UNIVERSITY PRESS

Contents

1	Introduction	1
1.1	Force systems	2
1.1.1	Units	2
1.2	Characterization of force systems	3
1.2.1	Distributed forces	3
1.2.2	Equivalent forces systems	5
1.3	Work and power	6
1.3.1	Conservative forces	7
1.3.2	Conservative systems	8
1.4	Static equilibrium	8
1.4.1	Equilibrium of a body	8
1.4.2	Virtual work and virtual power	8
1.5	Equilibrium of subsets: Free-body diagrams	9
1.5.1	Internal force diagram	9
1.6	Dimensional homogeneity	11
	Exercises	11
2	Tension–Compression Bars: The One-Dimensional Case	13
2.1	Displacement field and strain	13
2.1.1	Units	14
2.1.2	Strain at a point	15
2.2	Stress	17
2.2.1	Units	17
2.2.2	Pointwise equilibrium	17
2.3	Constitutive relations	18
2.3.1	One-dimensional Hooke’s Law	18
2.3.2	Additional constitutive behaviors	19
2.4	A one-dimensional theory of mechanical response	19
2.4.1	Axial deformation of bars: Examples	19
2.4.2	Differential equation approach	26
2.5	Energy methods	31
2.6	Stress-based design	34
	Chapter summary	35
	Exercises	36

3	Stress	41
3.1	Average normal and shear stress	41
3.1.1	Average stresses for a bar under axial load	42
3.1.2	Design with average stresses	43
3.2	Stress at a point	46
3.2.1	Nomenclature	47
3.2.2	Internal reactions in terms of stresses	48
3.2.3	Equilibrium in terms of stresses	50
3.3	Polar and spherical coordinates	53
3.3.1	Cylindrical/polar stresses	54
3.3.2	Spherical stresses	55
	Chapter summary	56
	Exercises	56
4	Strain	59
4.1	Shear strain	59
4.2	Pointwise strain	59
4.2.1	Normal strain at a point	60
4.2.2	Shear strain at a point	61
4.2.3	Two-dimensional strains	62
4.2.4	Three-dimensional strain	63
4.3	Polar/cylindrical and spherical strain	64
4.4	Number of unknowns and equations	64
	Chapter summary	65
	Exercises	65
5	Constitutive Response	67
5.1	Three-dimensional Hooke's Law	67
5.1.1	Pressure	69
5.1.2	Strain energy in three dimensions	70
5.2	Two-dimensional Hooke's Law	70
5.2.1	Two-dimensional plane stress	70
5.2.2	Two-dimensional plane strain	71
5.3	One-dimensional Hooke's Law: Uniaxial state of stress	72
5.4	Polar/cylindrical and spherical coordinates	72
	Chapter summary	72
	Exercises	73
6	Basic Techniques of Strength of Materials	75
6.1	One-dimensional axially loaded rod revisited	75
6.2	Thinness	79
6.2.1	Cylindrical thin-walled pressure vessels	79
6.2.2	Spherical thin-walled pressure vessels	81
6.3	Saint-Venant's principle	82
	Chapter summary	85
	Exercises	86

7	Circular and Thin-Wall Torsion	89
7.1	Circular bars: Kinematic assumption	89
7.2	Circular bars: Equilibrium	92
7.2.1	Internal torque–stress relation	93
7.3	Circular bars: Elastic response	94
7.3.1	Elastic examples	94
7.3.2	Differential equation approach	103
7.4	Energy methods	107
7.5	Torsional failure: Brittle materials	108
7.6	Torsional failure: Ductile materials	110
7.6.1	Twist-rate at and beyond yield	110
7.6.2	Stresses beyond yield	111
7.6.3	Torque beyond yield	112
7.6.4	Unloading after yield	113
7.7	Thin-walled tubes	116
7.7.1	Equilibrium	117
7.7.2	Shear flow	117
7.7.3	Internal torque–stress relation	118
7.7.4	Kinematics of thin-walled tubes	119
	Chapter summary	121
	Exercises	122
8	Bending of Beams	128
8.1	Symmetric bending: Kinematics	128
8.2	Symmetric bending: Equilibrium	131
8.2.1	Internal resultant definitions	132
8.3	Symmetric bending: Elastic response	136
8.3.1	Neutral axis	136
8.3.2	Elastic examples: Symmetric bending stresses	138
8.4	Symmetric bending: Elastic deflections by differential equations	144
8.5	Symmetric multi-axis bending	148
8.5.1	Symmetric multi-axis bending: Kinematics	149
8.5.2	Symmetric multi-axis bending: Equilibrium	149
8.5.3	Symmetric multi-axis bending: Elastic	150
8.6	Shear stresses	152
8.6.1	Equilibrium construction for shear stresses	153
8.6.2	Energy methods: Shear deformation of beams	158
8.7	Plastic bending	158
8.7.1	Limit cases	159
8.7.2	Bending at and beyond yield: Rectangular cross-section	161
8.7.3	Stresses beyond yield: Rectangular cross-section	163
8.7.4	Moment beyond yield: Rectangular cross-section	163
8.7.5	Unloading after yield: Rectangular cross-section	164
	Chapter summary	167
	Exercises	168

9	Analysis of Multi-Axial Stress and Strain	179
9.1	Transformation of vectors	179
9.2	Transformation of stress	180
9.2.1	Traction vector method	181
9.2.2	Maximum normal and shear stresses	184
9.2.3	Eigenvalues and eigenvectors	185
9.2.4	Mohr's circle of stress	187
9.2.5	Three-dimensional Mohr's circles of stress	190
9.3	Transformation of strains	192
9.3.1	Maximum normal and shear strains	193
9.4	Multi-axial failure criteria	197
9.4.1	Tresca's yield condition	198
9.4.2	Henky-von Mises condition	200
	Chapter summary	204
	Exercises	205
10	Virtual Work Methods: Virtual Forces	209
10.1	The virtual work theorem: Virtual force version	209
10.2	Virtual work expressions	211
10.2.1	Determination of displacements	211
10.2.2	Determination of rotations	211
10.2.3	Axial rods	212
10.2.4	Torsion rods	213
10.2.5	Bending of beams	214
10.2.6	Direct shear in beams (elastic only)	215
10.3	Principle of virtual forces: Proof	217
10.3.1	Axial bar: Proof	217
10.3.2	Beam bending: Proof	218
10.4	Applications: Method of virtual forces	220
	Chapter summary	225
	Exercises	226
11	Potential-Energy Methods	230
11.1	Potential energy: Spring-mass system	230
11.2	Stored elastic energy: Continuous systems	232
11.3	Castigliano's first theorem	235
11.4	Stationary complementary potential energy	236
11.5	Stored complementary energy: Continuous systems	237
11.6	Castigliano's second theorem	240
11.7	Stationary potential energy: Approximate methods	246
11.8	Ritz's method	250
11.9	Approximation errors	254
11.9.1	Types of error	254
11.9.2	Estimating error in Ritz's method	255
11.9.3	Selecting functions for Ritz's method	257
	Chapter summary	258
	Exercises	259

12 Geometric Instability	263
12.1 Point-mass pendulum: Stability	263
12.2 Instability: Rigid links	264
12.2.1 Potential energy: Stability	265
12.2.2 Small deformation assumption	267
12.3 Euler buckling of beam-columns	270
12.3.1 Equilibrium	270
12.3.2 Applications	271
12.3.3 Limitations to the buckling formulae	274
12.4 Eccentric loads	275
12.4.1 Rigid links	275
12.4.2 Euler columns	277
12.5 Approximate solutions	278
12.5.1 Buckling with distributed loads	282
12.5.2 Deflection behavior for beam-columns with combined axial and transverse loads	285
Chapter summary	286
Exercises	287
13 Virtual Work Methods: Virtual Displacements	291
13.1 The virtual work theorem: Virtual displacement version	291
13.2 The virtual work expressions	293
13.2.1 External work expressions	293
13.2.2 Axial rods	294
13.2.3 Torsion rods	296
13.2.4 Bending of beams	297
13.3 Principle of virtual displacements: Proof	298
13.3.1 Axial bar: Proof	299
13.3.2 Beam bending: Proof	300
13.4 Approximate methods	301
Chapter summary	307
Exercises	308
Appendix A: Additional Reading	310
Appendix B: Units, Constants, and Symbols	311
Appendix C: Representative Material Properties	315
Appendix D: Parallel-Axis Theorem	317
Appendix E: Integration Facts	318
E.1 Integration is addition in the limit	318
E.2 Additivity	320
E.3 Fundamental theorem of calculus	321
E.4 Mean value	321
E.5 The product rule and integration by parts	322
E.6 Integral theorems	323

E.6.1	Mean value theorem	323
E.6.2	Localization theorem	324
E.6.3	Divergence theorem	324
Appendix F: Bending without Twisting: Shear Center		325
F.1	Shear center	325
Index		331
