# Right triangle trigonometry word problems worksheet answers

question 1 :The elevation angle of the upper part of the building at a distance of 50 m from its foot on a horizontal plane is 60 degrees. find the height of the building. question 2 : a scale placed against a wall to reach the upper part of the wall height 6 m and the staircase is inclined to a angle of 60 degrees. Find out how far the scale is from the foot of the wall. question 3 : a string of an eagle is 100 meters long and the inclination of the rope with the ground is 60°. find the height of the kite, assuming that there is no slack in the string. question 4: from the top of the tower of 30 m tall a man is observing the base of a tree at a depression angle of 30 degrees. find the distance between the tree and the tower. Question 5:A man wants to determine the height of a light house. measured angle to and found that tan to = 3/4. what is the height of the light house if at is 40 m from the base? question 6: a staircase is leaned against a vertical wall makes a angle of 20° with the ground. the foot of the staircase is 3 m from the wall. find the length of the scale. Question 7: A kite flies at a height of 65 m attached to a string. if the string inclination with the ground is 31st, find the length of the string. Question 8:The length of a string between a kite and a point on the ground is 90 m. if the string is making an angle  $\theta$  with the level terrain that  $\tan \theta = 15/8$ , how high will the kite be?question 9:A plane is observedapproach the air point. It is at a distance of 12 km from the observation point and makes a 50-degree elevation angle. Find the height above the ground. Question 10: A ball is connected to a weather station by a 200 m long cable tilted at 60 degrees angle with the ground. Find the height of the ball from the ground. (Imagining that there is no slip in the cable) Answers Question 1 :The elevation angle of the upper part of the building at a distance of 50 m from its foot on a horizontal plane is found to be 60°. Find the height of the building. Solution: Now we need to find the length of the AB.tan $\theta$  side = opposite side / adjacent side  $60^\circ = AB/BC\sqrt{3} = AB/50\sqrt{3} = ABAB = 50\sqrt{3}$ The approximate value of  $\sqrt{3}$  is 1.732AB = 50 (1.732) AB = 86.6 mSo, the height of the building is 86.6 mQuestion 2 : A staircase placed against a wall that reaches the upper part of the wall of the height 60° Find out how far the scale is from the foot of the wall. Solution: Here AB represents the height of the wall, BC represents the distance between the wall and the foot of the staircase and AC represents the length of the staircase. In the right triangle ABC, the side that is in front of the 60° angle is known as the opposite side (AB), the side that is in front of 90° is called hypotenuse side (AC) and the remaining side is called adjacent side (BC). Now, we have to find the distance between the foot of theand the wall. that is, we must find the length of BC.tan  $\theta = \text{opposite side} / \text{axial side}$   $60^\circ = AB/BC\sqrt{3} = 6/BC = 6/\sqrt{3}BC = (6/\sqrt{3}) \times (\sqrt{3}/\sqrt{3})BC = (6\sqrt{3})/3BC = 2\sqrt{3}$  approximate value of  $\sqrt{3}$  is 1.732BC = 2 (1.732)BC = 3.464 m So, the distance between the foot of the scale and the wall is 3.464 m. question 3 : a string of an eagle is 100 meters long and the inclination of the rope with the ground is 60°. find the height of the kite, assuming that there is no slack in the string. solution: now we must find the height of the ab. sin  $\theta = \text{opposite side}/\text{Hypotenuse}$  sidein $\theta = AB/AC\sin 60^\circ = AB/100\sqrt{3}/2 = AB/100(\sqrt{3}/2) \times 100 = abab = 50\sqrt{3}$  mso, the height of the kite from the ground  $50\sqrt{3}$  m.Question 4:From the top of the tower 30 m tall a man looks the base of a tree at a corner of a depression. find the distance between the tree and the tower. solution: here ab represents the height of the tower, bc represents the distance between the foot of the tower and the foot of the tree. now we need to find the distance between the foot of the tower and the foot of the tree (BC).tan  $\theta = \text{opposite side} / \text{adjacent side}$   $30^\circ = AB/BC1/\sqrt{3} = 30/BCBCBC = 30\sqrt{3}$  Approximate value of  $\sqrt{3}$  is 1.732BC = 30 (1.732) bc = 81.96 mso, the distance between the tree and the tower is 81.96 m.Question 5:A man wants to determine the height measured the angle with a found that  $\tan A = 3/4$ . What is the height of the light house if A is 40 m from the base? Solution: Now we need to find the height of the light house (BC).tanA = opposite side / side Adjacente = BC/ABGiven: tanA = 3/43/4 = BC/403 x 40 = BC x 4BC = (3 x 40)/4BC = (3 x 10)BC = 30 m So, the height of the light house is 30 m.Question 6: A staircase is protruding against a vertical wall 20° makes a vertical wall angle. The foot of the staircase is 3 m from the wall. Find the length of the scale. Solution: Now we have to find the length of the scale (AC). Cos  $\theta = \text{adjacent side} / \text{side Hypotenuse}$  Cos  $\theta = BC/AC\cos 20^\circ = 3/AC0.9397 = 3/ACACAC = 3/0.9397AC = 3.192$ Cosi, the length of the scale is about 3.193 m.Question 7:A kite flies at a height of 65 m attached to a string. If the tilt of the string with the ground is 31st, find the length of the string. Solution: Now we have to find the length of the string AC. Sin  $\theta = \text{opposite side} / \text{side of Hypotenuse}$  Sin  $\theta = AB/AC\sin 31^\circ = AB/AC0.5150 = 65/ACACACAC = 65/0.5150AC = 126.2$  mHence, the length of the string is 126.2 m.Question 8 :The length of a string between a kite and a point on the ground is 90 m. If the string does an angle  $\theta$  with the ground level such that  $\theta = 15/8$ , how high will the kite be? Now we have to find the length of the AB. Tan  $\theta = 15/8$  -----> cot  $\theta = 8/15\text{csc } \theta = \sqrt{(1+ \cot^2\theta)}\text{csc } \theta = \sqrt{(1+ 64)/225}\text{csc } \theta = \sqrt{289/225}\text{csc } \theta = 17/15$  -----> sin  $\theta = 15/17$ Ma, sin  $\theta = \text{opposite side}/\text{late of hypotenuse} = AB/ACAB/AC = 15/17AB/90 = 15/17AB = (15 \times 90)/17AB = 79.41$  Thus, the height of the tower is 79.41 m.Question 9 : It is observed that a plane approaches a point that is at a distance of 12 km from the observation point and makes a 50-degree elevation angle. Find the plane height above the ground. Solution: Now we have to find the length of the AB side. From the above figure, AB stands for the plane height above the ground. sin  $\theta = \text{opposite side}/\text{Hypotenuse}$  sidein  $50^\circ = AB/AC0.7660 = h/120.7660 \times 12 = h = 9.192$  km So, the height of the plane above the ground is 9.92 km. Question 10: A ball is connected to a weather station by a 200 m long cable tilted at 60 degrees angle with the ground. Find the height of the ball from the ground. (I imagine there is no slip in the cable)Solution: Now we have to find the length of the AB side. From the above figure, AB stands for the height of the ball above the ground. sin  $\theta = \text{opposite side}/\text{Hypotenuse}$  lateral sin  $\theta = AB/AC\sin 60^\circ = AB/200\sqrt{3}/2 = AB/200AB = (\sqrt{3}/2) \times 200AB = 100\sqrt{3}$  Approximate value of  $\sqrt{3}$  is 1.732AB = 100 (1.732)AB = 173.2 mSo, the height of the ground ball is 173.2 m. In addition to the stuff given in this section, if youany other stuff in math, please use our Google custom search here. If you have any feedback on our math content, please send us an email: v4formath@gmail.com We always appreciate your feedback.
