ABSTRACT

FACULTY OF ENGINEERING, SCIENCE AND MATHEMATICS  
OPTOELECTRONICS RESEARCH CENTRE

Doctor of Philosophy

by Paul Chambers

The study of an optical correlation spectroscopy gas detection system is presented in this thesis. The correlation spectroscopy method uses a sample of reference gas as a filter to identify the concentration of the target gas in a measurement gas cell.

A review of optical gas sensing methods employed throughout the twentieth and early twenty-first centuries, which led to this version of correlation spectroscopy, is presented. The equation for the output signal modulation, the modulation index, is derived. The method of correlation spectroscopy is analysed by simplified approximation, which aids the understanding of the method.

The study primarily relates to the detection of CO<sub>2</sub> gas. The 2000 edition of the Hitran database was used to provide spectroscopic absorption data for a series of simulations of the correlation spectroscopy method. The simulations show the dependence of the modulation index on measurement cell target gas concentration, measurement cell target gas pressure and measurement cell target gas temperature. Experiments were carried out to assess the correlation spectroscopy method. These experiments used a large-core optical fibre implementation of a correlation spectroscopy detection system with LED infra-red optical sources. A comparison of simulated and experimental results is given. At gas cell pressures of 1 bar the experimental data and the simulated data were found to agree to within 15%. Simulated results for the detection of CH<sub>4</sub> and O<sub>2</sub> are also presented.

A method of increasing the output modulation index by the pressurisation of a CO<sub>2</sub> containing reference gas cell was also investigated by simulation and experiment. It was found by experiment and simulation, that by the pressurisation of the reference gas cell to 6 bar, the modulation index could be increased by up to a factor of 2. However, it was shown that the cross-sensitivity to a contaminant gas also increased.

Keywords: correlation spectroscopy, gas filter correlation, gas detection, infra-red gas detection, optical fibre sensor, carbon dioxide, methane, oxygen.

# Acknowledgements

I would like to acknowledge and sincerely thank the following:

- Professor John P. Dakin, who supervised this project, for his guidance and assistance in relation to the thesis and related publications.
- Dr. Ed A. D. Austin for collaborating on the production of publications and having constructed some of the experimental apparatus.
- Dr. Trevor P. Newson for his help and encouragement, and for having made many helpful observations about correlation spectroscopy.
- Dr. Eleanor J. Tarbox for having made many useful suggestions during the preparation of this thesis.
- Professor Harvey N. Rutt for pointing me in the right direction to find some early examples of correlation spectroscopy gas detection systems.
- Professor Peter G. R. Smith for his assistance at an early stage in the project.
- Friends and colleagues in the Optoelectronics Research Centre for their assistance and encouragement in many ways throughout my studies.
- My parents for their unwavering support.
- The EPSRC for the student bursary which supported me during my studies.
- The industrial consortium (B.O.C. Edwards, N.P.L., Kidde plc., Health and Safety Laboratory, National Grid Transco, Sira and Accurate Controls Ltd.) which provided funding for equipment during this work.

# Declaration of Authorship

I, **Paul Chambers**, declare that the thesis entitled:

“A Study of a Correlation Spectroscopy Gas Detection Method”

and the work presented in it, are my own.

I confirm that:

- this work was done wholly or mainly while in candidature for a research degree at this University;
- where any part of this thesis has previously been submitted for a degree or any other qualification at this University or any other institution, this has been clearly stated;
- where I have consulted the published work of others, this is always clearly attributed;
- where I have quoted from the work of others, the source is always given. With the exception of such quotations, this thesis is entirely my own work;
- I have acknowledged all main sources of help;
- where the thesis is based on work done by myself jointly with others, I have made clear exactly what was done by others and what I have contributed myself;
- parts of this work have been published in the publications listed in Appendix B.
