

EE-0001
PEEE Refresher Course

Week 1: Engineering
Fundamentals

Engineering Fundamentals

- Bentley Chapters 1 & 2
- Camara Chapters 1, 2, & 3
- Electrical Quantities
 - Energy (work), power, charge, current
 - Electrostatic pressure, resistance
- Circuit Elements
 - Resistor, Inductor, Capacitor
- Circuit Equations
 - Series, Parallel, Wye-Delta Conversions
 - Norton Equivalent
 - Thevenin Equivalent
 - Kirchhoff's Laws
 - Loop and Node equations
- Complex Algebra
- Transients & Resonance
- R, C, RC, RLC

Fundamental Electrical Units

Quantity	Units	Symbol	Formula	Equivalent Units
energy (work)	joule	W	$W = \int P dt$	watt-second
power	watt	P	$P = \frac{dW}{dt}$	volt-ampere or joule/second
charge	coulomb	Q	$Q = CV$	ampere-second
current	ampere	I	$I = \frac{V}{R}$	coulomb/second
electrostatic pressure	volt	V	$V = IR$	joule/coulomb
resistance	ohm	R	$R = \frac{V}{I}$	volt/ampere

$Q = CV$
 $V = \frac{Q}{C} \rightarrow 0$

EXCEL Power Waveform
 ~~~~~varying ~~~~~

$$W = P \cdot T$$

$$VA \approx P$$

$$W \approx P$$

# Voltage

- Energy gained or lost when a charge is moved from one point to another.
- Potential difference

$$V_{ab} = \frac{W}{Q} \left[ \frac{\text{joule}}{\text{coulomb}} \right]$$

$$= \frac{dw}{dq}$$

- EMF

$$E = \frac{dw}{dq} = \frac{P}{I} = V$$

$E$  = energy given up or generated

$V$  = potential difference between two terminals

YOUTUBE  
RAW  
POWER

CO

$$2.6 \cancel{[h]} \cdot \frac{3600 [s]}{1 \cancel{[h]}} \rightarrow [s] \quad \text{Power} \quad \left[ \begin{array}{l} \text{DIMENSIONAL} \\ \text{ANALYSIS} \end{array} \right]$$

- Time rate of doing work

- BTU/second
- Joule/second
- watts \*
- horsepower

$$P = VI \quad [\text{watts}]$$

$V$  = voltage

$I$  = current

$$\frac{10 [V \cdot A]}{5 [A]} \rightarrow [V \cdot A]$$

$$\rightarrow [W \cdot H]$$

$$P_{avg} = \frac{1}{t} \int_0^t v i dt \quad [\text{watts}]$$

ENERGY  $\rightarrow$  NRG

$$\frac{3600 [sec]}{1 [hour]} = \frac{1 [h]}{3600 [s]}$$

# Energy (work)

$$W = \int_{t_1}^{t_2} P dt \quad [\text{watt - sec}]$$

*Handwritten in green:  $\int P dt$  with an arrow pointing to the integral symbol in the equation above.*

where  $P$  = watts

- or -

$$W = Pt \quad \text{if power is constant}$$

# Ohm's Law

# Resistance

The resistance of a section of conductor of uniform cross section is:

$$R = \frac{\rho l}{A}$$

where

A = cross-sectional area (square meters or circular mils)

l = length (meters or feet)

R = resistance (ohms)

$\rho$  = resistivity of material (ohm-meters) = 1/conductivity

# Resistivity for Typical Conductive Materials

$[\Omega m]$

$\frac{\Omega \cdot m^2}{ft}$

| Material  | Resistivity,<br>ohm-meters | Resistivity,<br>ohm-circular mills per<br>foot |
|-----------|----------------------------|------------------------------------------------|
| aluminum  | $2.6 \times 10^{-8}$       | 17                                             |
| copper    | $1.7 \times 10^{-8}$       | 10                                             |
| cast iron | $9.7 \times 10^{-8}$       | 58                                             |
| lead      | $22 \times 10^{-8}$        | 132                                            |
| silver    | $1.6 \times 10^{-8}$       | 9.9                                            |
| steel     | $(11-90) \times 10^{-8}$   | 66-540                                         |
| tin       | $11 \times 10^{-8}$        | 69                                             |
| nichrome  | $100 \times 10^{-8}$       | 602                                            |

Note: The area of a circle one mil (0.001 inch) in diameter is one circular mil; the area of any circle in circular mils equals the square of its diameter in mils.

IEEE QUIZ

# Circuit Element Characteristics

| Element   | Schematic Symbol | Current Through                                   | Voltage Drop                | Power Dissipation          | Stored Energy          | Units                                   |
|-----------|------------------|---------------------------------------------------|-----------------------------|----------------------------|------------------------|-----------------------------------------|
| resistor  |                  | $I = \frac{V}{R}$                                 | $V = IR$                    | $\frac{V^2}{R}$ or $I^2 R$ | zero                   | ohm<br>$\Omega$ , $k\Omega$ , $M\Omega$ |
| inductor  |                  | $I = \frac{\phi}{L}$<br>$= \frac{1}{L} \int V dt$ | $V = L \frac{dI}{dt}$       | zero                       | $W = \frac{1}{2} LI^2$ | henry<br>h, mh, $\mu$ h                 |
| capacitor |                  | $I = C \frac{dV}{dt}$                             | $V = \frac{1}{C} \int I dt$ | zero                       | $W = \frac{1}{2} CV^2$ | farad<br>f, $\mu$ f, pf                 |

$\tau = RC$   
 $= \frac{L}{R}$

# Metric Prefixes

| Multiplier                   | Prefix                                                                                          | Symbol   |
|------------------------------|-------------------------------------------------------------------------------------------------|----------|

| $10^{15}$                    | peta                                                                                            | P        |
| $10^{18}$                    | exa                                                                                             | E        |

Note the use of lower case letters for multipliers less than one and the use of upper case letters for multipliers greater than  $10^6$ .

Inconsistent usage on “kilo”.

Commonly used multipliers shown in **bold**.

# Inductance

The inductance of a coil is:

$$L \propto KN^2$$

Φ
Φ

where

$N$  = number of turns

$L$  = inductance in henries

$K$  = a constant dependent upon geometry and material
