some $k$, we shall have $e_{f}(1)-e_{f}(0)=\frac{n-1}{2}-2\left(k^{2}+k\right)$, when $n$ is odd.
This is a decreasing sequence and it stops at $-\left|E\left(K_{n}\right)\right|$ by taking $\left\{v_{f}(1), v_{f}(0)\right\}=\{0, n\}$. What will be the first negative(highest negative) value? when the above sequence $e_{f}(1)-e_{f}(0)$ comes. The difference we call as $d_{-1}$.
Theorem 2.4 If $n=4 t^{2}+2 r$, for some $t, r \in N$ and $1 \leq r \leq 4 t+1$, then in $K_{n}, d_{-1}=-(4 t+2)+r$, where $d_{-1}$ is the first negative value of $e_{f}(1)-e_{f}(0)$.
Proof. When $n$ is an even positive integer, then $\exists t, r \in N$ such that $n=4 t^{2}+2 r$ and $1 \leq r \leq 4 t+1$ (See more detail in proof of Theorem 2.6).
By taking $\left\{v_{f}(1), v_{f}(0)\right\}=\left\{\left(2 t^{2}+r-t\right),\left(2 t^{2}+r+t\right)\right\}$, we shall have

$$
\begin{gathered}
e_{f}(1)=\left(2 t^{2}+r\right)^{2}-t^{2} \text { and } e_{f}(0)=4 t^{4}+4 t^{2} r+r^{2}-r-t^{2} . \\
\Rightarrow e_{f}(1)-e_{f}(0)=r>0 .
\end{gathered}
$$

Next we take $\left\{v_{f}(1), v_{f}(0)\right\}=\left\{\left(2 t^{2}+r-t-1\right),\left(2 t^{2}+r+t+1\right)\right\}$, we shall have

$$
\begin{gathered}
e_{f}(1)=\left(2 t^{2}+r\right)^{2}-(t+1)^{2} \text { and } e_{f}(0)=\left(2 t^{2}+r\right)^{2}+(t+1)^{2}-\left(2 t^{2}+r\right) \\
\Rightarrow e_{f}(1)-e_{f}(0)=-(4 t+2)+r<0 \text { as } r \leq 4 t+1
\end{gathered}
$$

Therefore $d_{-1}=-(4 t+2)+r$ in $K_{n}$, when $n=4 t^{2}+2 r$ and $1 \leq r \leq 4 t+1$.
Theorem 2.5 If $n=(2 t-1)^{2}+2 r$, for some $t, r \in N$ and $1 \leq r \leq 4 t-1$, then in $K_{n}, d_{-1}=-4 t+r$, where $d_{-1}$ is the first negative value of $e_{f}(1)-e_{f}(0)$.
Proof. When $n$ is an odd positive integer, then $\exists t, r \in N$ such that $n=(2 t-1)^{2}+2 r$ and $1 \leq r \leq 4 t$. (See more detail in proof of Theorem 2.6).
By taking $\left\{v_{f}(1), v_{f}(0)\right\}=\left\{\left(2 t^{2}+r-3 t+1\right),\left(2 t^{2}+r-t\right)\right\}$, we shall have

$$
\begin{aligned}
e_{f}(1) & =\left[\left(2 t^{2}+r\right)-3 t+1\right]\left[\left(2 t^{2}+r\right)-t\right] \\
& =4 t^{4}+4 t^{2} r-8 t^{3}+r^{2}-4 t r+5 t^{2}+r-t
\end{aligned}
$$

and

$$
\begin{gathered}
e_{f}(0)=4 t^{4}+4 t^{2} r-8 t^{3}+r^{2}-4 t r+5 t^{2}-t \\
\Rightarrow e_{f}(1)-e_{f}(0)=r>0
\end{gathered}
$$

Next we take $\left\{v_{f}(1), v_{f}(0)\right\}=\left\{\left(2 t^{2}+r\right)-3 t,\left(2 t^{2}+r\right)-t+1\right\}$, we shall have

$$
e_{f}(1)=4 t^{4}+4 t^{2} r-8 t^{3}+r^{2}-4 t r+5 t^{2}+r-3 t
$$

and

$$
\begin{aligned}
& e_{f}(0)=4 t^{4}+4 t^{2} r-8 t^{3}+r^{2}-4 t r+5 t^{2}+t \\
& \Rightarrow e_{f}(1)-e_{f}(0)=-4 t+r<0 \text { as } r \leq 4 t-1
\end{aligned}
$$

Therefore $d_{-1}=-4 t+r$ in $K_{n}$, when $n=(2 t-1)^{2}+2 r$ and $1 \leq r \leq 4 t-1$.
Theorem $2.6 K_{n}^{\star}$ is cordial, $\forall n \in N$.
Proof. We know that $K_{1}^{\star}=K_{2}, K_{2}^{\star}=$ Path on six vertices, which both are cordial graphs. $K_{3}^{\star}$ and its cordial labeling shown in Figure 1.

Figure 1. $K_{3}^{\star}$ and its cordial labeling $\left(v_{f}(1)=6=v_{f}(0), e_{f}(1)=7, e_{f}(0)=8\right)$
Also Kaneria and Vaidya (2010, p. 38-46) proved that $K_{t^{2}}^{\star}(t \in N)$ is a cordial graph.
So we assume that $n \geq 5$ and $n \neq t^{2}$, for some $t \in N$. At this stage we shall consider following two cases for $n$.

## Case $\mathbf{I} n$ is even

$$
\begin{aligned}
& \Rightarrow \exists t \in N \text { such that }(2 t)^{2}<n<(2 t+2)^{2} . \\
& \Rightarrow 4 t^{2}<n<4 t^{2}+8 t+4 . \\
& \Rightarrow 0<n-4 t^{2}<8 t+4 . \\
& \Rightarrow n=4 t^{2}+2 r, \text { for some } r \in N(1 \leq r \leq 4 t+1) . \\
& \Rightarrow d_{1}=\frac{n}{2}=2 t^{2}+r \text { and } d_{-1}=-(4 t+2)+r . \\
& \Rightarrow d_{1}+\left|d_{-1}\right|=2 t^{2}+r-r+(4 t+2)=2(t+1)^{2} \leq n=4 t^{2}+2 r .
\end{aligned}
$$

We know that $K_{n}^{\star}$ contains $n+1$ copies of $K_{n}$. If we take $r_{1}$ copies of $K_{n}$, which produces $d_{1}$ and $r_{2}$ copies of $K_{n}$, which produces $d_{-1}$, then union of $n+1$ copies of $K_{n}$ contains $e_{f}(1)-e_{f}(0)=r_{1} d_{1}+r_{2} d_{-1}$. Also to preserv $\left|v_{f}(1)-v_{f}(0)\right| \leq 1$ in union of $n+1$ copies of $K_{n}$, we would take $r_{2}$ even. If $r_{1}=-d_{-1}, r_{2}=d_{1}$ then union of $n+1$ copies of $K_{n}$ satisfies $v_{f}(0)=v_{f}(1), e_{f}(0)=e_{f}(1)$. Since $n$ is even we shall take central copy of $K_{n}^{\star}$ with $v_{f}(0)=v_{f}(1)=\frac{n}{2}$ and we shall join each vertices of central copy with other copies of $K_{n}^{\star}$ whose vertex label is 1 by an edge such edge get 1 edge label if vertex of the central copy has vertex label 0 , otherwise the edge get 0 edge label. This produce $e_{f}(0)=e_{f}(1)$ for $K_{n}^{\star}$ and it becomes a cordial graph.
When $r_{1} \neq d_{-1}$ or $r_{2} \neq d_{1}$ in which case we choose $d_{1}$ copies of $K_{n}$ which produce $d_{-1}$ and $\left|d_{-1}\right|$ copies of $K_{n}$ which produce $d_{1}$. Then remaining copies of $K_{n}$ is

$$
\begin{aligned}
\text { Rcopy } & =n+1-\left(d_{1}+\left|d_{-1}\right|\right) \\
& =n+1-2(t+1)^{2} \\
& =4 t^{2}+2 r+1-2 t^{2}-4 t-2 \\
& =2 t^{2}-4 t-1+2 r
\end{aligned}
$$

i.e. Rcopy $=2(t-1)^{2}+2 r-3=x$ (say).

Now this $x=$ Rcopy we have to make two parts say $y$ and $x-y$, so that

$$
\frac{y}{x-y} \approx \frac{d_{1}}{\left|d_{-1}\right|} \Rightarrow y \approx \frac{\left(2 t^{2}+r\right)\left(2(t-1)^{2}+2 r-3\right)}{2(t+1)^{2}}=\frac{d_{1} x}{d_{1}-d_{-1}} .
$$

Now $r_{2}=d_{1}+y$, which we take even to maintain $v_{f}(0)=v_{f}(1)$ in $K_{n}^{\star}$. So we shall take $y_{1}=\frac{d_{1} x}{d_{1}-d_{-1}}$ and

$$
\begin{aligned}
y & =\left\lfloor y_{1}\right\rfloor+1, & & \text { when }\left\lfloor y_{1}\right\rfloor+d_{1} \text { is odd; } \\
& =\left\lfloor y_{1}\right\rfloor, & & \text { when }\left\lfloor y_{1}\right\rfloor+d_{1} \text { is even. }
\end{aligned}
$$

Take $r_{2}=d_{1}+y$ and $r_{1}=(n+1)-r_{2}$.

By choosing $r_{1}, r_{2}$ copies of $K_{n}$ in $K_{n}^{\star}$, we shall have $e_{f}(1)-e_{f}(0)=r_{1} d_{1}+r_{2} d_{-1}$, if its absolute value is less than or equal to $n+1$, we can maintain $\left|e_{f}(1)-e_{f}(0)\right| \leq 1$ in $K_{n}^{\star}$, when $n$ is even as shown in Table 1 .

Table 1. Shows for even $n$ to produce $d_{1}$ and $d_{-1}$ in $K_{n}$ and to compute $r_{1}, r_{2}$ in $K_{n}^{\star}$

| t | $r$ | n | $\mathrm{d}_{1}$ | $\mathrm{d}_{-1}$ | $\mathrm{y}_{1}$ | y | $\mathrm{r}_{2}$ | $\mathrm{r}_{1}$ | $\mathrm{r}_{1} \mathrm{~d}_{1}+\mathrm{r}_{2} \mathrm{~d}_{2}$ |

Where $n=4 t^{2}+2 r, d_{1}=2 t^{2}+r, d_{-1}=-(4 t+2)+r, y$ taken as computation of the case, $r_{2}=d_{1}+y$ and $r_{1}=(n+1)-r_{2}$.

Case II $n$ is odd

$$
\begin{aligned}
& \Rightarrow \exists t \in N \text { such that }(2 t-1)^{2}<n<(2 t+1)^{2} . \\
& \Rightarrow 0<n-4 t^{2}+4 t-1<8 t \\
& \Rightarrow 2 \leq n-(2 t-1)^{2} \leq 8 t-2 \\
& \Rightarrow n=(2 t-1)^{2}+2 r, \text { for some } r \in N(1 \leq r \leq 4 t-1) .
\end{aligned}
$$

$$
\begin{aligned}
& \Rightarrow d_{1}=\frac{n-1}{2}=2 t(t-1)+r \text { and } d_{-1}=-4 t+r \\
& \Rightarrow d_{1}+\left|d_{-1}\right|=2 t(t+1)
\end{aligned}
$$

If we take Rcopy $=n+1-\left(d_{1}+\left|d_{-1}\right|\right)$ like Case I, we must have Rcopy $=2 t^{2}-6 t+2 r+2=x$ (say).
Now here we have to make two parts say $y$ and $x-y$, so that

$$
\frac{y}{x-y} \approx \frac{d_{1}}{\left|d_{-1}\right|} \Rightarrow y \approx \frac{d_{1}\left(2 t^{2}-6 t+2 r+2\right)}{2 t^{2}+2 t}=\frac{d_{1} x}{d_{1}-d_{-1}}
$$

Here $r_{2}=d_{1}+y$, we shall take even to maintain $v_{f}(0)=v_{f}(1)$ in $K_{n}^{\star}$. For this we shall take $y_{2}=\frac{d_{1} x}{d_{1}-d_{-1}}$ and

$$
\begin{aligned}
y & =\left\lfloor y_{2}\right\rfloor+1, & & \text { when }\left\lfloor y_{2}\right\rfloor+d_{1} \text { is odd; } \\
& =\left\lfloor y_{2}\right\rfloor, & & \text { when }\left\lfloor y_{2}\right\rfloor+d_{1} \text { is even. }
\end{aligned}
$$

By choosing $r_{2}=d_{1}+y, r_{1}=(n+1)-r_{2}$ copies of $K_{n}$ in $K_{n}^{\star}$, we shall have $e_{f}(1)-e_{f}(0)=r_{1} d_{1}+r_{2} d_{-1}$. If its absolute value is less than or equal to $n+1$, we can maintain $\left|e_{f}(1)-e_{f}(0)\right| \leq 1$ in $K_{n}^{\star}$, when $n$ is odd as shown in Table 2.

Table 2. Shows for odd $n$ to produce $d_{1}$ and $d_{-1}$ in $K_{n}$ and to compute $r_{1}, r_{2}$ in $K_{n}^{\star}$

| t | r | n | $\mathrm{d}_{1}$ | $\mathrm{d}_{-1}$ | $\mathrm{y}_{2}$ | y | $\mathrm{r}_{2}$ | $\mathrm{r}_{1}$ | $\mathrm{r}_{1} \mathrm{~d}_{1}+\mathrm{r}_{2} \mathrm{~d}_{2}$ |

| 4 | 5 | 59 | 29 | -11 | 14.5 | 15 | 44 | 16 | -20 |
| 4 | 6 | 61 | 30 | -10 | 23 | 16 | 46 | 16 | 20 |
| 5 | 17 | 115 | 57 | -3 | 53.2 | 53 | 110 | 6 | 12 |
| 5 | 18 | 117 | 58 | -2 | 56.1 | 56 | 114 | 4 | 4 |
| 5 | 19 | 119 | 59 | -1 | 59 | 59 | 118 | 2 | 0 |
| 6 | 1 | 123 | 61 | -23 | 29.1 | 29 | 90 | 34 | 4 |
| 6 | 2 | 125 | 62 | -22 | 31 | 32 | 94 | 32 | -84 |
| 6 | 14 | 149 | 74 | -10 | 58.1 | 58 | 132 | 18 | 12 |
| 6 | 23 | 167 | 83 | -1 | 83 | 83 | 166 | 2 | 0 |

Where $n=(2 t-1)^{2}+2 r, d_{1}=\frac{n-1}{2}, d_{-1}=-4 t+r, y$ taken as computation of the case, $r_{2}=d_{1}+y$ and $r_{1}=(n+1)-r_{2}$.

Tables 1 and 2 show that $r_{1} d_{1}+r_{2} d_{-1}$ is too small when $n$ becomes large. Also $\left|r_{1} d_{1}+r_{2} d_{-1}\right| \leq n, \forall n \in N$. Thus $K_{n}^{\star}$ can be made a cordial graph according to Tables 1 and 2.

Illustrative example $2.7 K_{5}^{\star}$ and cordial labeling is shown in Figure 2. According to Table 2, we have following data.

$$
n=5, d_{1}=2, d_{-1}=-2, y_{2}=1, y=2, r_{2}=4, r_{1}=2 \text { and } r_{1} d_{1}+r_{2} d_{-1}=-4
$$

Figure 2. $K_{5}^{\star}$ and its cordial labeling $\left(v_{f}(1)=15=v_{f}(0), e_{f}(1)=32, e_{f}(0)=33\right)$
Let $u_{0, i}(1 \leq i \leq 5)$ be vertices of the central copy $K_{5}$ of $K_{5}^{\star}$ and $u_{l, i}(1 \leq i, l \leq 5)$ be vertices of other copies of $K_{5}^{\star}$. According to above data we shall define $f: V\left(K_{5}^{\star}\right) \longrightarrow\{0,1\}$ as follows:

$$
\begin{aligned}
f\left(u_{0, i}\right) & =1, \quad \text { when } i=1,2 \\
& =0, \quad \text { when } i=3,4,5 \\
f\left(u_{1, i}\right) & =0, \quad \text { when } i=1,2 \\
& =1, \quad \text { when } i=3,4,5 \\
f\left(u_{l, i}\right) & =0, \quad \text { when } i=1 \text { and } l=2 \text { or } l=5 \\
& =1, \quad \text { when } i=2,3,4,5 \text { and } l=2 \text { or } l=5 ; \\
f\left(u_{l, i}\right) & =1, \quad \text { when } i=1 \text { and } l=3 \text { or } l=4 \\
& =0, \quad \text { when } i=2,3,4,5 \text { and } l=3 \text { or } l=4 .
\end{aligned}
$$

To join each copies $K_{5}$ with the central copy in $K_{5}^{\star}$, we have to produce four more 1 edge labels. So we can join $u_{0, i}$ with $u_{i, 1}, \forall i=1,2,3,4,5$.
Above labeling function give rises to $\left|v_{f}(1)-v_{f}(0)\right| \leq 1$ and $\left|e_{f}(1)-e_{f}(0)\right| \leq 1$, as $e_{f}(0)=33, e_{f}(1)=32, v_{f}(0)=$ $15, v_{f}(1)=15$ in $K_{5}^{\star}$. Thus $K_{5}^{\star}$ is a cordial graph.
Illustrative example 2.8 For $K_{22}^{\star}$ and its cordial labeling, according to Table 1, we have following data.

$$
n=22, d_{1}=11, d_{-1}=-7, y_{1}=3.1, y=3, r_{2}=14, r_{1}=9 \text { and } r_{1} d_{1}+r_{2} d_{-1}=1
$$

Table 3. Shows binary vertex labeling for $K_{22}^{\star}$

| Order of copy | $\mathrm{vf}(0)$ | $\mathrm{vf}(1)$ | $\mathrm{ef}(1)$ | $\mathrm{ef}(0)$ | $\mathrm{ef}(1)-\mathrm{ef}(0)$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Central copy | $11 \times 1=11$ | $11 \times 1=11$ | 121 | 110 | 11 |
| 1 to 8 | $11 \times 8=88$ | $11 \times 8=88$ | $121 \times 8$ | $110 \times 8$ | $11 \times 8=88$ |
| 9 to 15 | $7 \times 8=56$ | $14 \times 7=98$ | $112 \times 7$ | $119 \times 7$ | $-7 \times 7=-49$ |
| 16 to 22 | $14 \times 7=98$ | $7 \times 8=56$ | $112 \times 7$ | $119 \times 7$ | $-7 \times 7=-49$ |
| Other outer edges | 0 | 0 | 11 | 11 | 0 |
| Total | 253 | 253 | 2668 | 2667 | 1 |

Let $v_{i}(1 \leq i \leq 22)$ be vertices of the central copy of $K_{22}^{\star}$ and $u_{i, j}(1 \leq i, j \leq 22)$ be vertices of other copies of $K_{22}^{\star}$. We shall join $v_{i}$ of the central copy with $u_{i, i}$ the vertex of $i^{\text {th }}$ copy of $K_{22}^{\star}, \forall i=1,2, \ldots, 22$.
To define required labeling function $f: V\left(K_{22}^{\star}\right) \longrightarrow\{0,1\}$, we use Table 3 and vertex labels which are given below:

$$
\begin{array}{lll}
f\left(v_{i}\right)=0, \quad \forall i=1,2, \ldots, 11 ; & \\
f\left(v_{j}\right)=1, \quad \forall j=12,13, \ldots, 22 ; & \\
f\left(u_{i, j}\right)=1, \quad \forall i=1,2, \ldots, 8, & \forall j=1,2, \ldots, 11 ; \\
f\left(u_{i, j}\right)=0, \quad \forall i=1,2, \ldots, 8, & \forall j=12,13, \ldots, 22 ; \\
f\left(u_{i, j}\right)=1, \quad \forall i=9,10, \ldots, 15, & \forall j=1,2, \ldots, 14 ; \\
f\left(u_{i, j}\right)=0, \quad \forall i=9,10, \ldots, 15, & \forall j=15,16, \ldots, 22 ; \\
f\left(u_{i, j}\right)=1, \quad \forall i=16,17, \ldots, 22, & \forall j=1,2, \ldots, 8 ; \\
f\left(u_{i, j}\right)=0, \quad \forall i=16,17, \ldots, 22, & \forall j=9,10, \ldots, 22 .
\end{array}
$$

So above labeling pattern give rises to $\left|v_{f}(1)-v_{f}(0)\right| \leq 1$ and $\left|e_{f}(1)-e_{f}(0)\right| \leq 1$, as $e_{f}(0)=2667, e_{f}(1)=$ 2668, $v_{f}(0)=253, v_{f}(1)=253$ in $K_{22}^{\star}$. Thus $K_{22}^{\star}$ is a cordial graph.
Theorem 2.9 $C\left(n \cdot K_{n}\right)$ is cordial, $\forall n \in N-\{1\}$.
Proof. We know that $C\left(2 \cdot K_{2}\right)=C_{4}$, which is a cordial graph.
Case $\mathbf{I} n$ is even
$\Rightarrow \exists t \in N$ such that $(2 t)^{2}<n \leq(2 t+2)^{2}$
$\Rightarrow n=4 t^{2}+2 r$, for some $r(1 \leq r \leq 4 t+2)$ and $d_{1}=2 t^{2}+r, d_{-1}=-(4 t+2)+r$ with $d_{1}+\left|d_{-1}\right|=2(t+1)^{2}$.
Since $C\left(n \cdot K_{n}\right)$ contain $n$ copies of $K_{n}$, take $r_{1}$ copies of $K_{n}$, which produces $d_{1}$ and $r_{2}$ copies of $K_{n}$, which produces $d_{-1}$. In this case $C\left(n \cdot K_{n}\right)$ contains $e_{f}(1)-e_{f}(0)=r_{1} d_{1}+r_{2} d_{-1}$ and we shall take $r_{2}$ even to preserve $\left|v_{f}(1)-v_{f}(0)\right| \leq 1$.
First we shall choose $d_{1}$ copies of $K_{n}$, which produces $d_{-1}$ and $\left|d_{-1}\right|$ copies of $K_{n}$, which produce $d_{1}$. Then (the remaining copy of $K_{n}$ )

$$
\text { Rcopy }=n-\left(d_{1}-d_{-1}\right)=2(t-1)^{2}+2 r-4=x \text { (say) }
$$

Here we have to make $x=$ Rcopy as two parts say $y$ and $x-y$, so that

$$
\frac{y}{x-y} \approx \frac{d_{1}}{\left|d_{-1}\right|} \Rightarrow y \approx \frac{\left(2 t^{2}+r\right)\left(2(t-1)^{2}+2 r-4\right)}{2(t+1)^{2}}=\frac{d_{1} x}{d_{1}-d_{-1}}
$$

Now $r_{2}=d_{1}+y$, which we take even to maintain $v_{f}(0)=v_{f}(1)$ in $C\left(n \cdot K_{n}\right)$. So we shall take $y_{3}=\frac{d_{1} x}{d_{1}-d_{-1}}$ and

$$
\begin{aligned}
y & =\left\lfloor y_{3}\right\rfloor, & & \text { when }\left\lfloor y_{3}\right\rfloor+d_{1} \text { is even } \\
& =\left\lfloor y_{3}\right\rfloor+1, & & \text { when }\left\lfloor y_{3}\right\rfloor+d_{1} \text { is odd. }
\end{aligned}
$$

By choosing $r_{2}=d_{1}+y, r_{1}=n-r_{2}$ copies of $K_{n}$ in $C\left(n \cdot K_{n}\right)$, we shall have $e_{f}(1)-e_{f}(0)=r_{1} d_{1}+r_{2} d_{-1}$, if $\left|r_{1} d_{1}+r_{2} d_{-1}\right| \leq n$, we can maintain $e_{f}(1)=e_{f}(0)$ in $C\left(n \cdot K_{n}\right)$, when $n$ is even, as shown in Table 4 .
Case II $n$ is odd
$\Rightarrow \exists t \in N$ such that $(2 t-1)^{2}<n \leq(2 t+1)^{2}$
$\Rightarrow n=(2 t-1)^{2}+2 r$, for some $r(1 \leq r \leq 4 t-1)$ and $d_{1}=2 t(t-1)+r, d_{-1}=-4 t+r$ with $d_{1}+\left|d_{-1}\right|=2 t(t+1)$.
If we take Rcopy $=n-\left(d_{1}-d_{-1}\right)$ like Case -I , we must have Rcopy $=2 t^{2}-6 t+2 r+1=x$ (say).
Now this $x=$ Rcopy we have to make two parts say $y$ and $x-y$, so that

$$
\frac{y}{x-y} \approx \frac{d_{1}}{\left|d_{-1}\right|} . \Rightarrow y \approx \frac{d_{1}\left(2 t^{2}-6 t+2 r+1\right)}{d_{1}-d_{-1}}
$$

We shall take $r_{2}=d_{1}+y$ even to preserve $\left|v_{f}(1)-v_{f}(0)\right| \leq 1$ in $C\left(n \cdot K_{n}\right)$. For this we shall take $y_{4}=\frac{d_{1} x}{d_{1}-d_{-1}}$ and

$$
\begin{aligned}
y & =\left\lfloor y_{4}\right\rfloor+1, & & \text { when }\left\lfloor y_{4}\right\rfloor+d_{1} \text { is odd } \\
& =\left\lfloor y_{4}\right\rfloor, & & \text { when }\left\lfloor y_{4}\right\rfloor+d_{1} \text { is even. }
\end{aligned}
$$

We shall see that $n=t^{2}$, for some $t \in N, d_{1}=0$ and in this case we shall choose $r_{2}=n, r_{1}=0$ an exceptional case due to $n$ is odd and we can preserve $\left|v_{f}(1)-v_{f}(0)\right|=1$.

By choosing $r_{2}=d_{1}+y, r_{1}=n-r_{2}$ copies of $K_{n}$ in $C\left(n \cdot K_{n}\right)$, we shall have $e_{f}(1)-e_{f}(0)=r_{1} d_{1}+r_{2} d_{-1}$. If its absolute value is less than or equal to $n$, we can maintain $e_{f}(1)-e_{f}(0) \leq 1$ in $C\left(n \cdot K_{n}\right)$, when $n$ is odd, as shown in Table 5.

Table 4. Shows for even $n$ to produce $d_{1}$ and $d_{-1}$ in $K_{n}$ and to compute $r_{1}, r_{2}$ in $C\left(n \cdot K_{n}\right)$

| t | r | n | $\mathrm{d}_{1}$ | $\mathrm{~d}_{-1}$ | $\mathrm{y}_{3}$ | y | $\mathrm{r}_{2}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 2 | 4 | 2 | 0 | 2 | 2 | 4 |

| 2 | 1 | 11 | 5 | -7 | -0.42 | -1 | 4 | 7 |
| 2 | 2 | 13 | 6 | -6 | 0.5 | 0 | 6 | 7 |
| 2 | 3 | 15 | 7 | -5 | 1.75 | 1 | 8 | 7 |
| 2 | 4 | 17 | 8 | -4 | 3.33 | 4 | 12 | 5 |
| 2 | 5 | 19 | 9 | -3 | 5.25 | 5 | 14 | 5 |
| 2 | 6 | 21 | 10 | -2 | 7.5 | 8 | 18 | 3 |
| 2 | 7 | 23 | 11 | -1 | 10.08 | 11 | 22 | 1 |
| 2 | 8 | 25 | 12 | 0 | 13 | 13 | 25 | 0 |
| 3 | 1 | 27 | 13 | -11 | 1.63 | 1 | 14 | 13 |
| 3 | 2 | 29 | 14 | -10 | 2.92 | 2 | 16 | 13 |
| 3 | 3 | 31 | 15 | -9 | 4.38 | 5 | 20 | 11 |
| 3 | 4 | 33 | 16 | -8 | 6 | 6 | 22 | 11 |
| 3 | 5 | 35 | 17 | -7 | 7.79 | 7 | 24 | 11 |

Where $n=(2 t-1)^{2}+2 r, d_{1}=\frac{n-1}{2}, d_{-1}=-4 t+r, y$ taken as computation of the case, $r_{2}=d_{1}+y$ and $r_{1}=n-r_{2}$.
Above Tables 4 and 5 shows that $r_{1} d_{1}+r_{2} d_{-1}$ is too small, when $n$ is becoming large. Thus $C\left(n \cdot K_{n}\right)$ can be made a cordial graph, according to Tables 4 and 5.

Illustrative example 2.10 For $C\left(12 \cdot K_{12}\right)$ and its cordial labeling, according to Table 4, we have following data.

$$
n=12, d_{1}=6, d_{-1}=-2, y_{3}=3, y=4, r_{2}=10, r_{1}=2 \text { and } r_{1} d_{1}+r_{2} d_{-1}=-8
$$

Let $u_{i, j}(1 \leq i, j \leq 12)$ be vertices of $C\left(12 \cdot K_{12}\right)$. We shall define require labeling $f: V\left(C\left(12 \cdot K_{12}\right)\right) \longrightarrow\{0,1\}$ by taking help of Table 6 as follows.

$$
\begin{aligned}
& f\left(u_{i, j}\right)=0, \forall j=1,2, \ldots, 6, \quad \forall i=1,2 ; \\
& f\left(u_{i, j}\right)=1, \quad \forall j=7,8, \ldots, 12, \quad \forall i=1,2 ; \\
& f\left(u_{i, j}\right)=0, \forall j=1,2,3,4, \\
& \forall i=3,5,7,9,11 ; \\
& f\left(u_{i, j}\right)=1, \forall j=5,6, \ldots, 12, \\
& \forall i=3,5,7,9,11 ; \\
& f\left(u_{i, j}\right)= 1, \quad \forall j=1,2,3,4, \\
& \forall i=4,6,8,10,12 \\
& f\left(u_{i, j}\right)=0, \forall j=5,6, \ldots, 12 \\
& \forall i=4,6,8,10,12 .
\end{aligned}
$$

Also we shall join $u_{i, 2}$ with $u_{i+1,1}, \forall i=1,2, \ldots, 11$ and $u_{12,2}$ with $u_{1,1}$ by an edge to form the cycle graph $C\left(12 \cdot K_{12}\right)$. Above labeling pattern give rises to $\left|v_{f}(1)-v_{f}(0)\right|=0,\left|e_{f}(1)-e_{f}(0)\right|=0$ for $C\left(12 \cdot K_{12}\right)$, as shown in Table 6 and Figure 3 and so $C\left(12 \cdot K_{12}\right)$ is a cordial graph.

Table 6 . Shows binary vertex labeling for $C\left(12 \cdot K_{12}\right)$

| Order of copy | $\mathrm{vf}(0)$ | $\mathrm{vf}(1)$ | $\operatorname{ef}(1)$ | $\mathrm{ef}(0)$ | $\mathrm{ef}(1)-\mathrm{ef}(0)$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1 and 2 | $6 \times 2$ | $6 \times 2$ | $36 \times 2$ | $30 \times 2$ | $6 \times 8=12$ |
| $3,5,7,9,11$ | $4 \times 5$ | $8 \times 5$ | $32 \times 5$ | $34 \times 5$ | $-2 \times 5=-10$ |
| $4,6,8,10,12$ | $8 \times 5$ | $4 \times 5$ | $32 \times 5$ | $34 \times 5$ | $-2 \times 5=-10$ |

Figure 3. $C\left(12 \cdot K_{12}\right)$ and its cordial labeling $\left(v_{f}(1)=72=v_{f}(0), e_{f}(1)=402=e_{f}(0)\right)$

## 3. Concluding Remarks

In the present work cordial labeling for $K_{n}^{\star}$ and $C\left(n \cdot K_{n}\right)$ are discussed. This work rule out the impression of cordial labeling being a weak labeling. The labeling pattern is demonstrated by means of illustrations, which
provide better understanding of derived results. The combination of Number Theory and Graph Labeling is a real beauty of this investigations.
