Modern poverty, then, carries with it a *moral stain* as vexing as material uncertainty itself. Our understanding of poverty's disrepute is further complicated by the fact that poor persons are labeled disreputable even as disrepute has become increasingly associated with today's ruling elites (Lasch 1995: 25–49). Moreover, nostrums describing the poor as "good and hard working" merely confuse the issue. Too often, these shibboleths shield contempt for the poor and our own fear of falling.

David Matza has cut through this casuistry by defining the disreputable poor as being those who for extra economic reasons remain unemployed even during periods of high labor demand and who, by dint of that fact, become objects of moral censure (Matza 1966). Guided by this definition, he identifies several "disreputable fractions" of the poor: the *Dregs* whose occupational careers deviate from the normal

trajectories of their cohort; the *Newcomers*, strangers in a strange land, segregated and victimized by nativist prejudice; the downwardly mobile *Skidders*; and, finally, the *Infirm*. These categories echo Marx's (1979) *Lumpenproletariat* and Jack London's "people of the abyss."

POVERTY AND DISREPUTE AS PROCESS

Like all sociological entities, poverty's disrepute is ontologically stratified. It is structured by the complex interaction of six elements. First, modern poverty originates in the objective contradictions of capitalism: in the dictum that industrial efficiency requires the continuous generation of *superfluous populations*. The production of these surplus populations is a *systemic requirement* of capital's political economy. That is, the structure of commodity production requires some portion of the workforce to be held in reserve in order to accommodate sudden increases in market demand. Failure to maintain this standing army of unemployed or sub employed workers risks a breakdown of both market equilibrium and its integrative pricing function. And, to the extent that markets are free (i.e., their pricing mechanisms operate independently of moral imperatives), this economic superfluity generates perduring poverty amid material plenty.

Second, viewed *sociologically*, modern poverty's disrepute manifests itself as a social exclusion of the poor from full civic participation (Townsend 1962, 1970; Byrne, 1999). While the degree of exclusion varies, its legitimation requires the moral marginalization of the poor. This second element – the moral exclusion of the poor – lies at the symbolic core of modern poverty's disrepute. Indeed, it sets modern poverty off from historically prior poverties. As Polanyi (2001) reminds us, because pre capitalist markets were embedded in analgesic social institutions, poverty, no matter how grinding, provided a social nexus that guaranteed the poor a legitimate claim to social inclusion (Block 2001). Unabrogated access to these embedded rights formed a "social contract" protecting the poor. That social contract came to an end, though, with the triumph of self regulating markets. The commodification of life's necessities

stripped the poor of those cultural buffers that had insured them their social personage. No longer shielded by traditional ties of kinship, communal fealty, or Christian charity, the utilitarian cast of bourgeois culture and self-regulating markets paved the way for socially excluding the economically superfluous.

Third, modern poverty has an ideological component: a set of indispensable accounts that either justify or deny the legitimacy of excluding the poor. Exclusionary accounts are invariably class based. They center upon naturalistic accounts of poverty that justify existing inequalities. They are situated within a reified penumbra of pejorative judgments hierarchically ranking classes and their subcultures. Standing over and against such stigmatic labeling are those subterranean ideologies that debunk the accuracy and fairness of such labeling.

Taken together, these opposed constructions form the core of “ideological space.” This space is composed of rhetorics of exclusion fabricated from above and communicated downward through the class system, and subaltern arguments for inclusion manufactured from below and communicated upward. This double flow is integral to the class struggle. It morally partitions the superfluous into “deserving” and “undeserving” factions and, thereby, morally anchors the class system.

The fourth aspect of this process underscores the historically conditioned nature of disrepute’s social construction. Both hegemonic justification and subaltern pleadings of defeasibility draw their rationales from the immediate historical situation as they morally anchor the class system. Fifth, how an excluded group acts out its moral stain is “ecologically and locally conditioned.” That is, the shifting terms of moral exclusion depend upon the *community’s concrete situation and past experiences*. Sixth, the “wild card” of *human agency* allows individuals and collectives to negotiate “special terms” by which their ritual segregation from the community’s moral paragons is played out.

These six factors form a plausible starting point for grasping the dynamic link between poverty and disrepute. This link can best be seen by comparing the exclusionist ideology promulgated by Thomas Robert Malthus (1766–1834) and the inclusionist alternative Karl Marx (1818–83) offered, especially as they relate to

- (1) the origins of economic superfluity and
- (2) the assigning of moral responsibility for that superfluity.

THE IDEOLOGICAL CONSTRUCTION OF DISREPUTE

The opposed paradigms of Malthus and Marx have remained paradigmatic of the modern poverty debate for more than 150 years. The ideological power of Malthus’s *An Essay on the Principle of Population* (1960) lies in its contention that poverty is rooted in the natural order of things and is, moreover, part of the Divine design. Superfluous populations are generated by two demographic tendencies characteristic of all life forms. Animal populations, inclusive of humans, naturally reproduce at an ascending geometric rate while their means of subsistence increase at a slower, “arithmetic” rate. In a specific ecological setting, the incommensurate increase of the two ratios eventually precipitates a demographic catastrophe. During such catastrophes “excess populations” outstrip their resource base and are subsequently winnowed until their numbers once more conform to environmental capacity.

Malthus goes on to note that these “winter kills” occur less frequently than one might expect. This is because the “positive checks” of war, famine, plague, and misery (poverty) continually keep human populations below the catastrophic breakpoint. His religious training allows him, moreover, to move effortlessly from science to moral philosophy and theology by suggesting these positive checks have their final cause in Divine intention. Poverty, famine, etc. are, in the last analysis, trials for testing moral fiber and faith. As part of God’s grand design, positive checks should not be eliminated by Enlightenment reform, but endured as annealing devices of Christian virtue.

In a revision of his original essay – sometimes called *The Second Essay* – Malthus provides an exit from this dire scenario by giving “negative checks” – reason, foresight, and free will – a countervailing role. Together, they form the basis of disciplined self constraint and the cultivation of moral habits that limit family size. He argues that if the poor are schooled in moral self discipline, most will willingly diminish

their numbers and thereby command wages capable of lifting themselves from poverty. Moreover, the costs of church or state based poor relief, once reduced, can lead to increased capital investment and new job creation. Hence, in his *Second Essay*, Malthus shifts the liberation of the poor from their squalor squarely on the shoulders of the poor, while simultaneously making their refusal to rationally limit family size a moral failure. That is, if bourgeois society magnanimously underwrites the education of all classes, the lower orders must reciprocate. Failure to do so would be tantamount to an act of free choice and, hence, of moral perversity.

Malthus's line of reasoning not only blames the poor for their poverty, but in good conscience relieves society and Christian conscience of any further concern with these incorrigibles. Malthus can only make this argument, however, by reifying poverty on three levels: (1) by locating the origins of surplus populations in two natural ratios; (2) by defining poverty as part of God's benevolent plan; and (3) by locating the continued causes of economic malaise outside the political economy of capital. Indeed, this triad of reifications is the prototype of all ideologies designed to "blame the victim."

Marx's approach is diametrically opposed to Malthus's. While granting the validity of the latter's "laws of population" in pre capitalist formations, Marx argues they no longer apply in modern industrial societies. These latter have technologically superseded Malthus's demographics of wealth and poverty. Indeed, the mechanized, mass production of commodity wealth has produced a new crisis: "over production," not over population, now threatened the new industrial order.

In the early stages of industrialization, the production of commodity wealth hinged on the number of workers employed and on how effectively they could be sweated. Mechanization, however, largely resolved this problem. Labor's productive powers were so effectively enhanced that workers now risked being replaced by their machines. This substitution of machines for men created a new economic entity: industrial reserve armies of unemployed and sub employed workers. Indeed, superfluous populations existed, as Malthus claimed, but not because of undisciplined natural

increase. Instead, superfluous populations were a product of capital's rational pursuit of ever increasing rates of capital accumulation. Competing for an ever diminishing number of occupational slots, Marx's industrial reserves formed the *demographic core* of the new poverty. Only a thoroughgoing reform of capitalist relations could eliminate poverty.

Malthus's and Marx's accounts still ideologically bracket debates over poverty's enduring enigma. The former's naturalistic doctrine, while cognizant of the contradictions of capital, nonetheless defends entrepreneurial capitalism by holding the poor accountable for their own misery. By contrast, Marx avoids victim blaming by locating modern poverty's roots in the structural contradictions of industrial capitalism itself.

THE HISTORICAL EVOLUTION OF IDEOLOGICAL SPACE

Despite its evolution from entrepreneurial capitalism to monopoly capitalism, and from monopoly capitalism to globalization, today's capitalism still requires industrial reserve armies to sustain itself. It is little wonder, then, that debates over the disreputable poor have added but little to Malthus and Marx's original parameters – accounts that "blame the victim" and proposals for reforming capital's anti social tendencies.

Following Phillips (2004), we can go a step further in suggesting that at any given moment the plausibility of these opposed accounts is a function of capital's ability to maintain its hegemony over the warring class subcultures composing capital's *Lifeworld*. In surveying the recent history of the US, Phillips identifies three periods of "capitalist blow outs" – eras in which the equilibria of class power so necessary for democracy have been shattered by a rampant "plutography." These eras of America's anti democratic excesses occurred during the Gilded Age, the Roaring Twenties, and in our own era. During each blow out, the differences defining capital's class hierarchies intensified and victim bashing of the poor flourished.

These asymmetrical blow outs were punctuated by periods of economic crisis in which an

egalitarian "contraction" of the class hierarchy and a relative restoration of political balance between classes ensued. These periods of contraction witnessed the agrarian revolts and Populist movements of the 1880s and 1890s; the Midwestern Progressivism of the last century; and, finally, what Phillips calls the Great Contraction of the New Deal. With each contraction, the personal stain of poverty diminished, the working class and the poor were celebrated, reforms were implemented, and, in several instances, social banditry in the name of the poor was given folkloric treatment in the arts.

The history of the social sciences in America shows parallel cyclic variations. Hence, the antithetical sociologies of William Graham Sumner (1840–1910) and Lester Ward (1841–1913) continued the debate between social Darwinians and socialist reformers while remaining within the boundaries first set by Malthus and Marx. Baltzel (1987: 87–142) demonstrates that Malthusian inspired social Darwinism scientifically buttressed the xenophobic sentiments and racist doctrines that legitimated the WASP establishment's stigmatizing of foreign workers and agrarian populists alike. Opposing this misappropriation of science, the "New Social Science Movement" used a nature/nurture paradigm to explain the alleged racial differences dividing rich and poor. For them, these differences resided neither in biology nor in temperament. They were seen, instead, as originating in the caste like monopolies in the education and economic systems that perpetuated the hegemony of the WASP establishment. Developing this line of thought, social science scholarship celebrated the self redemptive powers of the poor and effectively refuted the Malthusian reifications of the upper class establishment. In time, the New Social Science became an intellectual linchpin of the social reform programs of the New Deal.

In the 1960s the War on Poverty extended New Deal entitlements to previously by passed populations. When that movement foundered on the fiscal shoals of the Vietnam War, conservative counterattacks freely marshaled Malthusian inspired "victim bashing." Edward Banfield's *The Unheavenly City* (1968), for example, argued that anti poverty reforms had hit a point of diminishing returns beyond which uplift and reform could not move. Striking a

Malthusian stance, he argued that the impoverished residue remaining in America's cities were moral incorrigibles. Their "present oriented" culture and their preference for the excitement of "street life" placed them beyond redemption. Indeed, the growing number of poor suggested reformers themselves had become part of the problem. Advances in public health and poor support programs were now blunting the beneficial power of Malthus's positive checks that in times past had limited the reproductive life spans of the incorrigibles.

Some 15 years later, Charles Murray's *Losing Ground* (1984) appropriated these same Malthusian motifs, taking Banfield's work several steps further. Murray now contended poverty was caused by the welfare system itself: by the dependencies transfer payments induced among the poor. In the grand fashion of Malthus's *Second Essay*, Murray suggested poverty could be ended not only by eliminating government welfare programs, but also by ending all federal transfer payments *tout court*. Rhetorically parodying the closing pages of the *Second Essay*, Murray leads the reader through a "thought experiment," asking what would happen if all such programs suddenly ended. He concludes little would change: legitimate programs would be continued by local agencies or private welfare groups; the remainder would deservedly die on the vine.

It would now appear that as capital's global reach expanded into the twenty first century, poverty and its disrepute have also become globalized. Not surprisingly, the debate over poverty's global origins and its amelioration has developed along the lines discussed here. In *Globalization and Its Discontents* (2002), Nobel Laureate Joseph Stiglitz suggests that anti poverty policies at the World Bank and the Import Export Bank have divided in accordance with the paradigms discussed here: neoliberal "market fundamentalism" and "neo Keynesian" interventionism. The former has cloaked itself in a Smithian adulation of the free market, arguing that if free markets are allowed to operate without societal interference, they will "naturally" eliminate both poverty and unemployment. For many neoliberals, unemployment is created largely by the individual "deciding" not to work (i.e., to engage in activities more pleasurable than disciplined wage

labor). Beginning with this assumption, neoliberal anti poverty strategies move away from Adam Smith and assume a distinctly Malthusian cast. When a given national economy falters due to lack of fiscal restraint on the part of those managing a nation's economy, neoliberal cures move directly to "restructuring" that economy: restricting as much as possible the latitudes of those traditional institutions impairing the impersonal mechanisms of the free market. In short, "market fundamentalists" seek to enhance the power of self regulating markets by negating the buffering effects of the institutions that embed the economy.

Neo Keynesians do not share this faith in untrammelled markets. They assume markets processes are, *a priori*, imperfect and hence periodically invite temporary intervention if poverty is to be eliminated. Hence, efforts to ameliorate poverty often begin with strengthening those institutions embedding markets and protecting the social personage of the poor. Once these embedding agencies are stabilized, enforcing market discipline can follow. This approach is, of course, anathema to the neo liberals. And just as neoliberalism is ideologically isomorphic to Malthusianism and Neo Darwinism, so the Neo Keynesian paradigm remains isomorphic to a Marxist critique of capital. The former moves directly to place "disreputable traditions" on the Procrustean bed of market fundamentals, while the latter pragmatically repairs the embedding institutions themselves before proceeding.

THE STRANGER AND THE VANQUISHED

If modern poverty lies at the very heart of the capitalist mode of production and its exploitive social relations, then the stigma of its disrepute resides in the vastness of the differential distribution of wealth and power marking class society. This axiom holds for the burgeoning system of global capital and its by passed Fordist Keynesian constellation, just as much as it held for nineteenth century entrepreneurial capitalism. In each sociohistorical formation class differences must be technically reproduced each generation, just as they must be morally vindicated. Because class warfare has

been, historically, a pandemic possibility, rendering the poor morally suspect stabilizes capitalist society in two ways. First, the stigma of poverty sustains the morale of ruling groups by legitimating their belief that they are naturally endowed with the moral capacity to rule. Second, the disreputable label has a *preemptive* function. It communicates to the "dangerous classes" both their social incompetence and the inferiority of their class subculture. This preemptive degradation thus becomes a powerful mechanism of social control, educating the poor and the near poor into a grudging acceptance of the moral correctness of their social exclusion.

Given these functions, there is still the issue of who among the poor get labeled "disreputable." In addressing this question, one turns from the *systemic* issues of superfluity to the concrete communal processes regulating the assignment of disrepute. Matza (1966: 291–292) bundles these processes under the rubric of "pauperization." Pauperization can occur at two sociohistorical junctures. First, a community or a society can be momentarily swamped by waves of unassimilated "newcomers." This produces an institutional anomie that requires the social order to defend against social disorganization. Pauperization is one such defense. It allows the community to distance itself from the recent arrivals by treating them as anathema – as morally disreputable.

However, the label of disrepute can also be applied to already assimilated members of a community. This second type of pauperization usually occurs when traditional modes of production and their occupational cultures are suddenly displaced by new technologies and new productive protocols of efficiency. Under these conditions, traditionally validated norms of care and craftsmanship are suddenly defined as dilatory, undisciplined, and indolent.

Hence, depending on pauperization's sociohistorical nexus, disrepute can assume one of two social forms: the "Stranger" or the "Vanquished." Following Simmel (1965; Hvinden 1995), the Stranger role emerges when migrants possessing a viable way of life resist immediate assimilation. Like Simmel's Stranger, they walk *among* a people, but are not *of* them. In time, most Strangers will either move on or accommodate to the host order. There will be a residue, however, that does not adapt

occupationally and that continues to resist acculturation. They are soon relegated to the ranks of the disreputable poor.

The Vanquished, by contrast, belong to families that were assimilated long ago. They are descendants of those who earlier challenged the reigning hegemony and failed. These families or kin groups are subsequently folded into the life of the community, often as a distinct caste. In accepting their subaltern status such groups are asymptotically assimilated, even as certain differences are tolerated and even nurtured by the reigning orthodoxy. As occupants of a circumscribed social niche, the Vanquished learn how to play to the vanity of their betters and, in time, wrest from them special dispensations. In time, such exemptions can mature into long term indulgences so that the Vanquished are paternalistically exempted from living up to the standards of social and moral competence expected of the rest of the citizenry. As part of a longstanding system of patronage, the Vanquished are seldom "dangerous," only disreputable. Indeed, their periodic failures at self improvement are tolerated since their failures testify to the metaphysical rightness of the existing hegemony. Moreover, having "learned their place," they can often form cross class coalitions with communal elites by forming united fronts against the latest wave of Strangers. Indeed, in particularly stable communities disrepute can pass from one generation to the next as part of a symbolic family estate. In America, poor white Southerners and various persons of color have played the role of the Vanquished. When enlisted in reactionary alliances, they are labeled by self described progressives as "Red Necks" and "Uncle Toms," or worse.

poverty and free trade

Christoph Henning

The relation of poverty and free trade is not obvious. Exactly for this reason it needs scientific clarification in order to be able to come to terms with it. From a sociological point of view, free trade is one of the cures of the poverty of nations, yet at the same time it must be named as one of the main sources of global poverty.

Among the reasons for poverty *within* a society are economic inequalities with regard to initial endowments. Though modern society is normatively based on equal opportunities, the unequal endowments that can be found in real life may worsen in trade. Both parties might benefit through trade, yet the richer party in many cases benefits more than the poorer party (even though that is not pictured in the "perfect" world of economic models), so inequality can and in many cases will grow. This is one of the reasons why trade is regulated from time to time. Yet poverty is measured in relative terms here: as the total wealth in industrialized countries is growing, so is the average standard of living within those countries, even for the disadvantaged groups. So in spite of increasing inequality, the standard of living of the poor can be lifted in absolute terms. Standard political philosophy, following John Rawls, considers this as just.

This theoretical win win scenario (though in detail some gain a little, others gain a lot) looks different from the global perspective. The amount of global poverty is growing not only relatively, but absolutely. There are whole countries that are becoming poorer and poorer. According to the United Nations Development Report 2003 this is true for more than 50 nations in the last few decades. Hunger is the number one global problem, followed by diseases that are equally widespread. Technically, the means to avoid these diseases have in many cases long been established. However, some nations cannot afford to buy such medical remedies on the global market. Usually, they are not even allowed to produce generic drugs themselves, although there are exceptions, such as in the case of AIDS in South Africa. There

are other problems intrinsically related to poverty. Worldwide migration, for example, is most often caused by poverty. Disasters caused by global climate change, as another example, usually hit the poorest regions the hardest, as poor regions cannot afford to protect the environment. Finally, civil wars often break out where people are hopeless due to their poverty. In other words, poverty is an urgent global problem itself, and indirectly it is the source of many other global problems. Global poverty calls for an explanation.

Worldwide poverty goes along with growing wealth in some regions. This obviously is a paradox. In search of explanations, pre sociological theories sometimes turned to morality: those that are well off *deserve* to be well off because they are virtuous and diligent. Likewise, the poor *deserve* to be poor because they are corrupted, not able to work, or not willing to work. Sociology cannot take such value judgments at face value. The science of society instead has to find social forces and structural reasons for this paradox. Among such explanations are political and economic approaches. Both deviate from the orthodox textbook image of free trade.

The standard economic explanation from undergraduate textbooks, following Ricardo's theorem of comparative advantage, is that all partners automatically benefit from free trade. If one country has disadvantages in the production costs of every good, it will still benefit from free trade if it finds another country that agrees not to produce the goods where the first country has a comparative advantage in production costs. Comparative advantage means that the opportunity costs for producing a certain good are expressed in the cost of production for another good: it may take Canada 4 units of beer to produce one unit of wine, whereas in Mexico the relation may be 2 to 1. This does not mean that it is actually cheaper to produce beer in Mexico. A comparative advantage can go along with an absolute disadvantage. If we follow this theory, Canada is expected to focus on beer and Mexico on wine, even when absolute costs for *both* products are lower in Canada. This is a strong assumption and resembles a planned economy more than a market. Another assumption is that the richer country will in the end exchange the goods

produced in the poorer country for their own products. Parties benefit from trade only if these strong assumptions are met. Let us say, instead of Canada producing 100 units of wine and 400 units of beer and Mexico producing 50 units of wine and 100 units of beer with half of their productive powers for each good and for their own use, we now have Canada producing beer only and Mexico producing wine only, which they exchange afterwards. Instead of 500 units of beer, we now have 800 units of beer in total, and instead of 150 units of wine we have 100 units of wine. The total wealth has increased from 650 to 900 units, even though the cost of wine goes up (but this will only benefit Mexico). Because it would cost Canada 4 units of beer to produce 1 unit of wine, Canada is assumed to exchange 50 units of Mexican wine for 200 units of Canadian beer (or even more). After this "international trade," Canada ends up with 600 units of beer and 50 units of wine; that is, 50 units of wine less, but 200 units of beer more. Mexico ends up with 50 units of wine and 200 units of beer; that is, the same amount of wine, but double the quantity of beer. In this example, both parties benefit in total. Yet it is very clear that there are many theoretical flaws in this harmonious picture.

The first one is that there are often political barriers to trade, and this is what recent theories of international trade have stressed. Every time a party starts to lose its gains from trade, it will try to introduce tariffs in order to protect its industry. Yet only strong countries will have the power to do so. A weaker party will often not have the means to introduce such measures, even where economic reasons would recommend them. Secondly, there are various economic arguments that cast doubt on this perfect picture, as for example dependency theory or the theory of unequal exchange. Many of these schools have a Marxist background, yet one can read in Adam Smith that countries with an absolute disadvantage can hardly gain from trade. Why should a country that has an absolute advantage in one good abstain from producing it? Besides, this story only works under the assumption of the quantity theory of money, which says that momentary gains from trade will lead to inflation (more money imported and more goods exported result in higher

prices, and these in turn level the advantage from trade). As soon as another, more realistic theory of money is used, the theory of comparative advantage is no longer convincing. Money can not only be used to purchase goods, it can also be used to invest in better production technologies or in order to lend it to other countries. If these other countries do not gain from international trade but experience a worsening of their "absolute disadvantage," this can result in a crisis of international debt. And this is what can be perceived during the last few decades.

power

Jason L. Powell

Power is an “essentially contested and complex term” (Lukes 1974: 7) that cuts right across social science disciplines. The literature on power is marked by a deep disagreement over the basic definition of power. Some theorists define power as getting someone else to do what you want them to do (power over), whereas others define it more broadly as an ability or a capacity to act (power to). Thomas Hobbes’s (1985 [1641]: 150) definition of power as a person’s “present means . . . to obtain some future apparent Good” is a classic example of this understanding of power, as is Hannah Arendt’s definition of power as “the human ability not just to act but to act in concert” (1970: 44). Feminist theorists of power Stacey and Price (1983) define power as the more or less one sided patriarchal ability to position women’s lives through the actions of men over them. Conversely, Michel Foucault (1977) suggests that power itself is “relational” in that whilst one social actor may exercise power with other individuals, we also need to be aware that all other individuals have “power” in their social relationship that can be expressed through “resistance.”

The historical emergence of sociological discussions of power has been crystallized in the work of Max Weber. In Max Weber’s famous work, *Economy and Society: An Outline of Interpretive Sociology*, he clarifies his typology of power. Weber highlights the distinction between coercive power and power based on various types of authority: charismatic, traditional, and legal rational. People obey charismatic leaders because of the personal qualities of the person doing the telling. Well known charismatic figures include Jesus Christ and Hitler. However, charismatic figures may arise in any social grouping and such people assume positions of authority over others on the basis of personal qualities of leadership perceived in that individual by other group members. Traditional authority involves acceptance of rules that symbolize ritual or ancient practice such as religion. By contrast, Weber also focused on the power of modern bureaucracies, such as civil

service, whose formal rules of procedure are legitimized by legal rational authority.

Pluralist theories see power being held by a variety of groups in society (some of which are more powerful than others) that compete with each other. Since no one group or class is able to dominate all other groups (because of checks and balances built into a democratic system of government), a “plurality” of competing interest groups, political parties, and so forth is seen to characterize democratic societies.

Elite theory involves the idea that rather than there being a simple plurality of competing groups in society, there are instead a series of competing elites – powerful groups who are able to impose their will upon the rest of society. The theory of “circulating elites” is a conservative form of theorizing associated with writers such as Mosca and Pareto (Lukes 1974). C. Wright Mills’s analysis has been termed as elite theory as well, but stems from the idea that certain elite groups arose to control various institutions in society. Since some institutions were more powerful than others (an economic elite, for example, is likely to be more powerful than an educational or religious elite), it followed that the elite groups who controlled such institutions would hold the balance of power in society as a whole – they would dominate politically on the structural level of power and involve the creation of a “power elite.”

The Marxist tradition elaborated the role of cultural hegemony in ideology as a means of bolstering the power of capitalism and the nation state. This is a Marxist form of theorizing that argues that power is fundamentally lodged with the owners and controllers of economic production (the bourgeoisie). Political power is seen to derive from economic ownership and, in this respect, we can identify a ruling class which not only controls the means of production, distribution, and exchange in capitalist society, but also dominates and controls the institutions of political power. There are two variations of Marxist views on power. Instrumental Marxism, associated with the work of Ralph Milliband and especially *The State in Capitalist Society* (1969), attempts to demonstrate empirically the nature of ruling class domination in society. Structuralist Marxism, associated with the work of writers such as Nicos Poulantzas, especially his *Classes in*

Contemporary Capitalism (1975), and Louis Althusser, concentrates more upon the structural arrangements of capitalist society. It attempts to show how a ruling class is able to dominate the rest of society economically, politically, and ideologically without the need for its members to personally oversee the workings of the state.

Finally, Michel Foucault's analysis of power has arguably been the most influential discussion of the topic over the last 30 years. Foucault's (1977) work analyzes the link between power and knowledge. He outlines a form of covert power that works through people rather than only on them. As he puts it, "power is everywhere, not because it embraces every thing, but because it comes from everywhere" (1978: 93). Foucault endeavors to offer a "microphysics" of modern power (1977: 26), an analysis that focuses not on the concentration of power in the hands of the sovereign or the state but instead on how power flows through the capillaries of the social body. For Foucault, "experts" such as medical doctors are key interventionists in societal relations and, in the management of social arrangements, pursue a daunting power to classify, with consequences for the reproduction of medical knowledge. At the same time, Foucault also recognized that power itself lacks any concrete form, occurring as a locus of struggle. Resistance through defiance defines power and hence becomes possible *through* power. Without resistance, power is absent.

power-dependence theory

Linda D. Molm

Power dependence theory is the name commonly given to the social exchange theory originally formulated by Richard Emerson (1962, 1972a, 1972b). As the name suggests, the dynamics of the theory revolve around power, power use, and power balancing operations, and rest on the central concept of *dependence*. Mutual dependence brings people together; that is, to the extent that people are mutually dependent, they are more likely to form exchange relations and groups and to continue in them. Inequalities in dependence create power imbalances that can lead to conflict and social change.

The publication of Emerson's theory in 1972 marked a turning point in the development of the social exchange framework in sociology. Power dependence theory departed from earlier exchange formulations by Peter Blau, George Homans, and John Thibaut and Harold Kelley in three important ways. First, Emerson replaced the relatively loose logic of his predecessors with a rigorously derived system of propositions that were more amenable to empirical test and the development of a strong research tradition. Second, Emerson established power and its use as the major topics of exchange theory – topics that would dominate theory development and research for the next 30 years. Third, by integrating principles of behavioral psychology with social network analysis, Emerson developed an exchange theory in which the structure of relations, rather than the actors themselves, became the central focus.

These distinctions influenced not only the character of power dependence theory, but also the continued development of the social exchange tradition.

The theoretical program of research conducted by Emerson, his colleague Karen Cook, and their students further developed the theory's character and logic while testing its basic tenets. After Emerson's untimely death in 1982, Cook's work with Toshio Yamagishi continued to modify and expand the theory. In addition, other established scholars who were not students of Cook or Emerson used the theory as a framework for developing related theories of power and power processes.

BASIC CONCEPTS AND PRINCIPLES

Power dependence theory shares with other exchange theories the basic concepts of actors, resources, rewards, and costs, but places greater emphasis on the form, rather than the content, of exchange relations. The participants in social exchange, called *actors*, can be either individual persons or collective actors such as groups or organizations, and either specific entities or interchangeable occupants of structural positions. This insight, along with the use of network concepts, allowed the theory to span different levels of analysis more successfully than earlier exchange theories. Resources are tied to relations rather than actors. That is, possessions or behavioral capabilities that are valued by other actors are *resources* in an actor's relations with those others, but not necessarily in other relations.

Power dependence theory also shares with other exchange theories the basic assumption of self-interested actors. Emerson's original formulation deliberately eschewed cognitive assumptions of rationality or conscious calculation of benefits, however, in favor of a theory based on operant psychology. Emerson avoided the problems of tautology and reductionism that plagued earlier behavioral approaches by recognizing that the core concepts of operant behavior, reinforcer, and discriminative stimulus form a single conceptual unit. Furthermore, their relation to each other is defined only across repeated occurrences of behavior and stimuli. By maintaining the integrity of this

conceptual unit, Emerson established the *social relation*, rather than the individual actor, as the basic unit of power dependence theory.

Although Emerson and others would later bring more cognitive concepts into the theory, the initial absence of assumptions about cognitions or motives helped build a theory that emphasized structure rather than individuals' thoughts or needs. This emphasis on structure is evident in the theory's analysis of both power-dependence relations – its theoretical heart – and exchange networks and groups.

Social exchange relations develop within structures of mutual dependence, in which actors control resources valued by each other. An actor's dependence on another is defined by the extent to which outcomes valued by the actor are contingent on exchange with the other. B's dependence on A increases with the *value* to B of the resources A controls, and decreases with B's *alternative* sources of those resources. The theory's title derives from the basic insight that actors' mutual dependence provides the structural basis for their *power* over each other. A's power over B derives from, and is equal to, B's dependence on A, and vice versa. Thus, power is a structural attribute of an exchange relation, not a property of an actor. *Power use* is the behavioral exercise of that structural potential.

Power in dyadic relations is described by two dimensions: *cohesion*, actors' absolute power over each other, and *balance*, actors' relative power over each other. Cohesion is equal to the average dependence of two actors on each other. If actors are equally dependent on each other, power in the relation is balanced; if B is more dependent on A, power is imbalanced, and A has a *power advantage* in the relation equal to the degree of imbalance.

Over time, the structure of power has predictable effects on the frequency and distribution of exchange as actors use power to maintain exchange or gain advantage. A's initiations of exchange with B increase with A's dependence on B. Also, the frequency of exchange in a relation increases with cohesion and, in imbalanced relations, the ratio of exchange changes in favor of the more powerful, less dependent actor. One of the theory's most important tenets is that these effects are produced even in the absence of intent to use power. That is, they are

determined by the structure of relations, not the cognitions of actors.

Emerson also argued that imbalanced relations are unstable and lead to *power balancing* processes. These processes reduce imbalance by decreasing the value of exchange to the less powerful actor ("withdrawal"), increasing value to the more powerful actor ("status giving"), increasing alternatives available to the less powerful actor ("network extension"), or decreasing alternatives available to the more powerful actor ("coalition formation").

Emerson was the first to link exchange theory with the growing field of social network analysis, a move that fundamentally changed the nature of exchange research. He began by distinguishing between groups and networks as different structural forms. *Groups* are collective actors, such as teams or organizations, that function as a single unit in exchange with other actors. *Exchange networks* are sets of *connected* exchange relations among actors. Two relations are connected if the frequency or value of exchange in one relation (e.g., A–B) affects the frequency or value of exchange in another (e.g., B–C). Network connections are *positive* to the extent that exchange in one relation increases exchange in the other, and *negative* to the extent that exchange in one decreases exchange in the other. Mixed networks consist of both. Emerson linked these processes to his conception of an *exchange domain*, a class of functionally equivalent outcomes.

The concepts of exchange networks and corporate actors allowed power dependence theory to bridge the gap between micro and macro levels of analysis. With these tools the theory could explain the emergence and change of social structures, including network expansion and contraction, coalition formation, and norm formation.

CONTEMPORARY DEVELOPMENTS

To test power dependence theory, Emerson, Cook, and their students constructed a laboratory setting that was to become the prototype for studying power in exchange networks. In contrast to the reciprocal exchanges envisioned by Homans and Blau and implicitly assumed in Emerson's original formulation, subjects in

Cook and Emerson's setting *negotiated* the terms of exchange, through a series of offers and counteroffers, to reach binding agreements. In conjunction with the negotiated exchange setting, the theory itself came to take on more of an economic flavor, with more emphasis on rational actors and comparison of alternatives. At the same time, however, Cook introduced concerns with commitment and equity that were not part of the theory's original formulation and that increased the motivational complexity of actors.

Cook and Emerson's (1978) work supported key tenets of the theory, showing that networks imbalanced on structural dependence produce unequal distributions of benefits, in favor of the less dependent actor, and that these effects occur even in the absence of actors' awareness of power. Later studies showed that disadvantaged actors can improve their bargaining position by forming coalitions – one of Emerson's power balancing processes – and demonstrated the critical importance of the distinction between negatively and positively connected networks (Cook et al. 1983). In positively connected networks, centrality yields power because central actors can serve as "brokers" in cooperative relations. But in negatively connected networks, centrality is less important than access to highly dependent actors with few or no alternatives.

Early tests of power dependence theory also displayed its inadequacies for analyzing complex networks. Although the theory takes account of the larger network in which actors are embedded, it predicts the distribution of power within dyadic relations, not the network as a whole. The need for new algorithms for measuring power in exchange networks stimulated a flurry of new, competing theories. In response, Cook and Yamagishi introduced a new algorithm in 1992, the *equi dependence exchange ratio*, for predicting the distribution of power in negatively connected networks. This algorithm determines the exchange ratios that will produce "equal dependence" of actors on each other in all relations throughout a network, based on iterative calculations of the value of actors' exchanges relative to the value of their best alternatives.

At the same time that Cook and Emerson were developing their research program, other

scholars, particularly Edward Lawler and Linda Molm, were drawing on concepts from power dependence theory to develop their own theories of power and related processes. Their work introduced ideas and concepts that were not part of Emerson's original formulation: greater attention to cognition and affect in exchange, consideration of punitive as well as rewarding actions in exchange, and analysis of different forms of exchange.

In the late 1970s and early 1980s, Bacharach and Lawler (1981) integrated power dependence theory's analysis of structural power with bargaining theories' analyses of tactical power. Traditional work on bargaining neglected the power structure within which parties negotiate; Lawler and Bacharach used ideas from power dependence theory to fill that gap. Their approach differed from Cook and Emerson's in important ways, however. They were concerned not only with the terms of agreements (the measure of power use), but also with whether and how actors reach agreement and the tactics they use. In contrast to Emerson's strongly structural approach, they argued that actors' perceptions of power affect their choices of tactics, and they envisioned the use of power as a more conscious choice.

Molm's (1997) work on coercion in exchange also focused more attention on strategic power use and expanded the theory to include punishment and coercion. While power dependence theory originally addressed only reward based power, Molm argued that both reward power and coercive power are derived from dependence on others, either for obtaining rewards or avoiding punishment, and potentially can be explained by the same principles. Unlike reward power, however, the use of coercive power is not structurally induced by power advantage (as Emerson argued), but strategically enacted as a means of increasing an exchange partner's rewards. To explain strategic power use, Molm introduced concepts of decision making under risk and uncertainty.

In contrast to the focus on negotiated exchanges in the experimental work of Emerson, Cook, Lawler, and others, Molm's work on coercion examined *reciprocal* exchanges, in which actors individually provide benefits for another without negotiating the terms of an exchange and without knowing whether or when

the other will reciprocate. Her later work showed that the form of exchange affects how structural dimensions of alternatives affect power use (Molm et al. 1999).

The most recent development among power dependence researchers is the shift from the study of power and inequality to the study of integrative outcomes: commitment, trust, emotions, and solidarity. Cook, Yamagishi, Lawler, and Molm have all turned their attention in this direction. Most recently, Lawler (2001) has proposed a new affect theory of exchange that – in sharp contrast to Emerson – makes affect and emotion the driving force underlying commitments in exchange relations. The theory still incorporates a number of concepts from power dependence theory, but focuses on the emotions produced by social exchange and their attribution to social units.

power elite

Jason L. Powell

As a concept, “power elite” can be defined as a small group of people who control a disproportionate amount of power, wealth, and privilege and access to decision makers in a political system. In a pathbreaking book, Mills (1956) claims that the US power elite consists of elite members of society characterized by consensus building and the homogenization of viewpoints. This power elite has historically dominated the three major sectors of US society: economy, government, and military. Elites circulate from one sector to another, consolidating their power as they go. Mills rejects pluralist assertions that various centers of power serve as checks and balances on one another – the power elite model suggests that those at the top encounter no real opposition and it implies a concentration of power, wealth, and prestige in the hands of the wealthy and powerful in American society. Mills wrote that the power elite refers to “those political, economic, and military circles, which as an intricate set of overlapping small but dominant groups share decisions having at least national consequences. Insofar as national events are decided, the power elite are those who decide them” (Mills 1956: 18).

According to Mills, the governing elite in the US draws its members from three areas: (1) the highest political leaders (including the president) and a handful of key cabinet members and close advisers; (2) major corporate owners and directors; and (3) high ranking military officers. First, the elite occupies what Mills terms the top command posts of society. These positions give their holders enormous authority over not just governmental, but also financial, educational, social, civic, and cultural institutions. A small group is able to take fundamental actions that touch everyone. Decisions made in

the boardrooms of large corporations and banks affect the rates of inflation and employment, for example. Secondly, the influence of the chief executive officers of large corporations often rivals that of the secretary of commerce. Thirdly, the military play a key role in positioning themselves to address “threats” that require resources to be mobilized, as in the case of war.

Having seen how the governing elite derives its strength, it is important to consider how this power is exercised in the political arena. What roles are played by the three parts of what Mills called the “pyramid” – the elite, the middle level, and the masses – in politics? Mills suggests that the power elite establishes the basic policy agenda in such areas as national security and economics. Of course, since it only sets the general guidelines, the middle level has plenty to do implementing them, but the public has been virtually locked out. Its main activities – writing campaign posters, expressing opinions to pollsters, voting every two or four years – are mostly symbolic. The people do not directly affect the direction of fundamental policies. Power elite theory, in short, claims that a single elite, not a multiplicity of competing groups, decides the life and death issues for the nation as a whole, leaving relatively minor matters for the middle level and almost nothing for the common person. It thus paints a dark picture. Whereas pluralists (e.g., Dahl 1961) are somewhat content with what they believe is a fair, if admittedly imperfect, system, the power elite school decries the unequal and unjust distribution of power it finds everywhere (Lukes 1974). These “top positions” encompass the posts with the authority to run programs and activities of major political, economic, legal, educational, cultural, scientific, and civic institutions.

The presence of the power elite in the political, economic, and military bureaucracies is obvious in America’s recent “War on Terror” and the Middle East crisis. The oil interests (economic) are involved with President G. W. Bush and Vice President Cheney (political) through their past connections in that field. These interconnections make the triangle complete in interconnecting war, business, and politicians.

One criticism of Mills is that there are many wealthy people in the US, but they are not all members of the power elite. Advantageous positions for power, prestige, and wealth

include the uppermost administrative positions in the three top bureaucratic organizations: the Pentagon, corporate America, and the executive branch of the US government. President Clinton had a lot of power when he was the president of the US, but as a retired president his power has been diminished. Similarly, the power of Richard Nixon eroded when he resigned as president after the Watergate affair in 1974. Indeed, the position or office holds the privilege of power, not the person. Holding these positions or offices enables the elite to gain administrative control of the main bureaucratic organizations, so they are able to maintain their own wealth, power, and privilege.

For Mills, the power elite has ensured the demise of the public as an independent force in civic affairs. Mills suggests that instead of initiating policy, or even controlling those who govern them, men and women in America have become passive spectators, cheering the heroes and booing the villains, but taking little or no direct part in the action. Citizens have become increasingly alienated and estranged from politics, as can be seen in the sharp decline in electoral participation over the last several decades. As a result, the control of their destinies has fallen into the hands of the power elite.

power, theories of

Shane Thye

In contemporary sociology, the term power is used in two distinct but interrelated ways. In the broadest usage, power refers to a *structural*

capacity for an actor A to cause any change in the behavior of another actor B (Weber 1968). This meaning of power captures the potential for power to be exercised or not in social interaction. The second meaning refers to a *concrete event* in which one individual benefits at the expense of another. Modern theorists refer to such events as *power use* or *power exercise*. Importantly, both meanings imply that power is a relational phenomenon. Thus, theories of power take as their focus the relationship between two or more actors, and not the characteristics of actors themselves. Although the terms are sometimes conflated, power is theoretically distinct from other relational concepts such as *influence* (which is voluntarily accepted), *force* (wherein the target has no choice but to comply), and *authority* (which involves a request from a legitimate social position). French and Raven (1968) recognized these distinctions over four decades ago, and they remain useful today.

Theories of power cross many ideological and epistemological lines. As a result, this literature has seen many debates. Theorists have contemplated whether power is best conceptualized as (1) a potential or something that must be used; (2) “forward looking” calculated actions or “backward looking” responses to reward and punishment; (3) intentional or unintentional behavior; (4) benefit or control, and so on. These early debates generated much heat, but very little light. They did, however, stimulate efforts to develop more formal theory. The majority of this work occurred within behavioral psychology and the exchange tradition of sociology.

Perhaps the first formal theory of power was proposed by Thibaut and Kelley (1959). They asserted that individuals evaluate their current relationship against some standard, or comparison level (CL). The theory also claims that actors assess the attractiveness of a relationship by comparing their focal relationship to benefits expected from others (CL_{ALT}). The power of actor A over B is defined as “A’s ability to affect the quality of outcomes attained by B.” There are two ways that this can occur. *Fate control* exists when actor A affects actor B’s outcome by changing her or his own behavior, independent of B’s action. For example, if regardless of what B does, B receives \$1 when

A chooses behavior 1 and \$10 when A chooses behavior 2, then A has fate control over B. *Behavior control* exists when the rewards obtained by B are a function of both A and B's behavior. To illustrate, when A can make rewards obtained by B contingent on B's actions (A dictates that behavior 1 yields \$2 for B, while behavior 2 yields \$4 for B), then A can control the behavior of B. In either case, whether A has fate control or behavior control, B is dependent on A for rewards and thus A has a source of power over B. Other power theories that emerged during that same timeframe echoed the importance of dependence.

A major theoretical shift occurred in the early 1970s with the development of Richard Emerson's power dependence theory (Emerson 1972a, 1972b). Unlike previous theorists, Emerson cast power processes in broader terms. He put forth the notion that relations between actors are part of a larger set of potential exchange relations (i.e., an exchange network). Thus, in analyzing a dyad, he asserted it is important to consider its broader connection to other dyads – the larger network in which it is embedded. Emerson considered two kinds of connection. A *negative connection* exists when interaction in one dyad reduces interaction in another. A *positive connection* exists when interaction in one dyad promotes interaction in another. The attention to dyadic connectedness gave Emerson's theorizing a decidedly structural theme: his were network embedded dyads.

Power dependence theory is anchored in operant psychology and relies heavily on the principle of satiation. The theory claims that power emerges because individuals in different network locations are satiated at different rates. The implication, as with previous theories, is that some individuals are more dependent than others for the exchange of valued goods. Dependence is the centerpiece of the theory. The theory asserts that the power of actor A over actor B is equal to the dependence of B on A, summarized by the equation $P_{AB} = D_{BA}$. In turn, dependence is a function of two key factors: the availability of alternative exchange relations and the extent to which the actors value those relations. To illustrate, imagine an auto builder (A) who must purchase specialized parts from a supply dealer (B). When auto parts are not widely available from other suppliers,

but auto builders are in high supply, then A is more dependent on B than B is on A, ($D_{AB} > D_{BA}$), due to availability. When the auto maker values parts more than the supplier values customers, then A is more dependent on B: ($D_{AB} > D_{BA}$). As such, the theory predicts B has power over A.

Since the original formulation, power dependence theory has given rise to numerous other branches of theory. For instance, Molm (1990) has expanded the power dependence framework to include both reward based power and punishment based power. She finds punishment based power is used less often than reward based power, due to the potential cost it entails. Lawler (1992) has developed a theory of power that includes both dependence based power and punitive based power. This work shows how structures of interdependence can promote either punitive or conciliatory bargaining tactics. Bargaining tactics, in turn, are theorized to mediate power exercise in negotiations. Both lines of work extend the basic power dependence framework, and affirm the importance of dependence in generating power.

An alternative approach to power is found in David Willer's *elementary theory*, which is based on classical understandings of power from Marx and Weber. Elementary theory opposes the notion of satiation as the basis for power, and instead anchors power in the ability of some actors to *exclude* others from valued goods. The theory identifies three kinds of social relations, defined by the kinds of sanctions found in each. A *sanction* is any action transmitted from one individual and received by another. *Exchange* occurs when A and B mutually transmit positive sanctions (e.g., I mow the yard, you do the dishes). *Coercion* occurs when a negative sanction is transmitted for a positive sanction (e.g., as when a mugger threatens "your money or your life"). *Conflict* exists when A and B each transmit negative sanctions (e.g., when two countries engage in bombing). The majority of research has centered on power in exchange.

Within exchange, the theory identifies three kinds of power structures. *Strong power* structures are those that only contain two kinds of positions: high power positions that can never be excluded and two or more low power positions, one of which must always be excluded.

The classic example is the 3 person dating network, in which B can date A or C but not both on any given night (A—B—C). B is powerful because B is always guaranteed a partner, while either A or C must be excluded. Strong power networks promote extreme power exercise. *Equal power* networks contain only one set of structurally identical positions, such as dyads or triangles. In *weak power* networks no position is necessarily excluded, but some may be. The simplest weak power structure is the 4 actor line (A—B—C—D). Note that when B and C exchange, A and D are excluded. Studies find that this produces a slight power advantage for the positions who need not be excluded.

At the heart of the theory is a resistance model that relates the distribution of profit when two actors exchange to the benefits lost when they do not. An actor i 's resistance to exchange is defined using the following equation:

$$R_i = \frac{P_i \max - P_A}{P_A - P_{Acon}}$$

$P_i \max$ represents i 's best hope from the exchange, P_A represents the payoff if the exchange is complete, and P_{Acon} represents the payoff when exchange is not complete. The numerator captures how far away the current offer is from one's best hope. The denominator represents the benefit of consummating exchange relative to no exchange at all. The model assumes that actors balance these motives when negotiating exchange. The theory predicts that when two actors i and j exchange, they do so at the point of equilibrium. That is, exchange is predicted when the resistance is mutually balanced for i and j . Tests find that the resistance model predicts power exercise in a range of settings.

The ability to predict powerful positions in exchange networks was an important methodological issue that occupied the attention of theorists during the late 1980s and early 1990s. Competing solutions were offered from power dependence theory (i.e., vulnerability), game theory (i.e., the core), utility theory (i.e., an expected value model), and network exchange theory (i.e., a graph theoretic power index). Each index offered unique predictions for power, and in 1992 an entire issue of *Social Networks* was devoted to comparing and

contrasting these approaches. In retrospect, the significance of this competition was to promote rapid theory growth, increased formalization, and the discovery of new phenomena.

Perhaps spurred by these advancements, modern theorists have identified numerous links between power and emotion, cohesion, and status. For instance, Lovaglia finds that power exercise often produces negative emotional reactions. In contrast, Lawler and associates have identified conditions under which equal power networks promote high exchange frequency, positive emotion, and a sense of relational cohesion. Thye (2000) offers a *status value theory of power* that anchors power, not in the structural conditions of networks, but in the culturally valued status characteristics that individuals possess. The theory claims that when exchangeable goods are relevant to the status (high or low) of actors, those goods acquire the same status value. That is, goods relevant to high status actors become more valued than they otherwise would be; goods relevant to low status actors become less valued. As with virtually all theories of power, the theory predicts that actors who possess less valued goods (i.e., the low status individuals) are at a power disadvantage. Tests find that high status actors have a power advantage over lower status actors, and that status value plays a crucial role.

practical knowledge

Nico Stehr

The assertion about the unique “complexity” or the peculiarly intricate character of social phenomena has, at least within sociology, a long, venerable, and virtually uncontested tradition. The classical theorists make prominent and repeated reference to this attribute of the subject matter of sociology and the degree to which it complicates the development of sociological knowledge. More specifically, the complexity of social reality has, it is widely argued, a most inhibiting effect on the production of powerful *practical* social science knowledge.

The assertion that social phenomena happen to be complex phenomena is designed to sensitize social scientists, from an epistemological perspective or in a more mundane sense, for the purposes of practicing their craft, to the kind of explanatory and methodological devices that are equal to the task of adequately capturing social reality. Thus, complexity means that a particular social process (e.g., exchange rates, unemployment, deviant behavior, etc.) are set in motion, reproduced, or changed by a multiplicity of interdependent factors and that it is most difficult to make a detailed and precise forecast about price changes, employment trajectories, or crime rates.

Any empirically valid representation, and therefore any effective and manageable *control*

of such a complex process, requires, according to this conception, a faithful and *complete* understanding of all the intricate factors involved and their interconnections. The alternative is to reconsider the notion of complexity, as an obstacle to practical knowledge, in quite a radical fashion.

Weber and Popper are among a few philosophers of (social) science who appear to be quite unimpressed with the familiar assertion about the intricate complexity of social phenomena. Popper is convinced that the thesis actually constitutes a subtle form of prejudice which has two origins. First, the judgment is a result of a meaningless and inaccurate comparison of circumstances; for example, of a comparison of limited and controlled conditions found in a laboratory and real social situations. Second, the thesis is the result of the orthodox methodological conception which demands that any adequate description of social phenomena requires a complete account of the psychological and material circumstances of all actors. Since humans behave in most situations in a rational fashion, Popper maintains, it is possible to reconstruct social interaction with the aid of relatively simple models which assume such rational conduct among the participants.

Weber, in his essay “Objektivität sozialwissenschaftlicher und sozialpolitischer Erkenntnisse” (1922), emphasizes that social science can only portray a fraction of the complexity of social reality and therefore cannot grasp it fully: “Every knowledge of infinite reality achieved by the finite human spirit is therefore based on the tacit assumption that only a finite *part* of it should be object of scientific inquiry and ‘essential’ in the sense of ‘worth knowing.’”

In addition, there are two further questionable premises of the orthodox position about the significance of capturing the full complexity of a specific social context in order to generate powerful practical knowledge. First, “mastery” and change of social conditions are not under all circumstances identical with and possibly based on the *complete* intellectual control of the complex origins and processes of social situations. Whatever control may be possible under given circumstances, such control likely is restricted to a few attributes of the context. Second, efforts to raise the theoretical complexity of social science knowledge may therefore

have the unanticipated effect of propelling such knowledge to an even greater distance to social action and its possibilities. Put bluntly, it is not the “scientificity” of social science knowledge (i.e., knowledge that captures the full complexity of social reality, conforms to specific methodological rules, or is expressed in a quantitative language) that ensures that such knowledge is practical.

Reflections about the conditions or constituents of practical knowledge have to start from the assumption that the adequacy (usefulness) of knowledge, produced in one context (*of production*), but employed in another context (*of application*), pertains to the *relation* between knowledge and the local conditions of action. Within the context of application constraints, conditions of action are apprehended as either *open* or *beyond the control* of relevant actors. Given such a differentiation, practical knowledge pertains to open conditions of action which means that theoretical knowledge, if it is to be effective in practice, has to be reattached to the social context in general and to those elements of the situation that are actionable in particular.

A brief example may serve as a first illustration. A rather common knowledge claim (at least, it appears to be central to a number of theoretical traditions within sociology) states that the degree of urbanization is closely related to the birth rate or the divorce rate. But such a knowledge claim clearly does not pertain, in all likelihood, to conditions that are open to action. Even very powerful politicians in a centralized state, concerned about a decline in the birth rate or an increase in the divorce rate and ways of affecting either rate in the opposite direction, would consider such a claim as highly irrelevant knowledge, since the degree of urbanization cannot be effected within their context of action. But that is not to say that the same context of action is void of attributes and conditions which are, in some sense, open and may in fact influence the rates under discussion.

Yet there is another way in which social science knowledge becomes practical, namely as knowledge that represents the becoming of social worlds. That is, a powerful but largely invisible effect of social science (as Michel Foucault and Helmut Schelsky among others remind us) is the impact it has on *interpretations*

of reality in everyday life and therefore the extent to which the self understanding of actors and the media in terms of which such convictions are expressed are shaped by social scientific conceptions.

Whether one is prepared to describe this process as a “social scientification” of collective and individual patterns of meaning may be left open. However, one might suggest that many of the current problems the social sciences face in practice are related to the fact that the self understanding of many groups and actors is affected, often in ways difficult to trace, by elements of social science knowledge. The empirical analysis of social problems by social science research then evolves into a form of self reflection or doubling of social scientific conceptions.

practice

Richard Biernacki

Practice is a rich if contested term on which sociologists converge when they endeavor to portray human action in its cultural and institutional settings. Concepts of practice highlight the influence of taken for granted, pre theoretical assumptions on human conduct.

Such covert assumptions embrace everything that is left out of economists' standard portrayals of intellectual calculations based on personal goals and known facts. For example, theorists of practice highlight the influence of bodily experience, practical know how, and institutionalized understandings of self and agency. Among the diverse theorists whose research has sustained this turn to practice are Garfinkel, Bourdieu, Foucault, Swidler, and Giddens. Their practice centered views of social life share three major themes.

First, thinking as situated activity. Thinking and feeling are not preparations for action, they *are* action – just as public, material, and situationally conditioned as other goings on. Classical social and economic theory once viewed thinking and feeling as mental processes separable from observable action. An invisible mind inside the person orchestrated in advance the actions to be observed from the outside. But as sociologists from the 1960s onward plumbed the life of science labs, hospitals, and other theaters of coordinated action, they concluded that individuals' thoughts are indefinable apart from the public protocols in which they come to expression. For example, the psychologist can scarcely define or reflect upon deviants without recourse to the routines for classifying and controlling them. Action is bound to the observable tools and tactics of a cultural setting.

Second, know how as the glue of actions. From the perspective of practice theory, it is not transcendent goals and values that link an individual's discrete acts together in a coherent life trajectory. As we know, a dancer cannot carry out the steps of a ballet by choosing each step as a means to an end. Instead, ingrained know how and routines for getting things done merge the steps from the very start into a coherent flow. Analogously, theorists of practice emphasize how know how anchors coherent lines of action across the career of an individual, or, for a group, across whole civilizations – even when the ends of action change for the individual or group. For example, after the religious ends of Protestant discipline faded in eighteenth century Europe, the ingrained know how of self asceticism continued to steer a whole style of life, from accounting to science and art. Practices define “truth.” The implicit assumptions by which we execute practices set

up a ground for ideology that is difficult to bring to awareness or to critique rationally. Practice theorists therefore emphasize how that implicit ground of knowledge comes to define the natural and real, including forms of selfhood. For instance, the practices of free market exchange in capitalist society seem to make the individual the ultimate unit of intercourse and consecrate the free will of the individual self as a reality of its own kind.

Third, what makes the operative assumptions of practice implicit and what keeps them that way? For practice theorists such as Bourdieu, who underscore our physical emplacement in the world, the answer is in part the nonverbal but a priori quality of corporeal experience. For practice theorists who highlight the uncertainties of any setting, such as Garfinkel, the answer is the inability to articulate fully how one puts general rules of the game to work in a particular setting. For practice theorists who emphasize the routinized qualities of much of our everyday life, such as Giddens, the answer is unreflective habit. Of these answers, that based on habit is perhaps least adequate, since it does not explain why custom remains implicit. With help from those outside sociology, practice theorists are reaching beyond study of the habitual. Historians such as Michael Baxandall have shown how unpredictable revolutions in the arts emerge from artists adapting old routines for new settings of action.

pragmatism

David L. Elliott

Pragmatism began in the United States of the 1870s, in the wake of the intellectual revolution touched off by Darwin, as a term for a method designed to clarify disputed, abstract intellectual concepts by defining them with reference to their concrete behavioral consequences. It later took on a broader meaning as the name for a comprehensive philosophical perspective which became widely known and influential from 1898 to its waning during the period of the Cold War. Nevertheless, the perspective continued to influence sociology throughout the twentieth century and into the twenty first, especially in the tradition of symbolic interaction.

A resurgence of research and interest in pragmatism, beginning in the 1980s and accelerating since 1990, has been seen in general sociology in the work of such authors as Hans Joas, Mustafa Emirbayer, Dmitri Shalin, and David Maines. The perspective's assumption of the social phylogensis and ontogenesis of humans, together with its antifoundationalism, fallibilism, meliorism, its view of nature as processual and relational, and its dissolution of the need for dualistic thinking, fit well with contemporary sociological concerns. Nevertheless, Eugene Halton's observation that symbolic interactionism (not to mention sociology in general) has not yet fully tapped the riches of pragmatist thought describes equally well the situation today.

A group of six Harvard graduates and scholars, having common intellectual interests in British philosophy and in the recent evolutionary work of Charles Darwin, organized themselves in 1871 into a discussion group that met regularly for about two years and came to be known as the Metaphysical Club. Three had

experience in experimental science (Chauncey Wright, Charles Peirce, and William James), and the other three were lawyers (Nicholas St. John Green, Oliver Wendell Holmes, Jr., and Joseph Warner, of whom Holmes and Warner were less active). Pragmatism was born out of the thoughts developed and shared by this group (Fisch 1986).

Peirce and Holmes, who would be the first to publish pragmatism inspired papers, were agreed that they learned the most from their senior associates Wright and Green. Wright taught them to think of the universe as contingent and indeterminate (later expressed by Peirce's concept of tychism), and Peirce referred to Green as the grandfather of pragmatism (with himself as the father) because of Green's persistence in arguing for the importance of applying Scottish psychologist Alexander Bain's theory of belief to their own work.

Bain had defined a belief as that for which a person is willing and committed to act, even in the face of considerable risk. For Bain, the opposite of belief was doubt, a state of confusion, uncertainty, anxiety, or frustration about how to act next. Peirce expanded on this theory of belief in his doubt belief theory of inquiry. Peirce maintained that belief breaks down and doubt ensues when the requirements of human organisms and those of their environment fall out of step with each other. Human doubt triggers inquiry, the goal of which is the "fixation of belief." In Peirce's hands, belief became defined as habit, or a disposition to act in a certain way under certain circumstances.

According to Peirce's pragmatic maxim, as expressed in its 1906 revision, the best definition of a concept is "a description of the habit it will produce" (quoted in Short 1981: 218). Concepts defined in this way are empirically testable, and a concept can be tentatively considered true so long as it passes all such testing. Hence, Peirce's pragmatic maxim is a part of his theory of inquiry. The maxim is also part of his semeiotic or general theory of signs, which was Peirce's crowning achievement and which became the linchpin of his entire philosophy.

Although Peirce was justified in calling himself the father of pragmatism, William James was the first to use the term publicly, in an 1898 lecture (published the same year) at the University of California. It would also be James whose

lectures and publications would popularize pragmatism and cause its wide dissemination throughout the world (Fisch 1986). However, James had already made his greatest contribution to the perspective in his 1890 *Principles of Psychology* because of the major influence this work would have on John Dewey and George Herbert Mead. In his *Principles*, James replaced traditional introspective, faculty, and associationist psychologies with a functional and processual psychology, in which the self and consciousness are seen not as entities but as functions that are actively engaged with the world (Sleeper 2001 [1986]).

John Dewey combined James's theory of the process by which logical forms emerge and change as products of concrete experience with Peirce's doubt belief theory in developing his own theory of inquiry. Henceforth for Dewey an empirical and critical method of inquiry (also referred to as the experiential method, the experimental method, the method of intelligent behavior, or the logic of experience) would provide the general model for philosophy and science. The foundation provided by traditional metaphysics, whether a priori, transcendental, or supernatural, is replaced by the test of experience in contexts of concrete problem solving. With Dewey and Mead, pragmatism as a procedure for clarifying the meaning of intellectual concepts expands into a general theory of inquiry that is applicable to all specialized areas of inquiry (including ethical inquiry and artistic work) and that explains how meaning in the broadest sense emerges (Sleeper 2001 [1986]).

Dewey undertook a special inquiry to discover the most general and irreducible traits of the natural world experienced by living organisms in and of that world. The resulting theory could serve as background assumptions and guiding principles for inquiry. Dewey identified five generic traits: the stable, the precarious, qualities (or the qualitative), ends, and histories. These traits and their interrelations are combined in the concept of the situation (or context), which always involves a transaction between an organism and its environment (Gouinlock 1972).

The use of the general term organism highlights the continuity of human behavior with that of other living forms and the continuity of the systematically reflective intelligence of

human science with human common sense as well as with the trial and error intelligence of the behavioral responses plants and animals make to their environments. Nevertheless, pragmatism focuses mainly on situations of the human organism and its cultures.

Dewey did not claim that the generic traits he identified make an exhaustive list. Instead, Dewey said that they are ones the neglect of which resulted in the principal dualisms of western thought, such as mind/body, fact/value, theory/practice, analytic/synthetic, a priori/a posteriori, art/science, affective/cognitive, individual/social, etc. Since the specified traits are drawn from an analysis of experience and are subject to experiential or empirical testing, social scientists as well as philosophers and all systematically reflective persons are called upon to test, critique, refine, and add to the list as the results of inquiry warrant.

The members of the trio Dewey, Mead, and Jane Addams (sometimes called the Chicago pragmatists) influenced each of the others significantly, and they shared a mostly common perspective. To date, Mead has received much more attention from sociologists.

RACE, GENDER, AND CLASS

Nancy Fraser (in Harris 1999) argues that Alain Locke, a student of James most widely known for his theories of multiculturalism and of the Harlem Renaissance, made a significant contribution to critical race theory in 1916 lectures published in 1992 as *Race Contacts and Interracial Relations*. According to Fraser, Locke offers "another pragmatism" through the greater role he gives to power, domination, and political economy in a sociological race theory that is pragmatist through and through.

Locke's analysis of race proceeds through three connected steps. The first step concerns so called scientific theories of race, usually biological or anthropological. These theories posit fixed, static, and "pure" races. They overstate variation between races while understating variation within races.

Locke's principal refutation of scientific racism occurs in the second step of his analysis on the practical and political conceptions of race. Locke argues that the political and economic

domination resulting from such imperialist practices as colonialism and slavery led to notions of racial superiority for which pseudo scientific explanations were formulated.

After having refuted the inherited race concept and having shown the invidious results of white supremacist practices, Locke argues in the third step of his analysis that the race concept should be reconstructed rather than being discarded. Locke's reconstruction of race consisted of two aspects. The first aspect was a civilization type with the characteristics necessary for a group solidarity that is not based on blood or ethnicity along with the characteristics required by modern institutions. The second aspect was a secondary race consciousness as a strategy for African Americans to promote racial pride and to use cultural means as part of the struggle to overcome racism.

In a more recent argument that Cornel West considered the finest defense for maintaining the concept of race, Paul Taylor (in Lawson & Koch 2004) laid out what he calls a pragmatic racialism. According to Taylor, pragmatism's practicalism, contextualism, pluralism, experimentalism, and social ontology allow us to think more productively about race.

Like Locke, Taylor describes race as a socio historical construction arising from the practices of white supremacy. Without the race concept, Taylor says, we would likely miss populations for which a common bloodline, identified through socially defined racial markers, is connected with a common social location and opportunity structure. The suggested conceptual substitutes for race, such as ethnicity, culture, and national origin, cannot be relied upon alone to identify such patterns of common outcomes. Despite the general, wide spread character of racial markers and outcomes, Taylor insists that race is the outcome of a particular history and that solutions to race problems must be tied to the conditions of individual situations.

While Dewey and Mead supported the work of their women students and freely acknowledged their intellectual debts to women, the acknowledgments were mostly made in prefaces, footnotes, popular journals, or privately. In the text of their major publications, they followed the professional convention of recognizing and discussing only male philosophers

and scientists. This was one type of sexist practice that led to the marginalization of women's contributions to pragmatism, a marginalization that Charlene Haddock Seigfried (1996) has worked to correct.

The very limited opportunities for women professors in early twentieth century American universities contributed to a gendered division of labor between theory and practice in early pragmatism. Most of the early women pragmatists wrote theory, most notably Hull House founder Jane Addams, but their major contribution was to put the theories of Dewey and the other male pragmatists to the test of practice and, through their practice, to influence male theory construction. For example, the women's practice in Dewey's Laboratory School had influenced and inspired Dewey's early theory of education as well as other areas of his thought. In turn, some of these women later founded and ran progressive, experimental schools designed around Dewey's theory. The women pragmatists exemplified the ideal expressed by male pragmatists of a unity of theory and practice, an ideal also widely shared by sociologists.

Addams, perhaps because of the high value she placed on inclusiveness, multiculturalism, pluralism, and what Mead called international mindedness, did not often theorize in explicitly feminist terms. Yet, she anticipated the thesis of Friedan's *The Feminine Mystique* (1963) in a more socially conscious way, and she also anticipated aspects of feminist standpoint theory (Seigfried 1999). Recently, Sullivan (in Seigfried 2002) argued for a pragmatist feminist standpoint theory that seeks to use Dewey's conception of objectivity to improve upon Sandra Harding's. In a related discussion, Gatens Robinson (in Seigfried 2002) drew similarities and differences between the respective ecological conceptions of objectivity of Donna Haraway and John Dewey.

The central and frequent use in classical pragmatist texts of such terms as scientific method, experimentalism, and instrumentalism has often led to interpretations of pragmatism as scientific and instrumental in the narrow sense. However, the early women pragmatists, recognizing the emancipatory potential of experimentalism, embraced it. For them, pragmatist experimentalism offered a justification to trust their own experience and their own judgment as well as a

means to evaluate problems and possible solutions without relying on the prescriptions of oppressive traditions and authorities.

Pragmatist experimentalism is democratic, including the values, ideas, and experiences of all parties affected by the problem prompting inquiry. The working methods of the women of Hull House exemplified the notion of experimentalism as community problem solving. These methods contrasted sharply with the growing detachment of social scientific methods and the top down, paternalistic practices of other burgeoning institutions of expertise. By living together in Hull House, amidst a mainly poor and immigrant neighborhood, the settlement workers were participant experimenters. Besides solving the particular problem at hand, a more general goal of the community engagement of the mostly upper middle class Hull House residents with the mostly lower class neighbors was to enlarge the selves of all parties through an enlargement of their experience. This goal reflected the core of the social ethical theories of Addams and of Mead.

Meera Nanda (2001) argued for the emancipatory potential of science in its broader pragmatist sense as a tool for improving the lot of India's untouchables by helping to overcome the cultural hold of India's caste system. She discusses in particular B. R. Ambedkar, a student of Dewey and a critic of Gandhi and the Congress Party for their paternalism and tacit Hindu acceptance of the caste system as natural. Ambedkar wrote on the parallels between pragmatism and the original Buddhist texts in terms of their naturalistic ontologies and their method of submitting knowledge to the test of experience. Toward the end of his life, Ambedkar led close to a million untouchables in renouncing their Hinduism and converting to Buddhism.

praxis

Susan Wortmann

Praxis is a term most commonly associated with the ability of oppressed groups to change their economic, political, and social worlds through rationally informed reflection and deliberate social action. As advocated and critiqued by contemporary theorists, the term itself is often loosely associated with the melding of theory to liberatory human action.

In classical sociological theory, praxis is connected with Karl Marx and his emphasis on the revolutionary potential of the proletariat. Interpretations of Marx's usage of praxis vary (see, for instance, Gouldner 1980, who discusses Marx's dual treatment of the term), but most associate a Marxist based praxis with societal transformation that involves a concomitant change in the proletariat's material activity, consciousness, and social relations. Hence, Marx is frequently quoted: "The philosophers have only *interpreted* the world, in various ways; the point, however, is to *change* it" (1978

[1844]: 145). Moreover, Marx and Friedrich Engel's *Communist Manifesto* lays out this theory and plan of praxis: the dual abolition of class and class exploitation in the forms of private property, the patriarchal nuclear family, traditional religion, and country and nation. At issue for Marx is holistic human and social transformation.

Contemporary theorists advocate praxis based solutions to end the subaltern status of many oppressed groups, including, but not limited to, the colonized, the poor, women, people of color, and gays and lesbians. For many, the institution of education is fundamentally linked to praxis. For instance, Paulo Freire's (1972) theory of praxis specifically offers Brazilian *campesinos* as a mechanism that combines reflection and action to transform a psychological, social, political, and economic legacy of imperialism and colonialism. For Freire, praxis is the act of creativity and social change achieved through the oppressed's own experience and the creative process of education: that is, acquiring and developing literacy and reactive responses to the ruling social and political structures. Freire's model of educational praxis is not realized in a "banking model," wherein students merely memorize and repeat "expert" knowledge. Instead, it is accomplished through a dialogic problem posing process in which the oppressed use their experiences and education to create new understandings. Hence, praxis and its ends are not preordained, but are, instead, a creative process of becoming. Like Freire, feminist bell hooks identifies the potential for active and transformative processes of education. It is hooks's declared oeuvre to interrogate and to critique systems of what she calls "Imperialist White Supremacist Capitalist Patriarchy," and to change them.

The above described renditions of praxis have their critics. For some postmodernists, for instance, praxis is solidly tied to a flawed Enlightenment project that erroneously connects liberation with rationality, thereby suggesting that a transcendent critic's body of knowledge should be privileged. Such critics question how enlightening happens, who facilitates it, and what actually changes as a result.

Contemporary sociologists continue to debate what role sociology and sociologists play in praxis. For instance, in 2005, both *Critical*

Sociology and the *British Journal of Sociology* devoted issues to international scholarly responses to American Sociological Association President Michael Burawoy's 2004 call for sociology as a critical public endeavor.

prejudice

Laura Jennings

Prejudice is the judging of a person or idea, without prior knowledge of the person or idea, on the basis of some perceived group membership. Prejudice can be negative, as in

the case of racist or sexist ideology, or positive, as in the case of a preference for a particular ethnic food, and can thus either help or harm a person so judged. Some writers, in defining prejudice, stress an incorrect or irrational component; others maintain that it is incorrect to do so because prejudice is often rooted in a quite rational self or group interest. Prejudice is often used synonymously with such terms as discrimination and racism.

Social scientists began to show great interest in prejudice in the early to mid twentieth century when anti immigrant sentiment was wide spread and often erupted in violence. Later concerns over fascism and the Holocaust fed scientific interest in prejudice. Psychologist Gordon Allport, in his seminal work *The Nature of Prejudice* (1954), described prejudice as the result of a normal – albeit emotion laden and faulty – psychological process of categorizing people into in groups and out groups. In groups are considered desirable and in possession of positive attributes, while out groups are seen as possessing negative or undesirable attributes and, thus, as appropriate targets for abuse. Allport noted the role of stereotyping in prejudice and discussed the acquisition of prejudice, its dynamics, personality types thought to be prone to prejudiced thinking, and possible ways to reduce prejudice, including legislation, education, and therapy.

Other works investigated further the idea of a prejudiced personality type, commonly known as the authoritarian personality, linking it with a tendency toward overly rigid thinking, acceptance of stereotypes, excessive conformity and submission to authority, discomfort with ambiguity, and highly conservative and/or fundamentalist beliefs. Uncomfortable with the linkage of prejudice and authoritarianism with right wing beliefs, other researchers attempted to show that those on the political left, too, could possess overly rigid thought patterns that might predispose them to prejudiced thinking.

STEREOTYPING

Stereotyping is thought to play an important role in the formation and maintenance of prejudice. Like prejudice, stereotyping involves the attribution of certain characteristics to a

person based on her or his membership in a particular group. Experimental and survey based studies have shown variously that prejudice and stereotypes are both remarkably resilient and subject to change over time in response to changes in social norms, that stereotypes can be based in either illusion or reality, and that stereotypes and prejudice can either overrule or be overruled by evidence to the contrary. Some research suggests not only that people seek with their behavior to confirm the prejudices to which they subscribe, but also that this behavior can actually elicit responses consistent with the prejudiced belief. For example, students believed by their teachers to be gifted begin to display greater ability in their subject than their fellow students, even if the students identified as gifted are so identified randomly by researchers. Similarly, people who believe that they are talking via telephone with attractive, outgoing members of the opposite sex speak with greater warmth and humor to their phone partners than do people who believe their fellow conversant to be unattractive and socially backward. The phone partners, in turn, respond accordingly, with those perceived to be attractive, humorous, and confident actually displaying those traits, and those perceived to be unattractive and introverted responding coolly and with reservation.

Prejudice and stereotyping have been shown to influence not only current behavior but also memory of past events; holders of stereotypes are prone to selectively remembering information consistent with the prejudices they hold. Furthermore, people are more likely to view negative behaviors as internally caused (i.e., through some personal or cultural flaw) if performed by those against whom they are prejudiced and externally caused if performed by members of their own group. Conversely, people credit positive behaviors by members of their own group to inner positive qualities, and positive actions by those against whom they are prejudiced as rare exceptions to the rule.

FORMATION OF PREJUDICE

Early theories on formation of prejudice in children stressed the importance of personality characteristics of parents, hypothesizing that

prejudice is the result of being reared in an overly strict and harsh home environment. Research, however, has shown that this is not necessarily true. Children from a very early age show an ability to categorize people into groups; they also show marked preference for some groups – especially the groups to which they themselves belong – over others. Moreover, children's attitudes do not appear to be entirely determined by the attitudes of their parents, which suggests that children are far from being passive receptacles for their parents' prejudiced views.

Herbert Blumer advanced the notion of racial prejudice as “a sense of group position” in which the words and actions of influential public figures establish a public perception not only of social group hierarchy but also of the positioning of one's own group relative to that of others. Blumer emphasized that feelings of superiority and identification of intergroup difference alone cannot account for prejudice; these must be accompanied by a sense of entitlement to certain resources or privileges and also by a sense that this entitlement is threatened by other groups. Attempts by oppressed groups to improve their social conditions are thus seen as threatening by the dominant group, which views these attempts as a rejection of the proper social order. Dominant groups are acutely aware of – and protective of – their superior social status, and prejudice flares when this status is questioned. Prejudice is thus not merely an individual ideology but a social phenomenon rooted in intergroup relations and arising from specific historical contexts. Blumer stressed that the formation of group identity, and thus of prejudice, does not take place in individual interactions but at an abstract level in the public sphere and is articulated most forcefully by widely respected figures in the public eye.

Blumer points out, as do other scholars, that prejudice is not only a way of identifying and denigrating out groups but also a powerful means of self definition of the in group in opposition to these out groups. Important qualities thought to be lacking in out groups are thus by definition thought to be possessed in abundance by in groups. Negative qualities attributed to members of out groups are overlooked or viewed as rare exceptions when exhibited by in group members.

As social scientists began to uncover the structural foundations of racism and sexism, interest in prejudice as a research topic began to wane. Focusing attention on the individual ideological aspects of prejudice was thought to divert attention from its even more harmful structural counterpart: institutionalized racial and sexual discrimination and violence. The uncovering of the racist and sexist practices of the state, of business, of the legal justice system, of commerce and real estate and employers, of science and systems of higher education, seemed to render the beliefs and behavior of individual racists and sexists trivial and insignificant. More recently, however, scholars are reemphasizing the importance of prejudice and the severity of its consequences; several prominent sociologists have urged that cumulative daily encounters with prejudice not be discounted in the rush to study structural factors. These writers encourage scholars to consider the impact of repeated experiences with prejudice at an individual level in conjunction with experiences of institutional racism and sexism. Both, they argue, are crucial in the formation of group and individual identity and in determination of the response – or lack of response – of victims of prejudice.

SUBJECTS OF PREJUDICE

Another current debate within sociology concerns new versus old forms of prejudice. Since the civil rights and women's movements of the 1960s, levels of racial and sexual prejudice have shown a decline by traditional measures. Some theorists maintain that this is evidence signaling that society is becoming less prejudiced. Others argue that the overt behaviors and vocabularies of racism and sexism have simply been driven underground by social pressures to be politically correct and that prejudiced ideology still flourishes in a more publicly acceptable new form. In terms of racism, this new form is sometimes described as aversive prejudice, in which people who score low on traditional measures of prejudice and antipathy toward out groups nevertheless display fear or discomfort at contact with members of out groups and so seek to avoid this contact. Another theory of a new form of prejudice is colorblind racism; colorblind

racists are those who view racism as a thing of the past and not something with which society ought to concern itself now. Proponents of a colorblind approach insist that those who wish to succeed can do so on their own merits and that to acknowledge race at all is to be racist. In this way of thinking, attempts to redress historical wrongs against non whites and females amount to current "reverse" discrimination against white males. Yet another theory, that of *laissez faire* racism, suggests that the new racists of today are characterized by protectiveness of their own group interest, their antipathy toward any kind of race targeted social programs, and their willingness to publicly condemn those who fail to achieve the American Dream. The *laissez faire* theory grew out of an earlier theory of symbolic racism; symbolic racism involved the substitution of ostensibly non racial vocabulary and symbols for the overtly racist rhetoric no longer considered acceptable.

All of these new theories are presented in contrast to old fashioned prejudice (often called Jim Crow racism), which had its roots in beliefs of the biological inferiority of non whites. The new forms, in contrast, are grounded in beliefs and rhetoric about the cultural inferiority of non white groups. Holders of the newer version of prejudice maintain that the unfortunate situation of the non white poor is their own fault. In these forms of prejudice, poverty and misfortune are viewed as pathology and the natural result of a failure to accept and conform to mainstream values. Those who do not succeed fail because they have simply not tried hard enough. The implication of such a view is that the dominant group has no responsibility to do anything to try to help members of less fortunate groups because the less fortunate are refusing to help themselves.

Because of the research linking prejudice to stereotyping and to various other traits such as conformity and lower levels of education, some social scientists have suggested education as a cure for prejudice. Others have suggested that prejudice arises from ignorance about the group(s) in question and hence that the remedy lies in increased contact between members of various groups. The theory in both cases is that access to new and better information can replace a flawed and harmful prejudiced thought process.

This contact theory, with its hypothesis that intergroup prejudice can be reduced by increasing the levels of contact between members of different groups, has been tested repeatedly, with mixed results. One such test was Sherif's 1966 summer camp study in which researchers first stimulated intergroup antagonism and then attempted, with some success, to reduce it. Other studies monitored the effects of school or neighborhood desegregation on levels of prejudice. In some cases, increasing contact between groups actually results in higher levels of prejudice, especially when the quality of contact is negative or when the contact situation is competitive in nature. Those situations in which contact does seem to result in lower levels of prejudice are those in which members of different groups have ample opportunity to interact in positive ways and to work together on cooperative tasks. Another essential element of successful contacts is that the participants are of equal status in the social situation(s) under study. The mixed success of this theory has left researchers seeking new and better ways to reduce levels of prejudice.

There is some evidence that, because stereotypes often have widespread social support, people's attitudes and prejudices are not likely to change unless positive individual interactions occur in a climate which encourages prejudice reduction. A vital component of such a climate is leadership support for change, and the willingness of authority figures to impose rewards and sanctions to further change. This suggests that leaders who adopt a color or gender blind approach, insisting that prejudice and discrimination are no longer problems, may actually help to preserve prejudice.

preparatory stage

D. Angus Vail

While George Herbert Mead never explicitly mentions this stage of development, many contend that he implies it in several of his seminal writings on the social, not biological, root of the self. According to Mead, the self arises from a process of interaction among one's consociates. As an individual develops a facility for language, he or she begins to understand the symbolic meanings of social objects and eventually develops the capacity to make him/herself into a social object. In Mead's model, children begin to show signs of developing a self when they learn how to play at the roles of important people in their lives. At this *play stage* they show elementary understanding of role taking, but their understanding of complex rules and subtle differences of individual positions in social settings is limited. As they develop more sophisticated understandings of social settings, they enter a *game stage* where they learn to take account not only of individual roles, but also of the abstract rules that make those divergent roles make sense in a given situation. Mead calls this set of rules the *generalized other*. The *preparatory stage* precedes these phases in the social genesis of the self, representing a stage of mimicry where a child, in essence, is preparing him/herself for the more complex, subtle, and sophisticated social tasks that are starting to become a part of his or her routine.

Children in the preparatory stage develop a capacity for mimicking the behavior of those with whom they come in contact on a regular basis. Thus, in this stage a child may "read" the Sunday newspaper with her parents even

though she knows neither how to read nor why the activity is important to her parents. Since the child has yet to develop the linguistic and social capacities for assigning meanings to social objects and/or activities, most would claim that this mimicry is not meaningful. It does, however, suggest a growing capacity to take account of social objects. While the child may not understand what a newspaper is, let alone why reading a Sunday newspaper is so ritualistically complex, she is showing that she understands that the activity is somehow important.

While preparatory stage behavior is not considered meaningful, it does lay the foundation for understanding role taking and the development of meaning. Children at this stage begin to learn that their activities generate responses from other people. While they are a long way off from being able to predict those responses, their behavior – and the reactions it generates – soon will lead to their developing a sense of their own independence and eventually to their own ability to make a social object of themselves.

In spite of the fact that Mead never explicitly discussed the preparatory stage in his essays on the sociogenesis of the self, the concept has become a staple in introductory texts and sociological social psychology texts as the first of the three stages of self development.

prevention, intervention

Franz Xaver Kaufmann

The terms "prevention" and "intervention" are used in many social sciences, from international politics to social work. They concern certain classes of intentional behavior by collective actors which are considered as interfering with given situations. Prevention means measures or actions to reduce potential risks, i.e., to hinder the future happening of certain kinds of damage, e.g., accidents at work, deviant behavior, or the spreading of contagious infections. Intervention, by contrast, means the interference with some actual situation or process in order to change the course of an ongoing problematic event "to its best." From an analytical perspective, both terms are rather equivalent: prevention in the ordinary sense means an interference in earlier stages of an assumed causal process than intervention.

Given the pervasive character of both kinds of actions, it is impossible to discuss here their implications with respect to specific fields of action. This is rather an attempt to specify their sociological character as a tool for reflecting on the operation of applied social sciences. Therefore, both terms are used here as concepts of a sociological observer interpreting actions of an actor pursuing defined goals in social situations defined by herself as problematic. The task of social science consists first in working out the implications of that very widespread form of social action. It has then to demonstrate the utility of such an inquiry.

There are three main fields of sociological inquiry related to the subject, namely, research and discourse about social problems, evaluation research, and political governance. For a long time, applied social science took for granted the definitions of social problems by certain ("focal") actors themselves and discussed only the means to influence or solve the problem. Meanwhile, the sociology of social problems has worked out the implications and contingencies of processes of the definition of social problems. In order to contribute valid knowledge for action, applied social science has to reflect the multiple perspectives of actors involved in a

process of intervention and to reconstruct itself the problem at stake and its issues.

Evaluation research began as the measurement of outputs and moved then to program evaluation. This paradigm supposed a technological understanding of intervention: the program was considered as a causal process introduced by an external authority pursuing certain goals. Evaluation then had to measure program effects, i.e., the changes observed in consequence of the introduction of a program were attributed to the program alone. This causal model of intervention makes sense in a laboratory, where the researcher has control over the whole situation and possesses standardized knowledge about the operation of intervening factors.

This model is not applicable to intervention in real life social situations, as the development of evaluation research has shown (Guba & Lincoln 1989). Compared to, for example, biochemical interventions, the bulk of social interventions are poorly standardized, and their "technological kernel" remains weak. The operator of the intervention cannot be left outside the conceptualization of the intervention process. Social intervention implies focal actors, their aims, resources, and relationships to the field of intervention, not only their action. Social intervention is directly or indirectly a process of interaction between the intervening actor and selective, reacting persons, whose perceptions and interests are mostly unknown to the former. Moreover, the target persons of an intervention live in circumstances and opportunity structures which can never be wholly controlled or kept constant by the intervening actor. The measurable changes of, for example, the behavior of target persons may be attributed to the intervention or to other changes in their situation.

Research on social intervention becomes therefore a more complicated task than the measurement of program inputs and outputs, the operation of the program remaining a "black box." The research design has to include:

- 1 *Relevant properties of the intervening (focal) actors:* What is their authority? Their problem? How do they define the situation? What are the resources and instruments at

their disposal? In short, what are their programs or models of problem solution? Moreover, focal actors are usually not individuals but collective, especially corporate, actors. In the case of corporate actors, a division of labor takes place so that intervention becomes a multistep process coordinating diverse operations, i.e., a process of governance.

- 2 *Relevant properties of the target persons or addressees:* How do they perceive the intentions of the program? Does it meet *their* problems? Have they competencies to resist the intervention or to use the operations of the program for other purposes than those intended by the focal actor?
- 3 *Relevant properties of the field of intervention:* What other factors contribute to the situation deemed problematic by the intervening actor? To what extent does the focal actor depend on third parties for affecting her program? Are the target persons isolated or may they interact? Are there in the field institutions shaping opportunity structures which may divert the operation from the aims of the program? To what extent is a program in accordance with value orientations shared by institutions and actors in the field?

Though not every one of these and related questions may find clear cut answers in a research situation, the different approach to an experimental design is evident. Especially in the case of complex multistep interventions (such as the introduction or modification of a policy), this kind of inquiry sensitizes researchers to the pitfalls of naïve quasi technological programming. The aim of intervention research is then not only the evaluation of outputs but also the inquiry into the processes of governance operating a program, as well as into the conditions for its implementation.

Such a program of research is not very promising for generalized knowledge. If each problematic situation and the operation of social intervention is unique, how can professional knowledge emerge? In fact, the results of evaluation research and of implementation research have not thus far proved to be particularly suitable for establishing generalized knowledge.

Professional knowledge is related not to the concept of intervention but to the institutionalized fields of action. For economists, the tools of economic policy are rather well known, and they may even be able to distinguish among the conditions under which such tools are promising. Nevertheless, even the practice of economic policy is not a science but an art in the Aristotelian sense. Its success depends on a capacity of diagnosis and a feeling for the peculiarities of a situation. This is even more true for fields of action where the impact of institutional structures and the functions of utility are less clear and where there is less “technological” knowledge available than in the economic field.

“Prevention” and “intervention” are useful as sensitizing concepts. They reconstruct political or social action so as to make us aware of their intricacies. To be sure this may not be helpful for quick decisions, but this has never been the task of social science. Applied social science may become useful in this context insofar as the sociologist is involved in the processes of planning and implementing an intervention as a kind of participant observer using tools of sociological observation and continuously providing evidence about the operation of a program. Social interventions are seldom effective without continuous processes of learning.

Though intervention may be openly hostile (e.g., in foreign affairs or in a criminal situation), discourse about social or sociopolitical intervention normally presumes it to be in the primary interest not of the intervening actor but of the “beneficiaries” of the intervention. From a humanistic point of view, this “reformist” cultural orientation merits being taken seriously. The “goods” which may be provided through sociopolitical intervention are of four kinds, and it is possible to organize “technological” knowledge about intervention following these four dimensions of social participation or inclusion:

- *Status, especially rights:* The basic condition of social inequality consists in the inequality of rights or of the opportunities to claim one’s title. Legal intervention aims at securing the rights of the weaker actors. This may happen on different levels of social action, from governmental initiatives to the legal aid by social work.

- *Resources, especially money:* In capitalist societies, self sufficiency has become marginal; everyone depends on income. Economic intervention aims at securing the means of life for those excluded from sufficient market income. Again this form of intervention begins with governmental institution building and ends with cash in the hands of the needy.
- *Opportunities, especially infrastructure:* Social inequality has not only a socioeconomic and cultural but also a spatial aspect of access. Opportunities (e.g., for work and leisure, for health and education, for mobility and administrative access) are distributed unevenly in space, usually favoring those who are better off in the other three dimensions. Interventions to improve local settings follow their own rules and depend particularly on local organizations and the given circumstances in place.
- *Competencies, especially personal services:* It is well known that competent persons tend to succeed in adverse circumstances. The enabling of persons is therefore the most promising way out of problematic situations. "People processing" operates mainly on the level of interaction and depends on both professional knowledge and empathy.

To be sure, improvements of the situation of socially disadvantaged people need interventions in several or all of the dimensions just mentioned.

Prevention intends to ban risks before they become actual. From an action point of view, one may distinguish two kinds of preventive measures: those influencing conditions and opportunity structures in order to minimize the frequency of risk, and those influencing persons, their resources and competencies, to cope with risky situations. From the actor's point of view, preventive seems preferable to corrective intervention. From the perspective of a sociological observer, the situation is more complicated, however.

Preventive action presupposes the idea of a coherent chain of events which can be interrupted at various points. One can prevent a risk or damage only if one can control its causes. In the physical world, appropriate knowledge is often available and follows the laws of simple

or probable causality. In the social world, such knowledge is – if available at all – incoherent and fuzzy. Normally, several factors, not just one, may influence the emergence of risk with unknown probabilities. The contingency is higher as potential risk is more remote from actual damage. The preventive control of specific factors therefore remains uncertain and may have additional undesirable side effects. Preventive measures thus have to be assessed for alternative consequences. A somewhat general improvement of the situation may often be preferable to targeted measures.

primary groups

David L. Elliott

Cooley (1909) coined the term primary group to denote intimate, comparatively permanent, and solidary associations of mutually identifying

persons, and a century of sociological research has increased our understanding of primary groups in their variety of forms and multifaceted, contingent functions. According to Cooley, primary groups are primary in the sense of providing the first and (because of the greater openness and pliability of children) the most important socialization. The most important examples he cited in this sense are the family, children's play groups, and the neighborhood or village community.

Primary groups are also primary in the sense of being the source out of which emerge both individuals and social institutions. Cooley agreed with George Herbert Mead that the self and its ideals emerge out of such primary relations. As examples of social institutions, Cooley cites democracy as an outgrowth of the village community and Christianity as an outgrowth of the family.

These groups are primary in the additional sense of providing primary human needs such as attachment, security, support, and recognition. Since these needs persist in some forms and to some degree throughout the life cycle, primary relations never cease to be important. In Cooley's conceptualization, a primary group instills feelings in its members of sympathy and identification with the group, its goals, values, and members. All that is distinctively human is a product of this feeling of a "we," which constrains but does not eliminate people's animal passions of greed, conflict, and so forth.

Classical sociologists (in the period roughly from 1890 to 1920) focused most of their attention on the rise and consequences of modernity, which they theorized as a general historical trajectory moving from the predominantly primary relations of primitive and feudal communities to the predominantly formal, rational, secondary relations of modern, urban, industrial societies. For example, Tönnies contrasted *Gemeinschaft* (or village community) relations with *Gesellschaft* (or societal) relations, Durkheim contrasted mechanical with organic solidarity, and Weber saw modern western history as a process of ever increasing rationalization.

The problem that engrossed the classical sociologists was how to maintain or recreate the recognition, solidarity, and support provided by primary relations and required for the health and flourishing of individuals within the increasingly

impersonal, formal, and rationalized environment of modern societies, while at the same time preserving the instrumental advantages of modern institutions. Some of these concerns have been resolved by subsequent research (e.g., Granovetter 1983; Freudenberg 1986).

In a number of organizational, political, and community studies of the 1940s and 1950s, primary groups were not the intended object of study, but were found to provide the intervening variable required for an adequate explanation of the phenomena behind the data. In their "Yankee City" studies, Lloyd Warner and colleagues expected income, neighborhood, and family variables to explain social mobility in the town. They found that the process of social mobility was largely mediated through membership in face to face primary groups they called cliques. The cliques were second only to family (another primary group) in explaining social mobility in the town.

Stouffer and colleagues' 1949 study of American soldiers and Shils and Janowitz's 1948 study of German soldiers in World War II found that soldiers' morale and motivation to fight were explained more by the loyalty, solidarity, and mutual protection and identification they felt for their fighting unit than by personal loyalty to national symbols or national war goals.

Lazarsfeld and colleagues in 1948 found individuals were influenced in their voting decisions by members of their primary groups that the researchers called "opinion leaders." Katz and Lazarsfeld (1955) found that the mass media influenced individuals through the mediation of opinion leaders belonging to one of an individual's primary circles. These mid century studies led to the widely shared proposition that a formal organization's effectiveness depended on the integration of its informal (primary group) structure with its formal structure.

Eugene Litwak was the primary user in sociology of the traditional primary group concept from the 1960s to the 1990s. According to Litwak, technological changes such as in communications and transportation lead to structural changes in existing primary groups and to new, more differentiated forms of primary groups. Litwak and colleagues expanded upon organizational contingency theory in their task specific model of social support, in which the task requirements of the whole variety of

primary human needs are matched to the specific primary group structure or formal organizational structure able to satisfy a particular need most effectively and efficiently. Litwak's research and analysis illustrates when and how tasks traditionally performed by primary groups can be performed by formal organizations and vice versa.

From the 1970s to the present, social network theorists such as Mark Granovetter and Barry Wellman have contributed significantly to the sociological understanding of the interrelations and functioning of primary and secondary relations. Granovetter (1983) conceived of a social tie (within one or more social networks) as varying in strength as measured by the tie's duration, its emotional intensity, its degree of intimacy, and its type and intensity of reciprocal services. Strong ties are characteristic of primary groups or primary relations, and weak ties are characteristic of formal organizations and work relations in less formal settings. Granovetter asserted that weak ties are important for social integration. Strong ties alone lead to societal fragmentation.

primate cities

Michael Timberlake

A primate city usually refers to a city that is disproportionately large in terms of population size relative to other cities contained within a given geographically bounded area, such as a region, a nation, or even the globe. Occasionally, other qualities of cities than relative population size are used to identify primacy, for example, indicators of the relative concentration of important organizations, such as headquarters for leading corporations. While the term is often applied to cities considered excessively (and pathologically) large, this is not technically appropriate. In fact Jefferson (1939), who first used the term, argued that primate cities play an important generative role with respect to national development.

The closely related concepts of primate city and urban primacy are rooted in theoretical approaches to urbanization in geography and sociology's human ecology that are about "central places" and "city systems." From these perspectives, a system of cities emerges historically when economic relationships among locales are first established and then elaborated. For example, once isolated locales may become interlinked through trade. Over time, such exchange relations lead to increasing interdependence among the locales as economic competition induces specialization. Locales specialize by providing a home for producers of the goods and services that are in demand and that they can produce and deliver more efficiently than those in other locales within the system. Cities that host the most efficient producers of the most desired goods and services become relatively dominant economically and politically, and this should be reflected in the relative population sizes of cities in a given system of cities. Hawley

(e.g., 1981) argued that cities in which were located the “key functions” of the particular territorially circumscribed economic system become the dominant cities in that system.

Urban primacy is operationally defined variously by comparing the population size of the largest city to the population in one or more other cities in the same system. Often it is measured in terms of the shape of the size distribution of cities which are included in a purported system of cities, with an understanding of what constitutes a normal distribution. The notion of normalcy in a city size distribution is based on the same theoretical approaches to systems of cities. These assume that in an economically “healthy” system of cities, exchanges among cities will be relatively free, and this will lead to a lognormal distribution of the cities’ population sizes. Clearly underlying this understanding, but almost always remaining unstated, is the assumption that capitalist markets, including labor markets, operate relatively unfettered, and, therefore, the benefits of development will “trickle down” the urban hierarchy from the primate city to the other, subdominant cities that are spread across the region in question.

In a lognormal city size distribution, the second largest city will be half the size of the primate city, the third largest city will be one third the size of the primate city, and so on. (Though at some point down the hierarchy, there may be many cities of about the same population size.) This definition of normalcy is known as the “rank size rule,” and was put forward by Zipf (1941). Scholars have proposed different measures of the degree of urban primacy. One, proposed by Davis (1976), uses the ratio of the size of the largest city’s population to the total of the sum of the population sizes of the four most populous cities. Walters (1985) uses the assumption of lognormalcy to propose a measure of urban primacy that is tied to deviations from lognormalcy, where increasingly positive numbers indicate increasingly high levels of urban primacy, i.e., the primate city is increasingly more primate relative to the standard of a log normal city size distribution. Increasingly larger negative numbers indicate flatter city size distributions; these are city systems in which the leading cities are more similar to one another in terms of population size (or whatever other

attribute is being used as a standard of urban primacy) than would be predicted on the basis of the rank size rule. Yet most empirical studies use cruder measures. A rare recent study of the causes of urban primacy uses the proportion of the urban population living in the most populous city of a country as a measure of the degree of urban primacy (Ades & Glaeser 1995).

Most research on urban primacy has defined the city system at the national level. Studies have shown that, in general, higher income countries tend to have city size distributions that are closer to the rank size rule than lower income countries, and in many of the latter, abnormally large primate cities are not unusual. For example Bangkok, Thailand is many times larger than the second largest city in the country, and Mexico City is nearly nine times more populous than Guadalajara. However, London and Paris are also significantly larger than the rank size rule would predict, while the city size distribution in the United States is less primate than the lognormal standard. Nevertheless, most cases of extreme urban primacy are in the low and moderate income countries of the periphery and semiperiphery, most prevalently in South American countries, rather than in wealthy, core countries. Thus, in the context of development studies, high levels of primacy are thought to be indicative of poorly integrated systems of cities, which means poorly integrated national economies – a form of socioeconomic “dualism,” or disarticulation, that not only signifies developmental problems for the national or regional economy, but also serves as an impediment to successful socioeconomic development. Abnormally large primate cities – cities far more populous than would be expected on the basis of the lognormal distribution – are said by scholars to indicate a poorly integrated national or regional economy, one in which developmental advances in the primate city lack mechanisms to “trickle down” the urban size hierarchy and across the country or region. In fact some scholars have argued that such primate cities are “parasitic” with respect to the national economy, sucking resources from the rest of the country and providing little in return. It is this apparent correlation between excessive urban primacy and underdevelopment that is responsible for the preponderant pejorative view of the primate city.

Geographers and sociologists have suggested several possible contributing factors underlying the emergence and persistence of such primate cities at the national level. These include political, economic, geographical, technical, historical, and global factors. For example, some have argued that in many low income countries state policies are biased in favor of urban areas in general, and the leading city in particular. Thus the largest city in the country, often the capital city, receives a disproportionate share of central government expenditures for social and economic infrastructure. This results in greater opportunities for employment, housing, education, and health care, creating a "city lights" effect and making these cities more attractive destinations for migrants from rural areas as well as from other, smaller cities than they would otherwise be. This understanding emphasizes the role of demographic factors in sustaining the primate city, and relates urban primacy to the broader phenomenon of "hyperurbanization" or "overurbanization." In some cases the primate city represents a relatively modern enclave in an otherwise "backward" economy, isolated from the rest of the country by poor transportation and communication linkages with the rest of the country, which, in turn, keeps it from developing the kinds of healthy economic exchanges that would occur in an integrated economy. Thus, in the extreme, the primate city is seen as a hallmark of the disarticulated national economy. Along these lines, some have suggested that the primate city is often a concomitant of internal social and political inequality, particularly in countries in which geographically distinct ethnic groups are the winners and losers in struggles for political power, with the winners implementing policies that favor "their" region and the leading city therein. This may exacerbate these cities' levels of primacy by making them more attractive destinations for migrants from rural areas and from relatively disadvantaged secondary cities.

On the other hand, some scholars have identified the primate city as an outcome of colonial and neocolonial economic and political relations. This seems evident when the primate city was the administrative headquarters of a former colonial power, maintaining, after independence, stronger ties with the former imperial country than with its own national hinterland.

Dependency theorists argued that such cities served as siphoning points in the asymmetrical flows of wealth out of former colonies or neocolonies back to the "metropole," thus contributing to the "development of underdevelopment" (Frank 1967). This approach to the primate city led to framing other aspects of urbanization in terms of theoretical perspectives sensitive to international or global relations of power, such as the world system perspective on social change. Since the mid 1980s there has been considerable research relating various aspects of urbanization, including primate cities, overurbanization, and world cities, to what is sometimes called world system theory.

The bulk of the research and theorizing on the effects of urban primacy has focused on excessive urban primacy relative to "normal" urban primacy (e.g., the rank size rule). Few have discussed the implications of unusually "flat" city size distributions in which the leading cities are similar to each other in terms of population size. An exception is Chase Dunn's (1985) very long term study of the global city size distribution, which shows that it has become alternately flatter and more hierarchical (i.e., more lognormal) in response to historically conditioned changes in the world system. For example, when the capitalist world system emerged in the seventeenth century, the city size distribution became more hierarchical with consolidation, integration, and the emergence of a hegemonic core power. But during periods of declining hegemony and corresponding increased rivalry among core powers, the world city size distribution became flatter.

In spite of considerable theoretical conjecture about the causes and consequences of excessive urban primacy, systematic research has provided little in the way of conclusive evidence in support of a particular approach. A fair conclusion from the research seems to be that excessively primate cities emerge from a variety of conditions associated with disarticulated or uneven development in nations (or regions), and that cases of extreme primacy serve as obstacles to achieving balanced regional economic development. Policy solutions have focused on creating alternative "growth poles," where investments in social and economic infrastructure are to be redirected in an effort to boost development in locales other than the primate city but at the

same time providing integration (e.g., by improving transportation and communication linkages) with each other and with the primate city. Such policies can be seen as efforts to create balanced development by attempting to build a healthy system of cities.

There has also been a tradition of scholarship on primate cities emphasizing their problematic qualities as places to live, particularly with respect to low income countries. Rapid population growth, overcrowding, strained infrastructure (including health, education, housing), and even political instability have been themes in the literature on the primate city. However, in recent years, with the remarkable growth in the population sizes of many of the world's largest cities, some within the same country, this line of scholarship has been subsumed under the rubric of "megacities." The megacity literature considers the livability and sustainability of the world's largest cities quite apart from the consideration of systems of cities in which the study of the primate city is embedded theoretically.

Also in recent years, the study of systems of cities has gone global. Scholarship on urbanization has produced a spate of work on "world cities" and "global cities" that theoretically frames the study of the world's great cities as an interrelated system of cities. Some of this research has involved ranking cities in terms of attributes that are theoretically related to their relative importance in the world system of cities. These attributes include indicators of the extent to which each city is an important site for operations of globally powerful firms, such as the top firms in finance and insurance. Similar studies, using formal network analysis, have identified global city hierarchies over time on the basis of each city's role as destination or point of origin in air passenger travel.

The recent research on the primate city per se seems to be primarily about managing urban growth so as to achieve balance across a region or nation, with the goal of implementing policies that promote growth in relatively lagging areas of a nation or region, whereas many of the other concerns that originally gave rise to interest in primate cities are addressed under new rubrics, including megacities, world cities or global cities, and world city systems.

primates and cyborgs

Amanda Rees

Where the figures of the primate and the cyborg appear together, they are ineradicably associated with the work of the American historian of consciousness Donna Haraway. Representing utterly different clusters of form, meanings, and demonstrations, the two images share at least one distinct function: they are literally literal figures, to be found on the category edges, both enacting and transgressing the boundary between nature and culture, body and machine,

human and animal. But their significance is not merely to be found in their presentation as a persistent reproach to the philosophical dualisms that have characterized western culture. Both figures invoke politics as well as philosophy, exhibiting and intimating the ways in which politics is implicit in one's philosophical position, and one's political philosophy represents the active choice and creation of a sense of social and cultural identity. In some ways, the primate and the cyborg represent opposite ends of the range of Haraway's understanding of the thematic and practical possibilities for humanity's imagined future, and as such, a consideration of layered meanings that underlie these iconic emblems can be used as a means of accessing and interrogating her wider theoretical project.

The figure of the cyborg came to wider public notice in the "Manifesto for Cyborgs," which appeared in the *Socialist Review* in 1985. This piece was produced and published during the early Reagan years, a period in which American political attitudes toughened both internationally, with the intensification of the Cold War, and internally, with the introduction of hardline neoconservative social and economic policies. The "Manifesto" was an attempt by Haraway to tell a number of different stories, a series of fables or legends, that could allow for an escape from the politics of dualism and would enable socialist feminists to develop new ways of thinking about society, politics, science, and war. At the heart of this ironic parable was the figure of the cyborg. Haraway did not invent the term: according to her account, the neologism originated with the work of Manfred Clynes and Nathan Kline, who used it to refer to the "*cybernetic organism*" that would have to be created if humanity was to explore and to colonize extra terrestrial environments. At the moment of the word's inception, then, it was profoundly implicated not just in the nature of the boundary between "man" and "machine," but in the wider politics of the Cold War era and the persistent and profoundly non prescient presumption that the coming decades would see the unproblematic adoption of technoscientific strategies as the key elements in the pursuit of human happiness and security. For Haraway, the cyborg was the figure that could stand as a symbol of her critique of contemporary politics.

A being that was both animal and machine, but neither bisexual nor gendered, neither innocent nor guilty, would enable one to demonstrate the nature of the breakdown of identity and identity politics and the realignment of both globalized and domestic social relations as a result of technoscience revolutions – and in particular, to demonstrate the consequences of these developments for women. Having shown the extent to which situated identities had shifted as high technology made it harder to maintain the old dichotomies of hierarchical domination, replacing them with the authoritative informatics of the command–control–communication intelligence characteristic of the developed military industrial society, she further developed her account of the meanings and significances of the cyborg in a 1992 article, "The Promise of Monsters."

Far more than the "Manifesto," this article represented a sustained attempt to show how the figure of the cyborg could be used to illuminate different networks of social, political, and technological relationships. "Promise of Monsters" is presented as a mapping exercise and as a series of demonstrations that the power to speak, or to speak out, is not restricted to particular positions or roles, but can depend on the destabilization of such positions. In this article, Haraway uses the notion of the cyborg as a means of moving through art and literature, science and advertising, protest and practice, to show how presumed analytical border lines can become front lines in the struggle to understand and so to avoid the structures and technologies of domination that underlie much that is taken for granted in the cultures that surround us. Much of this work turns on the idea that contradiction and confusion are in fact the only safe places from which to begin the reconstructions of identity that would enable the escape from the dialectics of dichotomy. Only by attending to the chaotic, enculturated circumstances of each border crossing – each encounter between the individual and the Other, nature with culture, body with machine – can one hope to move beyond dualisms and approach an understanding of a much messier, context laden, contradictory version of biopolitics, where the nature of authority and the authority to speak of nature are simultaneously intertwined and in opposition.

Similar themes within a different series of perspectives are illuminated by the figure of the primate, which appeared within Haraway's work at much the same time, and sometimes in similar places, as did the cyborg. Unlike the cyborg, however, the primate was much more evidently situated within particular examples of scientific practice – specifically, the history of primatology, or of human encounters with the non human primates. Haraway cast her explorations of primate convergences firmly within the context of the interrogation of the relationships and boundaries that could be shown to exist between nature and culture in the late twentieth century, using primate investigations as a means of illuminating the ways in which the broader themes of western culture – race, gender, ethnicity, class, nationality, and sexuality – had been and were being written into and onto nature. Primates, known to be the closest living relations of humanity, could be shown to occupy the trading zones, the transit zones between nature and culture, and depending on the location of the observer, could reveal either the naturalness of culture, or the enculturation of nature. It all depended on which standpoint one looked from, in which direction, and where one chose to focus one's gaze.

When the scientific investigations of the lives, the societies, and the psychology of the non human primates began in the early twentieth century, they were explicitly presented as a means by which humans could come more closely to apprehend the nature of their own biological history and the capacities and limitations of human nature itself. That is, the non human primates were not necessarily being studied for their own sake, but in order to advance our understanding of humanity itself. Some elements of human behavior that appeared central to the definition of humanity itself were difficult, if not impossible, to study in humans. The origin of language or of social life could not be directly observed in the laboratory, and to attempt to produce them in the laboratory using human subjects was clearly impossible – both the ethical and the practical problems were formidable. Additionally, since human relationships simply did not exist in the absence of a shared culture, it was deemed difficult to

investigate human nature in a way that would not be confounded by such cultural expectations. Initially, some scientists had turned to what were considered to be more primitive versions of human cultures – those societies that had come under progressively greater European imperial control during the nineteenth century – but decolonization and a more historicized understanding of the development of, for example, hunter gatherer society made this approach difficult, if not impossible, to sustain. However, the close relationship between humans and non human primates, which had been recognized long before it was possible to measure the amount of DNA shared between species, meant that the behavioral strategies and mental capacities of the other primates would probably be similar to our own – but would be expressed in a much simpler way, since the biological signal would be free of the cultural noise.

Since this was the intention, it is ironic in the extreme that the work of Haraway and other writers such as Pamela Asquith, Shirley Strum, and Linda Fedigan should so effectively have demonstrated the extent to which the study of primatology and the image of the primate are hopelessly impacted with encultured expectations of the human, the non human, the natural, and the social. Asquith's work was based on a comparison of the Japanese and the western styles of studying primates, and she was able to show that the accounts of primate social life emerging from these distinct traditions bore a close resemblance to the cultural expectations of appropriately socialized behavior in the different national contexts. Strum and Fedigan, primatologists themselves, successfully illustrated the ways in which the concerns of westernized primatology shifted over the decades following World War II in accordance with wider cultural shifts concerning the role of women, the practices of politics, and the shifting line being drawn between human and animal intelligences over the course of that half century. Haraway's impressive survey of the field (*Primate Visions*, 1989) allusively and elusively indicated the ways in which the study of primates over the course of the twentieth century was thoroughly embroiled and implicated in attempts to define and to demarcate something that was shaped by so

many dimensions as to refuse distinction: nature both produces and is itself produced by culture, and the attempt to resist the imposition of this fundamental natural/cultural duality is what lies at the heart of Haraway's wider project.

Like the cyborg, the primate is used by Haraway to demonstrate the extent to which the dichotomies, the demarcations, and the distinctions that have been at the heart of the western apprehension of the world have either become, or are becoming, unsustainable. Whether the perspective is philosophical, political, or personal, if one is to reach a fuller understanding of the range of relationships that can potentially exist within the world, then nature cannot be opposed to culture, female cannot be opposed to male, society cannot be opposed to science. Primates in particular are used to illustrate the ways in which science and society are categories artificially imposed on an incoherent cultural landscape: understanding primatology requires attention and sensitivity to the role of gender, the specificities of the animal-human relationship, the politics of science, of art, culture, practice, and institution. It can be understood as trading zone, a hybrid zone, an implosive zone, especially perhaps a transitory zone – but simultaneously as a place where real events occur, where practice becomes theory as theory is enacted.

The primate and the cyborg are not the only creatures (real and chimeric) to play these roles on Haraway's analytic stage. She has alternatively adopted such figures as the coyote, the modest witness, the vampire, the white rabbit, the trickster keyboard, and the metaphorical mirror – but in the recent past, the concept of the companion animal has come to loom large in her work, and to bear comparison with the earlier boundary figures. Like the primate and the cyborg, the companion animal represents a blending of nature and culture, lying on and therefore crossing the boundary that is so elemental to the socialized westerner's understanding of the world. In a sense, dogs have replaced cyborgs in Haraway's work, since where cyborgs represented individual beings, the idea of a companion animal requires that beings must by definition be in a relationship. Rather than humans domesticating dogs for

protection, for hunting, and for herding, it is possible to regard the relationship as co constitutive: dogs and humans evolved together, and each had a role to play in the creation of each other. We specify breeds of dog in the same way that humans used to specify race, with a similar lack of genetic support for the idea of purity or separation – dog breeds, like human races, represent both morphological reality and historical contingency and consequences. Although Haraway's account remains fragmentary, like the earlier primates and cyborgs, companion animals – or companion species, which is an even wider acknowledgment of potential moral community – demonstrate the analytical fluidity of categories thought to be concrete.

primitive religion

Peter B. Clarke

The evolutionary character of theories of primitive religion is present in the sociological literature from the beginning. It is evident, for example, in the writings of the so called founding father of sociology, Auguste Comte (1798–1857), who believed that religion originated in fetishism or the worship of inanimate things, then developed into polytheism which in turn developed into monotheism (Comte 1853). The view that religion evolved from polytheism to monotheism is, of course, much older than the formal beginnings of sociology and anthropology as academic disciplines. It is present in the Scottish philosopher David Hume's *The Natural History of Religion* (1759). The nineteenth century theorists – they would today be classified as armchair anthropologists and sociologists – most closely associated with the construction of the concept of primitive religion were less concerned about religion per se and its nature and more about finding proof with which to discredit the so called higher religions and in particular Christianity. Their intention was to discover the origins of primitive religion or religion in its most basic or elementary form in order to show that it was profoundly mistaken and arose from ignorance or some emotional need and that the so called higher religions which derived from such erroneous ideas and behavior did not therefore merit the assent and commitment of rational and emotionally mature and balanced people. In fact, religion held society back.

Among the better known of the nineteenth century theorists of primitive religion was the Orientalist and authority on mythology Max Müller (1823–1900) who claimed (1893) that religion was grounded in an intuitive sense of the divine which everyone possessed and which was awakened by the wonder and power of nature. Religion began in this way as metaphor and symbol and eventually the natural objects that evoked thoughts and feelings of the infinite were personified as gods in their own right. Others like the sociologist Herbert Spencer (1820–1903), who defined progress and the development of the heterogeneous out of the

homogeneous, maintained that religion began with ancestor worship, or more precisely with belief in the continued existence of the souls or ghosts of remote ancestors which in time were deified (Spencer 1901–7). The process of deifying ancestors exists in many societies, including the Yoruba society of southwestern Nigeria, but there is no evidence that the religion of these people began in this way. Spencer then asserts that the notion of soul or ghost developed into that of god or divinity. Thus, it is assumed without any supporting evidence that the notion of ghost is the first ever notion of divinity devised by humans.

The anthropologist Edward Tylor (1832–1917), whose main interest was in the evolution of society and its institutions, opposed theories of religion that reduced the phenomenon to the psychological immaturity of early human beings, and sought to base his own theory on reason, hence the description of his approach as intellectualist. Like Spencer, Tylor also traces the origins of religion to the development of the idea of the soul, which he contended originated in dreams. So called primitive people were alleged to believe that the soul left the body during sleep and actually experienced what they had been dreaming about while asleep, and inferred that this behavior would continue after death. Hence also the idea of immortality. Tylor went further, however, claiming that such people not only personified all other beings like themselves, but also natural phenomena, and endowed the latter also with souls. Tylor's use of the term soul in preference to ghost or spirit led to his being regarded as the founder of the animist theory of the origins of religion. As for his approach to the question of religion's origins, this is described as intellectualist principally for the reason that it insists on offering a rational basis for the belief in the soul, which it argues did not derive from fear or superstition or psychological immaturity on the part of the primitive, but resulted instead from a deductive and logical process, even if the reasoning was mistaken. While, as Evans Prichard (1965: 25) has pointed out, it is possible that the notion of the soul developed in this way, there is no evidence to say it did.

Tylor's successor at Oxford, the barrister and anthropologist Robert Marett (1866–1943), is credited with being the father of the pre animist

theory of religion (Marett 2001). He argued that in terms of its beginnings, a rudimentary religion, a form of supernaturalism consisting of awe of the mysterious, existed prior to ideas of soul, ghost, and spirit. It was this attitude of mind that provided religion with its raw material and could exist apart from animism and indeed might well have been the basis for animistic beliefs. This theory was based on Marett's interpretation of studies on Melanesian religious life and in particular its concept of *mana*. Religion, he insisted, was something that was lived or acted out: it helped the primitive to live, it provided the necessary assurance of being in touch with a higher power, and it offered hope and induced fear. Marett reduces both magic and religion to psychological states and suggests that they function most effectively in situations of emotional stress.

Sir James Frazer (1854–1941), author of the monumental and widely known work on primitive superstitions *The Golden Bough* (1920), also differed from Tylor in propounding a developmental theory of religion in which he introduced a pre religious stage in the form of a magical phase. His theory bears a striking resemblance (in the way it describes religion's evolution from magic to religion and religion to science) to Auguste Comte's three phases of intellectual development: the theological, metaphysical, and positive. Relying on ethnographical data of poor quality, Frazer, the last of the great armchair evolutionists, was to claim that magic characterized simple societies, and as they became more complex they also became less superstitious and more scientific and rational, a line of argument for which there is no proof worthy of the name. Moreover, like Lucien Lévy Bruhl, he wrongly viewed magic as an elementary form of modern science, but differed from the latter by mistaking ideal for real connections between things.

Intellectualist theories of the kind advanced by Tylor and Frazer were in turn opposed by thinkers concerned to locate the origins of "primitive" religion in social structure rather than logic and emotion. The best known and most influential theorists to adopt this approach were Robertson Smith (1846–94) and Émile Durkheim (1858–1917). According to Smith, the clan cult or totemism was the earliest and most elementary form of religion

and was best accounted for and understood by reference to its social character, an idea for which he was indebted to Fustel de Coulange (1830–99) and in particular to his major work *The Ancient City* (1980), a work that also influenced Durkheim.

Durkheim was unimpressed by the kind of animist, intellectualist, emotionalist, and action based theories of primitive religion advanced by Spencer, Tylor, Frazer, Marett, and others, and indeed by any theory that suggested religion was false or an illusion. Primitive religion was the earliest in the sense of simplest form of religion. It was the form that was practiced when human society was passing through its simplest form. Moreover, far from being an illusion, it was as much a thing or social fact, in the sense that it was a reality external to the individual, as any other thing or social fact. It enjoyed the same degree of reality as any material thing. It rested on a permanent underlying reality that could be uncovered if studied objectively: that is, society. Religion belonged, Durkheim argued, to the class of social facts that includes established beliefs and practices that were the product of the collectivity and/or a group within society. By treating religion in this way Durkheim believed he had given it a foothold in reality and made it accessible to scientific analysis. As to its earliest, most elementary or primitive form, Durkheim maintained that this was to be found in totemism, an idea he borrowed from Robertson Smith. He used the available ethnographic material on the Australian aborigines and in particular the Arunta to demonstrate his thesis, published as the *The Elementary Forms of the Religious Life* (1915). What bound clan members together, he argued in this study, was that each and every one of the members had the same totem, which in several senses was regarded as sacred, including the sense that it symbolized the totemic principle in the form of an impersonal religious force which he referred to as *mana*.

In Durkheim's evolutionist understanding of it, religion would regress – regression was also a notion used by Spencer in respect to civilizations and their institutions – as social institutions developed. As an example he pointed to religion's loss of control in modern society over men's (*sic*) minds compared with primitive society (where he contended religion dominated

everything) and went on to argue that to become intensely religious again it would be necessary for society to return to the beginning. In his own words religion could not regain its domination over people's minds as in primitive society "unless the great societies crumble and we return to small social groups of long ago, that is unless humanity returns to its starting point, religion will never be able to exert deep or wide sway over consciousness" (Durkheim 1952: 430).

Although Durkheim's highly speculative account of the origins of religion has been heavily criticized on methodological, logical, ethnographic, and other grounds, it nevertheless contains many valuable insights and remains one of the most thought provoking and influential studies of the sociological character of religion, particularly that part of it that treats the purposes and functions of ritual.

An almost exact contemporary of Durkheim, the German sociologist Max Weber (1864–1920), regarded as one of the founders of modern sociology and most widely known for his thesis linking Protestantism to the rise of modern capitalism and his comparative sociology based on the principle of *verstehen* or empathic understanding, also began his analysis of religion from an evolutionist perspective by looking at its most elementary forms. These, he believed, were to be found in the religions of tribal societies in which, he contended, questionably, people were so preoccupied with meeting their everyday needs that they had little alternative but to practice magic rather than religion. Such people were largely concerned with attempting to manipulate and coerce the gods, whom they conceived as being part of this world and immanent, rather than as in religion, which has a more transcendental conception of their status, with worshipping them. Thus, according to Weber (1965), elementary or primitive religion tends toward the magical and out of this emerges religious conceptions, as human society evolves. Magic begins to develop into religion when the extraordinary qualities or mystical powers (referred to as *mana* by Durkheim, Marett, and others, and as *charisma* by Weber) that are believed to inhere in objects are attributed less to the objects themselves and increasingly to a reality behind them, as it were, such as a soul, spirit, or demon. Thus, once the source of this

power came to be perceived as being outside the material world, and the spirits behind it came to be regarded as being more and more removed from this world, the way was open, Weber maintained, for ethical rationalization to begin to dominate religious attitudes. At this stage of religious evolution the gods become increasingly bound up with ethical considerations, and values and principles replace self interest as the core concerns of religion. Thus, Weber suggests, religion only truly begins with the appearance of ethical rationalization, and coterminous with this development is the demise of the central role of the magician and the rise of a priesthood that concerns itself with intellectual matters such as the formulation of doctrinal and ethical systems.

PRIMITIVE RELIGION AS MONOTHEISTIC

Andrew Lang (1844–1912) and the Catholic priest Wilhelm Schmidt (1868–1954) challenged the traditional understanding of the content of primitive religious belief. The latter contended that primitive monotheism predated the technological advances some believe led to it. Schmidt, founder of the journal *Anthropos* (1906), sought to establish a chronology of primitive cultures from circumstantial evidence. Like Lang, he maintained that people who were on the lowest rung of the ladder of social and cultural development were monotheists. Schmidt, though he was concerned to discredit the evolutionary kind of ethnography and ethnology prevalent in his day, did not escape their influence. He also believed he had been able to identify the ethnologically oldest people whom he claimed belonged to the most primitive culture. However, this was a culture in which totemism, fetishism, magic, and belief in ghosts or spirits were absent. Instead, these were a people who, by observation and inference, had come to believe in one, eternal, all knowing, all powerful, beneficent God who satisfied all their desires and wants. Once again, no strong evidence is supplied in support of this thesis on the origins of religion and primitive thinking about God and the supernatural order. As a theory, however, it was not without influence, shaping as it did the thinking of some missionaries

working in various part of the world about the beliefs of so called primitive people.

LÉVY BRUHL AND THE PRELOGICAL PRIMITIVES

The notion of primitive religion is closely linked not only to that of primitive society but also to the concept of primitive mentality, especially as it was developed by the French philosopher Lucien Lévy Bruhl (1857–1939), who in his *La Mentalité primitive* (1922) set about describing its attributes. He was not convinced by the theories of Tylor and Frazer, which assumed that the only difference between primitive and more advanced people was not one of intellect but of ignorance, the former being more ignorant than the latter. In terms of intellect, both were the same.

Lévy Bruhl saw things differently. Starting from the assumption that each type of society has its own distinctive mentality he contended that, broadly speaking, there were two types of society: primitive and civilized. He then proceeded to argue that there existed two types of mentality: primitive and civilized. These modes of thought, Lévy Bruhl maintained, were collective in the sense of being all pervasive, taken for granted ways of thinking to which there were no exceptions. The primitive mode he characterized as essentially prelogical and/or mystical, and the civilized as logical. The primitive mentality is prelogical and/or mystical in the sense that primitive people do not make the distinctions between the natural and the super natural order that so called modern, civilized people make. The latter are capable thus of seeking the causes of things in natural processes and explaining them scientifically. Primitive thought is guided by what he termed the law of participation and does not concern itself with contradiction or the rule of logic, but is rather held together by links or connections that do not conform to the logical thought patterns of more advanced peoples.

Lévy Bruhl is not suggesting by this that primitives are innately incapable of reasoning or thinking logically or that they are a logical, illogical, or anti logical. He is describing the categories in which they reason, their collective representations and the mystical realities in

which they move and which shape their thought. It is for this reason that primitives reason incorrectly and not because, as Tylor and Frazer suggest, their logical processes were mistaken. However, like the rest of the above mentioned theorizing about primitive religion, there is no evidence to support Lévy Bruhl's argument that "primitive thought" differs in quality from "civilized thought." Neither is there any basis for classifying en bloc whole peoples who differ so much from each other socially, culturally, and economically as either primitives or civilized, nor can it be automatically assumed that there is a contradiction between a scientific, causal explanation and a mystical one, or that because something is thought of in mystical terms it cannot also be understood scientifically (and the converse).

MODERN USAGE

While realizing its limitations and controversial character, some scholars have nevertheless offered a robust defense of their use of the term primitive religion. Douglas (1966: 81–2) considers her use of the term in the more general context of a discussion of the distinguishing features of the notion of primitive worldview, which she suggests be characterized by non differentiation. She also describes this worldview as subjective and personal, one in which different modes of existence are confused, and one in which the limitations of man's (*sic*) being are not known. It is anthropomorphic and resembles, Douglas maintains, a pre Copernican worldview. The belief of the !Kung Bushmen of the Kalahari Desert in N!ow provides a good example in her view of belief in anthropocentric powers.

Regarding the question of the use of the term primitive and whether it should be abandoned, Douglas expresses the hope that its use will not be discontinued, on the grounds that if this concept can be given a valid meaning in art and technology, and possibly economics also, then presumably it can also be given a similar sense when used of a certain kind of culture. While accepting that it can have a pejorative sense when used of religious beliefs, she is not convinced that because of this the label should be abandoned and suggests that to do

so could well amount to an inverted form of superiority.

Evans Pritchard (1965) defends his use of the term primitive on the following grounds: that he uses it in a value free sense, is obliged to use the language of those he is critiquing, that it is too firmly established to be dropped, and that etymologically it is unobjectionable. He also points out that the term primitive can be used in both a chronological sense (as it is used by him) and a logical sense, both of which should be kept distinct.

Others do not go to such lengths to defend their use of the term. Bellah (1964) in his treatise on religious evolution – in which one of the categories used is that of primitive religion – is more anxious to make clear what he means by evolution in this case. Evolving religion as he understands it is a symbol system that develops from a compact or primitive form or state to a more differentiated or modern one, the latter not necessarily being better or truer or more beautiful than the former. Thus, religious evolution involves a process of increasing differentiation and complexity of organization. The outcome of this process is to endow the particular system in question, in this case religion, with the greater capacity to adapt to its environment, thus becoming more autonomous in relation to that environment than was the case in its less complex stage. This is the underlying assumption on which Bellah constructs his evolutionary scheme of religion, which begins with primitive religion and evolves into archaic religion, followed by historic religion, early modern religion, and modern religion. These types are not seen as completely distinct, nor does Bellah suggest that this kind of evolution is either inevitable or irreversible.

Confining comment to Bellah's primitive religion, this owes much to Lévy Bruhl's (1922) notions of the mythical world and to research on the mythical world of Australian religion – in particular, anthropological interpretations of the core concept of Dreaming. Bellah's world of primitive religion is a world in which the actual and mythical worlds are closely related to each other, and one which – in terms of its organization – is extremely fluid. He characterizes primitive religion itself in language reminiscent of Marett: it is given over

not to worship or sacrifice, but is characterized by identification, participation, or acting out. It is ritual based. As to primitive religion's social implications, Bellah suggests in line with Durkheim that they consist in reinforcing social solidarity and in socializing the young into the norms of tribal society. These goals and the fluidity and flexibility of primitive religion militate against any kind of radical change.

Stark and Bainbridge (1987) construct a general theory of religion that is also evolutionist after a fashion. Again, it suggests that religion develops from more compact to more differentiated forms. It is argued that when societies reach a certain size and level of complexity specific social organizations emerge, including religious organizations. While in its early stages religion was closely related to magic, Stark and Bainbridge suggest that as society becomes more complex they become increasingly differentiated in terms of specialists and organizations. With increasing complexity the idea of gods emerged, who, though considered to be supernatural beings, were believed to share with humans the attributes of consciousness and desire and come to be seen as supernatural exchange partners who bestow upon humans rewards in return for the fulfillment of certain obligations. As society became even more complex the number of gods decreased – in other words polytheism has tended to give way to monotheism – and religious specialists have emerged to provide explanations of how rewards can be obtained, or if not the actual rewards themselves then how general "compensators" of a supernatural kind can be guaranteed and the costs involved assessed.

Prior to all of this in a simpler, less differentiated world people had resort to magic, which in the opinion of Stark and Bainbridge differs from religion in that it offers very specific compensators that are easily disconfirmed. Therefore, unlike religion, it does not have the capacity to foster long term exchange relationships and as a consequence does not develop into an organization such as a church.

CONCLUSION

The reasons behind the largely pointless search for the origins of religion in the nineteenth

century and first part of the twentieth century have been outlined above. We have also seen that well into the late twentieth century some scholars – in their attempt to construct a refined evolutionist theory of the development of religion – have continued to apply the term primitive to what they consider to be its earliest form. Despite the caveats and qualifications offered for the continuing use of this term, the question whether it should be retained remains. It is such a highly controversial term as to suggest that there is a strong need for a replacement, such as *traditional* or *early forms* of religion, although these two terms also have their limitations. While the label *early forms* is virtually free of any pejorative meanings, the limitations associated with the term primitive are especially evident in relation to the term traditional, which can convey the sense of stagnation and imply that a society where this type of religion is the norm is a society that is unchanging and lacking in dynamism and creativity. Although the term traditional is hardly value free either and raises serious methodological problems, it is less pejorative than the concept of primitive and of greater value analytically. As Evans Pritchard (1965) pointed out, the term primitive as used of religion creates only confusion and is likely most of the time to generate in the mind of the reader a negative stereotype about the religious beliefs, worldview, and practices to which it is applied and by implication about those who adhere to them.

print media

Dan E. Miller

Print refers to the production of text and images by applying inked types or plates with direct pressure onto paper. The process of printing, reproducing a manuscript in printed pages, allows the rapid production of multiple copies of books, pamphlets, periodicals, and newspapers that can be distributed to a reading public. A *medium* (pl. *media*) refers to the materials and format through which significant symbols are arranged, formatted, presented, and delivered from one person to others. The printed page is a medium of mass communication. Words, visual images, and other symbols are arranged on printed pages as discrete units, most often in linear sequences that cumulatively construct observations, ideas, arguments, and stories.

Produced in large numbers, printed pages are bound together and dispersed to people who, if literate, read the same text. In this way, the medium of print binds people together into a larger community.

Print media include books, pamphlets, periodicals, newspapers, and typewritten or photocopied manuscripts. A book is any printed publication of substantial length. Books are distinguished from pamphlets by their length, with pamphlets having fewer than 96 (or 64) pages. Books are distinguished from periodicals and newspapers not only by their length, but also because they are issued as a single unit whereas periodicals and newspapers are available with new content on a regular basis. Also, books are considered more important, requiring preservation, whereas periodicals are most often discarded after a short period of time. Books preserve information, knowledge, and narratives of enduring relevance, while newspapers and magazines are more constrained by events of the moment. Books preserve timeless information; newspapers present timely information.

Print media meet several needs for a complex society. These include the following functions.

- 1 *Information function*: the public learns about significant events and government actions.
- 2 *Surveillance function*: the public learns about dangers and opportunities.
- 3 *Solidarity function*: community identity and cultural continuity are developed.
- 4 *Agenda setting function*: social, political, and economic priorities are set by leaders.
- 5 *Community forum function*: through print important issues are discussed.
- 6 *Entertainment function*.

In addition to these positive functions, Merton and Lazarsfeld (1948) have identified a troubling process – the *narcotizing dysfunction* – wherein the inundation of information about an issue or event tends to make the reader complacent, comfortably numbed by the overcoverage. Aware but tired of the issue, people fail to act even if the issue is highly compelling.

Reading the history of print leads to the conclusion that the printing press was a key agent of social change (Eisenstein 1979), but only in those places in which the printing press developed in a marketplace context (Couch 1996).

The general principle concerning the development of print and subsequent social change was first articulated by H. A. Innis and Marshall McLuhan. Both offered a soft technological determinist argument that new forms of information technology undermine established media and traditional authority, ultimately establishing a new dominant medium and a new form of authority. The development of the printing press, the mass production of books and pamphlets, and the subsequent development of mass literacy undermined the authority of prior written texts and their interpretation by church officials. The Protestant Reformation and the emerging rational logic of the Enlightenment led to massive social, political, and intellectual change in Europe.

Developed in China in the first century CE, papermaking techniques were introduced into Europe via Spain by Arabs in the thirteenth century. Manuscripts became far less expensive to produce, and paper allowed writing on both sides. Collected sheets of paper were then bound into books. Most early books were reproduced by scribes affiliated with the Catholic Church. The majority of books written and reproduced were ecclesiastical. Ownership of books and literacy were restricted to a small, elite minority. Collections of books often were stored in monasteries. Readers of books, writers, and those who copied them settled near the collections, forming communities of scholars.

In Europe, the first mechanical printing press was invented around 1450 by Johannes Gutenberg (ca. 1397–1468), a goldsmith and merchant, in Mainz, Germany. Gutenberg was not the first to reproduce manuscripts onto paper via moveable type. This process was first accomplished in eleventh century China. Gutenberg's method of printing with moveable type was developed without knowledge of printing being done in Asia. To make the printing process more efficient, Gutenberg converted a winepress into a mechanical printing press, and using cast metal moveable type he was able to reproduce books quickly and inexpensively. Gutenberg's masterpiece, the 42 line Mazarin Bible, was published in 1455. Gutenberg's printing press was the first mass production technology. The publication of an increasing number of books created the potential for mass literacy, particularly in societies where written language

was composed using a phonetic alphabet – the visual representation of sounds (phonemes) which could be sounded out in sequence to form words (morphemes), sentences, and so on.

The European printing industry grew slowly at first, with only ten cities having printing presses in 1471. By 1481 over 100 printing presses were spread throughout Europe. By the end of the fifteenth century nearly every city in Europe had commercial printing presses. While printing presses proliferated, the number of books published grew slowly. Only 219 books were published in 1580 in England. That number grew to 600 books in 1800 and nearly 14,000 books in 1990. Some of the earliest population centers to adopt a printing press were university cities, where a symbiotic relationship was established between scholars and printers. The scholars both wrote and purchased books, while the printers reproduced and sold them.

In the early decades of the printing press neither state nor religious authorities attempted to control the growing print industry. Those authorities did not feel threatened. Before 1500 most books were printed in Latin and were much the same as those reproduced by scribes. However, within a few decades most books were published in the vernacular, the language spoken by the people. In the 1520s Martin Luther published the German Bible, believing there should be no mediation between the common man and the Bible, proclaiming that every Christian was a priest and every citizen was able to read the word of God. By 1550, over 30 vernacular translations of the Bible were in circulation.

Church authorities took little note of the printing industry until criticisms of the church began to be published and distributed in the early sixteenth century. Papal edicts did little to stem the flow of criticism. That criticism grew to major proportions when Martin Luther nailed his 95 theses to the door of Wittenberg church in 1517. With printing presses as commercial enterprises and printed materials increasingly oriented to public concerns, the Catholic Church could not contain the spread of alternative definitions of reality offered by Protestants and other reformers. As more people became literate, nearly every home became a school where the Bible and other books were

studied without the interference of a priest or other authority.

McLuhan's famous aphorism, "the medium is the message," suggests that each new medium of communication creates new symbolic and perceptual environments, making possible new forms of consciousness, thought, and knowledge as we adapt to the new environments. For example, the print medium and the act of reading formed the foundation of critical and reflexive thought. Access to books without direct surveillance and accountability allowed people to read, interpret, stop, think, write, and begin reading again. Inherent in the social form of reading is an absence of immediate reciprocity. Rather, the reader is alone with the text and his thoughts. Consequently, individual identities developed. A culture of individual thinking in a world of ideas was born. Readers tend to have an active life of the mind, full of knowledge, imagination, and a heightened awareness of the world and the possibilities it holds – a form of consciousness that was threatening to the traditional ecclesiastical authority of the church and to the uncritical obedience demanded by the state.

In those societies where the printing press was controlled by state or ecclesiastical authorities, large scale social change did not occur. For example, shortly after manuscripts were first printed in China, the state took control of the printing and distribution of those manuscripts. Print technology spread from China to other Asian nations, but always as a state controlled activity. While a great many books were published, only a few of each were printed and very few were circulated. The printing process, libraries, and literacy were tightly controlled. Standing authorities were not threatened. Similarly, a printing press was not established in a Muslim country until 1727 and then for only a few years. The first permanent printing press was established in Egypt after Napoleon's conquest in 1798. Nearly all printing presses were and continue to be controlled by Islamic authorities.

As printing developed, an interest in accuracy and correct interpretations emerged. Scholars began to note inconsistencies between traditional writings and their own observations. Removing or correcting inconsistencies in texts grew increasingly common. For example, Roger

Bacon called for the correction of the calendar because Easter was no longer being observed after the vernal equinox. By the sixteenth century, secular books began to outsell religious books. At the same time, secular intellectuals began to replace the clergy as sources of knowledge. Both secular scientific and pragmatic knowledge received greater attention and was increasingly accepted as valid knowledge. As the Enlightenment expanded in the eighteenth century, reason and science trumped faith as rationalizations for action. The printed page had undermined religious authority and teachings. Print media had altered society and the minds of those who read.

As printing continued to grow as a commercial enterprise, an increasing number of people began reading for pleasure – *ludenic reading* – which requires solitude and an expansive period of time. Ludenic reading is not always a trivial pursuit. It, too, can lead to significant social change by fostering a sense of injustice and desire to correct that injustice. Published in 1776, Thomas Paine's *Common Sense* sold 100,000 copies in two months and went through 25 editions. It is estimated that half the adult population in the American colonies read Paine's incendiary pamphlet and, in doing so, redefined the colonies' relationship to Great Britain and the British monarchy. Another example of this process involves the success of Harriet Beecher Stowe's *Uncle Tom's Cabin*, published in 1850. Several million people read this book, and within a year of its publication strong public sentiment in opposition to slavery had arisen in the Northern states, culminating in the abolitionist movement. These books provided an awareness of injustice, of alternative arrangements, and they provided a vocabulary for change. By the end of the nineteenth century, books had become the dominant sources of entertainment, valid information, and knowledge. Citizens consulted books and not people when they were searching for information. Knowledge became significant in and of itself – worthy of being preserved.

The spread of information through a community predates newspapers. Town criers, visitors with information from elsewhere, and rumors all reported information about current issues and events. However, "the news" as the regular reporting of significant daily events emerged

along with the establishment of the printing press, particularly in cities. In order to capture a large share of the reading public, the news as a regular forum of information was dependent on the gathering, rapid production, and dissemination of desired information and ideas. For this a printing press was required.

The first news sheet, the *Notizie Scritte*, was published in 1556 in Venice. This irregular paper reported on the arrival of ships, items for sale, and happenings from abroad. It was called a *gazetta* for the coin it cost to purchase it. By 1605, newspapers appeared in Germany, France, and Belgium. These newspapers typically carried stories about the happenings in a community, including economic and political activities, and hijinks involving the ruling elite. Governmental authorities, who had been slow to react to books, responded quickly to newspapers, particularly those critical of the government and the aristocratic elite. In 1632 the monarchy banned all "news books" in England. However, nearly all newspapers were profitable commercial enterprises and governmental acts to suppress or destroy them proved to be ineffective. Some editors and publishers were jailed and their presses destroyed, but as soon as one was suppressed another newspaper appeared. In 1644 John Milton advocated the concept of "the marketplace of ideas" and opposed the practice of censorship. His position was based on the notion that from the free flow of ideas came truth which would free us.

Most early newspapers were fiercely partisan, competing to establish a consensual definition of reality. The term "public opinion" emerged early in the eighteenth century as newspaper reading increased and those who regularly read the news began to develop a reflective standpoint toward authorities and the issues of the day. Those who regularly read the same newspaper tended to form a shared standpoint toward political and religious authorities. Regular reporting on and criticism of the actions of government authorities rendered those authorities mundane and profane, their actions often a source of ridicule, their authority compromised.

Newspapers and pamphlets not only can solidify public opinion, but also can move people to action. In the American colonies many newspapers were critical of the British control. Unjust actions were criticized – particularly

the Stamp Act of 1765. As the governmental authorities increased their controlling actions, a great increase in newspaper and pamphlet publishing ensued. Well read newspapers and pamphlets, such as Tom Paine's *Common Sense*, justifications for rebellion not only against particular acts and officials, but also against monarchy itself as a valid form of government. Phrases like "freedom of the press" and "no taxation without representation," first introduced in newspapers and pamphlets, along with the positions articulated by Milton and Paine, became the rationale behind the freedom of the press provision in the first amendment to the United States Constitution adopted in 1791.

The emotional response to reading newspaper accounts differs from that of reading books. Newspaper readers often show anger or pride as they read. Also, they are inclined to enter into agitated discussions about the stories they have read. On the other hand, book readers express far less emotional response. Cooler and more analytical, book readers more often enter into detached, intellectual discussions about the ideas they have read in books.

Beginning in the early twentieth century newspapers transformed. Prior to this time they had been highly partisan, representing the interests of labor unions, political parties, and ethnic groups, making money largely from newspaper sales. Increasingly, newspaper profits were realized through the sale of advertisements. In order to maintain a steady flow of advertising revenue, a style of reporting and editorial policies developed that did not alienate the business community. The principle of "objective reporting" most likely was derived from the non-partisan approach to reporting the news that became the norm after newspapers grew increasingly dependent on advertising revenue. The values of advertising and business became intertwined with news. Newspapers changed, offering fewer news accounts while adopting more sports, fashion, entertainment, and family stories, which often corresponded to the ads. Newspapers became advocates for businesses.

Early in the nineteenth century, public schools were established in the United States with the democratic intention that all children should learn to read and compute mathematics. Textbooks began to be written and published in a format that began with simple ideas and

progressed to increasingly complex ideas and operations. Prior to the printing press school instruction was conducted by a teacher reading from a solitary text, often with students repeating what had been spoken in order to memorize the material. With the advent of printed texts distributed to each student, public reading was replaced by silent reading. Similarly, with the increasing availability of printed material in general, people began to read silently. In North America reading was not an elitist activity. Instead, because print media had developed as a commercial enterprise, the content of print tended to serve the diverse interests of the reading public. A classless, democratic reading culture evolved.

Periodicals (journals and magazines) are published regularly at greater intervals than newspapers – weekly, monthly, or quarterly instead of daily. The content of periodicals ranges from technical and scholarly journals whose content has some longevity to mass circulated, highly illustrated magazines focusing on celebrities and entertainment whose reading life is very short. The first periodical, the *Journal des savants*, was published in France from 1665 to 1792. A literary, scientific, and art weekly, it has been widely imitated. Even today, many contemporary magazines are similar in appearance and content. By the end of the eighteenth century periodicals targeted to special identity groups appeared. Journals for lawyers and scholars were introduced, as were magazines targeted to women. In the nineteenth century, novels began to be serialized in magazines. For example, many of Charles Dickens's novels first appeared in popular magazines. A common theme of popular magazines was comedy, particularly political and cultural satire. In the United States, *Mad* magazine survived for decades. Today, the *Onion*, an Internet "publication," is a popular source of political and cultural satire, as are the stories and cartoons found in periodicals such as the *New Yorker*.

Magazines intended for women have been in existence for 200 years. However, since the development of modern advertising in the early twentieth century, women's magazines have changed. Increasingly, women's magazines are filled with advertisements – often much more than text. The ads are intended to promote consumerism. Stories, advice columns, and

reports of current trends illustrate how beauty, sexuality, health, happiness, career success, cooking skills, and social status are available, if not quite affordable. A superficial reading of these magazines may lead a reader to believe that such magazines equate status with consumerism. Ironically, women's magazines set the foundation for the women's movement by illustrating how women can gain control of their lives and find happiness through education and by entering into the professional and business worlds formerly dominated by men.

Increasingly, social scientists and historians are concerned over recent trends in the print media. While books continue to be published in record numbers – about 75,000 new titles in 2004 – book sales have stagnated and even decreased slightly in recent years. Similarly, newspapers continue to be published and continue to be profitable, but with less competition due to the fact that most cities have only one major daily newspaper. The number of daily newspapers has dropped only slightly since mid century – 1,763 in 1946 and 1,534 in 1994. As with books, newspapers in the United States are losing readers. It is rare to find a regular reader of a newspaper under the age of 40. The culture of print has ceased growing and is showing signs of significant decline.

Another concern is an increasing concentration of ownership of the print media by large corporations. About 75 percent of all newspapers are owned by corporate chains. Fewer corporations own and control an increasing number of newspapers, magazines, and book publishing houses. Many of these corporate entities are media conglomerates with print media constituting only a part of larger business empires that include radio, television, movies, and music industries. With conglomeration, a synergy develops wherein the different components of a corporate conglomerate work together to produce benefits for each other in a way that would not be possible without the interlocking connections that define this form of social organization. Thus, book publishers may favor the publication of books that can be made into movies, which subsequently are made in the conglomerate's movie studios and distributed by the conglomerate to the public. Magazines owned by the conglomerate featuring stories and photographs of celebrities who have just made a movie are

distributed to coordinate with the release of the movie in the theater chain owned by the conglomerate. The movie's stars and director appear on the conglomerate's television network talk shows to discuss the movie between commercials advertising the conglomerate's material products. The fear is that with this process fewer "good" books will be published.

Conglomeration, the concentrated ownership of the media, and the increasing reliance on advertising revenue strongly suggest a significant decrease in investigating and reporting corrupt business and governmental practices, a paucity of valid information, and the demise of competing views of reality. Social scientists and historians fear that these trends may lead to a single, dominant, uncritical, business friendly worldview – a condition of *ideological hegemony*, of ideas and values and little awareness of alternatives. Certainly, this condition does not yet exist in the United States, although the trend does fall in that direction. Recent research indicates that the content of print media has not yet become homogenized, that vast amounts of information and multiple perspectives on reality are readily available, and that the readers of print media continue to determine the types of articles and books that are written.

prisons

Melvina Sumter

Prisons are secure institutions which house juvenile and adult felons with sentences that range from one year to life who are remanded to the custody of a state or federal correctional agency for incarceration. These facilities have the task of carrying out the sentence imposed by the courts as well as protecting the public by preventing escapes through maintaining custody and safe and secure institutions. As well, these facilities are charged with the responsibility of providing all of the programs and services necessary to care for the inmate population remanded to their custody.

Prisons are operated by all 50 states and the District of Columbia, the federal government, and the military. Each of the 50 states and the District of Columbia operates its own correctional system; as such, there is considerable variation in terms of the organization, administration, operation, and management of these facilities as well as the programs and services offered. However, in the majority of state systems the administration of the prison is the function of the executive branch of state government in which the governor appoints a state director (also known as commissioner or secretary) to oversee the administration and operations of the state prison system (Clear & Cole 2003).

The Federal Bureau of Prisons is responsible both for juvenile and adult offenders who have

been convicted of federal crimes and for managing and operating federal facilities in the United States. Although the first federal prison was opened in 1790, it was not until 1930 that Congress created the Federal Bureau of Prisons to serve as a centralized administration to manage and regulate the 11 federal prisons in operation at that time (Bartollas 2002; Champion 2005). Today, the Federal Bureau of Prisons is headed by a director who oversees eight centralized divisions, an Office of the General Counsel, an Office of Inspections, six US regions in which federal prisons are located, and the National Institute of Corrections.

The US Army, Navy, Air Force, and Marine Corps manage prisons for military personnel who have been turned over to the military for trial, sentencing, and imprisonment after committing crimes in military or civilian jurisdictions (Stinchcomb & Fox 1999). Military prisons are also responsible for individuals who have been convicted of violations of the Uniform Code of Military Conduct or being Absent Without Leave. As well, military prisons house prisoners of war whose freedom is deemed a national security risk by military or civilian authorities (Stinchcomb & Fox 1999).

The Walnut Street Jail is considered to be the first penitentiary used exclusively for the correction of convicted offenders in the United States (Stinchcomb & Fox 1999). Moreover, in 1790, a portion of the Walnut Street Jail was converted to a wing called the penitentiary house to use imprisonment as an alternative sanction to the widespread use of corporal and capital punishment. As such, solitary confinement with labor inside the cell was viewed as a mechanism to provide inmates time for contemplation, repentance, and reformation in hopes that the introspection process would allow them the opportunity to reflect on, and thereby atone for, their crimes, and place themselves on the right path (Friedman 1993; Stinchcomb & Fox 1999; Clear & Cole 2003). The Walnut Street Jail served as the model for what became known as the Pennsylvania and Auburn Penitentiary Systems. While both systems included solitary confinement in separate cells and enforced silence at all times to prevent inmates from communicating, there were distinct differences in the operation of the two models. The Pennsylvania system was designed to isolate each inmate for

the duration of confinement; therefore, inmates remained in their cells during the entire period of incarceration. Conversely, the Auburn system developed a congregate system of prison discipline whereby inmates were held in isolation at night but congregated in workshops during the day with enforced silence at all times (Clear & Cole 2003). Because the inmates did not need large cell space to work and were able to generate productive labor, since they worked in a factory during the day, the Auburn system proved to be more financially practical than the Pennsylvania system. As a result, the Auburn system eventually prevailed in becoming the dominant penal model for maximum security prisons in the United States (Champion 2005).

TYPES OF PRISONS

After being sentenced to prison, inmates are transferred to a reception and evaluation center where they are assessed in order to determine the appropriate level of physical barriers and degree of staff supervision needed inside the prison to prevent escapes and maintain safe and secure correctional facilities. During the diagnostic phase, a classification instrument is used to evaluate the risk and dangerousness of the inmate and to match the inmate's programming needs and need to protect the community with a facility commensurate with the appropriate custody and security level (Champion 2005). As such, prisons are classified and designated by security levels that identify the type of institution required to house inmates based on their final classification score. This score is determined by factors such as the severity of the current offense, history of escapes or violence, sentence length, and number of prior convictions or commitments. Although there is administrative and operational variation among the three jurisdictions, inmates are generally assigned to a minimum, medium, or maximum security prison from the reception and evaluation center.

Minimum security prisons, also called open camp correctional institutions, or camps, house the least restrictive, low risk, non violent first time inmate. Inmates with violent offenses or long sentences who have clean disciplinary records and good behavior, and who have thus advanced through the classification system from

a more restrictive facility, may also be housed in minimum security prisons. These facilities have a minimal amount of external control, therefore generally possess only a single fence, with grounds and physical plant features resembling a university campus rather than a prison. There is a relatively low staff to inmate ratio and housing is often of dormitory style. Since a primary focus of these institutions is reintegration of the inmate back into the community, a significant portion of the department of correction's educational, vocational, and treatment programs are allocated to these facilities.

Medium security prisons, also called correctional facilities or institutions, house a wide variety of inmates who are less dangerous and escape prone than inmates housed in maximum security, but not of a sufficiently low enough risk to be entrusted a minimum level of security. These facilities are generally surrounded by a double chain link fence, topped with barbed or razor wire and electronic devices, and often use congregate housing or dormitory style living arrangements, which contain a group toilet and shower. These facilities also have a higher staff to inmate ratio than minimum security facilities, inmates live in cell type housing, and a wide variety of work, educational, vocational, and treatment programs are provided.

Maximum security prisons, also called penitentiaries, house inmates who have long sentences and pose a severe threat to society. These facilities were traditionally surrounded by tall thick walls, usually 30 to 50 feet high and several feet thick, topped with barbed or razor wire, with gun towers that are strategically placed in corners with armed correctional officers. As a result of cost, however, modern structures are more likely to be surrounded by chain link fences bounded by electrified wire than by thick walls (Clear & Cole 2003). The inmates generally live in small cells that contain their own sanitary facility. These prisons have a significantly higher staff to inmate ratio than medium security prisons, inmates live in multiple and single occupant cell housing, and there are fewer work and treatment opportunities offered than at medium security prisons.

Super maximum prisons are independent correctional facilities or a distinct unit within an existing prison that provide for the management and secure control of inmates who are

generally reassigned from a maximum, medium, or minimum security prison because of disruptive behavior. Moreover, super maximum prisons house inmates who have been officially designated as exhibiting aggressive or violent behavior, and therefore are unmanageable when housed with the general inmate population or placed in administrative segregation. The inmates placed in super maximum facilities often have assaulted other inmates or staff, are believed to be members of a security threat group, or have incited riots or other disturbances. These inmates eat and exercise alone and are not allowed contact visits.

Since the 1980s, some correctional facilities have been run by private corporations. Here the total operation and management of a correctional facility is transferred to a private corporation that operates the facility for a profit. Although the concept of private prisons emerged during the 1980s, correctional agencies have long contracted with private corporations for a variety of services to include providing medical and dental care, school programs, counseling, nursing homes, halfway houses, juvenile facilities, and alcohol and drug treatment services (Bartollas 2002). In addition to contracting with state and federal government for the total operation and management of a correctional facility, private corporations also finance, site, and build prisons.

PRISONS TODAY

Prison populations have more than tripled during the past several decades as a result of “get tough” policies such as the war on drugs, mandatory minimum sentences, habitual offender statutes, truth in sentencing and three strikes you’re out legislation, and the abolition of parole. All of these were designed to provide inmates longer sentences as well as keep them in prison for longer periods of time. As a result of the escalation in the prison population, current inmate populations exceed cell capacity in almost all state and federal prisons; therefore, many prisons are overcrowded. Prison crowding presents several challenges for correctional personnel. Overcrowding makes it difficult to manage safe and secure correctional facilities by placing more stress on correctional staff, who

are expected to maintain order within a facility holding more inmates than it was designed for (Mays & Winfree 2002). Likewise, prison overcrowding increases the propensity for violence among offenders, results in more serious injuries and assaults of inmates and staff by inmates, facilitates more disciplinary infractions, leads to more inmate lawsuits challenging conditions of confinement, and decreases access to programs and services (Clear & Cole 2003).

In addition to an influx of inmates, the composition of the prison population has also changed. More specifically, today there is an increase in the number of African Americans, females, juveniles, and geriatric offenders. Similarly, there is a substantial growth in the number of special needs offenders to include mentally ill and retarded offenders, offenders with AIDS, and alcohol and substance abusing offenders. As such, correctional administrators are tasked with the responsibility of supervising an increasing influx of diverse inmates without corresponding increases in funds, facilities, and/or other resources (Mays & Winfree 2002). Consequently, funds barely cover the programming and treatment needs of inmates or the increasing health costs because of the rise in the special needs population and offenders with AIDS. Hence, although correctional budgets have increased substantially, these funds are used primarily to build more prisons and for operational expenses. As such, prison administrators are limited to providing minimal treatment programs, educational and vocational programs, and health and medical services to the inmate population.

privacy

Gary T. Marx

Privacy, like the weather, is much discussed, little understood, and difficult to control. It is a multidimensional concept with fluid and often ill defined, contested, and negotiated borders, depending on the context and the culture. Along with its opposite *publicity*, it is nonetheless a cornerstone of modern society's ideas of the person and of democracy.

As the impacts of computerization on society (and the reverse) become ever more apparent, issues of privacy and publicity are vital for understanding society and for the creation of the good society.

Privacy and *publicity* are nouns. For purposes of explanation, they can be seen as polar ends of a continuum. This perspective draws attention to the moral or normative aspects of withholding and disclosing of information and asking or not asking for information. Depending on the context, social roles, and culture, individuals or groups may be required, find it optional, or be prohibited from engaging in these activities.

These in turn involve a broader area called the sociology of information. Governing rules here vary from situations where information must be kept private to those where it must be made public (or perhaps better, must be revealed – whether as part of a confidential relationship or to the public at large). There is considerable subjectivity with respect to expectations about how information is to be treated.

In contrast, *private* and *public* are adjectives that can tell us about the status of information. They describe whether or not the information is known. This has an objective quality and can be relatively easily measured. For example, the gender of persons we pass on the street is generally visible and known. The information is

“public.” In contrast, the political and religious beliefs of pedestrians are generally invisible and unknown.

Of course, normative expectations of privacy and publicity do not always correspond to how the adjectives public and private are applied to empirical facts. Thus the cell phone conversations of politicians and celebrities that have privacy protections may become public. Information subjected to publicity requirements such as government and corporate reports and disclosure statements may be withheld, destroyed, or falsified. Information not entitled to privacy protections, such as child or spouse abuse, may be unknown because of the inaccessibility of the home to broader visibility. Confidential or classified information may be leaked, hacked, or mistakenly released.

Privacy and publicity can also be thought of in literal and metaphorical spatial terms involving invisibility–visibility and inaccessibility–accessibility. The physical privacy offered by a closed door and walls and an encrypted email communication share information restriction, even as they differ in other ways. Internet forums are not geographically localized, but in their accessibility can be usefully thought of as public places, not unlike the traditional public square.

Privacy needs to be separated from related terms. *Surveillance* simply involves scrutiny (often using technical means that extend the senses) for a variety of goals such as control, protection, management, documentation, and entertainment. It is a way of discovering information. It may involve obvious invasions of privacy, as with selling the results of DNA and other testing to insurance companies, or illegal wiretapping or spyware placed on a computer. Yet surveillance can also be the means of protecting privacy. Consider biometric identification and audit trails required to access some databases or defensive measures such as a home security video camera.

Privacy is inherently social. The term was irrelevant to Robinson Crusoe when he thought he was alone on the island. It is social in the sense that it implies an “other” from whom information is withheld, or to whom it is supplied and who may, or may not, be under equivalent expectations to reveal and conceal.

Social roles structure the treatment of information and this often involves issues of power.

Thus, close friends in an equal relationship are expected to reveal parts of themselves that they would not reveal at the mall or at work. Sharing one's inner thoughts and feelings is expected to be reciprocal. A relationship of intimacy is partly defined by the mutuality of revelation. This contrasts with the more impersonal roles of doctor and patient. Thus the revelations of a patient to a doctor are not likely to be reciprocated.

Rules regarding who can collect personal information, what is collected, the conditions under which it is gathered, and how it is used (and by whom) are very much connected to social stratification. Rose Coser (1961) uses the felicitous phrase "insulation from observability" to describe the norms and resources that protect the actions of higher status roles in bureaucratic organizations.

Many contemporary concerns over privacy invasion involve large organizations and their employees and customers or police and suspects, professionals and clients, as well as interpersonal relations such as parents and children. In these contexts the rules are relatively clear about who can ask or observe and who is expected to reveal (or is entitled to conceal). Situations involving power differences with respect to gender and ethnicity may also reflect information inequality. On the other hand, maids, valets, butlers, chauffeurs, and personal assistants often know a great deal about the private lives of those they work for and this tends to be unreciprocated.

Confidentiality often accompanies expectations of privacy. It reminds us that information issues are fundamentally social. It refers not to the initial revelation or creation of information but to an expectation that personal information, once legitimately known by others, will be treated appropriately. This may involve sharing it according to established rules (e.g., as in medical treatment involving several specialists who discuss a patient), but otherwise keeping the information *secret* (as with social security numbers that must be given to an employer).

Secret is an adjective like private which can be used to describe the status of information. In restricting information, *secrecy* overlaps privacy. But it goes beyond it to characterize the information protecting activities of organizations as well as individuals. It generally has a

culturally and morally more ambiguous status than privacy.

When personal privacy is viewed as a *right*, it calls attention to the individual's ability to control the release of information. This does not mean that it cannot be shared, but that the individual has a choice. The 5th Amendment, for example, does not prohibit individuals from offering information, it simply prohibits this information from being coercively obtained.

In contrast, the rules applying to secrecy are more likely to involve an *obligation* that prohibits the release of information. This is often accompanied by sanctions for violation. In principle, individuals and organizations don't have a choice about divulging information appropriately deemed to be secret. Such protective rules, along with the fact that the very existence of the secret may be unknown to outsiders, can protect untoward behavior. As Georg Simmel (1950) suggested, the secret, whether legitimate or illegitimate, can also be a factor contributing to group solidarity.

SOME TYPES OF PRIVACY

In the age of new surveillance, we increasingly see techniques that break through borders that previously protected personal and organizational data, whether involving computer databases, Internet monitoring, videocams, drug testing, RFID chips, or DNA analysis. As a result, questions of *informational privacy*, or the ability of individuals to choose what information about themselves will be offered to others and how this will be treated, are important social issues. Rights to freedom of religion and thought, association, and speech are fundamental here.

Another form of privacy which calls more explicit attention to behavior itself (rather than information about it) involves *decisional privacy*. Consider, for example, personal choices involving reproduction and the refusal of medical services, as well as lifestyle issues such as sexual preference. The right to liberty is fundamental to this.

A concept encompassing both of the above involves privacy as *access* to the person. The metaphor of a border or wall surrounding the person can be applied. Is it (and when should it be) impenetrable or porous? To what extent

can the individual, in principle and in actuality, control information flowing *outward* involving telephone or computer communication, credit card and other transactions, beliefs and feelings, location, facial appearance, or biometric data such as DNA, voice print, heat, and scent?

Conversely, to what extent can the individual control information and stimuli going *inward* sent from others? This goes in the other direction – entering rather than leaving the person. The desire for solitude, often viewed as an aspect of privacy, may be seen here. Individuals seek to screen out undesirable sounds, smells, and sights, whether these involve propaganda and advertisements, or unwanted music and cooking smells from an adjacent apartment. This is part of an expectation to be left alone.

The telescreen in George Orwell's novel *1984* illustrates both forms. It transmitted the person's image and communication to Big Brother, while simultaneously broadcasting propaganda to the individual. There was only one channel and it couldn't be turned off.

A more descriptive definitional approach simply looks at the institutional setting. Thus we can speak of privacy as it involves consumption, finances, employment, medical, religious, political, and national security arenas. We can also consider a particular means used or activity (e.g., locational privacy, communication privacy – whether involving computers, telephones, or television). Distinct types of data may be involved – e.g., financial, genetic, or beliefs – and these can be expressed in different forms – e.g., as numbers, narratives, images, or sound. While there are commonalities, expectations and practices vary depending on the setting, means, activity, content, and data form. Social science and philosophy have only begun to disentangle these.

SOME CROSS CULTURAL ASPECTS

While information control is a factor in all societies and some activities such as procreation and elimination are generally shielded from others, there is enormous historical and cultural variability (Moore 1984). The Greeks, for example, placed the highest value on public life. One's sense of identity was found there. Privacy, being the realm of slaves, women, and children who

were restricted to the home, was not valued. To be private meant *deprivation*. In traditional communal societies where life is lived in close proximity to others, the distinction between privacy and publicity has little meaning.

We also see differences in how contemporary societies protect privacy. With respect to personal information issues, in the United States there is greater emphasis, relative to Europe, on the liberty to choose behavior and less government regulation, whether of monitoring in the workplace or of organizations that buy and sell personal information. Large organizations warehouse and sell vast amounts of personal data on the most intimate of subjects, generally without the consent of, and with no direct benefit to, the subject.

In contrast, the secondary use of information in Europe generally requires the informed consent of the subject. In much of Europe, citizens are offered general protection from new, potentially privacy invasive technologies through constitutional guarantees involving (a rather unspecific) right to personhood or personal dignity. Europe, Canada, and many Asian societies also have privacy commissions charged with protecting privacy and anticipating future problems.

The approach in the US is to regulate technologies on a case by case basis as they appear, rather than on the basis of a broad inclusive principle. This is particularly the case for new forms that are dependent on judicial review or legislation specifically crafted for the technique. This in turn is often dependent on some indignation raising misuse becoming public and a drawn out political process. Individuals also have greater responsibility for protecting their own privacy, whether through using protective technologies or suing privacy invaders (assuming the invasion can be discovered).

Conceptions of privacy (and publicity as well) are relatively new and are related to the emergence of the modern nation state and the economic and political rights associated with capitalism and democracy. Rules requiring privacy and publicity are very much a part of the modern state and, while going in opposite directions, developed in tandem.

Private property, particularly the home, suggested a location to be protected from outsiders. A *laissez faire* marketplace where participants

pursued their self interest required strategic control over information and the idea of information as property. The metropolis, with its social and geographical mobility and larger scale, offered a kind of anonymity unknown to the small village and new means for validating the claims of strangers. Larger living quarters meant more physical privacy as societies became richer. Most homes now have more than one bedroom and individuals have the possibility of their own bed.

Political democracy required both openness in government as a means of accountability and public discussion of issues. The latter required citizens with the liberty to form associations that were free to express their views in the public forums of civil society and that needed protection from government interference. Yet government was also given limited powers to cross personal borders to gather information relevant to health and safety, criminal justice, and national security in an increasingly complex and interdependent world.

Privacy is usually thought of as something belonging to individuals. The ability to control information about the self is central to the personhood and dignity implied in the notion of the modern citizen. However, the ability to control information is also significant to group and organizational borders. Privacy is a social as well as an individual value (Regan 1995). For example, a legal oppositional political group (or indeed any group) needs to be able to control information about members, resources, and plans and to feel that freedom of expression within the group is respected. To the extent that a group's borders are porous – punctured by informers and intensive surveillance – its ability to act strategically is weakened and, of course, democratic ideals are undermined.

Privacy can be seen either as a commodity or as a right to which individuals are entitled. The social implications of the view taken are quite different. As a commodity, individuals may sell, trade, or be coerced into giving away their private information (e.g., for frequent flyer miles or the convenience of using a credit card). They may pay for privacy protection, as well as purchase personal information on others – note the large number of Internet sites offering this service.

The US Constitution is seen by many scholars to imply a right to privacy, although this is not explicit. Justice William Douglas in *Grismold v. Connecticut* (1965) used the term “penumbra” in identifying various places where “zones of privacy” were guaranteed (e.g., the 1st, 3rd, 4th, and 5th Amendments to the Constitution). Some state constitutions (particularly in the western states) guarantee a right to privacy, as do the constitutions of most European countries. Privacy is also protected by organizational policies and privacy protecting technologies (e.g., encryption, shredders, and devices to discover bugs).

The notion of unrestrained, all powerful privacy invaders with ravenous and insatiable information appetites waiting to pounce on the unsuspecting individual is too one sided. Most organizations are inhibited by values and by concern over negative publicity should they go too far in crossing personal information borders. Furthermore, as the work of Erving Goffman (1956) suggests, through manners and rituals we also cooperate to varying degrees with each other to maintain individual privacy and self respect.

privatization

Burkart Holzner

Privatization is a transfer of public services provided by various levels of governments in national states to the private sector of business. It is a relatively recent transformation of governance and markets in countries worldwide. In fact, it is an extraordinary, rapidly expanding phenomenon that is rising in global waves, transferring ownership from governments to private enterprises.

Rendering public services via private businesses creates important political, economic, and cultural changes. The actual methods for privatization are manifold; they can be outright purchases, leases, subsidies or other cooperative partnerships, or yet other approaches. However, they put the privatized public service into the hands of private managers. The concept of privacy is not identical with privatization, but it is a part of the cluster of values linked to other changing values for governance and for markets. Privacy of enterprises emphasizes autonomy, independence, secrecy, and profit for the owners; both governance and markets demand transparency, accountability, and benefits for the public good. Democracy can be benefited by the efficiencies of privatization if the provided service responds to public needs and sensitivities, but it may be harmed where the private owners of a function are alien to the public.

The history of privatization begins relatively late in the western industrial nations. Monarchical nations were less differentiated than modern democratic institutions. Much of common (rather than public) property was that of the monarch, encompassing the functioning of government. The differentiation of modern societies includes now multiple institutions in government, such as foreign affairs, the military, health, education, justice, and markets. This growth of institutions gave room for the distinction of private versus public ownerships.

The Great Depression in the 1930s raised doubt about the viability of capitalism. Citizens were inclined to trust national states rather than risky markets. At the end of World War II the major industrial nations turned to the task of state rebuilding and reconstruction. This effort focused on the importance of state owned enterprises (SOEs) and on strategic sectors of the national economy. The reliance on the state was predominant, especially in “statist” Europe. The US, however, was and remained more flexible in encouraging enterprises as well as government. The role of the federal government was also strengthened, for example, by establishing social security and regulations. Yet private and public partnerships occurred well before strong efforts at privatization in the US.

Early efforts to reduce the economic role of the state included Churchill’s “denationalization”

of the British steel industry and Adenauer's withdrawal of the West German government's major investment in Volkswagen in 1961. However, denationalization at the time was not very popular. The major movement toward privatization was energized much later by Margaret Thatcher. She also coined the concept of privatization. At that time (the early 1980s) a number of privatization goals were pursued by the British government: (1) provide new revenue through privatization of public enterprises; (2) improve economic efficiency; (3) limit the government's role in the economy; (4) encourage broader share ownership; (5) encourage competition; (6) require SOEs to aspire to market discipline. In the US Ronald Reagan won a landslide victory in 1980 and easily won his second term in 1984. His policies were to reduce taxes, cut government programs, and finance an astounding defense buildup, resulting in a large budget deficit. Privatization in various forms was encouraged by Reagan. Reducing the role of government (except the military) was a high priority.

The collapse of the Soviet Union was completed in December 1991, but the breakdown had begun with the dismantling of the Berlin Wall in November 1989. The 1980s and 1990s saw a revitalization of capitalism and the rapid expansion of democracy, especially among the East European countries as well as in many other parts of the world. During this period a great sense of urgency arose to transform communist centrally planned economies to free markets. There was also a demand to reduce the powers of governments and make the building of democratic institutions possible, resulting in experiments in privatization, lawmaking, and institution building. In many ways the transition included an enormous wave of corruption in governments, but also in the rising private sector.

The ideology of freeing the citizenry from the constraints of government grew in the US, Britain, and to a much lesser degree in Europe. Some politicians in these countries believed privatization might eliminate government altogether in significant ways. However, the experience of "shock privatization" in the Russian Federation and difficulties in many of the transforming East European countries led to recognition of the necessity of the rule of

law, the creation of democratic institutions, and effective regulations for a functioning market.

After the expansionist enthusiasm for privatization in the 1990s, a more balanced approach is now emerging, increasingly based on the empirical experiences of successes and failures. Privatization of certain public services has actually proven to be efficient and workable, but this cannot be assumed to be generally true. However, great differences exist in cultural values, legal frameworks, regulations, and commitment to transparency and social responsibility. Some countries may be without workable institutional frameworks to support effective and ethical privatization. Where these conditions allow mismanaged or secretive measures, serious harm can occur. Unfortunately, such conditions prevail in several privatized military functions, certain privatized prisons, and in many other fields.

Public services have to be assessed for their mission, efficiency, ethics, and freedom from corruption. The idea that privatization can always reduce government effectively has to be questioned – it is likely to be very limited. There are other risks: privatization can reduce citizens' participation in democracy and may indeed be harmful to democracy (e.g., in the case of a public service carried out by a global corporation at a great distance). The emerging research literature will make it possible to reduce the ideology of "freedom from government by privatization" and provide the needed empirical knowledge to use privatization positively for the public.

privilege

Deana A. Rohlinger

There is a historical and cultural tendency for dominant groups to institutionalize discrimination against subdominant groups. Discrimination is justified by arguing that members of the subdominant group are deficient in some way when compared to members of the dominant group. The idealized characteristics of the dominant group are intertwined in social, cultural, and legal institutions and ultimately work to advantage, or privilege, members of the dominant group and disadvantage those of the subdominant group. Sociologists most often discuss privilege in terms of gender (how women are subordinated to men), race/ethnicity (how people of color are subordinated to those with white skin), and sexuality (how homosexuals, bisexuals, and transsexuals are subordinated to heterosexuals).

In the United States, gender roles and expectations have been governed by the doctrine of the separate spheres. This ideology holds that women are virtuous, nurturing, and frail and therefore unable to contend with the demands of politics and commerce. Men, in contrast, are aggressive, competitive, and strong and, thus,

better suited for public life. Even as these beliefs were challenged throughout the twentieth century, the inequities between men and women persisted. Sociologists identify male privilege as being both embedded in the structure of complex organizations and reproduced in social relations.

Sociologists analyze the ways in which male dominance in the public sphere affects complex structures such as the workplace and school. Scholars argue that gender stratification in the workplace (with women largely confined to low level jobs at the bottom of the organizational hierarchy) and the use of male characteristics to define the ideal worker diminishes the career mobility of women by shaping hiring and promotion practices, employee performance assessment, and the distribution of work tasks. Moreover, when women break through unacknowledged barriers to their advancement, or the "glass ceiling," they are treated like "tokens" rather than capable employees who possess the skills and wherewithal to do the job. Gendered expectations about the kinds of skills women and men possess and the kinds of jobs they are best suited for are learned in school. Textbooks and the courses targeted to girls (home economics) and boys (wood working) reinforce stereotypes about the fields in which boys and girls are likely to excel.

Sociologists note that male privilege also is reproduced through interactions in these structures. At work, women's jobs often require deference to and caregiving for a male authority. For example, secretaries, paralegals, and nurse assistants tend to the schedules and well being of their (male) bosses. In school, teacher interactions with students often reinforce gender stereotypes about the fields in which boys and girls excel by giving boys more attention than girls in science and math classes and by differently praising their work (commending boys for content while commending girls for being neat).

Race and ethnicity, like gender, are social concepts. While race and ethnicity have different sociological meanings, they are often used interchangeably. Race and ethnic categories are given meaning through the social relations and within the historical context in which they are embedded. For example, in colonial America, class and whether one was native born were more important than skin tone in determining

status. The American Revolution, which was based on the premises of equality and freedom, threw the institution of slavery into question, and an ideology that justified slavery and kept African Americans out of the increasingly competitive labor market for unskilled labor formed. The obvious characteristic was skin color, and the idea that non white groups, particularly African Americans, required supervision, education, and guidance quickly took hold.

While much of the early research on race and ethnicity tried to justify the subordination of people of color by citing biological and cultural differences, sociologists argue that white privilege, like male privilege, is embedded in institutional structures and interactions. Scholars specifically examine how institutional racism, or the system of beliefs and behavior by which a racial or ethnic group is defined and oppressed, affects the opportunities and realities of people of color. For example, many scholars have shown that the lack of access to decent jobs, adequate housing, high quality education, and adequate health care in the US has resulted in higher rates of poverty among African Americans.

Sociologists discuss two additional dimensions of institutional racism. First, scholars make distinctions between intentional and unintentional racism. After World War II, the federal government intentionally supported white privilege by refusing to combat racial segregation in social institutions that are instrumental for upward mobility (education, housing, and employment). For example, the Federal Housing Administration supported segregation and only underwrote loans in white neighborhoods, which prevented African American veterans from taking advantage of the suburban boom and locked them into urban areas. Racism may also be unintentional. White privilege becomes invisible to those who benefit from it. In the above example, the white veterans that took advantage of the suburban boom probably did not think about how the color of their skin enabled them to do so. Just as today, those with white skin think little of the fact that a "flesh colored" bandaid most closely resembles their skin tone.

The second dimension scholars analyze is the hierarchical organization of race and ethnicity.

Because the white ideal is the standard by which race and ethnic groups are evaluated, this creates a hierarchy both within and among racial groups. Within a racial or ethnic group, those with lighter skin and Caucasian features are considered closer to the white ideal, better positioned to succeed in a white world, and are at the top of the hierarchy. Race and ethnic groups are also hierarchically organized and evaluated against a white ideal. Asian Americans fall just below whites in the racial hierarchy and often are labeled a "model minority" because of their ability to immigrate and achieve relative financial and social success in a white world. This becomes a source of racial division as politicians and pundits compare groups to one another and offer insight into the relative success and failure of different groups, while ignoring the invisible white ideal and the differing historically embedded experiences of racism.

Sexuality too is rooted in privilege. Sociologists have followed two different analytical threads in the study of sexuality. Some scholars linked research on race, ethnicity, gender, class, and sexuality together. These scholars conceptualize race, gender, class, and sexuality as interlocking systems and argue that an individual's location in the system determines the kinds of privilege and oppression he or she will face. For example, beliefs about African American sexuality are important to maintaining institutional racism. The stereotype of the "welfare queen" ignores white privilege and attributes the inability of African Americans to pull themselves out of poverty to promiscuity and laziness.

The second analytical thread conceptualizes sexuality as a system of oppression comparable to race, class, and gender. These sociologists argue that heterosexism, or the institutionalized structures and beliefs that define heterosexual behavior as normative, privileges heterosexuality and subordinates alternative definitions of sexuality and sexual expression. Thus, like gender and race, sexuality is a historically rooted social concept that privileges one set of social relations between the sexes. The presumed inborn sexual instinct for a member of the opposite sex is a relatively recent phenomenon. The increased prominence of doctors as a professional group in the 1880s positioned them to scientifically contribute to discussions of gender

differences and to define and medicalize the ideal male–female relationship.

Research on heterosexism has been fairly limited. While the movements of the 1960s served as a catalyst for talking about sexuality and sexual oppression, meaningful discourse in research was stymied by the focus on AIDS in the 1980s. This “epidemic,” which was framed as a problem in the gay community, caused the medicalization of homosexuality and reinforced traditional notions of heterosexuality as natural and ideal. To date, sociological research has examined three aspects of heterosexism. First, scholars analyze how gay and straight identities are performed, maintained, and managed in different arenas (Connell 1995). Second, scholars examine how gender and sexuality categories are reproduced in cultural productions such as mass media texts (Sender 1999; Hart 2000). This line of work “deconstructs” cultural products and illuminates how privilege is embedded in texts. Finally, scholars have examined how heterosexism and homophobia work together to reproduce and buttress economic privilege and patriarchy (Pharr 1997). The literature on the repercussions of heterosexism is growing and sociologists are increasingly exploring how heterosexism is embedded in institutions, such as the workplace, and reinforced through practices (such as intentional and unintentional discrimination) and legal institutions.

In sum, beliefs about gender, race, and sexuality are embedded in social, cultural, and legal institutions and affect the realities and opportunities of dominant and subdominant members of these groups. Those in the dominant group (male, white, and heterosexual) are privileged and reap the benefits from their membership, while those in the subdominant group (female, non white, and homosexual, bisexual, or transsexual) are disadvantaged and are intentionally and unintentionally discriminated against. That said, it is important to recognize that gender, race, ethnicity, and sexuality are interlocking systems, and that one’s privilege varies according to one’s status within these systems.

Pro-choice and Pro-life Movements

Tracy A. Weitz and Carole Joffe

Abortion is one of the most contested social issues in the US. Despite its recognized status as a polarizing force in politics, a relatively small number of sociologists have studied the social movements that sustain the abortion debate.

As a result, the topic of abortion social movements, while widely written about by journalists, is often under theorized. The following review summarizes the study of movements supporting and opposing abortion rights as studied by sociologists and other social scientists, predominantly in the US, with some attention to the changing international dimensions of this debate.

Social movements that take up the issue of abortion are often thought of as resulting from the 1973 Supreme Court decision *Roe v. Wade* (410 U.S. 113) recognizing a constitutional right to abortion. However, social contestation over abortion predates this decision with two periods of high social movement activity: the physician anti abortion movement of the mid 1800s and the abortion rights reform/repeal movement of the 1960s.

A number of scholars, most notably Mohr (1978) and Luker (1984), argue that the early physician anti abortion movement was part of a larger professionalizing project within organized medicine. Formally trained physicians sought to rid the profession of practitioners without such training, as well as lay midwives who were the main providers of abortion to women. In opposition to abortion regular physicians could distinguish themselves from other unregulated practitioners. Because of its capacity to both control and distinguish the profession, abortion became a high priority for the American Medical Association (AMA), formed in 1847. In many ways the AMA can be thought of as the first abortion related social movement organization in the US. In large part due to the anti abortion campaign of the AMA, abortion became illegal in every state by 1900. (For a Foucaultian analysis of the early physician opposition to abortion, see Stormer 2002.)

Smith Rosenberg (1985) examines the cultural context in which the medical profession's crusade against abortion occurred. In the mid 1800s the transition to smaller family size evident among society's most affluent and influential groups contrasted with the more prolific childbearing of recent immigrants. That white, married, Protestant, middle and upper class women used abortion to space and limit their number of children concerned the elite class that comprised the medical profession. The need for social and ideological

control over reproduction helped justify a medical crusade against abortion.

There was no organized counter movement to the first anti abortion social movement. Although the dates of the anti abortion movement coincide with those of "first wave feminism," the early women's movement sought to articulate disparate male-female relationships in alternative language and sexual imagery rather than support for abortion rights (Smith Rosenberg 1985). They endorsed "voluntary motherhood," not through abortion but through abstinence and control of men's sexual activity.

Abortion did not reappear on the larger public agenda until the 1960s, when both the medical community and the general public became increasingly frustrated with the inability of most American women to obtain a legal abortion. The works of historians Garrow (1998) and Hull and Hoffer (2001) provide details of the development and tactics of the reform/repeal abortion rights movement. Initially, efforts sought to reform laws by allowing more conditions under which a physician could perform an abortion (e.g., when the pregnancy was the result of a rape or when the developing pregnancy suffered from a genetic anomaly). Although these claims had widespread public appeal, they comprised only a small number of reasons why women sought abortions and thus few women qualified for abortions under these reform conditions. Eventually the limitations of the reform agenda would give way to a demand for the full repeal of abortion laws.

Two medical crises appeared in the 1960s that reengaged physicians in the debate over abortion: The use of the drug thalidomide by pregnant women (as in the Sherri Finkbine story) and the exposure of pregnant women to German measles (rubella) (Hull & Hoffer 2001). Thalidomide was never approved for use in the US, but it was used by many American women as a tranquilizer. When used in early pregnancy thalidomide causes gross fetal deformities. Similarly, women exposed to German measles in early pregnancy were also at higher risk of genetic abnormalities. An epidemic of German measles in the mid 1960s resulted in many physicians being asked to perform abortions. Joffe's (1995) work on physicians who practiced prior to and at the time of *Roe* illuminates the reasons for physicians' additional engagement in the

efforts to fully repeal abortion laws rather than simply reform them. Both the witnessing in hospital emergency rooms of the disastrous results of illegal abortion and the lack of clarity regarding the legal status of the few in hospital abortions that physicians were providing served as motivation for social movement action.

In addition to the role of physicians in the reform/repeal efforts, feminist scholars highlight the role of the 1960s "second wave" women's movement in the pressure for full abortion law repeal. The claim was that women deserved the right to have an abortion for the reasons of their choice. Women engaged in both political action geared at changing the laws as well as in directing women to safe illegal abortion providers and in some cases performing safe illegal abortions themselves. The history of both the Society for Humane Abortion and the Jane Collective contribute to an understanding of the efforts of feminist activists at this time.

The efforts to repeal abortion laws through the states' legislative processes experienced increased resistance, in part due to rising opposition from the Catholic Church. As such, the leaders of the reform/repeal movement began to prefer a judicial strategy challenging the constitutionality of abortion laws. The path of the case that would become associated with the right to legal abortion, *Roe v. Wade*, is discussed in several books, most usefully by Garrow (1998) and Luker (1984).

The *Roe* decision served as a catalyst for two new umbrella social movements: supporters and opponents of the right to legal abortion as articulated in *Roe*. The titles for these movements are contested between the movements, but they are commonly referred to as the Pro life Movement and the Pro choice Movement.

Within social movement literature, the Pro life Movement can be understood as a counter movement developing in response to success of the abortion law reform/repeal movement culminating in *Roe*. In the 1970s changes to the tax code facilitated the formation of political action committees (PACs) and thus the opportunity for the Pro life Movement to actively engage in the political arena. Pro life PACs were formed to target vulnerable abortion rights supporting politicians using single issue voting, thereby aligning the growing Pro life Movement with the newly developing Christian Right. The

merger of the Pro life Movement and the New Right resulted in the adoption of a pro life platform by the Republican Party and the election of Ronald Reagan as a pro life candidate for president in 1980.

In addition to seeking to affect national politics the Pro life Movement maintained a state based strategy to limit access to abortions through the passage of laws in state legislatures. The first regulations to be upheld by the Supreme Court (1977) were state based restrictions on the use of Medicaid funding to pay for abortions for poor women; the court would eventually uphold the federal prohibition on Medicaid funds known as the Hyde Amendment in 1980. Until 1989 further restrictions were struck down at both the state and the district court level, based on the *Roe* decision. In 1989 the Supreme Court heard *Webster v. Reproductive Health Services* (109 US 3040) challenging the constitutionality of Missouri's restrictions on abortion. When *Webster* was announced, the court fell short of overturning *Roe*, but a slim majority upheld every restriction of the law.

With the green light from the court that some state based restrictions might be acceptable, the Pro life Movement increased its efforts to pass more restrictive state legislation. In 1992 the Supreme Court heard a challenge to the Pennsylvania law which included compulsory anti abortion lectures by doctors, a 24 hour waiting period, a reporting requirement, spousal notification, and parental consent in *Planned Parenthood of Southern Pennsylvania v. Casey* (505 US 833). In *Casey* the majority opinion upheld most of the abortion restrictions, articulating a new standard whereby state based restrictions on abortion would be found constitutional if they did not represent an "undue burden" on women. No definition of undue burden was provided.

In the mid 1980s some opponents of abortion began to take direct action against abortion providers. The most written about group of the direct action wing of the Pro life Movement is Operation Rescue. Breaking with the focus on simply limiting the legality of abortion, Operation Rescue sought to stop the actual provision of services. Initial tactics included blockading entrances to abortion clinics. These sit ins were billed as "non violent" and often referenced the work of civil rights activists. Operation Rescue's most successful action occurred in 1991 with

what would be called the Summer of Mercy, in which Wichita Kansas was under siege for 42 days as thousands of pro life protesters converged on the city to blockade its clinics. A federal judge eventually issued an injunction ordering Operation Rescue to call off its demonstrations.

Although Operation Rescue claimed to be non violent, harassment, bombings, arson, vandalism, invasions, and picketing became routine tactics of direct action activists. Blanchard (1994) argues that the adoption of violence as a tactic was fueled by feelings of alienation from the agenda of the more mainstream Pro life Movement which had begun to focus its efforts to restrict abortion at the state level rather than to seek a full ban. The perceived failure of traditional lobbying tactics and executive regulation to bring about the level of change required to stop abortion led many in the movement to adopt a more aggressive and violent stance. The apex of violence was the actual killing of abortion providers.

In comparison to the Pro life Movement, the Pro choice Movement receives less scholastic attention. Staggenborg (1991), who studied the social movement organizations that comprise the Pro choice Movement, provides the most comprehensive sociological discussion to date. According to Staggenborg, no demobilization of the abortion repeal movement occurred after the passage of *Roe*. Rather, the growing strength of the counter movement required the institutionalization of the Pro choice Movement and the use of tactics geared at maintaining abortion legality through legislative and judicial processes.

Although the Pro life Movement had successfully elected Reagan as president there remained insufficient support for the pro life agenda in Congress. Despite numerous attempts, the Pro life Movement failed to pass a constitutional amendment banning abortion. These attempts, however, raised concern about the right to abortion among the pro choice public. The Pro choice Movement was additionally concerned with the ability of the counter movement to forward its agenda by changing the composition of the courts. In 1987 open warfare broke out over the nomination of Robert Bork for the Supreme Court. The Pro choice Movement galvanized opposition, eventually defeating Bork,

resulting in the appointment of an abortion rights moderate who, while not willing to overturn *Roe*, accepted new restrictions on abortion in the *Webster* decision.

The Pro choice Movement experienced its greatest successes in the early 1990s. As the court heard *Casey* in 1991, the Pro choice Movement sponsored the March for Women's Lives, drawing between 500,000 and 700,000 marchers to Washington, DC. The momentum of the Pro choice Movement culminated with the election of President Bill Clinton in 1992. Just two days after his inauguration, President Clinton issued several executive orders overturning five abortion restrictions put in place by the prior Reagan/Bush administrations. During his term he appointed two pro choice judges to the Supreme Court. In March 1993 Dr. David Gunn was shot and killed, shocking the nation and prompting a call for federal legislation to protect women from clinic violence. As the Freedom of Access to Clinic Entrances Act (FACE) was being debated in Congress, two additional physicians were shot (one wounded and one killed). These killings prompted the quick approval of the federal FACE legislation.

Like the Pro life Movement, however, the Pro Choice movement lacked the votes to pass national legislation to codify in law their position on legal abortion. Efforts instead focused on challenging state laws to restrict access to abortion. No large national efforts of the Pro Choice movement were undertaken until the legal right to abortion was again threatened by the election of a pro life president, George W. Bush. In 2004 a repeat of the March for Women's Lives drew over 1,000,000 abortion rights supporters to Washington, DC. Despite this showing, a majority pro life Senate was elected along with the reelection of President Bush. Although the Pro choice Movement has sought to galvanize grassroots support for its cause, two new Pro life Supreme Court justices received confirmation in 2005 and 2006.

Saletan (2003) examines the overall successes and failures of the Pro choice Movement strategy in his work on how conservatives allegedly "won the abortion war." His particular interest is the adoption by the Pro choice Movement of the "who decides" frame – a frame in which support is sought not for abortion rights but for keeping the government out of the decision.

(For a more detailed discussion of how discursive formations are used to forward a particularized understanding of abortion, see Condit 1990; for a discussion of how the fetus has been used, see Petchesky 1987.) Saletan argues that while the “who decides” frame is successful in maintaining abortion as legal, it fails to gain actual support for abortion rights as women’s rights. With a few exceptions, most observers of social movement activity and abortion have failed to deal with issues of race. In her work on the subject, Nelson (2003) helps connect the reproductive rights movement with resistance to the eugenics movement and efforts to address sterilization abuse.

In addition to studying the political histories of the movements, sociology is interested in the people that actively join the two movements and in particular the meaning of abortion to those activists. The first major study in this arena was Luker’s (1984) landmark work on activists in California. Luker found that differing views of motherhood explained women’s engagement in abortion social movements. For those on the pro life side, legal abortion was a referendum on the value of “stay at home” motherhood. Ginsburg’s (1989) study of the battle over the opening of an abortion clinic in Fargo, North Dakota reached a similar conclusion – that those engaged in oppositional movements saw the meaning of abortion differently. Her work concludes that abortion is a symbolic focus for the assertion of mutually exclusive understandings about the place of women in society.

In her work on pro life activists, Maxwell (2002) uses social movement theory to focus on the individualized meaning of abortion for pro life activists; she argues that many activists view their efforts as fulfilling a personal obligation to God. Other women use activism as a means to resolve personal conflict with their own abortion experiences. Mason’s (2002) work on the apocalyptic narrative of pro life politics seeks to locate the extremist position which justifies “killing in the name of life” within the Pro life Movement as part of a larger effort to reestablish the US as a Christian nation.

The rapid decline in the number of abortion providers in the US requires a renewed attention to the role of abortion within US medicine. In addition to driving some physicians away

from providing abortion care, the rise in violence is understood to have prompted the activation of a new pro choice physician counter movement. The creation of the organization Medical Students for Choice is seen as a turning point in the reengagement of physicians as a social movement player in the current fight over abortion. The uneasy alliance between physician led activism and feminist led activism, which historically was critical of physician power and dominance, is discussed by Joffe et al. (2004). Another development within medicine that receives some attention is the 12 year political battle over the approval by the US FDA of mifepristone, known as RU486 in France and most commonly as the “abortion pill.” Although widely adopted by the health care providers already offering abortion services, medication abortion is not routinely offered by regular physicians as originally projected when RU486 was thought to be a solution to the “abortion war.”

While the debate regarding abortion in the US is not mirrored throughout the world, a growing globalization of the Pro life/Pro choice struggle is underway. This tension was played out at both the International Conference on Population and Development in Cairo in 1994, and the Fourth World Conference on Women held in Beijing in 1995, where disagreements regarding abortion dominated many efforts to build an international agenda. Opposition to international recognition of abortion rights was initially raised by a small group of countries (some Muslim, some Catholic, including the Vatican delegation), but is now led by the US. In 2000 newly elected President George W. Bush reimposed the “global gag rule,” a measure which stipulates that no US foreign aid funds for family planning services could go to organizations which use their own funds for abortion services or referrals. This ban also precludes organizations that wish to receive US funds from engaging in advocacy related to abortion, thereby silencing many pro choice voices within developing nations. Delegations from the US to recent international convenings have mandated that opposition to abortion be a central component of any agreement to which the US would take part. Within many developing nations as well as former republics of the Soviet Union, anti abortion

efforts are receiving substantial financial support from US based Pro life Movement organizations (for case examples, see Kulczycki 1999).

Within other developed nations little attention has been paid to the existence or non existence of abortion social movements, in part due to the lack of extreme polarization within electorates and the absence of violence. Francome (2004) briefly discusses the existence of abortion social movements within the UK, while Ferree et al. (2002) expose those groups working within Germany.

professional dominance in medicine

Donald W. Light

Professional dominance is a theory about professionalization and a profession's relation to society that implies that this relationship is out of balance. It thus opens up issues of trust, exploitation of patients and society, suppression of competing groups, subordination of allied professions, and escalation of costs. The term is inherently less neutral than "professionalism" or the study of professions in society. It is largely used in literature on the medical profession in modern times.

ORIGINS AND HISTORY

Eliot Freidson developed the concept and theory of professional dominance in 1970 in a book of that title. He also detailed its dynamics and pathologies in a second 1970 book, *Profession of Medicine*. His overall argument is that an occupation with valued and complex esoteric knowledge and skills strives to get special legal and institutional privileges from the state and society more generally, so that it can become a profession. This gives it critical powers, such as exclusive rights of licensure and control over its domain of work, which it tries to define as broadly as possible.

Other exclusive rights and powers include prescribing controlled substances, admitting patients to hospitals, ordering tests and procedures, putting patients into a death like state, cutting into their bodies, excusing people from work, enabling people to receive service and financial benefits, and exempting people from criminal prosecution in the case of insanity. In the twentieth century, professions typically were granted control over the content and execution of training, certification and licensure, defining whether other providers were practicing medicine without licensure, defining the standards of care, assuring good quality of care and ethical standards, and disciplining members who violated professional standards.

These powers reflect a tacit social contract between society and the profession: Because you have highly valued skills and address critical social needs (to heal, to cure, to stave off death), we will grant you autonomy over these powers with the understanding that you will serve patients' needs first and behave in an altruistic manner.

In his early seminal work, Freidson emphasized the ways in which the medical profession had parlayed autonomy into dominance by exploiting this kind of social contract. The American health care system in the 1950s and 1960s offered considerable evidence, as hospitalization, subspecialization, surgery, tests, other procedures, and charges rapidly escalated. Complaints of unnecessary tests, procedures, hospitalization, and overcharging proliferated in the 1960s. Without the constraints of a national health care system that most other countries had in some form, these pathologies

of professionalism flourished. Many other studies and books on the pathologies of professionalism soon followed. One of Freidson's observations was that the organized profession cannot police or discipline its members very strongly without alienating them.

Subsequent to Freidson, Larson (1977) wrote an influential history of the rise of professionalism as a form of monopoly, where a profession charges rents (fees) on its capital (exclusive expertise), which it can expand through specialization and control over health care institutions. Ivan Illich, a Jesuit priest with a worldwide audience for his wide range of incisive critiques of modern society, wrote *Medical Nemesis* in 1975. Just by extrapolating from clinical studies, Illich documented the ways in which the medical profession was poisoning patients with toxic drugs, mutilating them with bad surgery, making patients increasingly dependent on them, and medicalizing more and more of human life. *Medical Nemesis* was professional dominance gone mad. Wherever Illich spoke in the western hemisphere, there was standing room only.

Paul Starr's landmark history, *The Social Transformation of American Medicine* (1982), built on a body of historical work to detail how the American medical profession parlayed its professional powers into institutional, legal, and financial dominance. Of particular note are the ways in which physicians incorporated their practices, started corporations for hospitals, clinics, and other services, formed strong alliances with medical supply and pharmaceutical corporations, and started hospital chains in the 1970s. A short, more analytic update has been written by Donald Light (2004). In other countries, professional dominance was evident in different forms. Light and Alexander Schuller (1986) led a team that documented a similar rise from autonomy to dominance that occurred in Weimar Germany and led to private physicians strongly supporting Hitler's rise to power. He quickly gave them new legal powers to destroy early models of community based, inexpensive, patient run clinics; strip the licenses of doctors who worked in them; and institute a professionally dominated model of medical services that formed the basis of the West German health care system after World War II. Most of its problems of escalating costs and fragmented services can be traced to this history. This is one of many

examples of how the medical profession came to control the central regulatory, financial, and institutional bodies in countries with universal health insurance or services.

CHALLENGES TO PROFESSIONAL DOMINANCE

Soon after the relentless ascent of professional dominance was declared, it started to face challenges. One challenge came from the logical extension of professional dominance itself – the development of hospital and other corporate chains by investors who saw that the profession's economic and legal autonomy meant that it could make a lot of money with almost no downside risk. Even mistakes were billable. This led a great spokesman of the profession, Arnold Relman (1980), to write about “the new medical industrial complex.” Relman and thousands of other physicians were appalled at the corporate takeover of American medicine. What he ignored was 30 years of increasingly commercialized practice by the physicians themselves. Also overlooked were the ways in which dedication to good practice and altruism were easy because they paid. The more thorough and careful one was, the more money one made. The health care corporations simply dropped the altruism and said they wanted to make money. Their size and power, however, constituted a new dominant force.

Meantime, Congress and employers became increasingly restive about the escalating medical bills they had to pay, and studies kept coming from top clinical researchers that showed much care was unnecessary. Other studies documented large variations in how physicians treated patients with the same medical conditions. These constituted deep pathologies of professional dominance and even autonomy. A stream of studies up to this day shows unmonitored autonomy results in continued use of outmoded or discredited tests and procedures; under and over diagnosis of conditions; careless mistakes with dangerous consequences; incomplete work ups and treatment plans; and unnecessary exposure of patients to risks. Was professional dominance based on a false pretense at its core?

In response to such evidence, institutional payers began to behave like buyers, what Light

(2004) calls “the buyers’ revolt.” A new constellation of corporate middlemen arose in the later 1970s to help them contain costs and buy better value. Institutional buyers started to hire corporations to review costly tests, procedures, and hospitalizations. They hired other teams to identify which physicians and hospitals practiced more cost effective medicine and rewarded employees or beneficiaries to use them. Congress funded long range programs to assess different ways to treat common problems in order to identify which were more cost effective. Still other corporations specialized in managing the small percent of costly, chronic cases. These and other elements came together in the late 1980s to be called “managed care.”

Physicians began to feel like the proletariat (the exploited workers of capitalists) and proletarianization arose as a competing theory to professional dominance. The benchmark article (McKinlay & Arches 1985) regarded all infringements on autonomy as forms of proletarianization, even government prohibitions against practices that discriminated by race and gender. A few years later the Marxist framework was dropped and the same analysis was called corporatization.

On another front, as early as 1973, Marie Haug identified several ways in which deprofessionalization was developing. Alternate and paraprofessionals were proliferating; lay people increasingly challenged professional authority; and computers were enabling people to become expert patients. Haug and Bebe Levin summarized their work in *Consumerism in Medicine* (1983).

FROM DOMINANCE TO COUNTERVAILING POWERS

In a review of these competing theories, Light and Sol Levine (1988) faulted each as identifying one trend and one part of the whole. Each lacked a sense of historical development and could not explain change. In particular, professional dominance as a theory was unable to explain decline, because dominance begets further dominance. The authors called for a new framework. Some years later, Light developed a theory of countervailing powers that allows one to analyze historical changes in professional dominance

or decline within or between countries. The theory, depicted in Figure 1, looks at the medical profession as one of several countervailing powers that pursue their agendas with varying intensity from era to era (Light 2000).

Particularly notable is the historical, comparative study by Elliott Krause (1996).

Future developments seem to center on two issues. First, the medical profession is still reeling from the revolt of the buyers and the

Figure 1 Countervailing powers in health care.

<i>Traditional professionalism</i>	<i>The new professionalism</i>
<ul style="list-style-type: none">● Based on individual autonomy, accountable to self.● Quality focused on process and determined individually. Thus effectiveness and quality variable.● Subspecialization and hospital care as the center of power and prestige.● Physician-based practice and authority. Nurses and others are delegated what doctors don't want to do.● Aimed at treating the ill, heroic salvaging.	<ul style="list-style-type: none">● Based on evidence-based accountability to patients and payers.● Quality focused on outcomes established through clinical research. Guidelines, protocols, care pathways, with discretion.● Focus on primary care, prevention, and management. challenges to its core, autonomy and control over its work. Yet the uneven quality of professional services when left to autonomous providers is well documented, and autonomy at the individual level leads to fragmentation at the organizational level. In the journal *Academic Medicine* and reports of the Association of American Medical Colleges, one can follow the struggles by the American medical profession to reaffirm altruism, dutifulness, and autonomy as core values of a renewed professionalism. A basic problem, however, is that one cannot expect a profession to behave much differently than the institutional and cultural framework in which it works. If the health care system is based on the corporate practice of medicine, if selection of more profitable patients and procedures is rewarded, if elaborated care and "defensive medicine" pay well, how much differently can one expect professionals to behave? More promising is a reconceptualization of professionalism centered on accountability, as illustrated in Figure 2. Second, Stefen Timmermans and Emily Kolker (2004) point out that clinical guidelines and protocols have not affected professional behavior much and argue that it would be more useful to stop focusing on professional dominance or decline and study the specific forms of professional power and knowledge. That focus, in turn, opens up the question of whether there are, in practice, not a profession but multiple professions, and even made up forms of professionalism to carry out the dominant interests of governments or corporations like the pharmaceutical industry.

professions

Keith Macdonald

Professions have been of interest to all the main schools of sociology, both in their own right and in relation to such topics as capitalism, the

state, social stratification, patriarchy, power, and knowledge.

Contemporary studies broadly agree that the professions are those occupations based on "advanced, or complex, or esoteric, or arcane knowledge"; or on "formally rational abstract utilitarian knowledge" (Murphy 1988), whose associations, in order to protect their knowledge and the market in services based on it, have entered into a regulative bargain with the state. These features usually enable an occupation to achieve good economic rewards and relatively high social status; this leads other occupations to try to emulate them.

The regulative bargain typically includes the means of controlling members of the occupation, and the obligation to adhere to ethical standards and to act with probity in relation to their clients and to the public. These features drew the attention of functionalist sociologists, from Émile Durkheim in the late nineteenth century to Talcott Parsons in the 1950s and 1960s, and led them to see professions as the bearers and defenders of important social values in modern society. This emphasis on the eufunctional value of the professions led some sociologists to adopt the "trait approach," whereby they devised ways of deciding which occupations were professions or semi professions and which were not.

This rather sterile exercise provoked Everett C. Hughes (1963) to write that he "passed from the false question 'Is this occupation a profession?' to the more fundamental one, 'What are the circumstances in which people in an occupation attempt to turn it into a profession and themselves into professional people?'" This symbolic interactionist stance stimulated much fruitful work on the professions. Eliot Freidson's notable work on the medical profession in the 1970s provided the stimulus for what became known as the "power approach" to the study of the professions. Freidson himself considered that to examine power alone was not the way forward and in his own work took a broader and more nuanced position. This was developed further by M. S. Larson's seminal work, *The Rise of Professionalism* (1977), which extended the interactionist analysis by drawing on Marxian ideas of production, market, and social class, and Weber's concepts of social closure and qualifications as a basis for both

economic advantage and social status. Larson sees professionalization as an attempt to translate one order of scarce resources – special knowledge and skills – into another – economic and social rewards. Maintaining scarcity helps to achieve a monopoly of expertise in the market, and to enhance status in a system of stratification. Larson's work emphasizes that social mobility and market control are not merely straightforward reflections of skill, expertise, or ethical standards, but that they are the outcome of the collective efforts of members in pursuit of the "professional project."

The concept of "professional project" is seen as much less important by Andrew Abbott in another important analysis, *The System of the Professions* (1988). Instead he emphasizes the importance of studying the actual work that an occupation does, the extent of its "jurisdiction," and its competition with other occupations. One may draw many distinctions between the work of Larson and of Abbott but there is an affinity between the two approaches in the sense that they both have added structural elements to an interactionist theme, to provide an eclectic but coherent theorizing of professions. An important element was added by Anna Witz's study, *Professions and Patriarchy* (1992), which elucidates the practices of those occupations, one of whose original defining features was that they were fit for gentlemen. Macdonald, on the other hand, in *The Sociology of the Professions* (1995), takes the professional project as his starting point, and elaborates and contextualizes it in an effort to show its applicability to a number of aspects of the professions in a variety of cultural contexts.

Marxian sociology of the professions, in contrast to the interactionist theme, is one of structure and system, whose "processes," such as state formation, polarization of social classes, and monopolization of the means of production, are the consequences of the capitalist mode of production. The professions are seen as integral to these processes, which are depicted not as the consequences of the actions of individuals and collectivities but as part and parcel of the exploitative relations of capitalist production. Any control that a profession has of its knowledge, any gain it might achieve in its class position, would be regarded as merely contingent on the advantage that global capital derived from such

circumstances. There is also a Marxian flavor to one version of the power approach, that of Terry Johnson, which, in contrast to Freidson, is more concerned with the relative advantages that an occupation could derive from its market position and relationship with the state.

Michel Foucault has also studied the power of professions and their relation to the state, focusing on the connection between knowledge and power. He sees the modern state as developing the science of the right disposition of all things leading to the welfare of all. Professionals (as the experts in these new scientific disciplines) are crucial to modern government, and their professional associations, in which expertise is institutionalized, are integral to the governance of the modern state. Foucault's originality has stimulated many studies of the professions but some writers fail to find a connection between that originality and the sociological tradition, while others regard his work as opaque and devoid of flesh and blood actors.

The study of the professions has the virtue not only of providing an insight into one particular segment of society, but also, as Freidson demonstrates in *Professionalism: The Third Logic* (2001), of linking up with the wider sociological themes referred to above.

professions, organized

Chris Carter

Professions are one of the main forms of institutionalizing expertise in western societies (Giddens 1991). The term “profession” is a curious one. It immediately conjures up images drawn from television shows featuring lawyers or medical doctors. Such representations point to the hold that certain professions have on our imagination. In *Bleak House*, Charles Dickens's celebrated novel, Richard Carstone considers which profession he wants to take up. The realm of possibilities – according to the definitional criteria of the age – is the military, the clergy, the law, and medicine. Professions such as law and medicine have successfully maintained both their power and status across several centuries and are seen as quintessential exemplars of what constitutes a profession. In the late nineteenth century and throughout the twentieth, a raft of new professions emerged. Some, like accountancy, have accrued considerable power.

While the dazzling array of different professions renders a definition of a profession difficult (Friedson 1986), the legacy of structural functional research suggests that features of a profession include: a body of abstract and specialized knowledge; a professional's autonomy over the labor process; self regulation by the profession; legal rights restricting those who can practice; control of the supply and licensing of practitioners by the professional body; altruism; and the enjoyment of high status within society. Such characteristics form an “ideal type” of professional labor – one which is rarely observed in professions themselves.

The professional associations of many so called “new” professions, such as marketers and human resource specialists, have expended considerable effort in trying to emulate the traits of the more established professions. Professions are complex and variegated and there are crucial distinctions in their relative status, the length of their history, and power (Friedson 2001).

THE SOCIOLOGY OF THE PROFESSIONS

The early influential thinkers on the professions included Durkheim (1957), Parsons (1951), and Tawney (1921). Their views held sway for much of the twentieth century and saw professions in a benign way, representing them as the bearers of a neutral and technocratic logic. Being experts in a specific area, professions came into being because there was a functional need for them and they used their skills and knowledge toward the betterment of society. This was particularly so in their role in mediating between individuals and society. Parsons did not regard professionals as selfless; rather, he saw their interests as being non pecuniary and directed toward enjoying high status and reputation in society, which in turn ensured the provision of the best possible services to society. Structural functionalist research was generally directed to ascertaining the characteristics of a profession in contrast to a non profession (Etzioni 1969). This research did much to establish the trait approach to understanding professions – something that has been influential to many occupational figurations seeking to establish themselves as professions.

Resonant with structural functionalism was the developmental approach to studying professions over time. Wilensky (1964) argued that increasing numbers of occupational groups were laying claim to professional status. This had the effect of stretching the definition of professions to the point where it was meaningless. In his seminal study of the professions, Wilensky analyzed 18 different occupations. He developed a sequential model of the development of professions, which highlighted the stages in the development of a profession. Wilensky concluded that many of the aspirant occupations would fail in their quest to achieve professional status as many of the stages took considerable time.

The Parsonsian orthodoxy was subject to radical critique from the 1960s onwards. A generation of writers theorized professions through looking at the prevailing relations of power. Many writers, coming out of the Chicago School tradition, sought to debunk the notion of professionals as disinterested and altruistic. Instead they sought to understand

the means through which professions organized themselves, how they were able to uphold their privileges and status, how they managed their relations with the state, and the effects they had on other groups (Friedson 1970). British sociologist Terry Johnson (1972) analyzed professions from a neo Marxist perspective, seeing them as mechanisms of control where a profession is able to control its own members. For Johnson, the state had an important role to play in upholding the power of professions. In the late 1970s, Margali Larson's *The Rise of Professionalism* (1977) integrated both Marxist and Weberian perspectives and argued that professions are interest groups whose objective was a "collective mobility project" aligned to the class system of capitalist societies. Achieving professional status allowed occupations to ameliorate both their economic and their social standing. Similarly, MacDonald and Ritzer (1988) argued that professional groups seek to establish monopoly control over a particular jurisdictional area. They then seek to control the related activities, while keeping a distance from subordinate groups.

The critique of functionalism shifted attention to the means through which professions achieve and retain power. Andrew Abbott (1988) developed this work further by outlining a dynamic theory of professions. According to Abbott, competition ensues between aspirant groups, thereby creating stratified professions which vary markedly in their levels of jurisdiction. He argued that expertise became institutionalized through this jurisdictional competition, which established who controlled which domain, which in turn determined relative status and prestige. Abbott's analysis emphasizes that there is an ongoing process of competition among different groups, which means that over time the relative power of a profession might change dramatically.

PROFESSIONS, ORGANIZATIONS, AND MANAGEMENT

Many professions have changed dramatically over the last 20 years with the economic restructuring that had its genesis in the election

of Margaret Thatcher in the UK and Ronald Reagan in the US. Welsh sociologist Mike Reed (1996) argued that the experience of professions differs markedly. According to Reed, it is useful to draw a distinction between three distinct forms of profession. They are the "liberal," "organizational," and "entrepreneurial" professions, respectively. Liberal professions are those such as law and medicine. Their characteristics are that they are independent, work for fees, and enjoy autonomy over their work organization. Organizational professions owe their status and professional warrant to the organization in which they work. Many organizational professions are employees of the state. They are typically a product of the great expansion of the state experienced during the twentieth century. Schoolteachers, social workers, government scientists, and the utility engineers would count among the ranks of the organizational professionals. "Entrepreneurial" professions exploit opportunities offered by markets, such as IT and management consultants.

Liberal professions such as law, chartered accountancy, and medicine have encountered many changes. Research carried out at the University of Alberta in Canada identified two archetypes within professional service work, which were titled "professional partnership" and "managed professional business." The former emphasizes collegiality, serving the client and the public interest, while being dismissive of managerialism. In contrast, the managed professional business (MPB) embraces the market and is resolutely corporate in its approach to the conduct of the profession. MPB professional service firms have developed corporate brands in their own right and their interpretive schemes owe as much to the discourse of strategic management as to law or accounting. Hanlon (1994) has characterized this broad shift as the commercialization of the service class, which involves large law and accounting firms being engaged in capital accumulation strategies. In a fascinating study of the socialization of trainee accountants, Grey et al. demonstrate that commercialization has redefined what constitutes professional conduct. Broader civic concerns have been displaced by "pleasing the client," which in the case of accounting firms is the

company that pays for the audit. The wave of accounting scandals – such as Enron, Parmalat, and WorldCom – are for many the consequence of the commercialization of the accounting profession.

In contrast to the expansionary climate experienced by many liberal professions, the last 20 years have witnessed organizational professions encountering hostility from new right governments and attacks in the media. State sponsored professions such as teachers, social workers, and utility professionals have seen their status and autonomy eroded. This has led to speculation as to whether we are seeing the twilight of some professions – mainly those that expanded through state support in the twentieth century. In some cases the decline is for material reasons. In the United States, the high cost of higher education combined with the relatively low economic rewards make many professions unattractive to newcomers. Throughout the western world, industries have been privatized. In some cases this has led to a managerialist assault on established organizational professions. Carter and Mueller (2002) report the removal of a previously dominant cadre of professional engineers from a British electricity utility in the years following privatization. More generally, new public management or managerialism has challenged the autonomy and self governance of professions throughout the public sector. Professions such as nursing have been much changed in an attempt by western health authorities to respond to the challenges of the increasing demand and costs of health care. Nurses' responsibilities have been expanded greatly. The needs of western health care systems cast a long shadow over developing world countries as nursing staff are lured to the West by the promise of relatively good wages and conditions.

Entrepreneurial professions are those that have gained the most over the last 20 years. For purists, they do not constitute professions at all, yet occupational figurations such as management consultants and IT consultants have experienced unprecedented growth in both their turnover and their influence in civil society. The commercialization processes discussed above led many of the large accounting firms away from core accounting activities. For instance, Arthur

Andersen billed Enron for \$25 million for consulting services and \$27 million for the audit in their final year of trading. Of course, consulting does not fall into any neat categories of professional work. Many have characterized the activity as knowledge work or immaterial labor, whereby “symbolic analysts” manipulate signs, symbols, and images. Lacking an obvious “right answer,” knowledge work is inherently ambiguous. Consequently, Mats Alvesson has suggested that technical expertise – whilst important – is becoming increasingly secondary to image and rhetoric intensity, which help persuade a client of the efficacy of a knowledge worker’s proposed course of action. In short, it is not so much a case of being an expert as *appearing* to be an expert. Entrepreneurial professions do not typically possess the institutional pillar of a strong professional body and it will be interesting to see how such groups develop. In time will they emulate the traditional liberal professions, or do they represent a new form of professional organization centered on brand, image, and reputation?

It is a fascinating time for analysts of the professions, especially those with a management focus. Managerialism, commercialization, and privatization have radically changed the context in which professions operate. Professions are likely to remain important means of institutionalizing expertise, although how professions organize and what it is to be a professional are likely to be fruitful areas for research.

professors

Joseph C. Hermanowicz

Professors are people with academic appointments at institutions of higher education. Compared to just a half century ago, higher education is differentiated on many counts, including the professorial role. While definitions delimit boundaries, they are sometimes ambiguously drawn. Professors in the American context typically hold advanced terminal degrees in the specialty in which they hold rank as assistant, associate, or full professor, those ranks composing an ascent in an institutional career. Yet vast numbers of people with academic appointments occupy roles, often without advanced terminal

degrees, as lecturer, instructor, or, increasingly, as a temporary or part time adjunct or affiliate of a unit within colleges and universities. Thus one can be more liberal or restrictive in the application of the term, but this complexity raises core theoretic questions about the very topic of professors in contemporary society: Who are they? What roles do they perform? What is the academic profession to which these individuals purportedly belong? How has the profession changed over time in its form and function? Answers to these questions become even more complex when extending them across national boundaries, perhaps explaining why little systematic comparative work on higher education faculties has been attempted. A total of 138 national systems of higher education, involving most countries of the world and employing nearly all professors across the globe, are described over the four volumes of *The Encyclopedia of Higher Education* (Clark & Neave 1992).

There are over 560,000 professors (i.e., full time instructional faculty and staff) employed in over 4,000 accredited institutions in the US. The size alone of such a population speaks of variety, but when dimensions of institutional type, field, individual age, and career stage are added it is little wonder that scholars of higher education have alternatively referred to the landscape of small worlds or different worlds, each of which exhibits its own characteristic form of variety and constraint.

Professors – normatively performing roles of disciplined free inquiry through teaching, research, and other professional activities – have been studied as an object of inquiry unto their own. At root, the reasons for treating professors as an object of study are twofold. First, professors extend culture and civilization. As teacher, researcher, and scholar, professors transmit to their audiences knowledge that has, in principle, been socially certified by their professional disciplinary community. In this sense, they extend culture by both transmitting and building upon knowledge. In another sense, they extend culture by passing along a set of generalized values, attitudes, and beliefs to new generations who learn institutional patterns of life through the process of education.

Second, professors guard culture and civilization. Their profession writ large is uniquely

situated in society as the profession that trains people for all other professions and numerous other lines of work requiring certified education. In this sense, they guard culture by upholding cognitive and behavioral standards that have been created by their professional disciplinary communities to ensure competent role performance. In another sense, they guard culture by upholding a set of generalized ideals: as masters in their various roles, they seek precision and excellence, cogent and articulable thought – and seek to inculcate these characteristics in their student clientele – so as to produce a higher learning and more advanced civilization.

For these reasons, professors assume a privileged place in the social organization of modern societies. But while professors may be viewed as central to society, the development of the study of them has been erratic, and less central to the core disciplines that can arguably yield major insights into the social organization of professors, sociology chief among them. One can find a sociology of higher education within which professors are a subject of study, but it is a nascent and thus small specialty area within sociology proper, and an area of inquiry that emerged and developed apart from what some take to be a kind of specialty cousin, the sociology of education, which customarily takes schools and schooling in grades K–12 as its province. While it would seemingly make sense for sociologists of education and sociologists of higher education to be nearly one of a kind, in regular contact and exchange with one another, attending the same professional meetings, and reading and publishing in the same journals, they are not, and instead inhabit different universes that rarely coincide. This has occurred much to the loss of higher education specialists. It is conceivable that a sociology of higher education would have developed sooner and with greater theoretic grounding had a boundary between it and the sociology of education – where concept and theory development has proceeded more swiftly – not been drawn so heavily. But the divide developed and has become institutionalized, more so for intellectual than political reasons. Sociological theorists turned their attention in the early twentieth century – to the extent they turned to education – to early schooling, since this was where, in Durkheim's terms, "real life

began.” Higher education involving and affecting the masses, and thereby inspiring interest in its systematic study, would not reach that stage until roughly a half century later.

The bulk of work on professors has been completed by higher education specialists working outside the discipline of sociology. This body of work tends to be more descriptive than theoretic, and thus less focused on such core sociological concerns as the organization of the academic profession and professionalization, or selection, recruitment, and socialization. Nevertheless, this body of work has yielded significant findings pertaining to professors. Topics of inquiry run a gamut, from the educational background of professors, their demographic profile, their attitudes and values about faculty roles and rewards, to their teaching strategies and goals and their allocation of time among work roles.

If, though, one is interested in a bona fide sociology of professors, rooted thereby in key sociological concepts and theory, one has to turn to the sociology of science. Save for a small handful of sociological classics on the professoriate – all of which now bear a heavy patina – beginning with Logan Wilson’s *Academic Man* (1942) and including such works as Lazarsfeld and Thielens’s *Academic Mind* (1958), Caplow and McGee’s *Academic Marketplace* (1960), and Jencks and Riesman’s *Academic Revolution* (1968), a sociology of professors proceeded under the rubric of the sociology of science, concerned as it is with the production and organization of socially certified knowledge. Because many of the studies on the sociology of scientists are based on the functioning of the academic reward system and its consequences, they often have general applicability – in theme, substance, and significance – to professors outside of the natural and social sciences. Evocative discussion by Braxton and Hargens (1996) suggests frameworks for the study of academics within and across various fields.

Robert K. Merton, often taken to be the “father of the sociology of science,” is typically credited with having inspired this tradition of research through his own vastly productive work in the field. Among his more central contributions to the sociology of science – and to a social organization of the roles of scientists

in particular – is his articulation of four norms said to undergird an “ethos” of science (and academe more generally). The norm of *universalism* stipulates that when scientists contribute to knowledge, the science community’s assessment of the merits of the contribution should not be influenced by personal or social attributes of the contributor; and scientists should be rewarded in ways that are commensurate with their contributions. The norm of *communism* (later called *communalism*) stipulates that knowledge must be shared, not kept secret, for it is only by placing knowledge in the public domain that others can build upon it. The norm of *disinterestedness* stipulates that scientists should engage in scientific work with the motive of extending knowledge, free of any biases or other motives that compromise the integrity of the scientific role. The norm of *organized skepticism* stipulates that scientists must suspend judgment about conclusions to be drawn from research until all available evidence is on hand to render qualified assertions about the contributions of a piece of scientific work.

While these four norms are understood to carry equal weight in the performance of scientific/academic roles, one of them – the norm of universalism – has been the object of disproportionate inquiry, perhaps because it is the norm that most centrally governs scientific output, an avenue by which to assess productivity and, ultimately, a stratification system of scientists. Thus, researchers have investigated how the reward system in science operates and what consequences its functioning has on matters such as the job placement of PhD graduates, promotion, tenure, productivity, recognition, and other foci of participation and attainment in a systematically stratified system of science.

The norm of universalism, however, emphasizes research productivity. Other research finds that clear majorities of professors across many institutional types are inactive in research. Consequently, assessing role performance – and the organization of scientific roles more broadly – on the basis of this norm becomes problematic.

Hermanowicz (1998) proposed an alternative to conceptualizing the academic profession. Instead of focusing on compliance with the norm of universalism in the operation of the

scientific reward and stratification system, the focus shifted to accounts scientists (and, in principle, other academics) provide of their careers. Here the “subjective career” becomes the object of study. Professors – and the profession that socially organizes them and their work – are understood through narrative: how people account for what they do, how and why they do it, and the ways in which they envision their roles and the evolution of such understandings over the time spent in an academic career.

Hermanowicz advanced a view of the academic profession as consisting of three social worlds, each organized by specific patterns in the way academics account for their careers. The *elite* world consists of professors who place the highest premium on research. “Elite” uniformly describes the members who work in this world and the external definition of them and their academic departments. It also expresses the aspiration of its members – “to be among the best” – and the key collective goal that brings them together and establishes their membership in universities that are also elite.

The *pluralist* world answers to considerably more varied demands, those of mass teaching as well as research and service to the wider community and state. A pluralist department includes some members as eminent as those found in elite departments, but the pursuit of still more eminence is not what holds members together, nor does it provide a standard that all members unhesitatingly adopt. This type of department answers to considerably more varied demands, those of mass teaching as well as research and service to the wider community and state. Often, this results in a blend of people who exhibit radically different affinities, talents, and motivations: plurality thus conveys the essence of this type of world. As a division of labor, departments of this type mirror something of a “multiuniversity” of which they are a part.

The *communitarian* world, like that of pluralists, answers to many demands, but the fundamental basis of comparative worth is within the institution itself. “Good citizenship” is demanded of all and is a primary basis on which individuals are accorded honor and esteem. Commitment to and identification with science is varied and uneven. Scientists in these

departments are heterogeneous in their beliefs and practices about what defines a legitimate career. Those who lead essentially teaching careers, or careers in which research has been sporadic over the course of time, are most likely found here. In accounting for the way in which individuals establish legitimacy here, this is a world in which scientists believe that the person comes before the work: individuals are respected on the basis of their human virtues.

While each of the three prototypical academic worlds possesses central tendencies, they each also contain variety and partially overlap with each other. Consequently, one may speak of and find empirically professors who individually represent hybrids: elite professors employed in pluralist or communitarian departments; communitarian professors employed in elite or pluralist departments. This work makes an explicit attempt to reveal and conceptualize the profession’s internal differentiation, attending to the ways in which its diverse membership construes the professorial role and its unfolding in an academic career. If research on professors is to advance, it must more firmly locate itself within disciplinary traditions, so that it may break new ground by building upon foundational concepts and theory.

progress, idea of

Bernd Weiler

The idea of progress, commonly considered one of the most influential and multifaceted ideas in the philosophy of history, states that material, political, social, intellectual, and moral conditions have continually and by necessity improved throughout human history and that such an improvement will continue in the foreseeable future (Nisbet 1980: 4–5). Since the Enlightenment the idea of progress and the controversies concerning its validity and ideological connotations have played a crucial role in modern social science discourse. The idea has not only been employed as a powerful conceptual framework to explain social change and the emergence of a new type of society, but also as a means to legitimate the entire endeavor of social science itself. By discovering the mechanism of societal progress and by identifying possible obstacles to progress, social scientists have claimed an authoritative role for themselves in the management of society's affairs. This socio-critical promise, encapsulated in the Comtean positivistic formula *savoir pour prévoir, prévoir pour pouvoir*, has drawn and continues to draw its strength from the fact that knowledge of nature's laws has been accompanied by an increased control over nature.

Regarding the question of the intellectual origins of the progressivist idea, four ideal typical positions can be distinguished. According to one line of thought the idea of progress is rooted in human nature and presents the ever-present chasm between the real and the ideal. As a societal force the idea is seen to ebb and flow, gaining momentum in specific social and historical contexts. A second school traces the origins of the idea of progress back to the anti-metaphysical disenchantment and to

the scientific worldview of a group of classical Greek and Roman thinkers, often citing the words of the Ionian philosopher Xenophanes from the late Archaic period that “not from the beginning did the gods reveal everything to mortals, but in course of time they discover improvements” as the birth certificate and Lucretius' poem *De Rerum Natura* as the fullest embodiment of the idea of progress. A third position holds that the idea of progress is religious in origin and that it represents a special variant of the Judeo-Christian eschatological tradition. The last school, following Walter Bagehot's dictum that “the ancients had no conception of progress,” emphasizes a rather recent origin of the idea and its intimate linkage to the project of modernity (Bury 1955). In this context it is argued that by seeing the future as intrinsically dynamic, open, and indefinite the idea of progress, in fact, marked a sharp break with the belief in a timeless and unchanging heaven which formed a crucial element of the Judeo-Christian notions of millenarianism and redemption. As in Pascal's argument about increases in knowledge being proportional to the awareness of one's ignorance, expectations of future progress are seen to rise in accordance with the perception of past and present progress. The idea of progress, according to this interpretation, accompanied the rise of modern science and technology in the seventeenth century, gained force throughout the Enlightenment, and peaked in the second half of the nineteenth century. Despite disagreement concerning origins, the last three views concur in the opinion that the idea of progress originated in the West and that it has been one of its driving forces.

Within the modern social sciences the progressivist doctrine that all societies are bound to follow the same path of development and that the differences between societies merely reflect different temporal stages of development was firmly established by the middle of the eighteenth century and figured prominently in the works of French and Scottish theorists such as Turgot and Smith (Meek 1976). Condorcet's unfinished and posthumously published *Sketch for a Historical Picture of the Progress of the Human Mind* (1795), in which he even pondered the possibility of scientific progress abolishing illness and death, is often regarded as

the epitome of the Enlightenment's belief in societal progress. The progressivist idea of the eighteenth century rested on the widely held belief that contemporary society was on the brink of far reaching changes in terms of its political, economic, technological, and cultural structure, on the trust in the human potential to emerge from one's "self incurred immaturity," and the emphasis on the "psychic unity of mankind," as well as on the rich ethnographic accounts of "savage nations" which came to represent the starting line of the triumphant march of civilization. *Cum grano salis* one might generalize by saying that the French tradition viewed progress primarily as the result of the conscious and rational workings of the mind that is increasingly freed from tradition and religion, whereas the Scottish social theorists tended to see progress as the unintended result of intentional action. In the first case progress was often equated with the moral betterment and enlightenment of individual actors, in the second with the evolution of an institutional framework that enhanced the chances that individuals who pursued their self interest also contributed to the commonweal.

With the increasing dominance of western civilization, the rise of technology (especially the spread of railways, steamships, and telegraphs), and the concomitant transformation of everyday life, the progressivist doctrine flourished throughout the nineteenth century and became part and parcel of the social scientific worldview. The idea of progress can be seen as the missing link between such diverse concepts and theories as Hegel's idealistic philosophy of history, Comte's law of the three stages, Marx's materialist conception of history, Buckle's conjectural history of civilization, Spencer's law of social differentiation, Bachofen's evolutionary scheme of the family, Durkheim's distinction between two forms of solidarity, and Ward's doctrine of social telesis. The two world wars in the "age of extremes" weakened, but could not stop, the idea of progress from exerting a strong impact on social thought throughout the twentieth century. In this context it might suffice to point to the various modernization theories, popular in the 1950s and 1960s, that argued for the existence of a unilineal, lawful pattern of development for all countries, to the contemporary "liberal minded" discourse

on globalization, with its focus on the convergence of traditions and the emergence of "one world," and to recent military attacks against "backward" regimes justified in the name of democracy's and the free market's inevitable success in the near future.

Like all great ideas the idea of progress has had its great enemies ever since. Critics of progressivism are commonly of a conservative, pessimistic, or skeptical bent, arguing either that there is nothing new under the sun or that what is new is worse than what was there before. In the eighteenth century the main ethical and intellectual arguments that have made up the anti progressivist tradition until today were deeply entrenched in social theory. By emphasizing the unchanging nature and the indomitable passions of humans, as well as the irrational and a rational side of social interactions, the idea of human and societal perfectibility is discarded as naïve. At the same time the technological optimism that nature could be controlled and harnessed by science and human ingenuity is rejected. When technological progress is admitted, it is either seen as insignificant or as harmful to the true values of human existence. Throughout the centuries the question regarding the relationship between knowledge and moral conduct has remained the essential element of the debate on progress. In modern anti progressivist social discourse the loss of tradition, family life, and religion is usually lamented, the past glorified, and the future feared. Since the Enlightenment anti progressivist thinkers have criticized the idea that all societies develop along the same path and that all non western societies necessarily follow the footsteps of the West as repugnantly Eurocentric, falsely teleological, and as resting upon an erroneous dichotomy of tradition versus modernity. Severe criticism of the various aspects of the idea of progress can be found, for example, in the social thought of Herder, Burke, and Malthus in the eighteenth century, the sociological writings of Weber and the Italian elitist theorists Pareto and Mosca in the late nineteenth century, the cultural anthropology of Boas and his school in the early twentieth century, and the German tradition of *Kultursoziologie* and *Kulturphilosophie* in the inter war period. After World War II the Popperian epistemological critique of historicism, the emphasis on "multiple modernities" by Eisenstadt, the

ideology of the environmental and the anti globalization movement, and recent postmodernist crusades against “grand narratives” can be seen as continuing the different strands of the anti progressivist tradition. If the power of a doctrine is to be judged also by the vehemence of opposition, the idea of progress has certainly been one of the most stimulating ideas in intellectual history.

propaganda

Randal Marlin

The term propaganda arouses considerable interest and apprehension in modern society, conjuring up in the minds of many Orwellian images of totalitarian control. Any survey of contemporary popular usage is likely to find it used in a pejorative sense, as for example when labor and management call each other's information packages “propaganda.” But there also exists a more neutral sense of the term, tied to its derivation from the Latin word *propagare*, meaning “to propagate.”

In this neutral sense propaganda means spreading messages, conveying information, getting the word out through some means of communication. The means may or may not be devious, deceptive, and underhanded. The message itself, and any goals sought in spreading the message, may also be good or bad, but in this usage, no moral evaluation is conveyed by the word propaganda.

Many attempts have been made to define propaganda in a way that brings out the negative connotation. Propaganda in this sense essentially involves communicating in artful and manipulative ways with the aim of getting one's audience to think, feel, and eventually act in a way desired by the propagandist. The motivation may be self interested or it may be to promote a specific cause, such as universal free medical care, or a more abstract ideology. Typically, truth is valued only insofar as it contributes to the end sought. Where it does not, then lies, deceptions, appeal to emotions, or other tactics may be employed. A defining feature is the bypassing or suppression of a recipient's ability to evaluate properly the message that is imparted. One important way of doing this is by disguising the true source of a given message, for example by funding seemingly disinterested bodies to do

one's advocacy. Another is by selectively presenting factual material. G. K. Chesterton once drew attention to the hugely mendacious possibilities available to those who report only truths, but select them so as to present a false picture, as when one reports only misery, corruption, and hardship from a country that is no worse than others overall. Discourse as dialogue, open ended, and with respect for the freedom and autonomy of the other is the opposite of propaganda so defined.

Recent efforts have been made to rehabilitate the term by distinguishing between "old" and "new" versions. "Old" propaganda would be deceptive and constraining, whereas "new" propaganda would be enlightening, empowering, and respectful of its audience's autonomy. One difficulty with this proposal is that supposedly new propaganda is not all that new, and supposedly old propaganda is still very much alive today. An alternative to talking about new and old propaganda would be to speak of good and bad propaganda. Here it is important to bear in mind two components in the moral assessment of propaganda. One relates to the ends promoted by the messages, which can be good or bad; the second relates to the means chosen, which can be good or bad independently of the ends sought. It is possible to use morally disreputable means to promote a worthy cause, for example.

The impetus to study propaganda comes from many sources and sometimes for opposing reasons. Propaganda has proven highly successful as a route to totalitarian power, for Nazis, communists, and liberal democrats alike. It is understandable that a new generation of power seekers wants to know how to use it. But there are others who object to propagandistic (in the negative sense) methods for attaining power. These others would like to expose bureaucratic, political, and commercial propaganda techniques whereby a powerful few dominate the large majority. The aim of such exposure is to enable people to resist their influence. The effect of exposing propaganda is to negate its influence.

LANDMARKS OF MODERN PROPAGANDA

The French Revolution led to a mass oriented culture, which Napoleon exploited through

tight control over opinion, seeing this as the foundation of political power. Carl von Clausewitz in the nineteenth century knew about the need in wartime to maintain morale on one's own side, undermine the morale of the enemy, and seek the good opinion of neutrals. Theorists such as Vilfredo Pareto, Georg Simmel, Albert Venn Dicey, and Gustav Le Bon have pioneered, from diverse standpoints, the study of opinion and mass behavior. British propaganda in World War I set a new benchmark for the extent and thoroughness of its worldwide reach. As the war progressed British propaganda became more hard nosed, and demonized Germans by concocting and widely disseminating a story about corpse factories in which the Germans supposedly boiled their own dead soldiers down to make glycerine, fertilizer, and suchlike. The aim of atrocity propaganda was to fuel hatred and enhance recruitment, but when the war ended it made peacemaking more difficult.

Woodrow Wilson brought the US into World War I with the help of government sponsored propaganda, and the experience provided some lessons for business. But much of the pioneering public relations work of Ivy Lee in the US actually predated the war.

Harold Lasswell's sustained review of British World War I propaganda was an early milestone of propaganda analysis. Walter Lippmann paid close attention to those biases in communication that derived from wishful thinking rather than deliberate intent. The success of both Nazi and Leninist propaganda seems to suggest the vindication of V. I. Bekhterev's ideas about how crowds can be manipulated through developing reflex responses. But as regards media influence such a "hypodermic needle" concept has been much criticized by subsequent research. Studies, notably by Carl Hovland and others, revealed that people's beliefs and attitudes are shaped in more complex ways than the Pavlovian, including reliance on others whose opinions they trust. Noam Chomsky exposed dubious assumptions underlying analysis of verbal behavior in terms of stimulus and response mechanisms. Nevertheless new methods of catching message recipients off guard are continuously being devised. Product placement in film and television gained support from the reported

marketing success of the candy Reese's Pieces in the widely viewed film *E.T.*

Jacques Derrida and Michel Foucault revealed much about the framing of discourse and how this framing can shape opinion in the interests of an existing dominant group. Martin Buber, Karl Jaspers, Gabriel Marcel, and Emmanuel Levinas have sought to make discourse more open to the personhood of the other, in contrast to treating others as means to one's own ends. George Orwell, who engaged in propaganda for the British in India during World War II, was well versed in the deceptive use of language, and exposed not only Soviet and fascist but also Tory imperialistic propaganda.

In the US alarm bells have sounded, from both right and left, at the way governments and corporations have manipulated opinion, concealing conflicts of interest, using shoddy accountancy practices and the like. During the Vietnam War, Senator Fulbright exposed some of the Pentagon techniques for getting the public to acquiesce to its plans, including installation of ballistic missiles. George H. W. Bush got support for his war against Iraq in 1991 through use of the atrocity story about Iraqi soldiers supposedly dumping babies out of incubators in Kuwait hospitals. Later, the story was discredited. Despite this revelation, misleading information aimed at gaining support for the US led coalition in the build up to the war against Iraq in 2003 still found wide acceptance among the US public.

SCOPE OF RESEARCH

The scope of propaganda research today is very broad. The kind of study undertaken by the Institute of Propaganda Analysis in the late 1930s has continued, as new techniques of deception, intimidation, and co-optation are discovered and exposed. Researchers in linguistics, informal logic, cognitive science, and media studies continue to shed new light in these areas. More recently, philosophers have taken up the challenge of ethical examination of propaganda, and Stanley Cunningham (2002) has begun the task of reconstructing the idea of propaganda for useful academic service, linking the concept to its epistemic deficiencies. A different challenge relates to the conundrum of controlling hate

propaganda while trying to preserve freedom of expression. The massacre of Tutsis in Rwanda in 1994 was preceded by intense feelings of hatred and fear generated by radio broadcasts in which Tutsis were dehumanized by referring to them with words such as "cockroaches."

French theorist Jacques Ellul's seminal and provocative work in the early 1960s continues to inspire researchers today. While his form of expression is often dogmatic and seemingly exaggerated and contradictory at times, there is no doubt about his profound understanding of the modern day propaganda phenomenon, reflecting his exposure to it in France under Nazi occupation. Ellul's central theme is that human technique in industrial society has turned into a leveling process that always seeks the most cost effective results, oblivious to artistic expression and humanistic values. He sees propaganda as an essential component of this new technological world, as advertising and public relations contribute to the self augmentation of technology to a point where means take precedence over ends and control over human destiny is lost. From Ellul's point of view the differences between Soviet, Nazi, and US propaganda conceal a basic similarity, which is acceptance in each case of a world in which the needs of technological society take precedence over all else. Propaganda has to be all encompassing, he writes, or it is not propaganda. To be effective, propaganda must not be contradicted and all different sources of information and perception need to be controlled. A propagandist builds on existing myths and presuppositions of a given audience, and may spend time preparing these background beliefs so that on an appropriate occasion they may be harnessed. Hitler made obvious use of racial myths in this way, but Ellul characterizes beliefs in the hero, in work, in democracy, in the nation, etc. as sometimes having the character of myth, in the sense that they are capable of motivating action and at the same time are treated as above questioning. When democracy is invoked to justify installing a subservient and repressive government in another country, the word democracy has passed into that mythical realm.

Ellul's categories of propaganda reach beyond the political, top down, agitative and irrational model, to include propaganda which is *sociological*, meaning diffuse as to source; *horizontal*,

meaning spread among people of the same socio economic level; *integrative*, meaning binding people together as a nation or other group; and *rational*, meaning the use of polls, figures, and statistics in ways and contexts where there is no opportunity for scrutiny of their methods and premises, so that the scientific appearance is illusory.

Finally, Ellul's enduring contribution to propaganda study includes his important focus on individuals actually needing and wanting to be propagandized. Wanting to seem knowledgeable and responsible, citizens in a democratic society will not wish to reveal the many conflicts and gaps in knowledge that result from confusing news accounts. They are inclined therefore to latch onto a simplified, moralized view of current affairs when it is available to them (which may partly explain Fox News's success). For most people, the simplified account is also more likely to be entertaining. The lesson Ellul would have us draw is that our freedom and autonomy come at a price; namely, a struggle against the passivity and laziness that make us easy targets for propaganda.

A strong counter culture opposing domination by corporate controlled media has developed through alternate media and the Internet. Noam Chomsky, Jeff Cohen (of FAIR: Fairness and Accuracy in Reporting), Sheldon Rampton, and John Stauber (of PR Watch), along with many other academics such as Robert W. McChesney, have worked for many years to alert people to the often subtle ways in which their minds are influenced by selective presentation of news and opinion in the mainstream media, particularly with convergence of the media under fewer owners, and owners with other commercial interests. Under US President Ronald Reagan, and again under President George W. Bush, there has been a deliberate and concerted attempt to gain more control over public opinion at home and abroad, and to prevent a reoccurrence of the kind of groundswell of opposition over the Vietnam War. Conservative think tanks have flourished, supported by private corporations, supplying "expert" facts and arguments to the mass media. Public funding has existed for public interest groups that favor a liberal and left of center stance, but since the Reagan era the mainstream media have paid

more attention to conservative voices than previously. Chomsky and Edward Herman introduced a "propaganda model" detailing filters that operate on the mass media, skewing the process of news reporting that would be determined by journalistic values alone. When well financed think tanks produce elaborate content analyses claiming to show that "liberal" newspapers are biased, it may be hard to refute such studies even when they are off the mark. They put pressure on the media to tilt more towards a conservative vision of what is fair and balanced. Other filters that Chomsky and Herman describe are the ownership and profit orientation of the mainstream media; the need to satisfy advertisers' interests; the need to rely on information provided by government and business and their approved "experts"; and lastly, the use of anti communism as a means of control. By depicting communism as an absolute evil, an effect is to scare commentators from supporting measures that benefit labor, for fear of being labeled "pinko." Since the events of September 11, 2001 anti terrorism has been similarly exploited, as those who protest infringements on civil liberties and the rule of law are treated as "soft on terror."

FUTURE PROSPECTS

Future analysis of persuasion and propaganda can always benefit from a study of Aristotle's *Rhetoric*, the principles of which still apply even when the means of communication differ. Source credibility continues to be a paramount consideration, and it can be confidently predicted that the ingenuity of propagandists at disguising their (and their paymasters') hands in manipulative communications will constantly be seeking outlets, and the propaganda detectors will have no shortage of work to detect them. Watchdogs are proliferating on both ends of the political spectrum. For example, while FAIR's perspective tends to be left oriented, that of AIM (Accuracy in Media) monitors the media from a rightist standpoint.

While the Internet has provided previously undreamt of opportunities for pooling the information resources of scattered counter culture practitioners, the problem of reaching the wider

public still remains, and activist groups have recently been exploring the possibilities of communicating through short range radio.

Orderly society presupposes a minimum of shared beliefs among the general population, at least regarding procedures to resolve conflicts in interests and ideologies. Some believe that resolution of conflicts will require a measure of "bamboozling" the public into accepting measures in their own interest, in other words, making use of propaganda. Others, having more faith in the public's ability to think through the merits even of complicated policy matters, put their energies into exposing deceitful communications and making complex matters more intelligible to wider audiences. It will be an interesting job for sociologists and philosophers to trace the impact of these conflicting approaches, and to argue for a suitable communication ethics in the light of contemporary and historical experience.

property crime

Heith Copes and Crystal Null

Property crimes are defined as those offenses where offenders take money or property from victims without the use or threat of force. They include a long list of offenses such as burglary, larceny theft, motor vehicle theft, arson, shoplifting, fraud, embezzlement, and forgery. The Federal Bureau of Investigation (FBI) defines the first four of these offenses as Part I property crimes. These crimes make up the property crime index published yearly in the Uniform Crime Report (UCR). The majority of data collected by the FBI on property crime is concentrated around Part I offenses. The remaining offenses are classified as Part II property crimes in the UCR (FBI 2003).

By far the largest number of crimes committed in the United States in any given year are crimes against property, which make up about three quarters of all crime in the United States. Trends from the UCR and the National Crime Victimization Survey (NCVS) indicate that property crime rates have varied considerably over the past few decades. However, since 1992, property crime rates have begun to steadily decline to their current level. The estimated rate of property crime offenses known to the police in 2001 was 3,656 per 100,000 inhabitants, which is the lowest the rate has been since 1972. According to the NCVS, the rate of household victimization by property offenders has been steadily dropping from 544 in 1977 to 159 in 2002.

With such high numbers of property crime it is not surprising that the financial loss from these crimes is enormous. In 2002, the estimated loss attributed to property crimes (excluding arson) was \$16.6 billion. Although excluded from estimated property crime tabulations, arson had an average dollar loss of \$11,253 for the offenses in which monetary values were reported. Crimes against businesses and institutions are excluded from the NCVS, so losses from property crime are much higher than reported. For example, it is estimated that shoplifting alone costs retailers an estimated \$10 billion each year.

Despite the prevalence and cost of property crime, clearance rates for property crime are considerably lower than those of violent crimes. A crime is considered cleared when at least one person is arrested, charged with the commission of an offense, and turned over to courts for prosecution. Property crime clearance rates have been relatively stable since 1971, fluctuating from 16.1 percent to 18.5 percent with an average clearance rate of 17.5 percent.

The majority of property crimes are committed by occasional or amateur offenders who engage in a variety of offenses to supplement their incomes. Typically, these offenders do little in the way of planning, have few technical skills, and rely on found opportunities when choosing targets. Although the low clearance rate of property crimes makes profiles of offenders suspect, researchers have compiled a general view of property crime offenders that suggests they are disproportionately male, young, and non white. Historically, males commit twice as many property crimes as females. In 2002, for example, males accounted for 69.6 percent of property crimes and females accounted for 30.4 percent. However, property crime accounts for a larger percentage of the total crime committed by females.

Property crime offenders are disproportionately young. Almost one third of property crime offenders are under the age of 18 (30.4 percent). The peak age of property crime offenders is between 16 and 18. After this age, offending rates by age steadily decrease until around age 60, when property crime offenses level off at 0.4 percent.

The majority of property offenders are white (66 percent), followed by blacks (31.4 percent), Asian and Pacific Islanders (1.5 percent), and American Indian and Alaskan Native (1.3 percent). While the majority of property offenders are white, victims of property crime are disproportionately non white.

Although property crime has dropped in the previous decade, this drop has not affected all citizens equally as some groups continue to be at a higher risk than others. Both race and ethnicity of the head of the household are important factors when determining risk factors for victimization. The rate of victimization in households headed by a white person is 157.6, by a black person is 173.7, and by a Hispanic person is

210.1. These patterns of victimization have been relatively consistent for the past decade.

Household income, location of residence, and homeownership are also important predictors of the likelihood of property crime victimization. It appears that property offenders are more likely to victimize households with annual incomes below \$7,500. Offenders are also more likely to victimize households that are located in an urban area. Target households are usually rented, not owned.

Victims of property crime are often hesitant to report their victimization to police. Less than half of all victims of property crime report their victimization to law enforcement agencies. There is tremendous variation in reporting rates by types of property crime, however. For instance, 86.1 percent of victims of motor vehicle theft reported the theft, whereas only 32.8 percent of victims of larceny theft reported it. Not surprisingly, the main reason that victims reported the offense to police was to recover their lost property. The most common reasons for not reporting the offense were because the objects were recovered, the offender was unsuccessful, or there was a lack of proof.

property, private

Jack Barbalet

Property implies ownership, to which rights attach. These rights may take usurpatory, moral, or legal form. The types of things that

can be owned as property, and therefore subject to property rights, are enormously varied. Depending on the particular circumstances, they might include, for instance, a human person, a person's capacities (especially for labor), the products of another's labor, any material of use or exchange, land, options, patents, ideas, and so on. The structure of ownership is also variable. In ancient societies, classically described as the "indian village community" in Maine's *Ancient Law* (1861), co ownership or communal property prevailed. In peasant societies, on the other hand, the household rather than the community is typically the unit which exercises controlling rights over productive possessions. From early capitalist societies private property arose as the dominant form of ownership in which individual persons exercise rights over their objects of possession. In late capitalist societies corporate and public property forms emerge, combining elements of both communal and private property. Corporate property is communal insofar as ownership rights are shared by a number of proprietors, each of whom can exercise or dispose of their rights as they choose as individuals without collective constraint, and similarly use the benefits of their ownership as they individually see fit. Public property excludes private ownership and only nominally involves co ownership, as various forms of statutory authorities exercise such property rights, putatively on behalf of the public, subject to legal and political controls.

The concept of private property, at least since the seventeenth century in Europe, is central in political and social theory. This is because the issue of private property is fundamental to moral, political, psychological, and social principles and outcomes. Private property is closely associated with the concept of individual freedom, for instance, where other forms of property may curtail such freedom. Economic and industrial efficiency is also frequently regarded as optimized under conditions of private property and compromised – if not undermined – by communal or public property. Psychologically, however, private property is more than other forms of property held to promote an unhealthy regard for material possession and corrode ethical orientations, as well as undermine respect for the natural and social environment

experienced in common. Similarly, private property is regarded as the source and consolidator of inequitable and unjust distributions of earnings and wealth.

In liberal theory property rights have a distinctive role insofar as they attach not just to possession of land and movable objects but also to a human being's own person and the capacities of that person, especially the capacity to labor. In the chapter on property in his *Treatise of Government* (1690) John Locke famously declared "every Man has a Property in his own Person." The notion of a person's proprietorship of their own capacities has become foundational in liberal theory to other rights of the person, including civil and political rights. In this sense private property is the institutional basis of the entire edifice of liberal thought. The vexed question of ownership of the products of the exercise of a person's own capacities in the context of capitalistic labor is classically dealt with by John Stuart Mill. Factory operatives produce an object that they are legally prevented from claiming as their own property. This is no contradiction, says Mill, because "the labour of manufacture is only one of the conditions which must combine for the production of the commodity" and all the other conditions are the private property of the employer (*Principles of Political Economy*, 1848).

Marxism, on the other hand, focuses not on rights but on the productive relationships constitutive of private property. In this sense private property is understood in terms of power relations rather than rights. Marx holds that ownership or possession of property is the principle of organization within relations of production and distribution. Those who possess private property have direct access to means of consumption; those who do not must offer their labor services to owners, who pay wages in exchange for activating their property productively. In this exchange the reciprocity between property owners and property less workers is asymmetrical, with the material benefits being greater for owners and the opportunity costs being greater for non owners. This relationship Marx characterizes as exploitation. In this manner Marx holds that there is a characteristic endogenous dynamic within each form of property, corresponding to historical stages of societal development, including

primitive communism, Asiatic society, feudalism, and capitalism.

Sociological treatments of private property adopt elements of liberal or Marxist accounts. Private property, for Weber, results from appropriation and closed social relationships or closure (*Economy and Society*, 1921). The appropriation of economic opportunities, from which others are excluded, is the basis of an advantage, according to Weber, which may take the form of a right. If this right is enduring and can be transferred between individuals, then the appropriated advantage is property. Weber goes on to discuss how appropriation and property have taken different forms under different historical conditions and in different economic settings. Durkheim argues that inheritance of private property is responsible for a forced division of labor, resulting in anomie, through distortion of a natural distribution of talents (*The Division of Labor in Society*, 1893). He provides a historically insightful descriptive account of property rights in *Professional Ethics and Civic Morals* (1950), but without developing a theory of private property.

Frank Parkin (*Marxism and Class Theory: A Bourgeois Critique*, 1979), following Marx, distinguishes between two forms of private property: personal property and property as capital. Property as capital, he argues, following Weber, is exclusionary closure. Out of these relations arises class exploitation. The difficulty here is Parkin's exclusive focus on distributional relations and competition for resources; while addressing the production of life chances this account fails to treat the production of the means of production of life chances. Marx achieves this by understanding property as a productive relation. For Parkin, property is an essentially political facility. But practically all accounts of private property acknowledge in different ways its connection with power. It is also recognized, from Adam Smith (*Theory of Moral Sentiments*, 1759) to Thorstein Veblen (*Theory of the Leisure Class*, 1899), that private property as personal possession confers status or social standing on its owner.

prosocial behavior

Nancy Wisely

Social psychologists invented the concept of prosocial behavior to characterize a range of voluntary actions that benefit the welfare of others. Because prosocial behavior is socially defined, its specific nature may differ across societies or by situations. For example, the widespread norm, "Thou shall not kill," does not apply on the battlefield where killing may be rewarded with praise and medals. Prosocial behavior is consistent with social norms and provides a convenient antonym for antisocial behavior, or non normative behaviors such as crime and most forms of aggression. *Helping* is a prosocial subtype and refers to any behavior that has positive consequences for another. The helper's motivation may be altruistic or egoistic. Altruism is a special form of helping. The altruist is motivated by the ultimate goal of improving another's well being regardless of possible personal costs. Although the altruist may garner rewards in the act of helping, this does not preclude the altruistic intent. In contrast, egoistic responses are self serving and motivated by the desire to improve one's own welfare. The connection between altruism and prosocial behavior varies. Prosocial behavior will not always be altruistically motivated, and altruistic motivation will not always generate prosocial behavior (Batson 1991).

Prosocial activity includes emergency intervention, charity, donation, cooperation, volunteering, comforting, sacrifice, and sharing.

These behaviors require investment of time, energy, or material goods and often feature a single helper. Cooperation, or coordinating activities for mutual benefit, is a cornerstone of every society but is not considered helping because it implies intent to benefit the actors. Because all of these behaviors involve positive consequences, they can be classified as prosocial, but to determine whether they meet the criteria for altruism requires knowledge of helpers' motives.

Interest in prosocial behavior dates from the Greeks and is embodied in the Judeo Christian directive to "love thy neighbor." In the eighteenth century, Scottish pragmatists David Hume and Adam Smith separately advanced the radical notion that human nature includes a capacity for benevolence and compassion for others. This possibility continues to challenge the conventional model of egoistic human actors.

Within early social science, Comte is credited with coining the term altruism to describe the motivation to help others. By the early 1900s, McDougall recognized an altruistic instinct, but the idea faded as academic interest shifted from internal factors to the behaviorist focus on observable phenomena. In the 1930s and 1940s, Kurt Lewin set the guidelines for contemporary social psychology by proposing that behavior is the result of both the person and the environment (situation). Lewin summarized this then revolutionary idea in social psychology's most famous formula: $B = f(P, E)$, signifying that behavior is a function of the person and the environment. Lewin's conception of the person includes individual hereditary attributes, skills, and personality. The environment refers mainly to the situation and others who are present. Later researchers have debated which of Lewin's variables best explains prosocial behavior – personality traits or social situations.

It fell to George Herbert Mead, a modern pragmatist, to perhaps unwittingly rekindle interest in altruism. In developing symbolic interactionism, Mead proposed that role taking (taking the other's perspective) is integral to the development of the self as empathy enables the child to act reflexively. Current theories linking cognitive development and altruism are indebted to the observations of Piaget, while Kohlberg identified stages of moral development. Within

the social problem centered discipline of sociology, Sorokin risked his reputation by dedicating part of his later career to the examination of altruism and love. He conducted an empirical study of "good neighbors" and headed the Harvard Research Center in Creative Altruism. Prosocial study again received attention when Gouldner (1960) concluded that the neglected norm of reciprocity is a universal component of moral codes. This norm of social obligation makes two simple demands: people should help (and not harm) those who have helped them.

Until the 1960s, scientific study of helping was sporadic and only loosely connected. But in 1964, 39 witnesses failed to help Kitty Genovese, a murder victim, in Queens, New York. The brutal incident and the onlookers' apparent callousness captured national attention and generated concern about urban apathy and alienation. The public outcry awakened social psychologists and legitimated the relevancy of prosocial research. The puzzle of why so many bystanders had the same unexpected reaction to this crime spurred an investigation by Bibb Latané and John Darley. Their book, *The Unresponsive Bystander: Why Doesn't He Help?* (1970), is considered a classic in the field. Since then, prosocial behavior and altruism have been studied continuously and comprise a routinely recognized subfield of social psychology. Although the bulk of empirical work has investigated helping by strangers in emergencies, researchers have recently extended their studies to include the more mundane activities of volunteering, donation, and everyday helpfulness.

Philosophers, theologians, economists, and biologists have analyzed altruism and prosocial behavior for centuries. Current debate within social psychology and beyond is moving away from the established belief that behavior is ultimately and universally egoistic. A related issue is whether altruism is genetically transmitted and manifests itself as a personality trait.

THEORIES: ALTRUISM AND HELPING BEHAVIOR

Helping theories address internal motives and personality characteristics as well as external situations and social contexts.

Evolutionary theories apply the Darwinian principle of natural selection to explain helping motives. Thus, any trait that helps an organism survive will be genetically transmitted to the next generation. Under this rule, a gene for altruism seems contradictory because altruistic responses can require self sacrifice over self interest. Evolutionists emphasize that group survival depends on survival of the gene pool, not the individual organism. The major mechanisms for genetic transmission of altruism are group selection, kin selection, and reciprocal altruism. Kin selection implies that altruistic parents will save their children. This process, along with a reciprocity gene for mutual help, would enhance group fitness over time. Research confirms that people tend to help others who are genetically similar. Generally, successful groups should have a higher proportion of altruists than groups who die off. Applied to humans, this perspective is controversial. While it does show how self sacrifice can be consistent with natural selection, the theory reveals nothing about human goals. However, evolutionists have added fuel to the possibility of an altruistic personality.

Social learning theory posits that socialization, not heredity, is why people help. Learning to be altruistic occurs through instruction, reinforcement, and imitation. For individuals who internalize the altruistic tendency, self reward (self approval) and self cost (guilt, shame) can serve as reinforcements or punishments for helping or inaction. Exchange theory extends the reinforcement principle by viewing humans as rational actors who assess the ratio of costs to benefits in helping situations. Helping is less likely if costs predominate. Equity theory emphasizes fairness and distributive justice – helping should be reciprocated.

Developmental theorists observe that cognitive skills and capacities increase in complexity and sophistication in sequential stages as humans mature. Older children develop cognitive empathy and then learn to make internal self attributions. Eventually, they see their own helping as personality driven. Internalizing the belief that they are helpful persons sets a standard for self judgment of future behavior. Kohlberg's (1985) model shows how moral reasoning evolves. Martin Luther King, Jr. is often given as an example of one of few who

reach the highest level where moral decisions are based on concern for universal justice and personal ethics even if they contradict social norms.

The most sociological theories of helping, or normative theories, stem from symbolic interactionism and its dramaturgical metaphor. A theatrical analogy compares the social world to a stage where actors give scripted role performances for an audience. Thus, individuals are regulated by norms that prescribe the appropriate behavior in a situation. Conformity to three norms encourages helping: the norm of giving; the norm of social responsibility, or helping dependent others; and the norm of reciprocity or mutual help. "Mind your own business" is one of several norms that inhibit helping.

RESEARCH AND DEBATES

Bystander Intervention Studies

Early research studied intervention in emergency situations and produced several decision making models to understand when people will help. Latané and Darley identified steps that lead to action. Failure at any point cancels the possibility of helping. Researchers repeatedly find a counterintuitive bystander effect – as the number of bystanders increases, helping tends to decrease. Three explanations have been tendered. First, pluralistic ignorance occurs when bystanders seem to be unconcerned. Also, multiple bystanders diffuse responsibility whereas lone individuals carry full responsibility. Finally, bystanders may be unsure of their competence in a situation and find inaction preferable to failure or criticism.

By the 1980s, prosocial research had revealed that most people's behavior varies by situations, and evidence of behavioral consistency across situations was scant. This climate of preference for situational variables spurred personality theorists to demonstrate the impact of individual differences. Thus, empirical support for Lewin's original formula holds; the environment and person together explain behavior. Recently, Penner et al. (2005) suggested a multilevel approach (meso, micro, and macro) to understand helping.

Altruism

For centuries the image of egoistically motivated humans prevailed. Self interest was thought to be the ultimate goal of all behavior, and altruism was rarely mentioned. In this intellectual milieu, Daniel Batson (1991) initiated a 25 year crusade to demonstrate that empathy motivated altruism is an ultimate goal for some people some of the time. His research program is a classic example of scientific revolution. Batson systematically tested his empathy–altruism hypothesis against three alternatives. In two of the models, empathy motivates helping, but the goals differ: in one case, social and self rewards are the ultimate goal (Cialdini et al. 1987); in the second, avoiding punishment is the ultimate goal. In the third and most popular model (aversive arousal reduction), helping is the best way to relieve empathic distress (Dovidio et al. 1991). Dozens of empirical challenges have failed to refute the empathy–altruism hypothesis.

Demographic Variables

Generally, small town residents are more helpful than urbanites. Milgram identified information overload as the underlying cause of supposed urban apathy. City dwellers use several strategies to cope with the bombardment of urban stimuli: they identify high priority information, selectively attend to it, and limit some interactions to superficial involvement, all of which would reduce helping. But not all cities are the same. Experiments in 36 US cities show population density (not size) to be the strongest predictor of helping. Internationally, Hispanic cultures, where *simpatico* is the norm, rank highest in helping.

In the 1980s, researchers focused on gender differences. They found the kinds of help given to be consistent with gender role expectations. Men are more likely to help strangers in emergencies, or in situations of danger or requiring physical strength. Women are more likely to provide routine help and ongoing commitment to care for children and the elderly or support a friend. Gender differences peak when an audience is present, there is potential danger, and the recipient of help is female. Overall, men are more likely to give help, and women are more likely to ask for it.

Planned Helping

Recently, researchers have studied long term helping as in giving blood, charitable donation, and volunteering. Social factors (norms) combine with psychological factors (empathic feelings) to produce altruism in volunteers. Conceptualizing helping behavior as role behavior reveals how repeat blood donors experience role person mergers (blood donation becomes a core part of their identities) (Callero et al. 1987). Others view volunteering as productive work and analyze the capital inputs required (Wilson & Musick 1997). A third approach identifies six functions of helping. Volunteers can express humanitarian values, increase their understanding of the world, enjoy personal growth, acquire career experience, enhance social relationships, and address personal problems. Generativity or commitment to the welfare of future generations is another possible motive. This research has yielded practical results for volunteer recruitment.

prostitution

Julia O'Connell Davidson

The term prostitution is popularly used to refer to the trade of sexual services for payment in cash or kind, and so to a form of social interaction that is simultaneously sexual and economic. This makes prostitution a difficult cultural category, for in most societies sexual and economic relations are imagined and regulated in very different ways. Prostitution therefore straddles two quite different symbolic domains. Since these domains are highly gendered, the female prostitute has long represented a troubling figure, disrupting what are traditionally deemed to be natural gender binaries (active/passive, public/private, etc.), and stigmatized as unnatural, immoral, and polluting. Yet prostitution is often simultaneously viewed as an inevitable feature of all human societies, for it is held to meet the supposedly powerful and biologically given sexual impulses of men. Thus it is some times described as a “necessary evil” and considered to protect the virtue of “good” girls and women by “soaking up” excess male sexual urges which would otherwise lead to rape and marital breakdown.

This traditional view of prostitution found sociological expression in a classic article by Kingsley Davis (1937), which explained the institution of prostitution as a necessary counterbalance to the reproductive institutions of society (such as the family) that placed a check upon men's sexual liberty. Furthermore, Davis

argued, because prostitution enables “a small number of women to take care of the needs of a large number of men, it is the most convenient sexual outlet for an army, and for the legions of strangers, perverts, and physically repulsive in our midst” (1937: 754). This line of analysis was widely accepted by sociologists until Mary McIntosh subjected it to devastating critique in a seminal essay titled “Who Needs Prostitutes? The Ideology of Male Sexual Needs” (1978). Prostitution had been an important focus of feminist thought in the nineteenth and early twentieth centuries, and McIntosh's essay, alongside Kate Millett's *The Prostitution Papers* (1980), marked a renewal of feminist interest in the topic.

This interest has subsequently grown, not least because prostitution is part of a wider market for commercial sex that has expanded and diversified rapidly in both affluent and developing nations over the past two decades. Old forms of sex commerce, including prostitution, are taking place in more and different settings; new technologies have generated possibilities for entirely new forms of commercial sexual experience; women are now amongst consumers of commercial sex; the boundaries between commercial sex and other sectors, such as tourism, leisure, and entertainment, have shifted. But there are also continuities with the past. Female prostitution in particular remains a hugely stigmatized and often criminalized activity. Even where certain forms of prostitution are either legal or tolerated, female prostitutes are still frequently subject to forms of surveillance and social and legal control that are not applied to non prostitute citizens (or, very often, to male prostitutes).

There are also continuities as regards the strong relationship between colonialism, imperialism, nationalism, militarism, and war on the one hand, and prostitution on the other. The presence of international peacekeepers and police, civilian contractors and aid workers in post conflict settings has acted as a stimulus for the rapid growth of a prostitution market in many regions. Very often, working conditions and employment practices in these newly emerged markets are abysmal. Historically, links between prostitution and migration, and children's presence in prostitution have both

attracted intense public and policy concern. Such concerns recently resurfaced, for there are still children present in the sex trade, and in many places the majority of prostitutes are now undocumented migrants from poorer countries or regions.

Prostitution has commanded much attention from feminists in recent years, but has also highlighted deep theoretical and political divisions within feminism. On one side of the divide stand “radical feminists” or “feminist abolitionists” who foreground the sexual domination of women by men in their analyses of gender inequality, and view prostitution as the unambiguous embodiment of patriarchal oppression. All prostitution is a form of sexual violence and slavery that violates women’s human right to dignity and bodily integrity, and buying sex is equivalent to the act of rape. This account rests on the assumption that no woman freely chooses or genuinely consents to prostitute. It leaves little room for women as agents within prostitution, and provides what critics deem to be a gender essentialist, totalizing, and reductive analysis of prostitution. Although grounded in a critique of patriarchy, the feminist abolitionist account emphasizes sexual experience as a source of individual and collective moral harm, and privileges sexual acts that take place in the context of intimate, emotional relationships. It thus shares a certain amount of ground with moral conservatism. For this reason, critics point to uncomfortable parallels between contemporary feminist campaigns for the abolition of prostitution (and especially those against “sex trafficking”) and the moral purity and race hygiene movements that flourished in the early twentieth century.

On the other side of the divide stand those who might loosely be described as “sex work feminists.” They reject the assumption that prostitution is intrinsically degrading and, treating prostitution as a form of service work, make a strong distinction between “free choice” prostitution by adults and all forms of forced and child prostitution. Whilst the latter should be outlawed, the former can be an economic activity like any other, and should be legally and socially treated as such. This perspective emphasizes women’s capacity (and right) to act as moral agents within prostitution. Within this, there are sex radical theorists who celebrate sex

commerce as a practice that potentially subverts the legal and social binaries of normal/abnormal, healthy/unhealthy, pleasurable/dangerous sex, as well as of gender itself. Though some sex work feminists pay attention to the impact of global economic and political structures and processes on sex commerce, others have been criticized for their failure to engage seriously with questions about the sex industry as a site of labor exploitation.

Because the term “prostitution” embraces a diverse range of experience, and because “prostitutes” are not a homogeneous group, diametrically opposed positions on prostitution can each be partially supported by empirical research. Thus, feminist abolitionists refer to studies showing, for example, that entry into prostitution can be precipitated by the experience of rape and/or incest, and that prostitution can be associated with drug abuse, various forms of sexual and physical violence, and suicide. Yet sex work feminists can also back their claims by citing studies in which women describe themselves as having actively chosen prostitution, either for positive reasons or as preferable to other employment opportunities open to them.

Male sex workers rarely feature in such debates on the rights and wrongs of prostitution, and this may partly reflect an (untested) assumption that sexual transactions between men are inherently less exploitative than those involving a female seller and a male buyer (Altman in Aggleton 1999: xiv). Research on male prostitutes’ experience has largely been driven by concerns about sexual health and HIV/AIDS prevention, and to a lesser extent by interest in the relationship between male sex work and gay identities. However, this research also reveals that male prostitution, like female prostitution, varies enormously in terms of social organization, working conditions, and earnings, and that men’s and boys’ motivations for trading sex are as diverse as women’s and girls’. Questions about agency, choice, labor exploitation, and violence are thus just as relevant to the analysis of male prostitution as they are to that of female prostitution, even if they have to date been largely overlooked.

As sellers of sex, men may often have been ignored in research and debate on prostitution, but they have received attention as buyers of sex. So, for example, radical feminists have argued

that buying sex is an act of aggression, equivalent to rape, but this has been challenged by a number of researchers who have demonstrated the highly differentiated nature of demand for commercial sex and the diversity of male clients in terms of their social identities, motivations, and practices, as well as by researchers who have examined the phenomenon of female demand for the services of male sex workers (for instance, Sánchez Taylor 2001).

As the sex industry has expanded and diversified in recent years, so the literature (popular and policy as well as academic) that variously describes, criticizes, or celebrates it has also proliferated. This literature is increasingly an object of analysis in its own right, and a growing number of works are devoted to deconstructing historical and contemporary discourse on prostitution, revealing its basis in deeper anxieties about – or desires for – social change, especially as regards sexuality; relations of gender, class, and race; imperial decline, national identity, and migration patterns; the nature and boundaries of childhood; and/or public health. Yet prostitution continues to serve as a symbolic battleground for broader disputes about such issues, and there is still no consensus on how best to define, theorize, or respond to the phenomenon.

Although debates on prostitution are intractable in the sense that they are disputes about the moral and normative values that *should* inform sexual and economic life, they also hinge on claims about the empirical reality of prostitution in the contemporary world. For this reason, the existing body of research evidence on prostitution is important. However, the existing body of research evidence is patchy, incomplete, and unreliable, for the study of prostitution presents many methodological difficulties. First, there are definitional problems. “Prostitution” does not always involve a simple, anonymous, and instantaneous commodity exchange. It can also be organized in less explicitly contractual and more open ended ways, and so shades off into more diffuse, longer term relationships that are not always easily distinguished from conventional and legally sanctioned relations between spouses or partners. By the same token, the exchange of sex for some economic benefit is not legally defined as prostitution where it takes place within a marriage, or, in many countries, between people who are dating each other.

Sexual and economic life are not easily disentangled, for in most societies “sex is a resource with both symbolic and material value” and so also an exchange value (Zalduondo & Bernard 1995: 157).

Even when research focuses on sexual economic exchanges that are organized as commodity exchanges, methodological problems persist. Much prostitution takes place in an illegal and/or hidden economy, so that official statistics on the size and earnings of the sex trade in any given country are not available and it is extremely difficult to gather accurate unofficial data. Female prostitution has received much more research attention than has male prostitution. Within this, female street prostitution has been studied more extensively than other forms of prostitution, and it is sex workers rather than their clients who have received the lion’s share of research attention. Few studies of prostitution use control samples, so that claims about its unique properties remain difficult to substantiate empirically. More generally, the existing body of evidence on prostitution is unsatisfactory because it is an amalgam of information from different sources, collected in different ways, at different times, using different definitions of the phenomenon, by different agencies for very different reasons. Different political concerns about prostitution lead to very different research agendas – the questions that preoccupy policymakers, feminist abolitionists, HIV/AIDS prevention activists, and sociologists, for example, are not identical.

Though some commentators remain embroiled in the debate on whether prostitution should be viewed as a form of work or a form of male sexual violence, most sociologists now recognize the need to develop analyses of prostitution that can embrace its diversity and its particularity as both a sexual and an economic institution. This will require dialogue with scholars working on broader theoretical and substantive topics, for example with sociologists who study work, migration, and globalization, such that theoretical insights into the diversity and complexity of the power relations that surround human labor in the contemporary world can be applied to prostitution. And since the metaphor of slavery is frequently invoked in relation to prostitution and “trafficking,” there is room for much closer engagement with historical and

theoretical analyses of slavery, and more particularly the work of theorists who address questions about gender, property, and slavery (e.g., Brace 2004). Such scholarship highlights the fact that the lines between tyranny and consent, domination and freedom, and objectification and moral agency are not and never have been clear cut, and thus may help prostitution theorists to move beyond simple forced/free dichotomies. The social and political construction of the market for commercial sexual services is another area requiring development. Here, it will be important to draw on theories of consumption to explore the consumer market for commercial sex as a site in which status relations and hierarchies along lines of class, race, nation, age, and gender are expressed and reproduced. Finally, with some notable exceptions (e.g., Kulick 1998; Aggleton 1999), little research attention has been paid to questions about male and transsexual/transvestite prostitution, and it is to be hoped that work in this area will contribute significantly to theorizing on commercial sex.

protest, diffusion of

Sarah A. Soule

The term diffusion as it is used by social scientists refers to the spread or flow of some innovation, through direct or indirect channels, across actors in a social system (Rogers 1995). Diffusion of protest, then, implies that social protest (or some element thereof) is spreading across (or flowing between) some set of actors in a social system.

There are several components of this core definition of diffusion that are worth highlighting (Rogers 1995). First, implicit in this definition are four different types of actors. First, there are *innovators*, who are the very first actors to adopt an innovation. Innovators are said to be adventurous, willing to take risks (and incur losses at times), and connected to actors outside of the social system. Second, there are the *early adopters* of the innovation who, by adopting it, help to legitimize the innovation in the eyes of other actors who have yet to adopt. Third, there are the *later adopters* who come slowly to the process of adoption, but who nonetheless choose to adopt the innovation after careful deliberation. Finally, there are the *non adopters*, or those who have not, and presumably will not, adopt the innovation.

Thinking about the different types of actors relevant to the diffusion process has been of central importance to scholars of protest cycles (Tarrow 1998). A cycle of protest is a period of increased conflict, across many sectors of a social system, characterized by the diffusion of new tactical forms, identities, frames, and so on. Work on protest cycles distinguishes between “early riser” movements (which help to set a protest cycle in motion) and movements that are sparked by these earlier movements via processes of diffusion within the protest cycle.

In addition to the importance of the different actors in the diffusion process, this core definition also emphasizes that there is some *innovation* or object that is perceived as new and that spreads across these actors (Rogers 1995). Research in social movements has found that innovative protest tactics, frames, and ideology may all diffuse between actors and organizations.

Finally, this core definition emphasizes the channel or conduit along which the innovation spreads. As such, work in the area of social movements has emphasized the importance of both direct (or network) ties and indirect (or socially constructed) ties (Soule 1997).

Early work in the social movement literature was a product of the intellectual and social climate of the 1950s and 1960s. Early treatments of diffusion, like much of the social science in this era, were framed by an interest in psychology and micro level processes. As such, these tended to view diffusion as motivated by contagion between individuals in groups or crowds, for example when individuals react to stimuli from others. Maladaptive and aggressive impulses were to be feared, since they were thought to spread from person to person and drive collective action. Observers of race riots, lynching, Nazism, fascism, McCarthyism, and Stalinism viewed individuals as non rational and susceptible to the diffusion of these movements.

With the development of the resource mobilization tradition in the 1970s, and its focus on social movement organizations, it became possible to consider diffusion as a function of connections between different organizations. Thus, more recent treatments of diffusion recognize that the boundaries between movements and movement organizations often overlap, leading to a web of connections (both real and imagined) between actors and social movement organizations.

Most recent work on the diffusion of protest has gone beyond merely noting the existence of diffusion and has instead tried to better specify the mechanisms by which an innovation diffuses. As such, there are two broad categories of diffusion studies: those which focus on how *direct network ties* facilitate diffusion and those which focus on how *indirect ties* facilitate diffusion.

One of the earliest examples of the role of direct network ties in the diffusion of protest is

Rude's (1964) examination of the diffusion of information about rebellions along transportation routes in England and France between 1730 and 1848. Similarly, Bohstedt and Williams (1988) show that dense community networks formed through market transactions facilitated the imitation of food riots across communities in Devonshire in the late eighteenth century. Finally, and more recently, Hedstrom et al. (2000) found that the diffusion of the ideas of the Swedish Social Democratic Party between 1894 and 1911 followed the travel routes of political agitators at that time.

In addition to examining trade and travel routes, other studies have focused on additional types of direct ties. Petras and Zeitlin (1967), for example, found that the propensity of an agricultural municipality to vote for Salvadore Allende in the Chilean elections of 1958 and 1964 was directly related to the number of mining municipalities to which the agricultural municipality was connected. In their study, the mining industry spawned high levels of Marxist ideology and activism, which spread to agricultural municipalities via direct ties.

In another historical account, Gould (1991) argued that overlapping enlistment in the National Guard (i.e., people belonging to battalions outside their own districts) produced interdependencies across districts in the commitment to resistance of the Versailles army in Paris in 1871. More specifically, insurrection against the impending Versailles army in one district depended on the levels of resistance in other districts to which the district was directly linked.

Direct network ties have also been found to facilitate the diffusion of rioting behavior. Singer (1970), who interviewed 500 African American men about their sources of information on the Detroit riot of 1967, found that the chief source of information, according to his informants, was personal communication. This finding is similar to those reported in other studies of riots.

Finally, direct network ties can facilitate the diffusion of innovative protest tactics. Morris (1981) shows that the sit ins associated with the Civil Rights Movement were not spontaneous and uncoordinated activities, but rather that preexisting organizational and personal ties facilitated communication necessary for the emergence and development of this then innovative protest tactic.

In addition to direct connections between individuals and/or organizations, indirect ties can also facilitate the diffusion of protest. One type of indirect tie is the shared cultural understanding of similar activists or organizations in different locales. While not directly connected, activists who define themselves as similar to other activists may imitate the actions of others. An example of this process is the imitation by activists at Seabrook in 1976 of a mass demonstration at a nuclear site in Germany in 1974 (McAdam & Rucht 1993). In related work, Soule (1997) shows that innovative student protest tactics diffused among educational institutions which were similar along certain dimensions. The construction of categories of similarity served as indirect channels between colleges and universities in the mid 1980s, leading to the diffusion of the shantytown protest tactic during the student anti apartheid movement.

The mass media is another important type of indirect channel of diffusion. Noting that the urban riots of the late 1960s appeared to cluster in time, Spilerman (1976) hypothesized that riots diffused throughout urban black areas and were facilitated by television coverage of civil rights activism, which helped to create solidarity that went beyond direct ties of community. To Spilerman, then, the media served as an indirect channel of diffusion by creating a cultural linkage between African Americans in different metropolitan areas. Television, he argues, familiarized individuals all over the country with both the details of riots and the reasons why individuals participated in riots. Singer's (1970) aforementioned work on the Detroit riot of 1967 points to the media (as well as interpersonal or direct communication) as a leading source of information on the riot in that city. In more recent treatments, Myers (2000) finds evidence for the claim that riots that received national media attention increased the subsequent national level of riots, while smaller riots that received only local media attention increased riot propensities only in their local area.

In the literature on the diffusion of protest, there are at least three unanswered questions worthy of consideration. First, most of the empirical work on diffusion of protest has not adequately conceptualized which actors are truly at risk for adopting an innovation. When we

consider the previously discussed types of actors essential to the definition of diffusion, it is clear that some of these actors (in particular, the non adopters) are likely not really at risk of adopting the innovation to begin with. In Soule's (1997) work on the student divestment movement in the United States, she defines campuses as "at risk" of experiencing a shantytown event if the college/university had investments in companies doing business in South Africa. At one level, this is perfectly adequate and logical, especially from a methodological point of view. However, in thinking about the set of colleges and universities which at that time had investments in South African related companies, it is quite plausible that some of them would not *truly* be at risk for a shantytown event because, for example, they had no history of student activism. The difference may be a minor one: *technically* a university may be at risk for experiencing this type of protest because it is guilty of investing in South African related companies; however, in *actuality*, a university may not really be at risk simply because a good predictor of student activism is a history of activism. Diffusion scholars should carefully consider the "risk set" of potential adopters of an innovation so as to adequately discern between non adopters who were at risk of adoption and non adopters who were never really at risk to begin with.

A second consideration relates to the concept of *theorization* as advanced by diffusion scholars (Strang & Meyer 1993). Theorization is the development of abstract categories and hypotheses about patterns of, and relationships between, these categories. It is a way for individuals to make sense of the world around them. In many ways, the concept of theorization is similar to the way in which *collective action frames* are used by scholars of social movements. For example, consider the way in which an innovation (e.g., tactic, ideology) is framed strategically to improve its chances for adoption. In many ways, this is similar to the diffusion literature's focus on the role of theorization in helping to document the virtues of a particular innovation. Drawing connections between theorization and framing would be an interesting area in which social movements and diffusion processes might be advanced.

Finally, thus far scholarship on the diffusion of protest has not compared the relative

effectiveness of indirect and direct channels of diffusion for spreading elements of social movements. In the literature, there is an often overlooked distinction between *communication* and *influence* (Soule 2004). Both processes convey information, thus both have the potential to impact the actions of others. However, communication is less likely to change opinions than is influence. The former of these is exemplified by the mass media and may be parallel to indirect ties, while the latter is exemplified by direct, interpersonal ties. Thus, we might expect that, at least in certain contexts, direct ties may be better or more effective channels than are indirect ties. Most studies of diffusion in social movements have tended to focus on either direct or indirect ties and their role in the diffusion process; however, there is a need to carefully examine the differences between these two conduits of diffusion.

Protestantism

Jean Paul Willaime

Of the 2 billion Christians in the world today, Protestants make up about a quarter, while Roman Catholics represent a little over a half. If Protestant Christendom appeared in the sixteenth century within European Latin

Christianity and represented a number of fractures within it, then it would be wrong to associate modern Protestantism with western society (especially with North America). Protestantism has become a world phenomenon, present in Asia (more than 25 percent of South Korea's population is Protestant), Latin America (at least 10 percent of its population), and Africa (17 percent of the population). In the year 2000, out of every 100 Protestants, 31 were in Africa, 25 in Europe, 17 in North America, 12 in Asia, 12 in Latin America, and 3 in Oceania (where they represent 42 percent of the population, the highest proportion in any continent) (Hillerbrand 2004).

Protestantism has its origins in a number of key reformations within European Christianity in the sixteenth century: the Lutheran Reformation in the Germanic world, the Calvinist Reformations in France, Switzerland, and Scotland, the Anglican Reformation in England, and the Radical Reformation of the Anabaptists and Spiritualists. Even if the Protestant world includes branches which appeared later (Baptism in the seventeenth century, Methodism in the eighteenth, and Pentecostalism in the twentieth), it was these reforms which laid the doctrinal foundations for Protestantism and gave it shape. The Protestant world constitutes an extremely diversified and complex religious situation. It is polycentric – Geneva is not Rome – pluriconfessional, and multifaceted. A Lutheran church service in Sweden is quite different from a Pentecostal assembly in Brazil, or from a Baptist service in the Southern US. It is, in each case, one of the number of different faces of Protestantism. Although the Protestant world is uniform neither in its doctrine nor its organization (it is characterized by its theological and ecclesiastical pluralities), three fundamental principles give it a certain unity: (1) reference to the Bible, (2) religious individualism, and (3) a sense of Christian duty in the world.

Whatever the Protestant confession – whether it be Reformed/Presbyterian, Lutheran, Baptist, Methodist, or any other – great importance is given to the Bible within individual and collective piety, and reference to the holy scriptures is considered a fundamental source of religious truth and Christian behavior. From there, the ecclesiastic institution and its authorities have

been relativized. They are fallible and their faithfulness is measured according to the given scriptures (*sola scriptura*, “only scripture”). Luther's heirs felt freer to found other ecclesiastic organizations when they realized their church had become disloyal: there has been, throughout the course of history, a number of reforms among the heirs of the Reform itself. In certain respects, it can be stated that the desacralization of ecclesiastic institutions favored the development of free enterprise in religious spheres, as was the case of denominationalism in North America. This stance is thought to be the cause for the strong division between clergy and laity, which has contributed to “the universal ministry of the faithful” and the calling for each believer.

The second point which the Protestant world has in common is the concept of religious individualism (not to be confused with being isolated within religion; such individualism, on the contrary, nurtures all facets of sociability, including a sense of community centered sociability). Durkheim (1951) found that the highest incidences of suicide in Protestant populations were linked to such individualism and to a low level of collective integration. This depended on the community, whether Lutheran, Baptist, or Methodist, although it is primarily the concept of personal suitability of religion which is of primary importance in the Protestant interpretation of Christian living; whether this suitability be intellectual or emotional, whether it subscribes to the psychosocially “liberal” branches of the church (those which are pluralist and care little for monitoring the beliefs and practices of their faithful), or whether it subscribes to the psychosocially “orthodox” branches of the church (aimed at a society of believers sharing a common model and having the necessary means for control).

The third major characteristic deals with fulfilling one's Christian duty. The reformers, while criticizing monasticism, valued worldly saintliness rather than non worldly saintliness; that is, an inner rather than external monasticism being the source of an intramundane asceticism within the puritan posterity of Protestantism. The Protestant world is active in contributing to education (through schools and youth organizations), society (a variety of activities, the “social gospel”), and culture (philosophy, literature, music, etc.).

These three principles – reference to the Bible, religious individualism, and religious vocation, practiced in the secular world – have generated a particular religious culture and have shaped certain modes of behavior. From a sociohistorical point of view, Protestantism represents the beginning of a new way of living Christianity individually and collectively and which has not only endured but also grown. Far from being a historical digression, the Protestant Reforms of the sixteenth century were able to accomplish a lasting institutionalization of new religious societies as well as new individual attitudes. The result is a sociology of Protestantism which must not only research all branches of Protestantism and their inner dynamics, but also analyze the relationships within its environment and see where such relationships stand in the modern world.

STRICT IDEOLOGICAL CONTROL OF RELIGIOUS GROUPINGS

The domains of ritual, ideology, and charisma are present within every religious group, but in differing ways. Above all, they are hierarchically different according to religious tradition. One can immediately notice the importance of ritual in an Orthodox church service (the main role being the liturgy), the importance of charisma in Pentecostalism (the main role is played by the preacher prophet), and the importance of ideology in a Reformed service (the main role is played by the preacher theologian). In Protestantism, ideology is important owing to the strong emphasis on the Bible and its interpretation. The question of faith in the Protestant perspective is no longer an institutional one, but rather a question of hermeneutics. The objective is the interpretation of the Bible, and the debate about the truth of Christianity becomes a debate for exegetes and academics. The claim that religious truth is a question of interpretation leads straight to the heart of religious organization – a permanent debate on religious truth. The world of Protestantism is one of debates and controversies, divisions and unifications, based on disagreements and agreements of doctrine. Ritual is by no means absent, as it is emphasized quite heavily in certain spheres of Lutheranism and Anglicanism,

but within the symbolic economy of this religious world, in general, it takes second place. Charisma is equally important, but it is only in certain Pentecostal assemblies that it tends completely to relativize its ideology. Protestantism is a religion of the senses, of sound more than vision, expressed particularly through music and song (from Huguenot psalms and Lutheran choirs to Afro American spirituals and Gospel music). Protestantism is overall a religion centered on the senses just as much as the intellect.

Protestantism is beset by a tension between church and sect, so it is unsurprising that the sociology of Protestantism still accords attention to the classic Weberian/Troeltschian distinction between church and sect. Within this religion, the notion of church is also interpreted as being that body which administers what is required for salvation and whose function it is to exercise authority. It embraces everyone irrespective of their religious qualification, whereas the concept of sect is seen as a grouping unifying only people who are religiously qualified on the basis of their voluntary approach to religion. Within Protestantism there is constant tension between the religious group perceived as coextensive with society and delivering its requirements for salvation to all, and the religious group perceived as an association of militants making up a particular subculture within society. This tension is constitutive of Protestantism and is also constituted by established and liberal churches whose criteria are more flexible with regard to religious inclusion and religious practice (such as the Lutheran church) and those churches regarded as local voluntary assemblies where the faithful are qualified believers (as is the case for the Federations of Baptist Churches).

The Reforms of the sixteenth century are linked with the emergence of a new type of clergy (in the sense of religious profession): a clergyman/theologian allowed to marry, yet enjoying the state of being a lay person. The emergence of the pastorate represents a certain secularization of the clergy, a secularization marked by the passing of sacred power to intellectual and moral power (Willaime 1986). With the Protestant pastor, in effect, the clergyman is no longer considered to be a holy figure who enjoys a peculiar ontological position. On the contrary, he is a man like any other. Protestant ministers are ordained, but their ordination is

not a sacrament; they are not intermediaries bound to the religious lives of the faithful. This first secularization contributed to the reintegration of the clergy into society and everyday life. But the important intellectual and moral magisterium practiced by the pastor, added to the fact that all sacred authority had not disappeared – notably by means of the monopoly to administer the sacraments of baptism and communion – was limited to the effects of this first secularization. The priest dispenser of rites was substituted with the Protestant pastor doctor and preacher of holy scripture, thereby placing great importance on theological knowledge within access to religious legitimacy.

The concept of the ordered ministry was not very ecclesiastic and facilitated the admission of female pastors, who are nowadays accepted by the majority of Protestant and Anglican churches. Consequently, with the Protestant figure of the clergy, women having access to theological knowledge constituted a decisive step for Protestantism. If in effect it considered theological qualifications fundamental to exercising religious authority, then the fact of women holding qualifications in theology would only seriously weaken the argument of those opposed to female pastors. The admission of women into the pastorate can be seen as a second secularization of the role of the clergy, a second secularization marked by the loss of power by the clergy and the dissolution of its status. The acceptance of women into the pastorate serves to reinforce a functional concept of the ministry (women pastors placing on hold their pastorate when on maternity leave). The feminization of the pastorate is party to a broader transformation of pastoral practice and moves quickly in the direction of secularization, and toward a type of declericalization distinguished even more than the pastoral ministry.

PROTESTANTISM, ECONOMICS, AND POLITICS

From a sociohistorical point of view, religions could not be confined to the religious sphere, but must be considered as sociocultural facts that have exerted some influence in the various spheres of social life. Whether dealing with work, economics, family life, education, or

politics, people's behavior in these fields is linked to the way they represent the world and humanity. These representations, arranging social activities in a hierarchy and giving them meaning, influence people's attitude towards them, positively or negatively. Religious cultures played a role in shaping thought and people because of a system of representations that determines a certain kind of behavior in one sphere of activity or another. From this perspective, social sciences study the influence of Protestantism on economic and political domains.

Weber (1998), in his famous thesis on the Protestant ethic and capitalism, established a relationship between some Protestant concepts and the spirit of enterprise. Disclosing some affinities between the behavior of the Protestant Puritans and the spirit of capitalism, he wanted only to show that some forms of Protestant religious thinking encouraged the rationalization of business and its development: it is a matter of considering, says Weber, "how the contents of the religious beliefs biased the emergence of an 'economic mentality' or 'ethos' of economics." A more precise title for Weber's study could have been "The Contribution of Puritan Work Ethics in Shaping the Ethos of Western Capitalism." As Weber's friend Ernst Troeltsch, theologian and sociologist, quite rightly wrote in a 1923 text, "religions are not economic ideals, no more than economic structures and financial interests are religious laws. Their relationship is thus only indirect" (Troeltsch 1991: 138).

It is undeniable that the Calvinist perspective and its Puritan posterity developed a strong religious legitimization of work. From the Calvinist point of view, not to work means not to honor God. Since people do not own their possessions but only "administer" them, they should act as good administrators of worldly goods. Money is not evil in itself – it is how it is used that makes the difference. Such a view of work answered the needs of the petit bourgeois – craftsmen and farmers – who totally devoted themselves to production and who were about to become entrepreneurs. As Hill (1962: 223) points out, they needed a conceptual system which "would attribute full dignity to their work and bring into question at the same time the wealthy, the negligent and the squandering, and the poor, the lazy and the irresponsible. They found both these things in Puritanism."

According to Weber, the importance given to work and economic success by religion does not explain all. In order to devote themselves to business completely, people needed a psychological drive. It is at this level that Puritan Protestantism, acting like a "spiritual motive power," positively influenced economic development. There are various examples supporting this point of view: Baptists, Congregationalists, Quakers, and Methodists have all excelled in business. John Wesley himself, who deplored the rise to the bourgeoisie of his flock, remarked: "The Methodists become industrious and frugal everywhere they are, and as a consequence their wealth increases."

Weber's thesis was very controversial and led to a great number of studies and critiques. Troeltsch, whose line of thinking followed the direction of Weber's, insisted very much on the difference between "old Protestantism" (sixteenth and seventeenth centuries) – especially characterized by the ecclesiastic culture of the Middle Ages – and "modern Protestantism" (eighteenth and nineteenth centuries), which fully accepted the emancipation of the secular world from religious protection: "In so far as Calvinism applied to the capitalistic production, that it had tolerated, its methodical and permanent zeal, contributed notably to the emergence of the capitalistic mentality which rewarded work for work. As was the case for both sects and Pietism" (Troeltsch 1991: 163). As long as the religious factor is considered as just one among many others that played a role in the development of western economic rationality; as long as it is kept in mind that influence on economic activity was exerted in an indirect and temporary way through certain individuals; and as long as there is an awareness of its shortcomings (as Weber was aware), then it is justifiable to give Weber credit for his thesis. It is undeniable that a kind of work based religion is present in the Puritan consciousness, a work based religion where work is conceived as regular and dutiful practice of an activity. This practice has a link partly with a worldly ascesis and partly with the growing importance of efficiency (and thus with the development of the activity and its results).

Protestantism, in some respects and through some of its components (especially Calvinist and Baptist ones), made a contribution to

democracy. By provoking a new division within Christianity, and being divided in itself, Protestantism first of all promoted the secularization of politics. In the political sphere, this is the consequence of the secularizing effects of pluralism: "The fragmentation of Protestantism represented an important element in the development of religious tolerance" (Bruce 1990: 48). In desecrating religious authority, Protestantism contributed to desecrated political authority and asserted the willingness that it should be controlled by people (although Lutheranism increased the princes' power over the church). The ecclesiastical organization of Protestantism had some political elements which were in line with the process of democratization: synodal assemblies and the importance of the local church (Congregationalism). In France, during the reign of Louis XIV, Protestantism had "republican" features that threatened absolute monarchy. In the US, although some Puritans were theocratically oriented, others, such as the Baptist Roger Williams (1603–84) and the Quaker William Penn (1644–1718), experienced some elements of democracy before their time. The US was founded by immigrants who brought a "democratic and republican" Christianity, remarked Tocqueville, who was impressed by the relation in the US between the "spirit of freedom" and the "spirit of religion."

Although Protestantism influenced democracy through some of its principles, it does not mean that its relationship with politics was just one way. Three main attitudes characterized the connection between Protestantism and politics: conformist passiveness, radical conviction, and an ethic of responsibility. Thus, there were two extreme attitudes – withdrawal due to indifference and radicalism due to an ethic of conviction – in which one can distinguish a third: that one which, originating in the ethic of responsibility, induces a kind of mistrust of power and commitment in public matters. From a historical point of view, conformist passiveness was fostered inside Lutheran Protestantism and inside Evangelical and Pentecostal Protestantism. Since, in contrast to indifference, it is religious approval of sociopolitical commitment that is rewarding, the politician will often be inspired by an ethic of conviction, inciting radicalism in any given domain (e.g., abortion laws,

military installations, the environment, education, and civil rights). Whether it deals with fundamentalist theologies or theologies of freedom, political commitment is thus a categorical imperative and a religious duty. This radicalism can be either “conservative” or “progressive.” The third attitude, inspired by an ethic of responsibility, consists in being a “good administrator” of the worldly issues promoting both individual and collective responsibility and never trusting power and its appeal.

PROTESTANTISM WITHIN CONTEMPORARY ULTRAMODERNITY

Since Protestantism embodies a process of deinstitutionalization, declericalization, and deconfessionalization of Christianity, it represents a secularization of Christianity from within. Making tradition relative, Protestantism also introduced a permanent principle of transformation that enabled it to go with modernity and adapt to changes, notably in the area of the family ethic. The Reformed Churches have since been quite permeable to social and cultural change. And because of this permeability, they evolved together with global society, despite the strong opposition of fundamentalist groups to change. But the social paradox is that Protestant churches did not take advantage of their comparatively positive adaptation to modernity. As shown in various studies (Kelley 1972; Bruce 1990; Willaime 1992), those liberal churches that were more open to their secular environment often declined before the more conservative churches with a strong identity. If, as Gauchet (1985) put it, Christianity is the “religion of the *sortie*/end of religion,” is Protestantism the denomination of the end of Christianity? Its comparatively good adaptation to modern societies carries with it the risk of dissolution into the secular environment and a lack of visibility.

At the same time, in secularized and pluralist societies, the Protestant way of living Christianity is in accordance with developments pointing to identity reassertion and religious revitalization in the shape of groups of militant converts. Protestant sensibilities that insisted on personal conversion are in line with this context, where religion is no longer inherited but made by conversion. In secularized societies where religion is

no longer an objective dimension of society but a subjective dimension of the individual, Protestant religious individualism is a sign of the exhaustion not only of Christianity (Christianity with respect to political structures) but also of Christianness (Christianity with respect to global culture). Underlining the fact that the church is not a geographical space, nor something coming from tradition, but a regularly called local meeting of converts, the Protestant movement, especially in its Evangelical and Pentecostal expressions, witnesses in particular the dissolution of Christianity as an all inclusive culture in synchrony and as an inherited culture over time. Evangelical Protestantism, in its social expression of religion, is an example of the recomposition of religion within ultramodernity. Evangelical churches formed reference groups with a social importance for their members. In these groups, individuals, strongly symbolically structured and supported by a worshipping milieu, learned how to operate in a complex and uncertain secular universe. In societies where Christianity does not have the same cultural strength and capacity to organize society, it finds a way to reassert itself through some minor and militant forms, which – in Protestantism as in Catholicism – question and can sometimes destabilize ecclesiastic institutions accustomed to the quieter mass Christianity.

psychoanalysis

Siamak Movahedi

Freud defined psychoanalysis as a form of therapy, a mode of observation and inquiry, and a theoretical system. However, his passion lay primarily in psychoanalysis as a mode of scientific investigation. Psychoanalytic theory is based on Freud's image of the individual and his notion of psychic reality. The individual is presented as profane, irrational, self-deceptive, narcissistic, power hungry, and the slave of the most primitive desires. This is the image of the decentered man, and is perhaps one reason for Freud's popularity among postmodernists.

According to psychoanalytic theory, the ground on which the individual stands is paved with uncertainty, and the reality to which he or she appeals is highly suspect. The past is a reconstruction, the memory is a perception, and the perception is a fantasy. The person's conviction of the validity of recall is much more important than its factual authenticity. The patient's beliefs or fantasy about the experience of a sexual seduction have greater impact than the seduction itself. If one defines a seduction fantasy as real, it will become real in its

consequences. As with symbolic interaction theory, Freud was concerned not with the situation but with the individual's interpretations of it. Deconstructing such interpretations is the goal of psychoanalysis. Although psychoanalysis has gone through profound changes since Freud, it continues to remain an elegant mode of listening to a patient or reading a text. Contrary to other psychotherapeutic techniques, the analyst does not ask the patient to change, to give up his symptoms, to be normal, to adapt or behave in a particular way. The analyst is not to have any desire or plan for the patient but to help him discover his own desires rather than being the slave to others' demands.

Psychoanalysis is concerned primarily with the patient's mind rather than the patient's life. Reports of life activities in the analytic situation are understood as symptomatic of the patient's state of mind, or of her experience of the analytic relationship. Inference about the mind is to be made through the narrative activities in the psychoanalytic situation. The analyst focuses attention not so much on the content of life narratives as on their communicative functions and on what is omitted, disowned, avoided, and intimated. Although mind is not clearly defined in operational terms, it is assumed to reflect the joint analytic activities in the session. The patient comes to analysis with a conscious expectation that the analyst will help her search for the sources of her trouble. The analyst's sources of trouble are presumed to be unconscious. Their manifestation through symptoms is part of the individual's defensive system of keeping sources of trouble out of conscious mind. Thus a sharp distinction is made between the manifest (explicit) and the latent (implicit) meanings of the individual's communications.

Psychoanalysis unfolds through three critical processes: *transference*, *countertransference*, and *resistance*. Transference is what the patient brings to the analytic situation. It is the patient's characteristic mode of conflict, perception, expectation, object relation, or definitions of situations. These internalized patterns of conflict, object relation, and expectation tend to constrain the individual's external relations and to create problems that must be worked through. Transference also entails an emotional involvement with the analyst, not as a real object but as a projected figure from the past. Transference

is highly ambiguous and paradoxical. On one hand, almost everything that the patient reports in the analysis is addressed by the analyst. On the other hand, the patient's reports of positive or negative feelings *toward* the analyst are presumed to be in reference to the analyst as a fantasy figure of some sort.

Countertransference is what the analyst brings to the psychoanalytic situation. It consists of all of the analyst's subjective states, blind spots, and attitudes toward the analysand. Here a rough distinction is made between two kinds of countertransference feelings: (1) feelings that are evoked or elicited by the analysand and as such are grounds for valid inference about the analysand's state of mind and (2) feelings that are evoked by the analyst's own unresolved conflicts and that have to be kept in check.

Resistance is any defensive interpsychic activity that interferes with the analytic process. Working through resistance is critical, as its resolution entails new paths to memories. When Freud found hypnosis ineffective in ridding the patient's resistance to talk or recall, he created the psychoanalytic situation. The analytic situation is intended to be an inherently ambiguous situation, an intermediate state of experience between reality and illusion, where ideally there are no clear boundaries between fantasy and reality, past and present, and self and others. The goal is to bring about a partial suspension of the analysand's sense of reality in a safe mode where his unexamined assumptions, delusions, expectations, and self deceptions may be explored.

To be analyzed is a contract into which the patient enters by showing up for the first appointment and lying on the couch. Although many patients, as part of their pathology, unwittingly try to defeat the analyst, they also try to put their best foot forward and help the process get started. It is in this sense that, for an analysis to unfold meaningfully, the patient has to come of her own will and has to incur the cost personally rather than through a third party.

The methodological debates in psychoanalysis today are reminiscent of those in psychology and sociology almost a half century ago. A lively debate is in progress in psychoanalysis between those who call themselves "natural" scientists and those who maintain that psychoanalysis is inherently interpretive and hermeneutic and

should be studied with that fact in mind. Those adopting the natural science position are hopeful that, by reducing meaning to some form of brain functioning, they can become the biologists of the *mind* rather than the analysts of the *soul*. In turn, members of the hermeneutic circle reduce psychoanalysis to textual analysis, subject only to the requirement of internal coherence. There are also those who agree with the interpretive tradition, but maintain that psychoanalysis goes beyond the hermeneutic method in that interpretation of the text in psychoanalysis changes the text itself. Since psychoanalytic data consist of emotional exchanges in the analytic situation, the primary method of investigation in psychoanalysis remains participant observation and case study. The analytic situation is considered to be both a laboratory and an operation room for scientific and clinical work. The emotional climate of the analytic situation is of critical importance in interpreting any exchange in the analytic hour. Yet, for the analysis of emotional communication in a session, some researchers are increasingly experimenting with more standardized methods that may lend themselves to replication by other researchers.

psychoanalytic feminism

Kristina Wolff

Psychoanalytic feminism is a theory of oppression, which asserts that men have an inherent psychological need to subjugate women. The root of men's compulsion to dominate women and women's minimal resistance to subjugation lies deep within the human psyche. This branch of feminism seeks to gain insight into how our psychic lives develop in order to better understand and change women's oppression. The pattern of oppression is also integrated into society, thus creating and sustaining patriarchy. Through the application of psychoanalytic techniques to studying differences between women and men as well as the ways in which gender is constructed, it is possible to reorganize socialization patterns at the early stages of human life. Societal change, or a "cure," can be developed through discovering the source of domination in men's psyche and subordination in women's, which largely resides unrecognized in individuals' unconscious.

This type of feminism emerged out of *cultural feminism*, which investigates the differences between women and men to understand women's positions in society. Psychoanalytic feminists concentrate on early childhood development, primarily before the age of 3, examining how gender is constructed and practiced on societal, familial, and individual levels. Through understanding how the conscious aspects of personality evolve at the infant stages of life, we better comprehend identity formation and gender roles including expectations surrounding what is deemed "feminine" and "masculine." Freud's theories of the human psyche, including psychosexual development, as well as Lacan's reworking of Freud's theories provide a foundational framework for this body of feminism.

Psychoanalytic feminism addresses a variety of issues related to gender in society, concentrating on explanations as to why men continue

to repress women. There are two main sections. One branch focuses on examining differences between women and men, on a micro level, particularly on women's psychology as well as the environment in which the personality of a child develops. This includes childhood learning and formation, relationships with parents, and early sexuality traits. It also explores the establishment of femininity and masculinity and the relationship with identity and personality.

The other branch concentrates on investigating the construction of gender. This encompasses examinations of masculinity, femininity, the emergence of adult sexuality including recognition of the female libido, and the continual reinforcement of patriarchy (Mitchell 1974; Irigaray 1985; Kristeva 1987; Benjamin 1988). While continuing the use of psychoanalytic techniques on the micro level, this section also utilizes macro level analysis through studying societal institutions such as the economy and employment, science and knowledge, arts and language. From a psychoanalytic viewpoint, the first branch represents man's need for an heir, to create something that outlasts him, largely due to fear of mortality, while also providing a means of domination over women and his children. The second section also fulfills this need to create permanency such as through the establishment of business, wealth, science, art, and architecture. These larger structures and social systems organize society, creating a patriarchal system that serves to oppress and dominate women.

The exploration of women's roles as mother and daughter is a central topic in both branches of psychoanalytic feminism. Early theorists such as Jessica Benjamin, Jane Flax, Dorothy Dinnerstein, and Nancy Chodorow view mothering as a means for understanding the continual reproduction and production of the status quo, and therefore a place where social change can occur. Utilizing Freud's techniques as starting points of analysis, many psychoanalytic feminists examine people's pre Oedipal and Oedipal experiences in relation to gender and identity formation. It is at these stages, from birth until their third year, that children learn gender roles. Freud theorized that children develop their understanding of their gender due to their natural tendency to identify with the same sex parent. Some psychoanalytic feminists align with

this theory, examining gender formation at the Oedipal stage for boys and pre Oedipal stage for girls. Others, such as Chodorow, begin the analysis of gender acquisition at the pre Oedipal stage. Utilizing Freud's object relation theory, Chodorow examines the relationships of mothers and their children.

During infancy children are symbolically attached to their mothers. For women, the role of mother represents a dual identity, one of mother and the other as a child who was raised by a mother. Therefore her relationship with her daughter differs from that with her son. When raising a daughter, the mother imagines her life as a child and her own experiences being raised by her mother. This results in a deep bond with her daughter. This is also where the baby learns her identity as well as gender, through her mother, through representations of sameness. Theoretically, this creates less individuality in girls and as a result they develop more flexible egos and only feel a sense of completeness when closely connected to another person.

For sons, their identity becomes formed in a similar manner, yet it is through representations of difference. He signifies the "other" to the mother, defined by her expectations of him. This creates more individuality in boys and a sense of completeness through achievement and competition. In order for boys to develop their masculinity, they must separate from their mothers, just as girls need to be connected to their mothers in order to develop their femininity. This split from the mother creates a dualistic relationship between the two, making femaleness the polar opposite of maleness, distancing sons from mothers and giving rise to "abstract masculinity." As the children grow into adulthood, their gender identities can become threatened by challenges to these early practices. For men, they develop feelings of vulnerability when dealing with intimacy and women feel threatened by separation.

These varying levels of intimacy, of "relatedness" between children and their mother, create a different sense of self for girls and boys, solidifying femininity and masculinity as distinct, opposite categories, which maintain close relationship with one another. Femininity is representative of a strong tie to the mother; masculinity manifests itself as distance from both mother and father. Another theory posits

that the relationship between parents and children is a symbolic process. Masculinity and femininity are constructed on the basis of castration, which consists of a splitting that occurs with the desire for unity between genders, but this desire is repressed. Therefore, masculinity represents the possibility of gratification and femininity signifies the impossibility of union.

Gender roles are based on the household practices of the parents as well as how the children are socialized on conscious and subconscious levels. Children witness power imbalances between mother and father due to their roles within and outside of the household. This reinforces boys' desire to dominate girls and girls' willingness to cooperate and compromise their agency. The key to changing gender construction and, therefore, the practice of men dominating women can be achieved through altering parenting practices within each family. Men need to take a more active, personal role in caregiving and raising the children. This shift would significantly transform the structures of masculinity and femininity that provide the foundation for the sexual division of labor. This then leads to changes in gender construction, diminishing men's domination over women and women's subordination and increasing women's independence and men's relatedness to others.

The development of a person's sexuality and romantic desires also begins at an early age. Many theorists recognize that children have the potential for bisexuality during the pre Oedipal stage of their lives. Through the combination of parenting and the development of boys' masculinity and girls' femininity, they are socialized to be heterosexual. A young girl's relationship to her father is an essential element in her heterosexual development. In essence, she is competing with her mother for her father's attention. Due to her father's emotional and often physical absence, she remains emotionally attached to her mother, never completely leaving her. As boys move from the pre Oedipal to the Oedipal stage, they develop a sense of sexual or romantic love for their mothers, partially due to her physical otherness. As they enter the Oedipal stage, there is a realization that they cannot compete with their father for their mother's attention, therefore they begin to emotionally separate from their mothers. This draws them closer to males, thus making the separation

less painful and important to their male identity. This process reinforces the sexual and familial divisions that the children witness from birth. Boys and girls adopt their father's and mother's roles. Thus, boys join a larger collective group of males, who in turn dominate women, whereas girls remain close to their mothers, remaining on the margins of society, being ruled by men.

When entering into romantic and/or sexual relationships, men and women seek different things, often due to the separateness created from the construction of masculinity and femininity. Women desire completeness, intimacy, an end to emptiness, and therefore they seek men for completeness; men remain uncomfortable with intimacy, often criticizing women for their emotions, thus reinforcing their position as dominant and separate from women. Both Freud and Lacan provide a valuable framework for understanding the mechanics of sexual desire. Freud focused his analysis on the biological foundations of sexuality and placed the phallus as central to sexual desire and sexual difference, rather than constructions of masculinity and femininity. Therefore men and women place the phallus at the symbolic center of sexual behavior and leave their own personal understandings and desires for themselves to a level of internal fantasy. Lacan concentrates on sexual behavior as the desire for unity between men and women, moving beyond biological understandings of sexuality. Men and women are sexual together in order to fulfill fantasies that are culturally produced but not a result of being "male" or "female" due to essentialist definitions. This concept is then extended to understanding society as constructed as a phallocentric patriarchy which represses female sexuality, particularly female desire, thus reinforcing women's position as "other," remaining defined in opposition to men's desire. Irigaray challenges Lacan's theory and his central focus on the penis and definition of the clitoris as a "little penis." Instead, she notes that women experience pleasure everywhere, forcing a shift in the analysis and placing women in an equal position to men, rather than remaining defined in relationship to men (Irigaray 1985; Kristeva 1987).

The centrality of the phallus extends to the organization of society. Psychoanalytic feminism describes society as representative of men's

egos, their sense of self importance and desire for immortality. Therefore structures such as buildings, machines, bridges, and towers are made to outlast them while also replicating shapes that are most pleasing to them. Social systems are patriarchal, maintaining maleness and masculinity as central to their structures and operations. Some areas of examination by psychoanalytic feminists include the division of labor and economic systems, science and philosophy, as well as symbols and language. They seek to understand these systems while also using psychoanalytic techniques as a method for examining the reproduction of the status quo and as a means for social change.

The division of labor begins in the home, with women operating as the primary caretakers in society. Men are propelled into the work world due to their sense of independence, competitiveness, and desire to achieve, which developed during early childhood. This process produces the ideology and psychology of male dominance and denial of their dependence on women to help maintain the home, raise the children, and provide support for their needs. Male behavior is the norm of success, therefore if women have a desire to be successful in the paid work world, they are expected to act and often dress like a man. Often there is some deviation from this, but usually with unfavorable circumstances. Utilizing Marxist theory with psychoanalysis, the reproduction of mothering is viewed as the basis for the reinforcement of women's responsibilities in the domestic, largely unpaid work, sphere of society. As wives and mothers, women contribute to the continual production of people. Girls are socialized as caretakers, responsible for supporting their husbands and families. Boys are socialized as workers who are responsible for activities outside of the domestic arena and therefore for continual support of capitalistic production.

Experiences from the pre Oedipal and Oedipal stages of life shape our conceptions of science and philosophy. Western approaches to knowledge are founded on a male worldview, a male understanding of the world where there is a desire for separation and individuation. Early psychoanalytic feminist studies sought to reveal the male bias in academics, art, philosophy, and science (Gilligan 1982; Irigaray 1985; Kristeva 1987; Flax 1989; Elliot 1991). For example,

Carol Gilligan studied the work of Lawrence Kohlberg and his theory of moral development in which he concluded that girls were morally inferior. Gilligan exposed the bias in his work. Kohlberg used only boys' stories in his model. She argues that both cognitive and developmental psychology are biased due to their use of male subjects to establish a standard of normality. Gilligan reformulated the theory, concluding that morality is a negotiated path where people balance self needs and interests while caring for the "other" (Gilligan 1982; Dimen 1995). Within this body of research, of uncovering the male biases inherent within the practices and structures of science, philosophy, and the overall quest for knowledge, these scholars offer a solution through the reformulation of epistemology and metaphysics in our society. Dualistic thinking, the split between subject/object and mind/body, must be replaced by thinking that accepts differences without creating a hierarchy of superiority. This can be achieved by studying and reshaping early childhood experiences which create and reinforce the existing system of patriarchy and dominance.

Certainly, there are critiques about psychoanalytic feminism and the approaches used by its scholars. Due to the focus on early human development, the few strategies offered for creating change primarily concentrate on this period and are reliant upon parents raising their children in different ways. The theories that provide the foundation for a large portion of this body of feminism rely on scholarship by Freud and Lacan. While this classical body of work is valuable in that it illustrates that masculinity and femininity are achieved and that women have sexual desires and needs, many of these theories are also misogynistic and place men in positions of superiority over women. Some question the use of basing psychoanalytic feminism on theories created by men, particularly since they are often presented as "truth claims" and "cures" for those who are subject to psychoanalysis. Additionally, psychological theory interpreted the feminine experience largely in relation to masculinity, which is one of the critiques of science and knowledge offered by psychoanalytic feminism.

While there is an acknowledgment of the need to change dualistic thinking, by framing the examination of women's subordination on the

differences between genders, the either/or split that is being challenged by psychoanalytic feminism is actually being reified. Women are assumed to naturally want to have and raise children and men are assumed to be satisfied being away from their families, both physically and emotionally. There is no accounting for ambiguity in gender or that sexuality and sexual differences are not necessarily related to gender. Within this type of feminism, there is no space for sexuality other than heterosexuality. Other assumptions including those of race/ethnicity, class, nation status, ability, and other issues that affect family structure, childhood, and parenting also largely remain unacknowledged and unexamined. Also, by primarily placing the focus of change on individuals, either in the realm of parenting or in that of creating knowledge, larger societal institutions and systems that create, produce, and reproduce oppression continue without question. There are scholars within psychoanalytic feminism who are actively working to answer these critiques and therefore expand this body of feminism. This includes integrating concepts of gender that are more fluid, ambiguous, and expansive. Through the incorporation of postmodernist perspectives, understandings of gender, particularly "female," are no longer defined in relationship to and from what is "male" (Weedon 1987; Dimen 1995). By widening the approach beyond dualistic definitions and assumptions of gender and sexuality, this work seeks to encompass the influence of history, politics, and cultural influences shaping understandings and experiences of gender and women's multiple locations in society.

psychological social psychology

Joel Powell

Psychological social psychology is concerned with social influences on individual behavior. In its century of modern history, psychological social psychology has addressed issues of attitude, perception, memory, prejudice, personality, emotion, conformity, learning, socialization, persuasion, and cognition. In topics, methods, and theory there has been minimal overlap with sociological social psychology primarily because of psychology's persistent emphasis on the individual as the most important unit of analysis.

Social scientists made no significant proprietary claims on early modern social psychology. Anthropologists and sociologists were investigating small groups and large populations. Psychologists had already staked out productive areas of research and debate in learning, memory, motivation, and animal behavior. Before the twentieth century, psychological experiments in human social influence had been

conducted, notably Norman Triplett's 1897 study of the effects of competition upon performance. But social context was seen as a given feature of the environment and psychologists seemed content to share the study of social life with other disciplines.

The first systematic attempt in psychology to account for human group life was William McDougall's *Introduction to Social Psychology* in 1908. McDougall argued that group behavior was innate, instinctive, and modified in experience. A popular text primarily for its unique subject matter, McDougall's *Social Psychology* was influential for a short time until it fell from favor along with most instinct theories. The more foundational work was accomplished by Floyd Allport in his 1924 *Social Psychology*. Allport identified social psychology as an exclusive subfield of psychology, and as an experimental science of the individual, dismissing what he saw as sociology's reliance on imaginary social forces to explain human behavior. In casting social psychology as an experimental science, Allport invited the control and predictability of the laboratory. His desire for clear, scientific results precluded the study of face-to-face transactions in favor of scenarios involving individuals behaving in the presence of others. By insisting on a social psychology of the individual, Allport liberated the new science from merely speculative social mechanisms like LeBon's crowd contagion or Durkheim's collective conscience. Instead, social psychology would observe and explain the influences that individuals exert upon one another.

These central features of early social psychology created a divide between psychological and sociological social psychologies that has lasted to the present. The division becomes sharper in consideration of how Allport set the direction of causal analysis. Phenomena for sociology – contexts, conditions, or structures – in psychological study became relevant only insofar as they influenced individual behavior. Moreover, features of the individual could be formulated as dependent variables. So while sociologists were struggling with the self as dependent upon and determined by social relations, psychologists were able to investigate the impact of social variables on stable entities like personalities. Comte's description of the individual as both cause and consequence of society was

inapplicable to the elegant and controlled psychology that made independent variables of sociology's subject matter.

It is widely acknowledged that social psychology surged forward shortly after Allport's bold initiatives. To some extent this is because Allport's construction of social psychology as a science of the individual conformed the discipline to conventional topics and methods, making social psychology more competitive with differential (individual) psychology. Survey research and psychological testing found places in social psychology as new, sophisticated tools were invented. Thurstone proposed attitude scaling measures by 1929 (the first publication year of the *Journal of Social Psychology*), and by 1932 Likert had perfected the simple 1 to 7 continuum of agreement and disagreement. The most memorable stagecraft in experimental social psychology was also a product of this era. A classic example of laboratory experiments in social influence is Sherif's study of group convergence in judging the movement of a light. Although the light in his laboratory was stationary, autokinetic effects produced the illusion of movement, and Sherif found that individuals tailored their reports about the distance a light moves to fit a group norm. This study was modeled by many researchers over the next 40 years, and the famous conformity studies of the 1940s and 1950s by Solomon Asch and the obedience studies of the 1960s by Stanley Milgram are often mentioned in tandem with Sherif's work.

Increasingly complex instances of social influence were managed in laboratories throughout the middle decades of the twentieth century. The acclaimed creative champion was the gestalt psychologist Kurt Lewin, whose influential field theories and group dynamics characterized psychology as a social science. Lewin felt that psychology should consider the total situation of an individual's "life spaces" by attending to environmental and social variables. Although Lewin produced elaborate, geometrical descriptions of individuals moving through systems, these were upstaged by his provocative laboratory simulations of leadership groups. Lewin and his associates created different leadership conditions for small groups of boys who were assigned to produce crafts. In an authoritarian leadership condition, adults made decisions, concealed the

ultimate goals of projects, acted aloof, and freely rewarded and punished individual group members. Democratic leaders encouraged group decision making and the free discussion of alternatives, and stated goals clearly. Boys in the democratic leadership condition were more productive and cohesive. They were also more adaptable than their authoritarian counterparts, as was evidenced by their superior ability to adjust when placed in the opposing condition.

These and similar experiments inspired by Lewin led many to credit him with moving social psychology away from a purely individualistic effort toward more transactional studies of group phenomena. However, the balance of Lewin's work (and subsequent investigations built upon his systems) consistently privileged individual responses to social stimuli. Lewin's legacy is pervasive in virtually all areas of psychological social psychology, not because he moved psychology away from its study of the individual, but because he encouraged the integration of creative experimentation and holistic gestalt principles of perception and form.

The energizing work of Lewin and the influence of gestalt principles fostered a new family of cognitive social psychologies. These perspectives are linked by the observation of a basic urge to see consistency in and between thoughts and feelings. Fritz Heider's balance theories were the first in this generation of contemporary influences. Heider asserted that individuals confronted with incomplete information about others will pattern beliefs, attitudes, or motives of others in consistent and sensible ways. These can be familiar processes such as friends assuming they share attitudes, beliefs, or tastes about things they have not discussed. They can also be complex, as when an individual attributes motives to a stranger. Regardless of the relative accuracy of assumptions and attributions, people will try to balance their elements. It completes a pattern in a balanced way, for example, when friends assume that they share interests and attitudes. Ideas about consistency in attributions continue to be refined and elaborated, and have grown to include research on how people associate positive traits, motives, actions, and other qualities of people they encounter. Topics such as personal attractiveness have generated an immense number of studies revealing that people tend to associate many positive traits with

physical beauty. More important than these intriguing studies is the channeling of social psychology toward the study of individuals making mental representations of social reality. The social cognition theories that dominate psychological social psychology are still developing from these basic ideas.

The touchstone for cognitive social psychology is cognitive dissonance theory. As interest in the processing of conflicting information grew, Leon Festinger's observations of the consequences of holding contradictory thoughts and feelings were among the most discussed, cited, and developed findings in all of modern psychology. Festinger's initial assumptions were simple: two cognitive elements in relation to each other will produce consonance or dissonance. Opposing thoughts or feelings produce uncomfortable dissonance in individuals. They will try to reduce it. The areas of interest for experiment and observation are in the strategies for reducing dissonance, and studies have yielded surprising cognitive and emotional responses. Festinger's own real world study in 1956, *When Prophecy Fails*, details the behaviors of members of a UFO Doomsday cult whose predicted day of apocalypse came and went without incident. Rather than abandon their beliefs and activities, believers intensified group activities including efforts to recruit new members. In laboratory experiments Festinger found that participants asked to describe a dull task as exciting rated their own enjoyment of the task differently according to how much they were paid. Festinger confirmed the presence of dissonance reduction when lower paid (high dissonance) participants expressed more enjoyment than higher paid (low dissonance) participants. There are supportive findings from studies of behaviors that spring from the production of consonant thoughts and feelings. Eliot Aronson (Aronson & Mettee 1968) produced a typical instance of this work. Aronson lowered the self esteem of laboratory participants by telling them they had tested as immature, uninteresting, and shallow on a personality inventory. Given opportunities to cheat later in a card game, participants whose self esteem had been manipulated cheated significantly more than participants in a control group.

Experiments, theoretical refinements, formalizations, and debates about cognitive dissonance

continue into the twenty first century. By the middle 1980s, much of this work had explicitly acknowledged that consistency theory and research had pulled together many threads of mental representations of social reality into a greater understanding of social cognition. As a theory of how social and individual realities are represented in thought, contemporary social cognition is perfectly situated to address key conceptual and theoretical areas in social psychology, including attitude formation and change, attribution, judgment, personality, and self. Its level of abstraction and its status as the most cumulative and integrated of psychological social psychologies has allowed social cognition to infiltrate and influence virtually all topical areas of modern psychology.

In its present incarnation, psychological social psychology is mostly in the business of formalizing and mathematizing theories, and making incremental refinements in perspectives through controlled experimentation. Along with long term adherence to the study of individuals and to strict scientific protocols, this provides a contrast to sociological social psychology – seen as absent controls, struggling with methods, and grappling with many versions of its basic unit of analysis. It is therefore not surprising that cross fertilization is minimal between the two social psychologies and that the majority of contributions flow from psychology to sociology. At present, social psychological research in the traditions of analyzing individual behavior has had the most impact on exchange, rational choice, and expectation states perspectives – the most psychological of the sociological social psychologies.

public broadcasting

Stuart Allan

Precisely what counts as public broadcasting varies from one national media system to the next across the globe. Common to most definitions, however, is the understanding that it revolves around a public service ethos that may be contrasted with the economic (profit oriented) priorities of private or commercial broadcasting. A continuum of sorts exists between the model of public broadcasting introduced in the US, on one end, and that developed in countries such as the UK, Germany, Japan, and Australia, on the other. In the US this type of programming constitutes a small proportion of audience share in television and radio, and is perceived to be of marginal significance in public life. The reverse is the case in the UK, for example, where public service broadcasting – led by the British Broadcasting Corporation (BBC) – is the predominant institutional

arrangement wielding considerable influence. Public broadcasting systems around the world can be situated within the parameters of this continuum.

Several contentious issues – and conflicting philosophies – have informed the historical evolution of public broadcasting, all of which remain pertinent today. In the US, broadcasting was defined from the outset as a business enterprise, raising concerns about the quality and diversity of its provision – especially in public service terms – as well as its relationship to government regulation. Most of the emergent radio stations in the 1920s were commercial, with a small number of public stations appearing in association with educational institutions on an ad hoc basis. By 1925 the Association of College and University Broadcasting Stations (ACUBS) was campaigning to ensure frequencies remained open for educational purposes (it would evolve into the National Association of Educational Broadcasters (NAEB) in 1934). The Radio Act of 1927 created the Federal Radio Commission (FRC) as the body responsible for regulating the radio spectrum as a public resource, although critics – such as the Broadcast Reform Movement – challenged its commercial orientation. No provision was made available by the state to establish a national network, which meant that non-commercial stations struggled to endure financial hardship, many of them succumbing to the dictates of the marketplace. Fewer than 50 such stations were broadcasting by the early 1930s.

The Roosevelt administration's Communications Act of 1934 replaced the FRC with the Federal Communications Commission (FCC), the remit of which included coordinating the use of radio (as well as the telegraph and telephone). It possessed the powers to revoke, or refuse to renew, a license where it determined that a station's policies and programs were inconsistent with "the public interest, convenience and necessity" (fines could also be imposed). Such action was extremely rare, however, leading to charges that the FCC was little more than a "paper tiger." In the eyes of broadcast reformers fearful about the growing network control of radio in commercial terms, the FCC was failing to meet its public responsibility to ensure access to the airwaves for those groups who felt that their right to free speech was being

denied (they included educators, agricultural interests, the labor movement, civil libertarians, and religious groups). Any notion of public service broadcasting, they maintained, was incompatible with the conformity of opinion represented by an advertising dominated commercial system.

Such claims were countered by organizations such as the National Association of Broadcasters (NAB), a powerful lobbying group capable of bringing formidable pressures to bear on the FCC in order to protect the interests of commercial radio. NAB sought to discourage the airing of "controversial" viewpoints by imposing on its membership what it considered to be a new ethical code of practice. This code prohibited the discussion of issues deemed to be divisive outside of those news and related programs specifically devoted to the expression of opinions. In this way, NAB argued, it was ensuring that radio stations would be self-regulating so as to reduce the likelihood of the federal government intervening to monitor the content of programming. Although the code was legally unenforceable, it succeeded in severely restricting the diversity of voices being heard. Most broadcasters were content to interpret the code in such a manner as to virtually rule out the exploration of any subject which even had the potential to upset program sponsors.

Critics of NAB argued the values endorsed by the code affixed broadcasting's proclaimed commitment to public service within strictly commercial imperatives. Members of radio's audience were being defined, they argued, not as citizens in need of a public forum for argument and debate, but rather as consumers in search of entertaining diversions from everyday life. Under pressure, the FCC began to set aside high frequency band radio channels for educational broadcasting prior to the start of World War II. While the number of non commercial radio stations slowly increased in the years following the war, few were broadcasting beyond a narrowly defined target listenership. It would take the arrival of television to propel these developments forward.

The impetus to establish an educational television network in the US was made feasible by a grant from the Ford Foundation in 1952. The first station went on the air in 1953, slowly

joined by 43 others over the course of the decade (many of which broadcast for only a few hours a day). National Educational Television (NET) facilitated the exchange and distribution of programs – criticized by some for their "highbrow" content – between local television stations. By 1954 it was airing 5 hours of programming per day, frequently covering topics otherwise marginalized or ignored altogether by commercial stations. News and current affairs programming on the main television networks – ABC, CBS, and NBC – were becoming increasingly ratings driven due to the high sponsorship revenues they could demand. In general, network newscasts did their best to avoid controversy for fear of offending either advertisers or government officials. Such apprehensions routinely led to self censorship, thereby calling into question the networks' provision of impartial journalism consistent with the public interest.

Meanwhile, the FCC sought to ensure that the networks observed the tenets of what would eventually evolve into a fully fledged "Fairness Doctrine" as part of their license obligations. Attempts had been made by the FCC even before a statutory basis for the doctrine was established in 1959 to enforce a principle whereby the right of stations to "editorialize" on the air would be strictly limited. These attempts at regulating fairness, promoted under the FCC's 1949 report "In the Matter of Editorializing by Broadcast Licensees," revolved around a declaration: "Only insofar as it is exercised in conformity with the paramount right of the public to hear a reasonably balanced presentation of all responsible viewpoints on particular issues can such editorialization be considered to be consistent with the licensee's duty to operate in the public interest."

In general, the FCC's efforts met with little success throughout the 1950s, partly due to its inability to adequately police agreed requirements. A further contributory factor was the Commission's internal confusion over how best to delimit a balance between advocacy on the part of the broadcaster, on the one hand, and the rights of those expressing opposing views, on the other (these issues were clarified to some extent in the Communications Act (1960), although not to the satisfaction of any of the parties involved). The net effect of the fairness

requirements was to encourage the makers of news and current affairs programs to avoid items likely to attract the attention of the FCC even if, as was likely the case, its strictures would lack sufficient bite to be meaningful.

By the early 1960s public opinion surveys were routinely indicating that television was beginning to displace both radio and the news paper press as the principal source of news for audiences in the US (and likewise in countries such as Britain). Many commentators were asserting that the capacity of broadcast news and current affairs programming to shape the “public agenda” signified that the electronic media were providing a progressive, even democratizing function with regard to public enlightenment about social issues and problems. Other commentators were far more pessimistic, arguing that the lack of democratic accountability over broadcasting institutions was ensuring that public service would always be rendered subordinate to their financial interests.

Against this backdrop, President Kennedy signed the Educational Television Facilities Act in 1962, which provided the first substantive federal aid package (some \$32 million) to build new stations. Three years later the Carnegie Commission on Educational Television was formed to provide a blueprint for public broadcasting as a national service. Following its report, President Johnson signed into law the landmark Public Broadcasting Act on November 7, 1967. The Act established the Corporation for Public Broadcasting (CPB) to coordinate a national system in support of both radio and television. However, the Commission’s recommendation that a tax be affixed to the sale of television sets to generate revenue for the CPB was not implemented, nor was its commitment to establishing a relationship of relative autonomy to government upheld. Nevertheless, the Act required a “strict adherence to objectivity and balance in all programs or series of programs of a controversial nature.”

In 1969 the CPB oversaw the founding of the Public Broadcasting Service (PBS), the first national network of non profit television stations. Launched in October of the following year, PBS initially pulled together some 128 television stations into a centralized organization. PBS is effectively operated by its individual member stations, many of which are

associated with local educational institutions and community organizations. Programming is provided from these stations in the main – ranging from news and current affairs to the fine arts, science, entertainment, and children’s genres – although material from independent producers and international sources (such as the BBC) rounds out the provision. This emphasis on distribution (a role set down by its predecessor, NET) means, in turn, that PBS does not produce its programs centrally. The Service’s income is derived from private donations made by viewers (the principal source), as well as from fees paid by member stations and funding from the CPB. Some member stations are also able to draw on other sources – government and corporate – to help underwrite their costs. Today, PBS is owned and operated by 346 public television stations and reaches some 99 percent of US homes with televisions.

Also in 1970, National Public Radio (NPR) was created by the CPB as a non profit coordinator for national program distribution. Its remit, in contrast with PBS, included program production, making it the center for news, information, and cultural programming for the service. At the time of its launch with 90 stations as charter members, NPR’s role as a producer and distributor of programming was funded primarily from government. However, the relative share of such support was sharply reduced over the 1980s, to the extent that funding today is derived mainly from fees member stations pay for programming (funds from listeners via on air pledge drives, charitable foundations, and corporations are also important sources of finance). In 2003 NPR received \$200 million from Joan B. Kroc, philanthropist widow of McDonald’s founder Ray Kroc – reportedly the largest single donation bequeathed to a US cultural institution (the amount was almost twice NPR’s annual operating budget at the time). NPR is widely respected for high quality news and information and the diversity of viewpoints it brings to bear on issues of public concern. Its programming is currently heard on over 750 independent stations by an audience of some 22 million listeners each week (stations can be members of NPR and also affiliates of either American Public Media or Public Radio International, both competing public radio networks, selecting content from each).

Highlighted in this historical overview is a range of longstanding questions which continue to be the subject of considerable debate. In its appraisal a decade after the launch of PBS and NPR, the Carnegie Commission on the Future of Public Broadcasting concluded that "public broadcasting's financial, organizational, and creative structure [is] fundamentally flawed." In the course of investigating why the system is "out of kilter and badly in need of repair," the Commission argued that the "power of the communications media must be marshaled in the interest of human development, not merely for advertising revenue. The outcome of the institution of public broadcasting can best be understood as a social dividend of technology, a benefit fulfilling needs that cannot be met by commercial means." In this way the Commission neatly pinpointed the key source of tension between the values of business and the ideals of public service before outlining, in turn, a detailed strategy for introducing a system free of commercial constraints. Its vision of public broadcasting as "a forum for debate and controversy," providing a "voice for groups in the community that may otherwise go unheard" so as to "help us see America whole, in all its diversity" was all but ignored in Washington.

Little has changed over recent decades. Most appraisals concur that the future for public broadcasting is far from assured. For some critics, the privatization of public broadcasting is overdue. They have long maintained that government involvement in broadcasting is an inappropriate use of taxpayers' monies and, moreover, poses a threat to freedom of expression that only a market based system can adequately preserve. Some claim to detect a "liberal bias" in its programming, which they insist is out of step with popular opinion. Still others contend that the relatively small audience figures for public broadcasting – there is an average audience rating of about 2 percent of households for PBS in primetime, for example – constitutes evidence that commercial television more than satisfies public demand.

Advocates of public broadcasting, in sharp contrast, highlight what they perceive to be the shortcomings of ratings driven commercial media. Many believe that it caters to a wider spectrum of interests than those which

advertisers are inclined to support, thereby addressing important gaps in programming – news and documentary being regularly cited in this regard, as well as children's programming (the award winning *Sesame Street* being one example). While conceding that audience figures are small, they nevertheless point out that a high percentage of viewers and listeners are decision makers in corporate, political, scientific, and educational realms whose perceptions of program quality contrast with the "lowest common denominator" orientation of the commercial networks. Hence the calls made for new types of support to be introduced so as to offset both political pressures and the influence of corporate financing, and thereby better reflect the values, tastes, and preferences of diverse communities.

Looking beyond the US model, the term public service broadcasting is typically employed to describe those systems which share its educative aims as a means to redress market failure. From its origins in the 1920s the BBC has pioneered a conception of public service broadcasting that is free of commercial advertising and, in principle, political influence. Its mission statement, as expressed by John Reith, the Corporation's first director general, is to "inform, educate, and entertain." Funded primarily through a license fee system, the BBC is currently the largest public broadcaster in the world. Its annual budget (£3.8 billion in 2005) enables it to offer a comprehensive provision of programming – news, current affairs, arts, and entertainment – across radio, television, and the Internet. Facing intensifying pressures from commercial rivals (both nationally and globally), it strives to balance its public service remit with a commitment to attracting wide audiences to its services. In addressing these audiences as citizens, as opposed to prospective consumers, the BBC's preferred definition of the public interest is privileged over and above what interests the public.

The BBC model has proven to be considerably influential, with several of its main tenets closely emulated in a variety of national contexts. The social and moral ideals of the Reithian conception of public service, thrown into sharp relief by profit led alternatives, informed broadcasting's development throughout the Commonwealth from the 1930s onward

(examples include the Australian Broadcasting Corporation and the Canadian Broadcasting Corporation). The BBC model has similarly served as an exemplar for some countries in Europe, Scandinavia, and Asia, and more recently in the former Soviet bloc. It is recurrently the case, however, that these systems have evolved to the point where they have come to rely, to varying degrees, on commercial revenue to meet operating costs. This trend appears to be accelerating, with powerful business interests acting in concert with "market friendly" regulatory authorities.

New challenges are emerging for public broadcasting across its varied inflections in different national contexts. The era of interactive digital and high definition technologies poses important questions about its continued viability. The growing competition for viewers, together with contending demands on governmental support, raises concerns about how best to sustain a public service ethos for a type of broadcasting increasingly being fragmented into narrowcasting. While some insist that public broadcasting is no longer relevant or necessary in a multi channel universe, others believe that its daily reaffirmation of common values and traditions underscores the vital contribution it makes to enhancing mutual understanding and dialogue among a citizenry in accordance with the public trust.

public housing

D. Forbes Edelen and J. Wright

Public housing policy in the United States did not emerge in response to the social needs of citizens but more out of economic necessity. Its development has been shaped by ideological, economic, sociopolitical, and demographic forces that emerged from the Great Depression. Some of these forces and their associated controversies include: ideological differences about whether it is the business of government to provide housing for needy citizens or whether this is better left to the private business sector; discriminatory practices among real estate, mortgage, and banking interests whose actions created concentrations of poor, segregated, African American ghettos; demographic changes that led to the suburbanization of America; an increasingly conservative fiscal and political climate, which has contributed to chronic underfunding of public housing initiatives, depletion of the public housing stock, and deterioration of existing units; and the unintentional effects of housing policies intended to help the poor but that functioned as disincentives for escaping poverty.

The first Housing Act of 1934 established the Federal Housing Administration (FHA) and was designed to resuscitate the real estate and finance markets during the Great Depression. The FHA and later the Veterans Administration (VA) accomplished this by restructuring housing market practices and financing, including introducing homebuilding and homeowner ship subsidies. These federal interventions put homeownership within the reach of middle income families and within a few years transformed America from a nation of renters into a nation of homeowners. These early successes encouraged further governmental interventions in the housing market. One important new intervention was the effort to provide temporary housing for working families (the working poor) who aspired to middle class status and homeownership but who required short term housing subsidies in order to accumulate sufficient capital. This was the animating vision of the nation's first true public housing law, the Housing Act of 1937.

This 1937 Act signaled the beginning of efforts to address the housing needs of the working poor. Local public housing authorities were established and given power of eminent domain to condemn and redevelop privately owned land for use as rental housing for working low income families. The Housing Act of 1949 introduced urban renewal to the overall effort, that is, the removal of old, decaying housing and its replacement with improved new homes. Urban renewal was founded on the principle of "a decent home and suitable living environment for every American family." This principle reflected the post war thinking that good housing (like other essential services regulated by government such as drinking water, highway development, and public safety) was in the national interest and so was the government's responsibility, especially for those Polton (1996) describes as the "deserving poor," the "suppressed middle class," and the nation's veterans.

Between 1949 and 1968, however, numerous factors combined to create a public housing system that was far from the temporary refuge for the working poor that was originally envisioned. Among the more important were discriminatory practices by local housing authorities who steered African Americans into inner city housing units far from affluent white neighborhoods; opposition of business and real estate interests to any government intervention in housing markets, which was seen as a threat to the free market system; and the unintended consequences of legislation like the Brooke Amendments which put caps on earnings of public housing residents, resulting in eviction of many upwardly mobile poor. Instead of temporary housing for the working poor, public housing rapidly evolved (certainly by the 1960s) into the housing of last resort for the poorest, neediest, and most dependent sectors of the urban population.

Today, public housing is populated almost exclusively by young, African American women with children, typically two or more. This population is characterized by high rates of welfare dependency, low skills, limited or non-existent labor force experience, and limited educational credentials and literacy skills. In short, the public housing population has become the chronically impoverished, welfare dependent,

female headed household that is the principal object of welfare reform.

Recent research presented by Sams Abiodun and Sanchez at the National Poverty Center Conference (2003) has refined our sense of the female headed household in impoverished public housing communities. They found that although women are usually the leaseholders of record and are not formally married, they often cohabit with men "in relationships of greater and lesser reciprocity and dependency." Many of these men, it was found, are attached to multiple households, to each of which they contribute either financially or in other ways (e.g., by caring for children, stepchildren, elderly mothers, nieces and nephews). These officially invisible cohabitating black males were also found to be "persistently unemployed or under employed and the victims, and perpetrators, of violence"; and they often had drug and alcohol issues as well. So while the pecuniary value of their contributions to the households with which they are attached may be limited, they are, nonetheless, present in a surprisingly large fraction of public housing families.

Many citizens and elected officials tend to blame (or perhaps want to blame) the deplorable conditions in many public housing developments on the undesirable characteristics of the people who live there. At best, this is simplistic. The problems of public housing are the combined result of failed policies, social and spatial isolation of residents in these racially and economically segregated communities, and the discriminatory practices of powerful business and real estate interests. For example, the isolated locations of many public housing dwellings limit access to job opportunities, restrict social networks, and lead to civil disengagement. This creates a climate where many residents view dealing drugs as an economic necessity, appeasing drug dealers as the only way to ensure personal safety, and taking drugs as medicine to numb the feelings of inadequacy and indignity they experience daily.

By the end of the 1970s, reform programs such as Section 235 and 236 were developed by the Department of Housing and Urban Development (HUD) to address some of the problems of public housing through public-private partnerships aimed at urban renewal and revitalization. These programs provided

subsidized loans, market insurance, and low interest rates to encourage private sector partnership in achieving the urban renewal goals of increasing public housing stock and redeveloping deteriorated units. These programs generally failed to accomplish their goals largely due to mismanagement and fraud. Another factor contributing to failure was the economic pressures exerted by the stagnant wartime economy of the mid 1970s. These ushered in a fiscally conservative political climate, which continues today, and in the 1970s led to a moratorium being placed on public housing spending. This moratorium brought urban renewal to a standstill. Housing that had been demolished to make room for urban renewal was never replaced, other housing slated for redevelopment fell into disrepair, and without the promised capital expense subsidies and tax abatement incentives provided by Section 235 and 236, private homebuilding and mortgage lending partners retreated from the now unprofitable public housing market.

These fiscal and economic pressures of the 1970s coincided with growing ideological shifts in national values in which any government involvement in public housing came to be viewed as problematic (housing and everything else is better left to private market forces, according to this view). These shifting values reflected the emerging belief that the poor were no longer *deserving* people who had fallen on hard times, but were to be blamed for their own conditions largely because they were lazy, undisciplined, drug addicted, and welfare dependent. This view continues to prevail today and has led to a zero tolerance climate: basically a one strike and you're out standard that has proven a very useful public housing policy tool for evicting public housing tenants judged to be undesirables. These ideological biases drive the public housing debate and shape national housing policy to this very day.

Interestingly, many people on the left have also concluded that government must disengage from managing public housing and cede management, administration, and ownership to the private sector, a process known as privatization, not because they are ideologically opposed to governmental intervention in the housing market, but because the records of the past three decades can be taken as evidence that

government lacks the ability, commitment, or vision to satisfactorily address the problems of public housing. The commitment to privatization has recently become the cornerstone of federal and local housing policy, although the origins of the policy can be traced to Jack Kemp's tenure as HUD secretary during the first Bush administration.

Privatization of public housing has also become the trend in European countries since the 1970s, primarily out of economic necessity. For example, the increasing cost of fully subsidizing new public housing construction has resulted in a shift from solely federal government financing of public housing in the Netherlands, Germany, and the United Kingdom. Each of these countries has devised various partnership and funding strategies for sharing the financial burdens of providing housing for their poor with the private and non profit sectors and local municipalities represented in each country.

Germany uses private landlords or institutions willing to adhere to certain conditions, including rent controls and minimum building standards established by the government, to provide housing for its lowest and just below middle income populations. These investors receive incentives in the form of low interest loans, operating cost subsidies, and interest adjusted loans, and are allowed to make a profit as long as they accept tenants who meet the income qualifications for public housing need. Although the federal government largely withdrew from direct financing of these public housing subsidies in the early to mid 1980s, leaving it solely to the states and local authorities, reunification and other social changes have dramatically increased the need for public housing and the federal government has responded by tripling its public housing budget allocations throughout the 1990s. The result is that the rate of public housing construction in Germany rebounded to only about 7 percent lower in the early 1990s than its peak 1970s rates.

By contrast, the rate of public housing construction in the UK has dropped sharply, about 34 percent, since the 1970s, largely due to strict government controls over local authorities' borrowing of public money for public housing construction and cuts in federal subsidies. The UK also uses what Smith and Oxley call a *rebate element* and *housing element* system to

award local authorities their subsidies based on market values of public housing property. Because the UK system does not use rent controls, rent increases are set each year according to assumed increases in property values. From these estimates, local public housing authorities are provided with increases or decreases in their subsidies (the housing element) to make up for any deficits due to anticipated increases in housing costs or to control for any overages expected due to lower anticipated costs. As for the rebates, these are provided to lower income tenants who cannot afford any rent increases; in essence, as Smith and Oxley (1997) point out, the tenants who are financially better off subsidize their less well off peers.

Hence the move toward privatization is not unique to the United States, although the political, fiscal, and social forces that drive the trend, and how it is implemented, are unique to each country. In the US, the move toward privatization has been strongly influenced by shifts in perceptions of the poor; it has been fueled by the persistent tendency to disfavor the poor, which has shifted the focus of public housing reform away from social structural causes and toward holding public housing residents accountable. HUD has freed local housing authorities from the mandate to function as the housing of last resort and has encouraged zero tolerance policies. At the same time, HUD has shown its renewed commitment to market interventions by expanding the Section 8 voucher program and the newer HOPE VI housing reform program, staples of public housing policy since the 1990s.

The Section 8 program is meant to promote privatization by allowing low income families to rent apartments from private sector landlords at market rates. Local housing authorities in essence provide vouchers that pay the difference between the market rent and what these families can afford to pay for housing (stipulated in the Brooke Amendments as no more than 30 percent of gross monthly income). HOPE VI in turn intends to deconcentrate poverty by demolishing densely populated public housing complexes and replacing them with mixed income, low rise apartments and townhomes.

The evidence so far suggests that Section 8 programs have achieved mixed results, and that the HOPE VI program, while doing a fairly

good job of meeting its deconcentration goals, still falls short of fully achieving the goal of eliminating the concentration of poverty in public housing. For example, a 2003 study by Kingsley, Johnson, and Pettit of 73 housing developments in 48 cities, published in the *Journal of Urban Affairs*, found that Section 8 recipients who were relocated from HOPE VI developments did indeed show lower poverty rates than their public housing peers who remained behind, but there was still "significant clustering" of the poor in some neighborhoods in most of the 48 cities in this study.

In an earlier Housing Policy survey study prepared for the American Sociological Association's annual meeting in 1998, Wright and Devine examined the potential impact of welfare reform on public housing tenants of a New Orleans public housing development. Interestingly, more than half of the respondents felt that welfare reform would not impact their personal lives substantially. A majority also felt it would have no effect or a positive effect on welfare recipients in particular, and on African Americans in general, as well as on New Orleans and American society as a whole. It is, of course, too early to tell whether the optimism of these public housing tenants is well founded because solid, broad based empirical evidence of the consequences of welfare reform and other recent devolutionary federal policy changes on public housing residents remains quite scarce.

Similarly, an innovative trend, one being used in developing countries like Bangladesh, Egypt, Ghana, and Zimbabwe to increase public housing supplies and reduce the public costs of maintaining them, is to transform public housing occupants into owners of their housing units. With the help of government subsidies that are shifted from private investors and non profit housing authorities, public housing tenants are allowed to purchase their public housing units and to add extensions on them for a variety of personal uses. These uses can include providing rent free housing for poorer family members; earning income as landlords, by renting the extra rooms to other low income tenants; or engaging in other business ventures that can range from operating nursery schools to night clubs and food stores. These ventures are seen as a way to encourage employment and

income generating opportunities in economically deprived areas, and to allow these residents to earn self employment income providing services in their own communities that are usually not readily available, to other residents in these areas, at costs that are affordable to their low income peers. While hopes are high, it remains to be seen whether the goals of this innovative approach will lead to decreases in poverty, economic revitalization of public housing communities, and a reduction in the burdens of providing housing for low income and poor residents in these countries. The results of several studies, now underway, will soon tell us more about the impact of this emerging public housing policy.

Other key areas for future research include studies of the impact of HUD's abandoning its role as the provider of last resort for the most vulnerable members of society. Where will homeless people, the mentally ill, disabled veterans, women who have exhausted their welfare eligibility, and other vulnerable groups find housing if not in the public housing developments? Will these policies create even more homelessness? Or will the new emphasis in HUD and elsewhere on self sufficiency make it possible for the excluded and dispossessed to obtain their own housing? Only time will tell.

As this body of research grows, it will allow social scientists to assess the true impact of welfare reform, zero tolerance, devolution, privatization, and deconcentration interventions on public housing residents and the nation. It will also provide insights into the long term effects of Section 8, HOPE VI, and other tax credit and block grant programs passed during the 1990s to facilitate these shifts in public housing policy. Research of the next decade will tell us whether it was a good idea or not to abandon a principle expressed in the 1987 Stuart B. McKinney Homeless Assistance Act: that it is the fundamental duty of good government to provide decent housing for its most vulnerable citizens.

public opinion

Connie de Boer

The concept of public opinion is widely used in the social sciences: psychology, sociology, political, and communication science. Three distinct perspectives emerge from the many

different definitions of the concept: individual, collective, and process.

The most general and inclusive approach is that which conceives of public opinion at the individual level as an aggregation of the preferences of a group of individuals. Scholars with a more holistic view describe public opinion at the collective level as an emergent product of debate and discussion that cannot be reduced to individuals. Within this perspective, the public is not just a group of individuals but a dynamic collectivity. Public opinion refers to a group of people who are confronted by an issue, are divided in their ideas as to how to meet the issue, and engage in discussion over the issue (Blumer 1946). Public opinion is also defined as a communication process that allows people to organize into publics within which opinions are formed and which enable them to exercise their influence. In this perspective, the individual and collective aspects of public opinion are more integrated (Price 1992).

There is a tendency for social scientists to emphasize in their definitions those dimensions of the concept that are related to their own academic discipline. Thus, psychologists are mainly interested in the process of opinion formation and focus on the factors that influence individual opinions. Political scientists draw attention to the role of public opinion in the political system by limiting their definitions to opinions, which governments find it prudent to heed, or to opinions about public affairs. By observing public debates or opinion polls, politicians and other government officials come to know what the public thinks and in that way public opinion can have a political impact. Moreover, politicians may be influenced by their expectations of the opinions of the public. Such latent or unvoiced opinions do not have to be expressed to be deemed to have an effect.

Public opinion is structured, which means that not all opinions have the same value: the opinions of those in powerful positions will always matter more than those of common citizens. And, because not everybody in the public is equally informed or equally active in the public debate, the extent of information and deliberation on which opinions are based varies among members of the general public.

Sociologists have a preference for definitions of public opinion at the collective level, and

they emphasize the role of public opinion in a social system as a form of social control. Communication scientists emphasize that public opinion is confined to opinions that are made public, and hence they limit their accounts of public opinion to opinions that are expressed. Given the linkage with the public debate and discussions about issues, they see public opinion as a communication concept.

Social scientists from all disciplines thus acknowledge that public opinion is closely related to the notion of public debate. In the rational model of public opinion, people are understood to develop their opinions during a public debate by listening to and presenting arguments in which their opinions are rationally sound judgments based on thoughtful consideration. Public opinion is also conceived, however, as a form of social control, where its role is to promote social integration and to ensure that there is a sufficient level of consensus on which actions and decisions may be based. These two models differ from each other as to the mode of opinion expression, the effort required for opinion expression, and the conceptualization of the public. The rational model emphasizes the verbal expression of rational arguments and opinions. Opinions are formed as a result of a process of deliberation. For participation in rational discussions, the ability and motivation to acquire information and to discuss the issues are prerequisites. When public opinion is viewed as social control, various forms of opinion expression are possible, ranging from rational debates and casual talks to facial expressions, gestures, and publicly visible symbols. In the latter forms, participation in the process of opinion formation is interpreted as requiring much less deliberate effort than in a rational debate. In the rational model, the term public refers to a group of politically interested and knowledgeable citizens, as, for example, they are described in Blumer's classic account, whereas in the model of social control the notion of public involves everybody (Scheufele & Moy 2000).

Public opinion emerges in and through the mass media, where people play the role of actors and spectators in the public debate. The media are interpreted as carrying out a surveillance function when they alert publics to problems, and they provide the principal mechanism for

allowing the public to monitor the social and political environment. The mass media are also the carriers of public opinion by reporting the views and arguments on an issue. Exposure to the media and participation in discussions allow people to assess the extent of consensus and controversy. It is this mutual awareness of the extent of consensus and controversy which ensures that public opinion can act as a social force, whereas the aggregation of individual opinions that are not expressed does not have such power. The media provide the means by which members of a public communicate. Elites use the media to influence public opinion, and at the same time those media provide elites with an impression of the views of the public on the issue at stake. Perceptions of public opinion matter not only because individuals attend to their social environment, but also because these perceptions potentially influence the behavior and attitudes of individuals and officials in political, social, and commercial organizations.

Ideas about public opinion can be found in eighteenth century philosophy, in Renaissance literature, and even in the works of Plato and Aristotle. Up to the mid nineteenth century, the bulk of writings dealing with public opinion were normative and philosophical in nature, being studies in political theory rather than studies of public opinion itself. Toward the close of the nineteenth century, public opinion came under increasingly systematic analysis in the empirical manner, characteristic of the developing social sciences. In tandem with the growth of the social sciences within the academy, twentieth century works on public opinion more clearly reflected sociological and psychological rather than political and philosophical concerns. Analysts increasingly turned their attention to the problem of understanding the social and behavioral aspects of public opinion, but considerations of the underlying normative questions concerning public opinion have continued throughout the twentieth century.

Over the course of the late seventeenth and early eighteenth centuries, a variety of novel social institutions came to prominence: the coffeehouses of England, the salons of Paris, and the table societies of Germany. In these gatherings public opinion emerged as a result of a free exchange of information and arguments about political issues. This emerging public opinion,

which was closely followed by those in power, became a new form of political authority. In contemporary politics, legislators, interest group leaders, politicians, and journalists have multiple means for gauging the public mood. They attend to the mass media, communicate (in many different ways) with colleagues and citizens, conduct focus groups, and monitor the behavior of voters. Yet the opinion poll is the most ubiquitous and authoritative measurement instrument.

Earlier analysts were far more likely to frame public opinion as an inherently collective, supra individual phenomenon. As survey research and opinion polling got underway in the 1930s, the daunting task of empirically observing the public as a fluid and complexly structured group, consistent with the sociological model of public opinion, led to its replacement with a far more tractable approach – essentially, an aggregate “one person, one vote” conception. The advent of opinion polling redirected attention toward social psychological as opposed to broadly sociological concerns, and it placed problems of individual level opinion measurement at the top of the research agenda. The combination of advances in measurement and sampling techniques placed researchers in a position to study opinions and attitudes in large populations and also to gather what were increasingly believed to be very accurate readings of public opinion on matters of political and social significance. Opinion polling has changed the essential nature of public opinion itself. The assumption implicit in all polls that everyone might have an opinion and that all opinions are equally important creates an impression of public opinion as the aggregate of opinions of individuals who are also uniformly informed. In some situations one might even say that opinion polls have replaced public opinion. When heeding public opinion, politicians increasingly turn to opinion polls in order to validate and defend their positions on the issues of the day.

Since the inception of public opinion research, great emphasis is placed on questions concerning how to conceptualize individual opinions and how to measure them accurately. Studies of public opinion attempt to describe and account for the preferences and beliefs of citizens, and to assess the (political and social) impact of these preferences and beliefs.

Researchers have tried to explain individual opinions using concepts such as values, attitudes, and ideologies. Converse (1964) showed that survey respondents rarely make use of systematic ideological concepts. The opinions expressed by respondents are often inconsistent and unstable (non attitudes). After the abandonment of the role of ideologies as a central variable in the 1960s, this topic has reappeared on the research agenda, but the focus of the research has shifted from how many citizens think ideologically to what impact ideology has on the political beliefs, opinions, and actions of citizens.

Theories about schematic information processing have improved our understanding of the process of opinion formation. Schemas, understood as cognitive structures that represent one's general knowledge about a concept or stimulus domain, provide shortcuts in thinking about an issue. Schemas are used as heuristics, simplifying the task of evaluating objects. Another such heuristic is the elite cue, which refers to the practice of individuals making decisions by considering not the details of the issue but rather the positions taken by trusted elites.

Subjective estimates of the climate of opinion, or perceptions of public opinion, are also recognized as having an impact on the process of opinion formation. Such perceptions of public opinion do not necessarily reflect the objective reality of aggregated opinion, but may be distorted by pluralistic ignorance, false consensus effects, and by overestimating the impact of events or media messages on the opinion of others ("the third person effect").

The process of opinion formation is heavily influenced by the context in which the opinion is expressed, in that it depends upon the situation and on which attitudes, values, schemas, group identifications, or perceptions of public opinion come to mind. Thus, the same person may well express different views about an issue in different situations. This also explains why slight changes in the way opinion questions and response choices are formulated in a survey produce different results.

There are recurring concerns in the writings about public opinion. First of all, it is suggested that the public at large lacks the competence to be active and involved in all the pertinent issues of the day. Although in simpler societies rule

by public opinion might be a possibility, the modern world has become too large and too complicated. Second, attention is drawn to the lack of resources available to the public. The necessary information to form rational opinions is not adequately disseminated by the public communication system. Despite a lack of detailed information about ideologies, policies, and candidates, people nevertheless make sense of the political world, but they do so using information shortcuts and gut reasoning.

A third enduring concern is the danger that a kind of mediocrity in opinion will prevail created and maintained by the pressure of the majority. The notion of conformity to majority opinion has been a persistent theme, both in social criticism and in social science. A fourth theme centers on the public's susceptibility to persuasion and to highly emotional and non-rational appeals, nourished by the growth of and developments within the mass communication system. Fifth, it is also suggested that, as a correlate of the domination of government and corporate elites, sections of the public are increasingly passive.

Normative concerns about the quality of public opinion have led to the development of "deliberative polling," designed to combine the efficiency and representativeness of conventional opinion polls with the informative and deliberative aspects of a town meeting. Respondents are brought together with policy experts, public officials, moderators, and one another to consider political issues in depth. With deliberative polling the aim is to find out what the public would think if it was fully informed and if it had time and opportunity to think and talk about the issue. There is a considerable difference between the opinion which people produce in an artificial situation such as a survey and the opinion they produce in a situation closer to the daily life situations in which opinions are challenged and/or confirmed.

Analysts of public opinion continue to face the challenge of trying to understand large scale social and political processes: the constitution of publics around shared problems, the negotiation of competing policy proposals, the emergence of issues, and the formation of coalitions among political elites, shadowed by broader coalitions among their supporters or detractors in the spectator public. In studying

these processes the researcher is confronted by the need to understand individual phenomena: the attention given to particular issues, the determination of which issues are personally or socially relevant, the acquisition of information, the formation of opinions in people's minds, and the translation of those opinions into political action.

There has been a growing interest in the deliberative aspects of democratic politics. The theory of deliberative democracy, in which public opinion is interpreted within the rational model, assumes that egalitarian, reciprocal, reasonable, and open exchanges among citizens about public issues will lead to a number of individual and collective benefits. Mendelberg (2002) argues that existing research shows that while deliberative processes in and of themselves are no guarantee of a more participatory, communal, and rational democracy, there is enough evidence in support of these ideals to make further research worthwhile. Research focusing on the communicative processes within the model of public opinion as social control is still scarce (de Boer & Velthuijsen 2001).

public order crime

David Huffer

Complex, collective actions, people adjusting, cooperating, accommodating, and compromising in social intercourse, are the constituent elements of civil societies. Binding societies are social meanings and expectations of acceptable behavior, a social fabric. This tacit understanding, shared by residents and users of public spaces, reflects a pervasive sense of civility, mutual responsibility, and morality as well as desires for a pleasurable life and a safe environment. Public order crimes threaten, prevent, or otherwise interfere with these pursuits.

Laws maintaining public order focus on physical acts and their residual effects. Physical acts span a menagerie of petty crimes and inappropriate behavior. These include soliciting alms; aggressive panhandling; loitering; obstruction of streets and public spaces; vandalism; unlicensed or unsolicited vending, peddling, or services; public drinking; public intoxication; public urination and defecation; street prostitution; and illegal drug sales. Residual effects of these acts include the presence of graffiti; abandoned cars, homes, and buildings; sustained disrepair; unsupervised, rowdy teens; open prostitution and drug sales; and vacant, trash filled lots. Though clearly among the least extreme of crimes, such collective victimization has consequences for both real and perceived quality of life that, left unchecked, can spiral communities into a sequence of decline.

Disorder and order maintenance are not new concepts. Disorder has plagued communities since their inception and, from their beginnings, policing agencies were charged with its prevention. This model was, by most accounts, effective through the 1950s when crime rates were consistently low. Rocketing crime rates in the 1960s spurred national concern, reshaped political thought, and diverted policing focus from its roots. Attention drifted as police instead began to favor making arrests, solving crimes, and gathering evidence to quell serious crime. This shift from an order maintenance into a crime fighting model was essentially pandemic by the early 1970s when, in reflecting contemporary social and political emphases,

policing agencies increasingly responded to escalating crime rates by gradually narrowing the scope of their work. Order maintenance gave way to the sole pursuit of fighting serious crime.

Research in the 1970s renewed interest in disorder. Seemingly inconsistent findings began emerging mid decade both from analyses of the National Crime Victimization Surveys (NCVS) and from independent policing studies. Research indicated fear of victimization greatly exceeded what would be expected given local crime patterns. In grappling with this disjunction, theorists attempted to identify causes and sources of fear perceptions and began exploring its effects once it became pervasive. Aside from actual crime levels, they noted community characteristics such as disorder influenced resident fear of crime. Early work focusing exclusively on the psychological effects of disorder reasoned that higher than expected victimization fear was an experiential consequence of exposure to widely occurring disorder. Conceptual elaborations to this purely micro level process were introduced beginning in the late 1970s that both increasingly recognized the significance of human agency and broadened the theoretical scope. Theorists incorporated a greater respect for cognition, conceptually freeing residents to perceive, reason, and judge disorder, and they introduced broader, contextual effects into a system linking disorder, fear, and neighborhood decline.

While early models held that fear of crime was simply an evaluative reaction to disorder, elaborations asserted instead that residents observed disorder, ascribed it meaning, and subsequently reacted to these ascriptions. The ascriptions rather than the observations shaped fear and, further, residents attributed concentrated, unregulated disorder to a community wide inability to protect the social fabric, which thus engendered a general sense of uncertainty and left residents questioning whether order could be maintained, and, if not, how then crime could be controlled. Individual responses to this uncertainty theoretically ushered in gradual, practically inescapable community decline.

Wilson and Kelling (1982) likened this declining process to that unfolding given persistent, unkempt community physical features.

The metaphorical broken window signals to observers there may be little social investment in improvement, and for some, like delinquent groups and petty offenders, this provides opportunity. More windows are broken and if these too remain unattended, it further substantiates perceptions of disinvestment, and thus observers reason there is little regulating the area. It neither is the window alone, the building, nor the street; rather, observers ascribe meaning to the sign inferring that, as a whole, there is little community interest in mobilizing resources – particularly those responsible for public safety. This concern sparks dissatisfaction, selective migration, and inhibits effective informal social control.

Minor, disorderly behaviors needle at, potentially unraveling, the social fabric. Satisfaction sinks, solidarity collapses, and mutual responsibility vanishes while fear of victimization grows larger. This stimulates withdrawal among all but opportunists and those unable to flee, leaving informal social controls otherwise curtailing minor breaches of order virtually disabled. Able law abiders take flight and, over time, serious offenders, capitalizing on available opportunities, take their place. Further, area avoidance and compositional shifts negatively affect the local housing market and economy, increasing inequality and instability. Those able avoid commercial and residential areas perceived as unsafe. They move, market elsewhere. Businesses close, housing prices plummet, neighborhoods fall into ruin, and entire communities decline. This impairment is dynamic, developmental, and creates a context favorable for persistent, serious crimes.

public and private

Charles Turner

The analytical distinction between public and private life has proved to be a useful tool for charting long term social change and in particular for understanding modern society. In classical Greece the equivalent distinction would be one between participation in the (public) life of the polis and the management of one's (private) household, within an ethical framework which saw the political life as higher and more self sufficient (Aristotle) than the life devoted to meeting mere material needs. In this world, privacy implies privation, the lack of something required for a full human life. This ideal of the polis, of politics as the highest form of human activity, has hovered over modern social and political thought since Machiavelli. But it has appeared ever more ethereal with the emergence of modern industrial society. For if in feudal society political power is the source of wealth, mature industrial society (or what Tocqueville calls "democracy") makes possible the pursuit of wealth without recourse to politics, and the putting of self interest before the public good. The modern state becomes either the minimum framework necessary for the pursuit of individual self interest (liberalism) or a mechanism for the maximization of collective wealth (a possibility utilized by modern welfare states and by state socialism). In either case politics loses its status as the most self sufficient activity and becomes a means with which something else can be achieved. The most sustained intellectual assault on this

development – in which, for instance, liberalism and Marxism are seen as two sides of the same coin – is found in the writings of Arendt, Oakeshott, and Wolin. Against this judgment stands the claim, popular with eighteenth century political economy, that it is precisely the pursuit of private gain in commercial society which opens individuals to the variousness and nuance of human affairs and which indirectly fosters the moral sentiments consistent with public virtues (Pocock 1985).

If classicist political theory equates public/private with politics/economics and laments the triumph of privacy, sociology, social history, and philosophy introduce new distributions. For instance, for sociology, the release of the energies required for the pursuit of individual self interest brings with it a more complex division of labor, the growth of new forms of refinement, and a greater variety of marks of social distinction. Privacy begins to be equated not with the household economy but with the family as a source of individual labor. This process of visible individualization is accompanied by a new organization of domestic space. The growth of the city, too, gives rise to new possibilities of distance, reserve, and inwardness (Simmel's blasé attitude), which fuse with already existing ideas about the inwardness of the self borne by (especially) Protestant Christianity. Public/private is equated with external/internal to the self.

The tradition of philosophy which begins with Kant provides another sense of public and private. The fusion of eighteenth century rationalism with German pietism led Kant to what is now called the "deontological" view of the self, in which individuals have the capacity to abstract from all of their determinate social and political relations. The fruit of such abstraction is not melancholy introspection or personal brooding, but the discovery of the individual's capacity for reason and judgment; at their most inward and private, individuals discover not their own uniqueness, but the moral law, a principle of duty which is the same for all. Individuals are also equipped with the capacity to make use of their unaided, autonomous reason in public. Indeed, the public use of reason is Kant's definition of enlightenment. "Public" here cannot be equated with politics in the classical sense, but exists as a republic of

letters between the private (both economic and intimate!) sphere and that of government and administration. For Habermas, the story of the twentieth century is that of the loss of the public sphere's distinctiveness as a result of the interpenetration of state and society under modern welfare regimes and political democracy. A series of partial publics emerges instead, pervaded by large organizations representing sectional interests, overlain with a thin veneer of publicity in the form of "public opinion," to be mobilized for demagogic as well as democratic purposes.

The idea of a loss of the public as polis, and of the public as republic of letters, lies at the heart of theories of European modernity. Alongside them, a third theme emerges in theories of American modernity: the loss of civility. Whether it be a culture of narcissism, the triumph of the therapeutic (Rieff 1966) or the fall of public man (Sennett 1977), American individualism is held to have developed to such a degree that individuals now view public questions in private terms, see the world as a mirror for the self, and fail to display the requisite distance from self which makes possible civil behavior between strangers. New forms of collectivity can arise out of this imbalance, but they are forms of community based upon the private principle of resemblance to self rather than forms of sociality based upon the public principle of commonality of purpose.

Curiously enough, in the 1960s this plea for civility, self distance, and a clear distinction between private and public matters was counterbalanced by the feminist slogan "the personal is political." This has been interpreted in two ways. According to the first, the neglect of the operation of power mechanisms in the sphere of personal relations is a major lacuna in modern social and political thought, to be filled both by consciousness raising and by new forms of empirical research; according to the second, the very tradition at the heart of which is a concern for the fate of the polis, or the public sphere, or civility, is itself pervaded by a masculinist reason. Both have had far reaching consequences for public and private life and for scholarship.

public realm

Lyn H. Lofland

While widely used in the contemporary discourse of such diverse fields as philosophy, political theory, sociology, art, media studies, architecture and urban planning, and gender studies, as well as in everyday speech, the concept of public realm has no consensual definition and definitions that are proffered are often both imprecise and enigmatic. What all the diverse usages do agree upon is that their referent is some sort of non private arena of social life and most judge that arena to be both critically beneficial and unappreciated; what they disagree about is its exact character. To add to the confusion, the non private arena may also be discussed under other names such as public sphere, public order, public domain, public world, and civic space.

Arendt's (1958) usage is at once among the most enigmatic, evocative, and, perhaps, influential. She traces the term back to the Aristotelian and Roman distinctions between the private world of the household and the public world of the *bios politikos* (for the Greeks) or the *polis* (for the Romans). And although the meanings attached to each realm shift somewhat through time, the dyadic distinction remains and is, for her, of considerable philosophic import.

The public realm is that arena where "every thing that appears . . . can be seen and heard by everybody and has the widest possible publicity . . . [and] appearance – something that is being seen and heard by others as well as by ourselves – [is what] constitutes reality" (p. 50). The public realm is also the world common to all of us and is "distinguished from our privately owned place in it. This world, however, is not identical with the earth or with nature, . . . it is related, rather to the human artifact, the fabrication of human hands, as well as to affairs that go on among those who inhabit the man made world together" (p. 52). In contrast, "To live an entirely private life means above all to be deprived of things essential to a truly human life: to be deprived of the reality that comes from being seen and heard by others" (p. 58). Interpreters seem to agree that what Arendt is talking about here, despite what her words may seem to imply, is not all publicly visible human social life outside of the household, but political activity – especially political speech – the goal of which is to exchange views about and to formulate shared purposes and to take action on them. Other areas of non household social life like government, administration, and economic activity seemingly are excluded.

Habermas's (1964) discussion of what he calls the public sphere is somewhat similar and may rival Arendt's in its influence, and it too has an elusive quality. In his conceptualization, the public sphere is a "realm of our social life in which something approaching public opinion can be formed[, a]ccess is guaranteed to all citizens[, and a portion of it] comes into being in every conversation in which private individuals assemble to form a public body . . . Today newspapers and magazines, radio and television are the media of the public sphere" (p. 49). He also differentiated among the political public sphere and other arenas of discourse, such as the literary, his own interest being primarily in the former. Unlike Arendt, Habermas saw the political public sphere as not emerging until the eighteenth century, when the distinction between opinion and public opinion developed, but similar to Arendt he viewed this arena as centrally important, not just to a fully human life, but especially to democratic governance. Some readers of Habermas have equated the political public

sphere with government and with electoral politics, but his interpreters insist that this is a misreading, that the state and the public sphere are in opposition to one another, the latter being "the sphere of non governmental opinion making" (Hohendahl 1964: 49). Because he insisted that the requisite discourse in the sphere be reasoned and critical, Habermas was not sanguine about its post World War II character or future. He argued that it was being undermined by such forces as advanced industrial capitalism, the social welfare state, and a mass media which tended to translate public communication into public relations.

Movement toward a more limited, technical, and precise definition can be seen in the work of four sociologists: Richard Sennett, Claude Fischer, Albert Hunter, and Lyn Lofland, although three of the four (Fischer excepted) also carry on the larger tradition of attempting to remedy what they see as an unfortunate disattention. Sennett (1977) equates the "public domain" with "the world of strangers, the cosmopolitan city" and he contrasts it with the private arena of intimate relationships. Though still retaining the historic private–public dichotomy, the word "public" here shifts somewhat from the difficult to locate realm of political talk and action to the more ordinary and mundane intercourse between urban people who do not know one another personally. This public domain, Sennett argued, is tragically undervalued in the contemporary West, primarily as a result of the rise of privatism and its overvaluation of intimacy. And this is dangerous because "the notion of a civilized existence [is one] in which people are comfortable with a diversity of experience and indeed find nourishment in it . . . In this sense, the absorption in intimate affairs is the mark of an uncivilized society" (p. 340).

Fischer (1981) explored the longstanding assertion that urban life is necessarily alienating and is the locus for interpersonal estrangement. In doing so, he distinguished between the "public world" (or sphere) and the private world (or sphere) of city life, and like Sennett he defined the public world as the "world of strangers," a "world of people who are personally unfamiliar to one another" (p. 307). He concluded (using survey data) that in the public world, alienation and estrangement from others

could be discerned, but that in the private world of city life composed of close associates and other familiar people such as neighbors, it could not.

Hunter (1985), pursuing his interest in the issue of social control, also grounded his definitions in everyday interactions, but made a break from the traditional divide of public and private to suggest the utility of understanding these everyday interactions in terms of the specific normative “orders” in which they are embedded. He identified three of these: the *private order* is “found in both informal and more formal primary groups where the values of sentiment, social support, and esteem are the essential resource”; the *parochial order* is “based on the local interpersonal networks and interlocking of local institutions that serve the diurnal and sustenance needs of the residential community”; and the *public order* is “located preeminently in the formal, bureaucratic agencies of the state” (pp. 233–4). And like Sennett, Hunter’s concerns are also moral ones: “The private, the parochial and the public social orders cannot maintain social order throughout a society without a mutual interdependence . . . A civil society, that provides both for safety from strangers and safety for strangers, requires an acknowledgment of the intrinsic limits [of each order] and a recognition of the need for better articulation among [them]” (p. 240).

Borrowing freely from prior work, especially that of Sennett and Hunter, but also extending and altering them, Lofland (1998) contrasted both the private realm (the world of the household and friend and kin networks) and the parochial realm (the world of neighborhood, workplace, or acquaintance networks) with the public realm (the world of strangers and “the street”). Specifically, she defined the *private realm* as “characterized by ties of intimacy among primary group members who are located within households and personal networks”; the *parochial realm* as “characterized by a sense of commonality among acquaintances and neighbors who are involved in interpersonal networks that are located within ‘communities’”; and the *public realm* as “the non private sectors of urban areas in which individuals in co presence tend to be personally unknown or only categorically known to one another” (pp. 9–10). Despite the hint of geographical concreteness

in the last definition, Lofland conceived of the three realms as social psychological rather than territorial spaces. They come into existence when one or another of the three relational types reaches a proportion and density in some territorial space such that it dominates that space. And while each realm may be most “at home” in its associated territorial space, each may also exist in “alien” space (e.g., a wedding in a public park, an “open” house in a private residence, a neighborhood bar in a “downtown” location). Like Sennett, Lofland’s special focus is on the public realm and for a similar reason: she argues that it is a realm of immense social value which offers, among other benefits, a rich environment for learning, a site for needed respites and refreshments, a locus of communication, an opportunity for the practice of politics, a stage for the enactment of social arrangements and social conflict, and assistance in the creation of cosmopolitans (pp. 231–46).

These more extended discussions of “public realm” and related concepts probably represent only a fraction of contemporary usages. More frequently, the term is employed loosely, with little attempt at definition, although the author’s meaning is usually implied by the context and bears some resemblance to one or another of the meanings developed in the longer treatments. In discussions of architecture and urban planning, for example, public realm seems primarily to mean legally public space – specifically, outdoor public space, as in parks, plazas, and promenades. Among those interested in the Internet, the public realm translates as cyberspace, where non corporeal interactions blossom. For some artists, it is identified with sites of public art, and for some media scholars and/or defenders of the public ownership of media, it refers to government sponsored enterprises like the BBC in Britain or the ABC in Australia. To some students of higher education, the public realm finds embodiment in the institution of the university, and in gender studies treatments it often refers to that social arena where laws, contracts, and other civic agreements are reached and which has traditionally been considered “off limits” to women.

public sphere

Gerard Delanty

The concept of the public sphere has become a key term in sociology since it was introduced by Jürgen Habermas as a sociologically pertinent concept. The public sphere refers to the space that exists in modern societies between the state and society. It concerns a domain that is generally related to civil society, but goes beyond it to refer to the wider category of the public. The public sphere comes into existence with the formation of civil society and the forms of associational politics to which it led. But it refers essentially to the communicative content of political modernity. Although the English

term public sphere suggests a spatial notion of the public, the German term *Öffentlichkeit* conveys a stronger notion of a realm of communication, suggesting a discursive condition of "publicness."

The public sphere can be seen as a modern approach to the older question of "public man" or the public realm that Hannah Arendt believed came into existence with the Athenian polis and political relations based on citizenship. The turn to the public was originally a development within political theory, as reflected in the writing of de Tocqueville and Arendt. Although Arendt saw a decline in the public realm in modernity, de Tocqueville believed it was one of the key features of modernity. Habermas's major work *The Structural Transformation of the Public Sphere*, originally published in German in 1962, has generally provided the main point of reference for recent debates on the public sphere (Habermas 1989). The work can be seen as a combination of de Tocquevillian and the Arendtian stance.

According to Habermas, modern society from the seventeenth century to the early nineteenth century saw the emergence of a social domain distinct from court society, on the one side, and the absolute state, on the other. This was the space of the public, which was formed in new spaces such as the coffee house, public libraries, a free press, and wherever public debate took place outside formal institutions. One of its main features was public opinion. Initially, the public sphere was defined by opposition to the court society, but it also increasingly became defined by opposition to the private domain of domestic life. In Habermas's early theory of the public sphere, it was characteristically associated with the political and cultural world of the European Enlightenment. So the structural transformation occurred when the culture of the Enlightenment declined and the public sphere was absorbed by capitalism. The decisive event in this was the commercialization of the press, which was originally an organ of public debate, but with the rise of commercial newspapers that came with the consolidation of bourgeois society and intrusion of the market into civil society the public sphere went into decline. In an approach that reflected Arendt's pessimistic view of modernity and one that was influenced by the cultural critique of modernity by the Frankfurt

School, Habermas saw only the decline of the public sphere with modernity. The rise of modern mass society in the twentieth century with the manufacture and control of public opinion by political parties completed the structural transformation of the public sphere that had begun in the previous century.

By the time of the translation of Habermas's book into English in 1989 he had moved on to a new theory of the public sphere which no longer concentrated on the decline of the Enlightenment model. However, the English translation opened up a huge debate on the public sphere (Calhoun 1992). The point of departure for many of these new approaches was a critique of Habermas's earlier model. The new theory of the public sphere that emerged in the 1980s can be summed up under four points.

The first was a rejection of the idealization of the historical model adopted by Habermas. Many critics argued that there was not a single historical model, but several, and the notion of a pure domain of public space opposing power was a romanticization of historical reality. Indeed, much of what Habermas called the public sphere occurred within the broader category of the state and cannot so easily be accounted for in terms of a domain of free communication.

Second, any account of the public sphere must consider the existence of alternative or counter public spheres. In this regard, what many critics drew attention to were alternatives to the bourgeois public sphere. Negt and Kluge (1993) wrote about the "proletarian public sphere," which did not figure in Habermas's model. In addition to this there is the feminist charge that the early conceptualization of the public sphere assumes a too strict separation of the public and the private, whereby the latter is reduced to a non political condition (Landes 1988).

Third, more recent debates on the public sphere concern the existence of the public sphere in non western societies (Hoexter et al. 2002). In contrast to the Eurocentric bias of Habermas's early theory, the public sphere was not a condition peculiar to eighteenth century Europe and North America and does not consequently require an "Enlightenment."

Fourth, a question that has been at the forefront of much of the recent debate on the public sphere is whether there is a cosmopolitan

public sphere (Kögler 2005). Where Habermas largely assumed the existence of discrete national public spheres, the idea of a global or cosmopolitan public sphere has contemporary relevance as a result of globalization. One important application of this is in the idea of a European public sphere (Eriksen 2005).

In sum, the notion of the public sphere is today generally seen as a plural condition: there is not one single or ideal public sphere, but many. The public sphere is the space of debates and the ongoing contestation of power.

purdah

Hasmita Ramji

Purdah literally translated from its Persian origins means veil or curtain. It is a concept that is used as a synonym for social practices that

isolate or separate different groups in society. Although purdah can refer to many different social practices of isolation, the term is most immediately associated with a practice of gender segregation in mostly although not exclusively Muslim societies.

There are various forms and degrees of purdah that may be observed in Islamic societies. Purdah, for instance, can refer to the use of high walls, curtains, and screens erected within the home as well as public places to keep women separate from men or strangers. However, the most widespread practice of purdah refers to the seclusion of women from public observation by wearing concealing clothing. This form of purdah is also seen in other religions such as Christianity and Judaism – it is not unknown for certain Christian and Jewish denominations to require women to be “covered” whilst worshipping (if only by a hat or similar symbolic object). The practice in Islam is traced to both the Qur’an and the Hadith. The usual garment worn to accomplish this form of purdah in Islamic societies is termed a *chador* (all enveloping black mantle), which may or may not include a veil to conceal the face, a *yashmak* (De Souza 2004).

The limits imposed by this practice vary according to different countries. Purdah, for example, was rigorously observed under regimes such as that of the Taliban in Afghanistan, where women had to observe complete purdah at any time they were in public. Only their husbands, fathers, siblings, children, and other women were allowed to see them out of purdah. In other societies, purdah is often only practiced during certain times of religious significance.

The practice of purdah has become increasingly controversial in recent times. Feminists, for instance, have perceived the practice of purdah to be an extension of men’s control over women in patriarchal society (El Guindi 1999). Purdah suffocates the rights of women and is used as an instrument that enables men to dominate the family structure, resulting in a gendered division of labor that leaves women extremely dependent upon them.

Others, mostly believers in Islam, see purdah as a practice that liberates women, by enabling them to be judged not by their physical beauty but by their intellect, faith, and personality (Ahmed 1992). By covering themselves, women are prevented from being viewed as sex objects that can be dominated, enabling them to enjoy equal rights with men.

Purdah, however controversial, still remains an integral part of everyday life for many people as it is practiced to greater and lesser degrees in most contemporary Islamic cultures.

Q

qualitative computing

César A. Cisneros Puebla

Qualitative computing refers to the ensemble of technology and methodology for qualitative data analysis. Its development is rooted in qualitative sociology and the tradition of symbolic interactionism and is embedded in the evolution of computers. It goes beyond simple data management, incorporating features such as criticism of traditional approaches to data analysis, searching for new logical strategies for theory building, and innovative ways to visually represent multiple realities. Some criteria to differentially assess the software programs, among others, are ease of integration of all research process stages, type of data, process of searching units of analysis to read and review, memo writing managers, categorization and code book access, analysis inventory and assessment, capability to export and import quantitative data, and options to merge data from different projects.

At the beginning of the 1980s, researchers from the US, Australia, and Europe developed prototypes of different computer programs to work with qualitative data, called CAQDAS since 1989, which stands for Computer Assisted Qualitative Data Analysis. Similar to computational sociology, it seeks to deal with data complexity but its aim is not to model an “artificial society” as the former does. Qualitatively driven strategies of handling digital data provide a relational and dynamic model for conceptually mapping all research project components. Qualitative data are analyzed in inductive, iterative, and recursive traditions. Therefore, qualitative computing is composed of epistemological assertions of using computational devices to study language and meanings; methodological claims about using Boolean tools and algorithms to

create new data; and ontological arguments on the computer’s role in interpretive inquiry. There is no more debate about the implications of “computer aided methods” in qualitative analysis because qualitative social scientists know using software is not synonymous with incontestable research design, methodological rigor, validity, or objectivity.

Qualitative computing is very often recognized as a computerized tool for grounded theory. Beyond applying the constant comparative method linked to this qualitative approach, there is increasing interest in understanding analytical induction strategies to theory building, and the related cognitive process of abduction. As a consequence of this concern, there have been some attempts to apply artificial intelligence tools and machine learning strategies. Qualitative computing also has features useful in conducting ethnographies, narrative research, phenomenological inquiry, and case studies. Data mining, knowledge representation, and knowledge discovery databases are also related areas of computational investigation. The emerging interest on hypermedia ethnography, visual narratives, fuzzy logic and natural language, large scale video projects and hypertextual analysis is moving qualitative computing in new directions in advanced technological sophistication, which demands more creativity and researchers’ imagination.

Qualitative computing is basically associated with the analysis of text, images, video, and audio. A seminal book on this field is Tesch’s *Qualitative Research: Analysis Types and Software Tools* (1990), but Weitzman and Miles’s *Computer Programs for Qualitative Data Analysis: A Software Sourcebook* (1995) is also important despite its now outdated format. As in other fields applying digital technology, any book attempting only to describe computational applications easily becomes useless as a result of the

constant updating of programs. Of historical interest are the special issues prepared by David Heise for *Sociological Methods and Research* (titled "Microcomputers in Social Research," 1981) and by Conrad and Reinhartz for *Qualitative Sociology* (titled "Computers and Qualitative Data," 1984). Another special issue by Mangabeira for *Current Sociology* (1996) portrays the worldwide diffusion of CAQDAS.

If the social sciences' "quantitative revolution" in the 1970s was associated with a technological transformation in the means of querying and handling numbers and statistical analysis, the increasing advance of qualitative computing in the ensuing "post positivist" period has represented a kind of quiet revolution common to diverse social disciplines in the means of querying and handling words and qualitative data analysis as a consequence of the digital avalanche. A relevant impact on doing hybrid or mixed methods is noticeable in research design as a result of the application of qualitative computing strategies. In depicting the processes of qualitative data analysis by means of relationships among codes, categories, subcodes, textual, video, or audio files and memos, some metaphorical concepts have been built, hence there are analytical approaches from hierarchical trees, semantic networks, or case based thinking. The promise and perils of the new frontiers in qualitative computing remain on the limits of researcher-computer integration given that such technological devices have superior abilities for processing patterns, although humans remain superior at interpreting meaning in patterns. Technology is a medium to transform traditional ways of inquiry and is a powerful tool to enhance our creative and qualitative thinking.

Even though qualitative computing has influenced fields and subfields of social and behavioral sciences such as psychology, education, nursing, public health, sociology, women's studies, anthropology, communication and market research, among others, its total integration into curricula and schooling practices is incomplete, just as qualitative methods are in the current state of the art over the world. The future of qualitative computing is connected to the deepest and most thoughtful analysis of the mathematical basis of qualitative inquiry and is related to the soft sociology legacy and reflection about soft data analysis. Computing with

words appears as a discipline in the neighborhood of qualitative computing, although in its present stage there is no large collaboration in progress; some skepticism is around, just as in the case of using artificial intelligence to improve some features of particular software programs.

qualitative methods

Jeffrey Michael Clair and Jason Wasserman

Methodological debates in sociology are longstanding and pervasive. The tension between qualitative and quantitative methods is at the heart of much discourse about the state and direction of the discipline (see Blumer 1956; Denzin & Lincoln 2003; Hesse Biber & Leavy 2006; Karp 1999). This article (1) provides a definition and explanation of qualitative methods; (2) elucidates its contrast with quantitative

methods; (3) explains underlying epistemological considerations that are at the heart of methodological disputes; (4) suggests that the fundamentally different pursuits of these methodologies nullify conflict; and (5) concludes by suggesting some future challenges that qualitative methodologists should attempt to address.

Suppose a researcher wishes to study death in a certain population of people. There are numerous possible ways to approach this broad topic, and various possible research questions that could be asked. One researcher may wish to know how the mortality of the population is affected by poverty. To answer this question, the researcher might collect data on the two variables, mortality and poverty, and see if there is a statistical correlation between them. If there is a strong positive correlation – if, as the rate of poverty increases among that population, the mortality rate also increases – then we may have good reason to assert that mortality is predicted, at least in part, by poverty. However, another researcher may want to understand how death is perceived among that population. In that case, the question is not what *predicts* mortality but, rather, what does death mean, how is it understood, how is it dealt with, and so on? In order to address these types of questions, one must gain an intimate knowledge of the people in that population and their culture. While collecting data on poverty gives us a good prediction of mortality, understanding what death and dying *mean* to people requires us to reach for a deeper understanding of who they are and how they view death in particular and the world around them in general. While quantitative methodology works well to answer the first question, qualitative methods better address the second (see Balshem 1997).

PRACTICES

Qualitative methodology refers to ways of conducting sociological inquiry using empirical practices such as observation and interview. Qualitative researchers typically use in depth interviews or participant observation in order to get a detailed picture of the populations they are investigating. They are interested in understanding and describing the people and

phenomena that they observe, whereas quantitative research is typically focused on *prediction* rather than description (Becker 1970, 1998). Thus, the quantitative researcher most often uses highly structured survey techniques that can be efficiently administered to large numbers of people from a given population. By contrast, the qualitative interview tends to be less structured and delves deeper into the lives of subjects. The fundamentally different pursuits at which these methodologies are adept produce a number of practical differences in their use. Some of these differences are summarized in Table 1. It is important to keep in mind that these classifications are by no means definitive. For example, the depth of understanding that qualitative researchers pursue typically means that researchers spend a great deal of time with their study population and, in turn, their sample sizes often are smaller than those in quantitative studies. However, this is not always the case.

Practical differences between quantitative and qualitative methods are most clearly expressed in their differing uses of the interview as a research instrument. In the typical quantitative interview, participants select responses from a predetermined set of choices, such as a Likert scale. For example, a researcher measuring poverty may pose a statement such as, “I have trouble paying bills.” Respondents might be asked to select one of the following

Table 1 Qualitative and quantitative techniques compared

	Qualitative	Quantitative
Research goal	Description	Prediction
Sample sizes	Smaller	Larger
Research instruments	Semi-structured or non-structured interviews, participant observation, etc.	Structured surveys, data from census and government records, etc.
Perceived logic	Inductive, interpretive	Deductive, objective
Epistemology	Interpretivist	Positivist
Benefits	Depth, fluid and adaptable to various cultures and individuals	Efficiency, formalized and comparable results

four answers that best applies to themselves: (1) Never, (2) Not very often, (3) Often, (4) Always. The qualitative researcher would typically use a less structured interview to attempt to understand a respondent's financial situation. Respondents would be allowed to answer the question in their own words and often encouraged to expound on their answers. For example, suppose the qualitative researcher asks, "Do you ever have trouble paying bills?" and the respondent answers, "Yes, sometimes." The researcher would probe for further discussion by saying, "Tell me about that," or "Tell me about the last time you had trouble paying bills." It is at this point where the qualitative interview significantly diverges from quantitative instruments. For qualitative research, the interview is a meaning making *partnership*, a knowledge producing *dialogue* (Hesse Biber & Leavy 2006).

The notions of dialogue and partnership highlight an important aspect of qualitative research: the researcher is a fundamental part of the research, not just the proctor of a questionnaire. A good interviewer listens and helps the respondents flesh out their stories, encouraging them as experts on their own lives. Beyond the ostensible subject matter of the interview, the researcher must constantly pick up on *markers*. Markers are important pieces of information that respondents offer as they are talking about something else – a passing reference made by respondents to important events or feeling states. These may be significant pieces of information themselves, but also they suggest other lines of inquiry for the researcher to pursue. The ability to follow these lines of inquiry that emerge *during* the interview is partly what enables qualitative research to achieve depth and rich description, whereas quantitative research is constrained by the instrument at the time of the interview.

Of course, there are benefits and drawbacks to both quantitative and qualitative methods. By giving respondents four choices to select from, the responses of various individuals can be easily and directly compared. In other words, it can be decisively said that those respondents who selected "never" in regards to having trouble paying bills are better off financially than those who selected "always." Quantitative methodology is able to summarize

efficiently and compare large numbers of people using these sorts of structured research techniques. Qualitative research is not usually able to make these sorts of efficient comparisons. Instead, the financial situation of each respondent must be interpreted by the researcher. But the qualitative researcher is able to learn more about the financial situation of the respondent than the quantitative researcher. The open ended nature of the qualitative interview allows respondents to give more information, for example, to explain *why* they had trouble paying bills or how they felt about it. This depth and the complex variation between different individuals cannot be easily captured by the highly structured quantitative interview.

Since the qualitative researcher uses less structured research techniques, and thus must interpret the results, qualitative research is typically seen as an inductive practice. That is, there is nothing concrete that tells the researcher what the data mean. Instead the researcher must decipher a meaning. In the quantitative example above, respondents who reply that they "always" have trouble paying bills are assigned number one and those who mark that they "never" have trouble paying bills are assigned number four. Four is greater than one, i.e., respondents who never have trouble paying bills have higher socioeconomic status (SES). The nature of this type of concrete data makes interpreting results less nebulous. Some assert that this minimizes or even eliminates the biases of the researcher, something that remains problematic for qualitative methodologists. However, there is much to suggest that quantitative research is not, in fact, a deductive practice, at least in the social sciences. This is particularly true with questions of causality. Data in quantitative social research tend to identify tendencies, but not certainties. The complexity of social phenomena means that quantitative researchers cannot control for all confounding factors. The proper specification of a model in quantitative research decidedly is an inductive practice, and means also that the researcher must induce (not deduce) causal relationships, since the correlation between two variables does not decidedly entail that one causes the other. At an even more primary level, the construction of a

questionnaire involves the operationalization of the concepts to be investigated. There is nothing that deductively links a concept to its measurement in a questionnaire. In other words, the issue of construct validity (external reliability) calls into question the objectivity of quantitative practices. The inductive/deductive dichotomy as a difference is included in Table 1 because these methodologies are often perceived in these terms, but caution is needed because deeper inquiry calls into question the accuracy of this perception.

EPISTEMOLOGICAL FOUNDATIONS

A key difference between qualitative and quantitative methodologies concerns the varying epistemological foundations on which they are seen to rest (see Denzin & Lincoln 2003). While not a definitive distinction, qualitative methods are currently conceived as founded on interpretivist notions of reality, whereas quantitative methods are conceived as founded on positivist notions of reality. Interpretivism asserts that everything in the world is the product of human conceptualization (see Foucault 1965; Kuhn 1962). Reality, then, is a human construction and, thus, it can vary from culture to culture, or even person to person. The *sine qua non* of interpretivism is a commitment to seeing the world from the point of view of the actor.

Positivism asserts that there is a reality independent of human conceptualization. Human beings can learn about reality, but reality does not depend on humans to construct it (see Archer 1995; Bhaskar 1979; Popper 1994). Positivist approaches typically view events from an outsider point of view. Positivists assert or imply that if researchers employ scientifically legitimized procedures and properly apply methodological rigor, the subjectivity can be contained and an accurate, objective depiction of the subject rendered (Smith 1987; Smith & Deemer 2003). Qualitative researchers often see the quantitative application of empirical directives and concerns as being imposed upon social reality with little reference to the meaning of the subjects, viewing people as inert and unchanging. The most critical, contrary to the logic of this kind of methodological quest, would sum it up as quixotic.

The interpretivist–positivist dichotomy does not neatly overlay the qualitative–quantitative one. For example, early ethnographic work (e.g., Malinowski, Evans Pritchard) was based on decidedly positivist epistemology (Marcus & Cushman 1982). Moreover, there is nothing about an interpretivism that precludes the use of quantitative methods, given that meanings are widely shared, even if they do not have absolute truth correspondence to the world. This notion is echoed by a variety of philosophers of science who take on middle ground epistemological positions such as contextual objectivity or Richard Rorty's notion of neopragmatism (Kincaid 1996; Logino 1990; Rorty 1991).

The positivist assumptions of quantitative research typically are implied rather than explicit. For example, collecting quantitative data on poverty assumes that there is such a thing as poverty, and, more importantly, that people roughly share the same idea about what it is. Certainly this may *not* be the case. Thus, the conceptualization of a variable – e.g., what constitutes poverty – is ultimately an interpretive process (see Blumer 1956; Fox 2004; Whyte 1955). Poverty in one culture may mean having little livestock, whereas in another it may mean having few monetary assets, and in another the concept could be nonexistent, for example, in highly egalitarian societies. Of course, quantitative researchers can be adequately sensitive to cultural differences as explicit as this, but subtle variations within or between populations may be more difficult to detect using structured research techniques, which do not allow the researcher to pursue the meanings and implications that lie behind an individual's responses.

Working from the notion that the way a particular group or culture views the world may be significantly different from others, qualitative work seeks to understand a particular population by using techniques such as the open ended interview that can be adapted to varying populations and contexts (see Denzin & Lincoln 2003; Hesse Biber & Leavy 2006; Lofland, Snow, Anderson, & Lofland 2006; Robben & Sluka 2007 for a full discussion of epistemology and qualitative methods). Being able to alter research plans to accommodate serendipitous occurrences is a sharp contrast

to fixed measurement and typical hypothesis testing (Bryman 1984). Within this paradigm, the study of poverty would be up close, local, and an act of searching for the culture of different sites. This is perhaps the best justification of ethnographic work, legitimately witnessing the local sufferings that distant powers generate and then disregard (Agar 1996; Bourdieu et al. 1999; Katz 2004).

CRITICISMS OF QUALITATIVE METHODS

The interpretivist foundations of qualitative methodology and its subsequent lack of structured research techniques form the primary point at which it is criticized (see Denzin & Lincoln 2003; Hesse Biber & Leavy 2006). Because the data collected cannot be easily compared between respondents in the study or between various different studies, nor can they be deductively generalized, critics of qualitative methods have accused them of being overly subjective and, thus, scientifically problematic. Detractors charge that the results from qualitative work amount to little more than the researcher's subjective impressions and opinions. Qualitative research findings are not verifiable or falsifiable since they rely on the interpretation of the researcher.

Responses to these criticisms have been varied. Some qualitative researchers have responded by aspiring to a positivist model. They have attempted to quantify qualitative data, for example by counting up references to particular concepts. While this provides comparable data for analysis, it does little to address the subjectivity that exists in the interview process, the coding process, or in the interpretation of the subsequently quantified data. For example, the initial and follow up questions that a researcher asks in a less structured interview may be affected by a number of subjective considerations such as rapport between the interviewer and the respondent. This, of course, also may be problematic in the face to face quantitative survey. Another response has been to use an experimental design for qualitative studies (Sherman & Strang 2004). The essential goal is to create comparable subgroups within a study, for example one group

who participated in a program and one group who did not. In depth qualitative research might then be used to identify thematic differences between these two groups.

Other qualitative researchers defend their practices by asserting that understanding the complex meanings that various populations ascribe to their social world is not quantifiable and thus will always be interpretive (Denzin 1999; Gans 1999; Gubrium 1988; Thorne 1980). Further, they assert that quantitative research is equally plagued by the cultural and personal biases of the researchers at a number of levels, such as constructing the survey instrument and inducing causality from the statistical correlations embedded in the data (Blumer 1956). The idea of conducting a random sample to generalize also can be seen as absurd, because even if generalizations are qualified with the probabilities of quantitative logic, the composition and biographical reality of the population is never the same as the one from which data are extrapolated (Katz 2004).

However, even if the subjective biases of the researcher (both qualitative and quantitative) cannot be eliminated, perhaps they can be overcome by exposing the audience to them (Denzin 1999; Denzin & Lincoln 2003). Some researchers have attempted to explicate their own biographies and the roles they play in the research situation in order to elucidate potential biases. This is the thrust of reflexive ethnography, a tradition of qualitative fieldwork where researchers actively analyze themselves as a fundamental part of the research (see Salzman 2002). If these biases can be exposed, not only do they become less problematic from an investigative standpoint, they can actually be informative. Some work even locates the researcher as the central object of analysis, an approach labeled by Hayano (1979) as autoethnography (also see Ellis & Bochner 2003).

FUTURE DIRECTIONS FOR QUALITATIVE RESEARCH

Combining formality and fluidity in qualitative research seems to be its foremost challenge (Sanders 1999). Scientific inquiry is characterized by taking a structured approach to analysis of a problem. Since qualitative methodology is

perceived as being unstructured, it is often perceived as being unscientific, as an extension of the humanities rather than a social *science*. But while there is not necessarily a structure to qualitative methods, in general, there most often is a conceptual framework in which particular researchers operate. If explicated, this can provide structure for particular studies, if not qualitative research over all. Further, there has recently been a move toward formalizing qualitative research without aspiring to positivist models of scientific inquiry (see, for example, Harrington 2003). This has occurred at two levels: interacting with participants and interpreting data.

Addressing issues of access in fieldwork, Harrington (2003) asserts that various issues of population access and researcher-participant interaction can be organized under conceptual frameworks of social identity and self presentation. Researcher narratives about gaining access and interacting with a population can be embedded in broader theoretical paradigms such as symbolic interaction and understood in terms of the identity and self presentation of the researcher and the participants. These frameworks can provide structure to qualitative research and even allow researcher narratives to be compared to one another.

In terms of interpreting data, grounded theory as detailed by Glaser and Strauss (1967), Clarke (2005), and Charmaz (2006) provides a formalized method for analyzing qualitative data, which does not rely on quantification. Grounded theory is a method for generating theory rather than testing it, which is the thrust of quantitative work (Charmaz 2006; Strauss & Corbin 1997). The grounded theory technique works by coding data into concepts in a hierarchical fashion. The coding of qualitative data is thus different from quantitative coding where the data must be located in an *a priori* coding schema. In other words, for grounded theory coding categories are created from ongoing interpretations of the data rather than being conceptualized prior to their collection. The goal is for the data to speak to the researcher, rather than for the researcher to mold the data to fit preconceptions (Glaser & Holton 2004). The process is as follows: (1) develop categories; (2) saturate these categories by gathering data and coding them until no

new codes are emerging; (3) note and develop links between categories and pursue investigation of these with more data collection; (4) consider the conditions under which the links hold; and (5) make corrections, where relevant, to the theoretical models. This allows for a thematic analysis of the data.

The initial text on grounded theory was a polemic work. The modes of theorizing then predominant in sociology were directed toward speculative and deductive forms of theorizing, in which theories were first dreamed up, so to speak, before being tested against research evidence (see Dey 1999). The emphasis was on verifying, not generating, theory. Verification becomes irrelevant for grounded theory because ideas are induced from the data (Glaser & Holton 2004). This hierarchical process of grounded theory allows for more transparency in the interpretation of data.

Finally, while grounded theory provides a transparent way to link individual concepts to the data, through the coding process, theory building requires the linking of concepts to other concepts. We can have the concepts of health and poverty, but we do not have meaningful theory until we assert a relationship, for example, that poverty is related to health. Grounded theory provides a systematic method for deriving concepts, but not conceptual structures. This highlights a future challenge for qualitative research in the area of formalized complexity, that is, how to systematically and/or transparently build conceptual models from the transparently emergent conceptual pieces.

CONCLUDING REMARKS

Sociologists explicitly engaged in assessment of sociological methodology largely recognize that the split between qualitative and quantitative methodologies is dogmatic and somewhat arbitrary. Although we may argue about the degree to which research is subjective, clearly both quantitative and qualitative work fail to achieve absolute objectivity. Most would acknowledge that no such thing exists. But rather than accept the legitimacy of both methods, academic departments, journals, and all sorts of various professional circles seem to accept this division as real and important. The benefits

and drawbacks of each method have been outlined in an attempt to explain the important role of qualitative methodology, a role that cannot be filled by quantitative work, no matter how methodologically rigorous. Moreover, future challenges for qualitative methodology have been detailed that will make it increasingly potent in the decades to come. However, sociology is more generally faced with the future challenge of overcoming its methodological divide, a goal often talked of in methodological and epistemological writing, but just as often neglected in action and attitude within the discipline of sociology.

quantitative methods

Julie Lamb

Quantitative methods are those that involve numerical data resulting in statistical analysis. The quantitative approach relies on the stance that an overall view of society (or the gathering of social facts) is preferable to in depth information provided by a few individuals. In other words, data on social facts can be collected from a sample of individuals and applied to the

societal level. This idea of generalization from a sample to the population of interest is of key importance in any quantitative method – data collected must be shown to be able to represent the population under study.

Data for use in quantitative methods have to be collected in an objective manner, usually taking the form of a survey interview or postal questionnaire which is highly structured to be sure to collect the same information from each individual. Using these data collection techniques, one ends up with a large collection of individual variables which can be coded into categories before being analyzed. In this manner, data collected can be tested for reliability (if the same instrument was used again by a different person would it give the same results?), validity (how true is the data to the real population?), and representativeness (how does the information apply to the population under study?) using statistical techniques. The measurement of variables in social research (social measurement) is of key importance to data quality and is a topic in its own right.

Statistics enable us to see a very large amount of information in a summary format, making it easier to understand. Statistics also make it possible to see the world in a structured way outside of the individual level so that theories and policies can be made in a reliable way on account of facts gathered to represent the whole population rather than individuals. One example of this are the labor force statistics gathered on a continuous basis from a sample of the population in the UK (other countries also routinely collect labor force information). These data are then analyzed using statistical methods to produce, for example, numbers of unemployed people in the country, which go on to inform policy decisions and sociological theories.

Quantitative methods do not have to involve a large element of mathematical reasoning. Descriptive statistics can be used as a basic way of backing up an idea or showing the basis for new research. For example, if one is interested in studying unemployment, statistics describing the basic situation at the time of the research can be used to show why the subject is of importance. This can be done from looking at materials already produced, such as reports on the labor market situation without any math involvement. It is when one is creating and testing theories that

statistical techniques involving formulas can be used to test hypotheses.

“Doing” quantitative methods can be broken down into three stages: defining the research problem, data collection, and data analysis. Choosing a method of research is largely determined by the research topic and the researcher’s own view on the world. Some research problems will be much better suited to quantitative methods than others; for example, it would be extremely difficult to gain a representative sample of homeless people. A survey of students’ views of the university beer provision would be more feasible as there are already established lists of students attending the university which could be used for sampling.

Quantitative data collection is usually carried out using a survey method – a structured questionnaire or interview with predetermined response categories. Carrying out such surveys and sampling techniques can be extremely cost prohibitive, both in terms of money and time. Secondary analysis using the quantitative techniques outlined here of existing survey data is a cost and time effective strategy for researchers wishing to use quantitative methods. Data archives exist in many countries where data from existing large scale surveys can be downloaded and reanalyzed by individual researchers.

Once data have been gathered and coded, statistical techniques can be used to analyze the variables. This is usually carried out using a software package such as SPSS or STATA. These packages allow basic and advanced statistical manipulation of data. Basic quantitative analysis of variables involves describing the data using frequencies (e.g., 35 percent of the sample were unemployed and of these 67 percent were male). These are descriptive statistics. The mean, median, and mode can also be used here. The standard deviation and tests of significance are used to describe the reliability and validity of the data. If the result of the analysis is significant above a certain threshold, then the findings of the research are not due to chance and the hypothesis can be seen to be proven.

Quantitative methods can go much further than this basic level. Why are people unemployed? How do they differ from others in the sample? Do they have a longstanding illness? Answering these questions can be achieved by using techniques of regression. Regression

analysis can show whether there is a relationship between a dependent variable (unemployment) and one or more independent variables (health), and how strong (or weak) that relationship is. In this way we may see that if health is poor then the risk of unemployment rises or falls by X percent.

This is a gross summary of an extremely large field. More details of these techniques and how to perform them can be found in the suggested readings.

queer theory

Chet Meeks

Queer theory is an interdisciplinary approach to the study of sexuality. Queer theory’s insights derive from multiple sources: feminist scholarship, gay and lesbian studies, cultural studies, social constructionism, deconstructionist and poststructuralist social theory. In general, queer theory takes account of the cultural products (e.g., knowledges, films, television shows), social practices (e.g., dating and marriage), and institutions (e.g., the state) which together bestow on heterosexuality a sacred status and make it into a compulsory requirement. The origins of queer theory are themselves ambiguous; while

as an academic movement queer theory is typically associated with the 1990s, its earliest articulations can be traced to the 1970s in the work of Michel Foucault (1978) and the 1980s in the work of scholars like Teresa de Lauretis (1987) and Gloria Anzaldúa (1987). As forerunners of queer theory, these scholars interrogated the way in which western social orders deploy rigid standards of gender and sexual intelligibility as a method of social regulation.

Many scholars commonly associated with queer theory have been trained in disciplines such as philosophy (Judith Butler) and English (Michael Warner), but the basic impulse of queer theory has a substantial history in social science disciplines. Before there was a distinct area of study called queer theory, sociologists criticized the conventional notion that society is divided between individuals who are, by birth, either heterosexual or homosexual, and that such a division is a constant feature of all societies across time and space (see, e.g., Weeks 1977). Contrary to this notion, social scientists have argued that "homosexuality" and "heterosexuality" are socially constructed. A social constructionist approach to sexuality argues that we must distinguish between "behaviors" and "identities." While homosexual or heterosexual behavior might be a constant throughout history and in different cultural settings, it is only in a specific historical and cultural context that something like homosexual behavior comes to be culturally codified as deviant and pathological, and where such a codification is used to ensure widespread social conformity to a heterosexual norm (MacIntosh 1968; Sagarin 1971). As well, it is only under specific social conditions that something like same sex desire becomes the focal point of personal fulfillment, community building, and politics (D'Emilio 1983).

Queer theory shares the basic impulse of the social constructionist project – to illustrate the social underpinnings of homosexual and heterosexual difference, and to critique the idea that heterosexuality and homosexuality correspond to opposite natures. Queer theory, though, also criticizes two specific problems with the social constructionist approach. First, social constructionist approaches, while they recognize that sexual identities are social in origin and not natural or culturally universal, nevertheless often assume that once sexual identities *are*

established, they exist as relatively stable empirical facts, and as valid ways of representing populations of people. Gay identity, though social in origin, and limited to a distinct time period and culture, is thought, once established, to refer fairly unproblematically to a delimited minority group. Queer theorists have argued that, although it is at times necessary and useful to refer to gays and lesbians using such an analytical lens, we must also attend to the ways differences among gays and lesbians complicate the representative and empirical validity of homosexual identity. The place of gay identity in one's life can vary dramatically, for example, depending on one's race.

Second, social constructionists, in viewing homosexual and heterosexual identities as stable, help to solidify the notion that heterosexual and homosexual worlds are separate and distinct. Heterosexuality is thought to correspond to a specific set of cultural meanings (family, romantic love, marriage, virtue), whereas homosexuality is thought to correspond to an alternative, even if positive, set of meanings (communal values, the positive affirmation of sexual pleasure, etc.). Queer theorists have argued that rather than being thought of as culturally separate, as referring to distinct worlds, communities, and meaning systems, heterosexuality and homosexuality are part of the same unstable system of cultural and linguistic signification. "Heterosexuality" and "homosexuality" do not refer to anything empirical, but rather, as signs in a language system, they refer to and derive their meaning from each other. Heterosexuality, in order to be articulated in any meaningful way, must make reference to homosexuality while also repudiating it. Consider the way heterosexual rituals such as the wedding ceremony work. During the "I now pronounce you" moment at a heterosexual wedding, homosexuality represents the unspoken, invisible, yet ever present Other which makes such a pronouncement possible (Butler 1997). The wedding, as a cultural ceremony, betrays the usual claim that heterosexuality is natural; it illustrates, on the contrary, that heterosexuality has to be continually enacted and performed. That heterosexuality can only derive its cultural intelligibility from the invocation and repudiation of homosexuality in this way means that both heterosexuality and homosexuality are inherently unstable.

Queer theory is also closely related to queer politics. Gay and lesbian minority politics focuses on gaining expanded rights and positive recognition for gays and lesbians. The underlying claim of gay and lesbian minority politics is normalizing: gays and lesbians are normal and homosexuality represents a positive, morally equivalent counterpart to heterosexuality; homosexuals are no different than other American minorities. Queer politics, emerging in the 1990s in America out of groups like AIDS Coalition to Unleash Power (Act Up), moved away from a normalizing, minority based politics and focused instead on the way a heterosexual/homosexual binary operates to make heterosexuality superior, and to exclude more ambiguous and queer forms of sexual difference that threaten both heterosexual and homosexual intelligibility (see Berlant & Freeman 1993). Queer politics is anti normalizing in that it contests not only the social dominance of heterosexuality, but also the mainstream of the gay and lesbian community, which makes a certain version of gay minority identity (white, middle class, usually male) into a representation of gay "normality." Gays and lesbians of color, transgender people, bisexuals, intersex peoples, gay people with AIDS, and working class gays and lesbians argue that this identity excludes their experiences and political priorities. Sexual justice, from this point of view, cannot be achieved simply by arguing that gays and lesbians are "normal," because this sort of political rhetoric only solidifies the outsider status of queer, different others. Queer politics is critical of the minority logic of gay identity because it is exclusionary and reproductive of the "regime of normality" that is inherent in the western compulsion to classify, evaluate, and regulate desires, pleasures, and bodies.

In recent years, two developments have begun to change the shape of queer theory. First, in addition to theorizing heterosexual dominance, some scholars have begun to extend queer theory's critical insights to new areas of social analysis and political struggle. The social subjugation of homosexuality is taken to be part of a broader system of power, control, and discipline which privileges and makes normal some types of bodies while marking other bodies as other – as deviant, abnormal, unattractive, or disabled. New endeavors in the arena of disability studies,

for example, bear the mark of queer theory. As a recent volume of *Gay and Lesbian Quarterly* (McRuer & Wilkerson 2003) makes clear, the challenge today is not so much theorizing the social machinery responsible for the subordination of homosexuals, but rather theorizing the possible coalitions between gays and lesbians and a wider variety of subjugated bodies. What sort of common politics could be forged between queers, people with HIV/AIDS, the uninsured, women, the elderly and the young, and third world victims of the first world pharmaceutical industries? All of these individuals, one could argue, occupy bodies that have been classified and then acted upon as weaker, less abled or disabled, less powerful or less attractive by a disciplinary order that makes hegemonic masculinity, strength, and virility into the most socially desirable mode of embodiment.

Second, some have argued that queer theory has been, perhaps, too overreaching in its critique of identity (see, e.g., Kirsch 2000; Green 2002). The tendency in queer theory has been, in a way, to dismiss identities due to their minoritizing, exclusionary, and normalizing consequences. Many queer theorists reduce identity to a "signifier" in a language sign system, and in doing so, contribute to the erasure of homosexual actors and limit our understanding of the way that identities come to be embedded in institutions, social roles, and daily practices. Homosexuality is more than the effect of a linguistic or textual system; it is an identity that informs the practices of individuals in their daily lives, practices that vary depending on the contingencies of different institutional settings and the complexities of other social roles. "Queer" identity is often more present in theory than in actual politics, and can be written about in ways that pay little attention to concrete institutional dynamics and lived experience. The second trend in queer theory, then, has been to move away from a metatheoretical critique of identity and toward empirically rich and concrete analyses of lived sexualities (e.g., Seidman 2002).

The future of queer theory and politics will likely consist of continued attempts to think beyond the limits of a gay and lesbian minority model of sexuality and politics, beyond the analytical foci of social constructionist approaches, and to theorize the potential coalitions with

others struggling against a variegated range of bodily and sexual norms. Alongside such work, future scholarship will likely consist of an endeavor to be more concrete, empirical, and sociological about the contribution of the social to the sexual, and about the way sexual identities come to be embedded in social institutions and roles. If the major contributors to queer theory in the 1990s were mostly literary scholars and philosophers, the future of queer theory – at least a large portion of it – belongs to sociology.

R

race

Mikaila Mariel Lemonik Arthur

To sociologists, race is a system of stratification based on physical differences (“phenotypes”) that are seen as essential and permanent. These differences may be real or they may be imagined. Though individuals can and do come to identify in racial terms, race is most important as a system of categorization which is externally imposed. The fact that race is imposed externally is the major difference between it and the concept of ethnicity.

HISTORY OF RACE AS AN IDEA

While people have always found ways to stratify and differentiate in groups from out groups, the concept of race emerged relatively recently in human history. Many historians of race believe that the concept of race emerged with modernity and was in particular the consequence of two major developments in European society: first, the development of a capitalist ethos which blamed those who did not progress for their own fate; and second, the British experience of colonizing (and “othering”) the Irish, which lay the ground for future experiences in colonization and racial hierarchies (Smedley 1999). Other analysts point to the important role of Christian religious thought in developing conceptions of race. In particular, these analysts point to the Myth of Ham, a biblical tale which tells how Noah’s son Ham and his descendants were condemned to servitude because Ham “looked upon the nakedness of” his father (McKee Evans 1980). This story was used by some Christian religious authorities to justify the enslavement of black Africans, since they were seen as the racial descendants of Ham.

With the arrival of the Enlightenment and rational scientific thought, people turned to scientific methods to seek an understanding of racial differences and to justify their conceptions of racial hierarchies. One of the first scientific projects for racial scholars was the development of comprehensive taxonomies of racial difference. First attempted by Carl Linnaeus in 1758, many European men of science followed behind with classification schemes which specified the number and variety of human races, ranging from a low of 3 (African, European, and Mongolian) to a high of over 30. It was not uncommon for racial taxonomists to divide Europeans, for example, into 4 racial groups: Nordic or northern, Alpine or central, Mediterranean or southern, and Slavic or eastern. These taxonomies were generally based on ideas of the physical, but also included some attributes which we would not today think of as biologically based, such as clothing and cultural behavior.

As the modern scientific method developed, scientists who studied human variation came to believe that it was not sufficient to label races based on classifiers’ superstitions or beliefs. Instead, they pushed for the development of scientific techniques and experiments that were carefully designed to measure the degree of racial difference and inferiority. The earliest techniques, called craniometry, involved measuring skull capacity and other dimensions of the head. However, by the late 1800s most of these techniques had been discredited or were in doubt. After the IQ test was invented in 1905, it was used to demonstrate racial difference and inferiority. IQ tests were successful at producing results that lined up with people’s expectations about race and intelligence.

While most contemporary social and biological scientists do not believe that there is any biological or genetic evidence for racial

difference, some geneticists have turned to the field of population genetics to look for patterns of genetic expression among supposed racial groups. These geneticists believe that the differences they find may be useful in medical and forensic applications. However, new evidence about the degree of mixing between people from different continents over time casts doubt on this conclusion. In fact, some researchers have suggested that as many as 80 percent or more of American blacks may have some white ancestors in their family tree.

INTERNATIONAL CONTEXT

The contemporary image of racial difference varies across national and cultural contexts. In particular, the conception of the dividing lines between racial groups is not the same everywhere. For instance, in the US, race has traditionally been perceived through the lens of the "one drop rule," meaning that anyone with any demonstrable degree of black ancestry (even so little as one 32nd of one's ancestry, and even when the individual appears phenotypically white) is seen as black. This racial ideology is related to a history in the US of cultural and legal barriers against miscegenation, or marital and sexual relationships across the color line. Though the increase in multiracial marriages and births has caused this "rule" to decline in force somewhat, as recently as 1985 the Louisiana Court of Appeals declared that Susie Guillory Phipps could not have her race on her birth certificate changed from black (or "colored") to white because she could not "prove" that fewer than one 32nd of her ancestors were black.

Not all nations and societies stick to such a rigid system of racial classification. For instance, in many Caribbean and Latin American societies there are gradations of race between black and white. Individuals' own places on these scales can vary according to class, education, and skin color, not just ancestry. In many of these countries, miscegenation was not considered to be an especially big problem. In fact, in Brazil, interracial unions were considered to contribute to a "unique Brazilian mixture" of racial backgrounds (Lesser 1999). It is important to remember, however, that mixing between races and a less rigid color line do not mean that race

is any less important in regulating the life chances of individuals (Twine 1998).

Another variation in the conception of racial difference can be found in South Africa during the time of Apartheid. South Africa's racial order was, like that of the US, predicated upon restricting the mixing of races. However, instead of declaring all of those of mixed racial backgrounds to simply be black, in South Africa a new racial category called "colored" was created to take in those who were considered to be neither black nor white (Dubow 1995).

CONSEQUENCES

Though as noted above race is not a biological reality, as W. I. Thomas said, "if people define a situation as real, it is real in its consequences." Race continues to play an important role in individuals' daily lives. According to the American Sociological Association's 2003 statement on race, the effects that it has can be classified into three major categories: sorting people into categories on the basis of which they choose appropriate family members and friends; stratifying people in terms of their access to resources; and organizing people into groups through which they seek to challenge or maintain the racial status quo.

People often take race into account when choosing whom to count as potential family members or friends. Until 1967, when the Supreme Court declared them unconstitutional in *Loving v. Virginia*, laws in some US states prevented miscegenation, or interracial marriage. Though interracial marriage is now legal and occurs with some frequency, it remains rare between blacks and whites. Similarly, when individuals or couples choose to adopt, they continue to choose children who are phenotypically similar to them. In fact, until 1978, the National Association of Black Social Workers defended the practice of refusing to place black children with white parents.

Friendships and other social interactions also continue to divide along racial lines. In large part this has to do with the continuing presence of residential and educational segregation. While it has not been legal to engage in *de jure* since the *Brown v. Board of Education* decision in 1954 or in *de jure* residential segregation since

the passage of the Fair Housing Act in 1968, schools and neighborhoods remain segregated. Schools remain segregated first and foremost because most children are assigned to public schools based on where they live. Residential segregation is more complicated. One important factor in residential segregation is the wealth disparity between blacks and whites, as discussed below. In addition, real estate brokers and mortgage lenders continue to engage in racial steering, redlining, and other discriminatory practices so as to maintain the racial “stability” of particular neighborhoods. Finally, because of both stereotypes about blacks and the reality of falling property values in neighborhoods undergoing a transition in their racial makeup, whites continue to be likely to move away as black families move in (“white flight”).

Race continues to play a significant role in dictating individuals’ life chances in terms of financial, education, and general well being. Most striking is the wealth gap between blacks and whites. The 2000 US Census data show that white families on average own almost 11 times the assets of black families. Though the disparity in income is not as significant (since income is earned by an individual, while wealth is compounded across generations), black men still earn only three quarters of what white men earn, while black women earn almost 90 percent of what white women do. Black families are also more likely than white families to live in poverty or experience unemployment.

While the picture in terms of education is more hopeful, racial disparities have not been erased. Blacks graduate from high school and start college in numbers nearly comparable to whites’. However, the gap between blacks and whites on the SATs remains at about 200 points, limiting the access of black students to the most selective colleges. And blacks remain significantly less likely than whites to graduate from college or graduate school.

There continue to be racial disparities in other areas of life as well, such as in terms of health and imprisonment. For instance, blacks continue to live fewer years than whites, have higher infant mortality rates, and have less access to good health care. Blacks are also more likely than whites to be arrested and imprisoned.

Because racial disparities have such significant affects on individuals’ lives and are so

important in sorting people into groups, many social movements have formed around racial interests. Movements like the US Civil Rights Movement and the anti Apartheid movement in South Africa were formed to create change in the racial status quo. Other social movements, such as the American Indian Movement, La Raza Unida, and Black Power, have been formed to promote solidarity among and advance the perceived interests of members of particular racial groups.

Similarly, majority group members have organized on racial lines to defend the racial status quo. These organizing activities are not limited to far right groups or extreme nationalists like the Ku Klux Klan or neo Nazis. There are also much more mainstream groups who attack affirmative action, welfare, immigration, and other social practices and policies based on the effects that these have on the privileges that whites are accustomed to exercising in society.

Organizing around race is not limited to the social movement sphere. In fact, much of conventional politics is affected by the organization of race in society. Perhaps most importantly in the American case, voting districts have often been drawn in ways that disperse or concentrate voters of a particular racial group in an attempt to alter the electoral outcomes in that region (“racial gerrymandering”). Similarly, political candidates can target racial groups through their campaign in an attempt to influence voting blocs to support them.

race and crime

Roland Chilton and Ruth Triplett

The importance of race in the production of criminal conduct has been an issue in American criminology for decades. The fact that minority groups, particularly African Americans, are disproportionately involved as offenders in the criminal justice system in the US is not in dispute. However, there is little agreement among criminologists on what this means. Some argue that the relationship between race and crime is largely the result of the conduct of African American men and boys. Others argue that the relationship between race and crime suggested by official statistics is the result of discrimination in the various systems of justice in the US.

Official arrest, incarceration, and public health data all point to a disproportionate involvement of black people, especially black men and boys, in predatory crime in the US. In 2003, the FBI's Uniform Crime Reports (UCR) indicated that blacks accounted for 37 percent of all arrests for violent crimes though blacks account for only about 13 percent of the

population. Black men are also overrepresented as victims. US public health statistics consistently show homicide is a leading cause of death for black males (Anderson 1999). In addition, the FBI's Supplementary Homicide Reports suggest that black offenders are responsible for most homicides involving black victims. Black males have been over represented in both victimization and offender figures for over 35 years.

The over representation of minorities as both offenders and victims is found in victimization surveys as well. National crime victimization surveys published by the Bureau of Justice Statistics from 1973 through 2003 have consistently shown higher victimization rates for black respondents. While the information on offenders in the victimization surveys is limited to assault, rape, and robbery, it generally suggests higher black than white or other rates of offending. Hindelang (1978) found that victimization data were generally consistent with data on arrestees and that "most of the racial disproportionality in arrest data is shown by victimization survey data to be attributable to greater involvement of blacks in rape, robbery, and assault."

National Crime Victimization Survey (NCVS) and UCR data for 1996 to 2002 provide less support for this statement than do the numbers for 1974 that were used by Hindelang. The NCVS average percentage of robbery offenders described as black for this 7 year period was 46. In the UCR data, about 55 percent of those arrested for robbery during this period were black. For rape, the NCVS figure is 23 and the UCR figure is 37. Even taking into account the absence of reports of commercial robberies in the victimization data and the failure of many victims to recall and report victimizations by family members and friends, the NCVS percentages suggest the possibility of "over arrest" of black people for these offenses.

Early self report studies suggested little difference in the number of black youths reporting involvement in criminal conduct in comparison with the number of white youths reporting such conduct. However, many of the early self report studies focused on social class rather than race, with one important study dropping all black respondents because of a belief that the black respondents lacked the verbal skills needed to complete the surveys.

In addition, early self report studies generally captured trivial offending rather than the serious predatory crimes captured by official data. However, in a review of later self report studies, Hindelang et al. (1981) found that while there was little difference by race in the proportion of youths who reported having committed trivial offenses, race differences were found for serious offenses and in the *rate* of offending. These later self report studies found that black youths were more likely to report having committed serious offenses and reported doing so at a higher rate.

In general, then, most official data and many independent studies suggest that black Americans, especially black men, are over represented as both offenders and victims. But it would be misleading to present a discussion of race and crime without noting that it has become almost traditional when discussing murder rates to say that the high homicide offending rates for black males are a function of social class. Some recent studies provide support for this position. For example, Parker and McCall (1999), using race specific independent variables for about 100 US cities, concluded that economic deprivation affects the intraracial homicide rates for whites and blacks. In a study of the impact of poverty and deprivation on black murder rates, Ousey (1999) reported black murder arrest rates that were five times as high as white murder arrest rates. Although he found that measures of poverty and deprivation had an impact on both black and white murder arrest rates, the effects of these variables were stronger for whites than for blacks.

Explanations for these differences have ranged from biological to sociological. At least one recent theory has attempted to explain the rates in purely biological terms. Although anthropologists have abandoned the notion of distinctive racial categories, Rushton (2000) suggested that the lower IQs, higher testosterone levels, and smaller cranial capacities of black people explained their high rates of criminality. This kind of biological explanation is clearly a racial theory of crime because the conduct being explained is attributed to what are called racial differences. Wilson and Herrnstein (1985) came close to presenting a racial explanation for differences in crime rates by race in their focus on intelligence as a "constitutional" cause of

crime and in their subsequent conclusion: "The one factor that both seems closely associated with offending and appears disproportionately among blacks is a low intelligence score."

Today, however, most people trying to explain the differences in black and white arrest and incarceration rates focus on social, cultural, economic, or political factors. For these theorists, patterns of homicide rates by race suggest that the rates are primarily linked to exclusion and segregation – economic, racial, and ethnic – but especially to the separation and isolation of large segments of urban populations based on income and assets. This view is supported in part by a number of city level analyses, such as Peterson and Krivo's (1993) analysis of homicide victimization rates for 125 US cities, which found that black homicide victimizations were linked to racial segregation.

One recent explanation which takes an Afrocentric approach focuses on the historical role of slavery in the US as a cause of high black crime rates. King (1997) argues that much of the violence today must be seen as an indirect result of enslavement and violence directed against African slaves combined with the impact of a violently discriminatory system of justice. He sees the net effect of this history accompanied by limited opportunity and mass media images that undermine appropriate value systems as the cause of high rates of violent conduct by black male teenagers and adults.

Other theorists focus more specifically on the cultural impact of isolation, while still others focus on the social structure. Ousey (1999) suggests that extensive and long term disadvantage may have produced cultural and normative adaptations that have produced this gap in the rates. Anderson (1999) argues there exists a "code of the streets" in largely poor, inner city black neighborhoods. The code is a set of informal rules for interpersonal behavior that describe when violence is acceptable. He argues that the code is a cultural adaptation that developed from alienation from mainstream society and the belief that the police and the criminal justice system cannot protect them from others.

Recently, Sampson and Wilson (1990) paid careful attention to both cultural and structural effects of segregation by race and class. They note the existence of neighborhoods highly segregated by race, class, and level of family disruption,

isolated from mainstream culture. They argued neighborhood characteristics were the result of policies of racial segregation, structural economic transformation, black male joblessness, class linked out migration, and housing discrimination and suggested that the result of the segregation and isolation was structural and cultural disorganization.

Not every criminologist believes that the differences by race found in official data are the result of real differences in behavior. These criminologists tend to argue that the numbers reflect the racial bias of those operating the system of justice. Historically, racial bias in some state systems of justice was clear and obvious. The law itself was biased. Examples include the use of the legal system to take American Indian lands, the creation and use of opium laws in response to Asian immigration, and the use of Jim Crow laws to disadvantage African Americans. Many scholars see the sharply higher punishment for the possession of crack cocaine in comparison with the punishment for possession of cocaine in its powder form as a recent example of discriminatory law. Although it would be hard to show discriminatory intent, the impact of this legislation has been hardest on poor, inner city, African Americans.

Although official definitions of crime are legislative, crime is also defined by administrative policies and enforcement practices. The police, for example, have wide discretion in decisions to arrest. Given the history of race relations in the US, it would be surprising to find that race does not play a role in some decisions to arrest. In a review of race and police discretion, Walker et al. (2000) found a number of explanations for the disproportionate arrest of black Americans, only one of which was that they commit more crime. They found research suggesting that situational factors, especially the type of crime committed and the attitude of the suspect, played an important role in decisions to arrest. They also found reports suggesting that African Americans commit more serious crimes and are more likely to have a disrespectful attitude toward the police, both of which are factors found to shape the arrest decision. Other studies in their review suggested that African Americans are often arrested on less stringent evidence than whites.

Reviews of court studies prior to the 1960s for sentencing disparity by race since suggest the

evidence is inconsistent. Today, researchers in this area examine context, asking "When does race matter?" In their review of this literature, Walker et al. (2000) suggest there is evidence that race matters when the crime is less serious, when the victim is white and the accused is not, and when the accused is unemployed. In a recent example of researchers examining the context in which race matters, Steen et al. (2005) found that it is important to examine the factors that may indicate dangerousness and blameworthiness among felony drug offenders. They found that both black and white offenders who fit the criteria for "most threatening" were likely to be incarcerated. However, whites who fit the "less threatening" criteria were less likely to be incarcerated than African Americans who fit the same description. Their research suggests both a need to examine context and that most incidents of bias are found among less serious cases.

The ways and extent in which race is linked to specific criminal conduct remain unresolved issues in criminology. There is a strong indication that the relationship is different for serious and minor offenses and for predatory and non-predatory offenses. Young black males may be "over arrested" for minor offenses and offenses involving drug possession or sale. And a disproportionate number of young black males may be involved in murders, rapes, robberies, and other forms of predatory crime. However, in the light of the sad history of race relations in the US it is hard to identify the reasons for the differences in any of these arrest and offending rates. Nevertheless, careful and sustained studies of questions about the linkages of race and crime are long overdue. As in many areas of criminology, there is no shortage of theory, assertion, and speculation. But there is a serious shortage of well focused, dependable research on the relationship of race and crime.

race and the criminal justice system

Laurie Samuel

The criminal justice system is a system of social control designed to regulate the behavior of citizens. Through the creation and enforcement of the law, it defines what behavior is and is not

acceptable. The criminal justice system is made up of several components, which include the police, courts, corrections, probation, and parole. Lawmakers guide the movements of these units and define those behaviors considered criminal. The process begins, however, with the police, who detect lawbreakers and arrest them. The process then moves to prosecution where arrestees are formally charged. Once a charge has been determined, arrestees may or may not go to court for a formal trial. In those cases where there is not a formal trial, offenders may admit guilt. Once guilt is established, the offender is either sentenced to a period of incarceration or may be given a sentence of probation, community service, or ordered to pay restitution to his or her victim(s). These less serious forms of punishment are usually reserved for first time non serious offenses and sometimes for juveniles. Though mechanisms exist for the structuring of discretion, the existence of discretion means that at each stage in the processing of individuals through the criminal justice system, the possibility for disparity in treatment exists. For example, decisions by the police on lawbreakers are sometimes based on personal biases and stereotypes. Researchers have long been interested in the factors that shape discretion. Race is a critical part of the discussion of factors that shape discretion as many of the decisions made by police, prosecutors, and judges are based on this factor.

Race is a socially constructed term designed to categorize groups of people based on certain physical qualities. The problem with the existence of varying socially constructed racial categories is that they are often accompanied by stereotypes. When one thinks of the color white, for example, one thinks about goodness and purity. On the other hand, the color black is often associated with things that are dark, predatory, and negative. Due to the enormous power of the media, these stereotypes are foremost in our minds and often taken as facts. Crime, then, is often linked with blacks and other minorities. Any discussion of race within the criminal justice system must acknowledge these biases.

The criminal justice system is responsible for detecting criminals and meting out punishment when crimes are committed. The term "justice," however, can be somewhat misleading as it implies a sense of fairness. When the

system is applied unevenly, it negates the justice it claims to protect. Thus the same system that is supposed to restore order manifests itself as a dysfunctional entity needing reform. Over the last 20 years notable criminologists such as Coramae Richey Mann, Jeffery Reiman, and Michael Tonry have analyzed the historical relationship between race and the criminal justice system. They have found, for example, that throughout time blacks are routinely arrested, convicted, and incarcerated at rates far higher than their representative numbers in the general population. At no other time has this been more pronounced than with the enacting of stringent drug policies in the 1980s, often referred to as the "war on drugs." Aimed at reducing drug use, these policies imposed mandatory minimums for the possession of certain drugs. These guidelines, however, impose stiffer penalties for the possession of crack cocaine than for powder cocaine. Whether this was a purposeful move on the part of lawmakers to incarcerate a large number of the black community is debated, but the fact remains that crack cocaine is most likely sold by blacks and powder cocaine by whites. Furthermore, the visibility of black drug dealers who sold their product out in the open streets of disorganized neighborhoods made it very easy for them to be detected and arrested. White users and dealers, on the other hand, usually come from middle class neighborhoods and therefore their behaviors are confined indoors.

Not only have these drug laws contributed to the increasing arrest rates of minorities, but also, unlike their white counterparts, minorities often lack the financial resources to secure superior legal representation and must therefore settle for a court appointed public defender. Public defenders normally have large caseloads, leaving them little time to devote adequate attention these cases often need. Given these disadvantages, minorities are more likely to be denied bail and detained. Today, black men are being arrested, convicted, and sentenced at rates far greater than their white counterparts (Reiman 2001). The result has been a "warehousing" of minorities.

The discriminatory treatment of minorities is only part of the story, however. It is not only that minorities are treated more harshly, but also that the crimes of the majority are often

ignored. In his well known book *The Rich Get Richer and the Poor Get Prison*, Jeffrey Reiman (2001) provides a convincing and compelling argument that criminal justice officials overemphasize street crime, although many of the actions and behaviors of the ruling class cause far more widespread damage and impact. Corporate and white collar crime, the crimes most likely to be committed by the ruling class, cause overwhelming financial and human cost to society. For example, white collar crime has been estimated to cost the United States approximately \$388 billion a year. However, one rarely hears about the fraud, death, and environmental destruction caused by large corporations. It is through the combined processes of the criminal justice system, which overemphasize the street crimes of minorities and ignore the white collar crimes of the ruling class, that myths about race and crime are promulgated in society.

The issue of the differential treatment of minorities by the criminal justice system has become all the more important because of recent evidence regarding the level of crime relative to the use of imprisonment. Recently, criminologists have demonstrated that crime rates (particularly violent crime) have been steadily declining over the last few years (Tonry 1995; Reiman 2001), yet formal interventions (i.e., punishment) are increasing. For example, in 1993 the rate of violent crime was 747.1 per 100,000 and the rate of imprisonment was 359 per 100,000. In 2001, the violent crime rate dropped to 504.5 but the rate of imprisonment rose to 470. Punishment is not increasing equally for everyone, however. Whites represented 60 percent of violent crime arrests in 2001 whereas blacks accounted for approximately 37 percent. When violent crime arrests are compared to incarceration rates, blacks are clearly disproportionately imprisoned. Whites were incarcerated at a rate of 138 per 100,000 in comparison to 703 per 100,000 for blacks.

Over the years, politicians have created law and order platforms rooted in the menacing figure of crime. This get tough approach plays on citizens' fear of crime and racial minorities have been typecast in the role of the criminal. Skin color is a paramount issue within the criminal justice system. For example, at every criminal justice system stage from arrest

through incarceration, "blacks are present in numbers greatly out of proportion to their presence in the general population" (Tonry 1995: 49). Even with the decline in crime rates, blacks are "seven times more likely" to be incarcerated than whites (Tonry 1995). There is an overemphasis on blacks as perpetrators of violent crime in the criminal justice literature. African Americans and other minorities thus are stereotyped as violent, which excludes other groups from the discussion.

It has been argued that the study of race and the criminal justice system suffers from faulty, slanted research designs and poor operationalization. Much of the literature uses official records, which include arrest and incarceration rates, to measure crime. Official records may paint a false picture, often revealing more about police and criminal justice system practices than criminal behavior. For example, they do not tell us about people who are committing crimes but are not getting caught. The aggressive nature of police toward minorities contributes to overstating their involvement in crime. Therefore, other techniques such as self reports (interviews and questionnaires) should be used to fill in the blanks left by official records.

Researchers in this area are interested in documenting not only the existence of discriminatory treatment but its effect as well. They argue convincingly that the effect of discrimination by the criminal justice system goes beyond the effect on the individual. According to Hagan and Coleman (2001), war on drugs crime policies from the 1980s aimed at controlling the crack epidemic have negatively impacted the inner city black community. The war on drugs has caused an alarming rate of imprisonment among young black males and has had dramatic and devastating effects on the African American family. In addition to racism, discrimination, and lack of opportunity, these policies have worsened an already desperate and bleak situation. The criminal act should be put in context of the cultural and structural factors affecting the offender and the response to the offender as criminal is "a reflection of something larger and deeper" (Radosh 2002: 300). This approach has alienated, ostracized, and further pushed minorities to the bottom of the barrel and has made it exceedingly more difficult for them to claw

their way back to a status that often still is inferior to the dominant class.

In 1904, African American sociologist W. E. B. Du Bois declared that "Negroes came to look upon courts as instruments of injustice and oppression and upon those convicted in them as martyrs and victims." Although these words were penned over 100 years ago, they are just as meaningful in the twenty first century as the criminal justice system is a site of racism and oppression for racial minorities. Inequalities are now subtler, but disparities still exist. The criminal justice system was created to establish law and order and to ensure the proper functioning of society. Over time, however, it has become a system of power that serves the interest of the dominant class. While crime rates are decreasing across the nation, rates of incarceration for blacks and other racial minorities are increasing. It is vital that practitioners, scholars, and politicians alike further address the nexus between race and the criminal justice system and devise alternatives that ensure equity, fairness, and survival.

race and ethnic consciousness

Steven J. Gold

Race and ethnic consciousness refers to the awareness of membership in a racial or ethnic group by both group members and the larger society in which they reside. The concept embodies both popular and social scientific understandings of classification and membership. Popular perceptions often attribute race and ethnicity to biological origins. In contrast, social scientists insist that these categories are the consequence of a social construction process. Despite the social basis of race and ethnicity, social scientists acknowledge that they are real in their consequences. Race and ethnicity shape social stratification, underlie individual and group identities, determine patterns of social conflict, and condition life chances. In fact, so important is the notion of consciousness to the comprehension of race that eminent scholar George Fredrickson defines race as "*consciousness of status and identity based on ancestry and color*" (1988: 3; emphasis added).

Fredrickson traces the concern with race and ethnic consciousness to the 1970s debate between neo Marxists and Weberians on the origins of American racism. Prior to that time, racism was interpreted in light of psychological constructs including ignorance, prejudice, and the projection of hostility onto low status groups. Rejecting the causal importance of these factors, Marxist scholars like Eugene Genovese emphasized the economic benefits acquired by slave owners in exploiting African origin people. They contended that anti black ideologies were determined by the relations of production, and reflected the class consciousness of slave owners who imposed these outlooks on non slave owning white workers. While admitting the importance of class in racial inequality, Fredrickson and colleagues countered Marxist contentions about the economic basis of racism by reviving a polemic first made in the 1940s by W. E. B. Du Bois. They cited the many ways that poor whites, who had little economic interest in exploiting the labor of African Americans, were nevertheless passionate white supremacists. Race and ethnicity were meaningful determinants of social differentiation in their own right. Paraphrasing Marx, Fredrickson utilized the term *race consciousness* as an alternative to class based identities in shaping identification and solidarity.

Research by Van Ausdale and Feagin reveals the primacy of race consciousness in constructing identity by demonstrating that children as young as 3 years are well aware of racial and ethnic classification and deploy invidious distinctions based upon their comprehension thereof.

Much sociological knowledge about the nature and functioning of race and ethnic relations is rooted in the analysis of the highly structured situation of the American South prior to the Civil Rights Movement. However, recent research conducted within the highly diverse, multicultural, and globalized contemporary social environments, wherein migrants account for a significant fraction of the local population and explicitly racist statements are taboo, yields a much more intricate and varied array of racial and ethnic situations than in an earlier time. While race and ethnic consciousness remains a powerful force in such contexts, its codification is much more complex. As Winant,

Bonilla Silva, and others argue in their theories of racialization, racism has multiple bases, impacts groups in different ways, and changes according to time, place, class, and gender (Bonilla Silva 2001: 41).

Migration has the potential to radically transform the prisms and boundaries through which race consciousness is formulated. Accordingly, systems of racial and ethnic classification and consciousness defy general principles and must be studied at the local level. For example, a growing literature on African origin immigrants in North America shows that despite the pervasive, phenotypically based ideology of racism that exists in the US, dark skinned newcomers often reject the US system of racial classification and use language, social practices, and selective patterns of social interaction to exempt themselves from it.

In a large body of research on the children of immigrants in California and Florida, Portes and Rumbaut found that the more assimilated immigrant youth are, the less likely they are to call themselves American and the more likely they are to identify with their country of origin. As such, their self proclaimed foreignness is "made in the USA" (Portes & Rumbaut 2001: 188). In contrast, the children of immigrants in the United Kingdom downplay national identities and instead emphasize their parents' religion, preferring to be classified as Hindus, Muslims, or Sikhs in their interactions with the native British, even if they do not practice their faiths any more assiduously than most British people practice Christianity (Banton 1997: 121).

In multi ethnic societies, groups come to be seen, and to see themselves, as members of broadly inclusive pan ethnic categories that were unknown in the country of origin. People who had thought of themselves as members of families, regions, religious groups, or nationalities learn to identify with labels such as Asians, Latinos, or Ukes (short for Ukrainians, this term denotes various Eastern European groups in Ontario) in the host society. Such categories can be influenced by language, class position, neighborhood, popular music taste, gender ideologies, and patterns of consumption.

Despite the merging of groups with common regional origins or phenotype into a single category, awareness of difference remains. The

greatest rivalries sometimes occur among populations that the larger society believes to be members of the same race or ethnicity. In New York City, West Indians report conflicts with Haitians and African Americans, while South Americans collide with Dominicans and Puerto Ricans (Kasinitz et al. 2004).

In his study of white identity in black majority Detroit, John Hartigan found that working class whites attribute the declining quality of life in their neighborhoods not to African Americans – as popular stereotypes about urban whites might suggest – but rather to the racialized category of "hillbillies," relative newcomers who entered the Motor City from Appalachia in search of industrial jobs. Finally, some groups with a strong minority identity, such as Jews from the former Soviet Union, who arrive in the US and Canada are surprised to find themselves regarded as members of the white majority, albeit with a foreign accent.

Sociologists Jennifer Lee and Frank Bean have explored the changing nature of the color line in the US as the country incorporates a growing mixed race population and numerous immigrants who are neither black nor white. The authors review theories and data that suggest that increasing racial and ethnic diversity will make American society either less concerned with such distinctions (yielding a color blind society) or will result in a shift of the color line. Citing low rates of residential segregation and high rates of intermarriage between Asians and Latinos and native whites, as compared to lower rates of black–white interaction, the authors conclude that a new color line that sets off blacks from all others may be coming into existence, leaving African Americans in disadvantaged positions that are not qualitatively different from those perpetuated by the traditional black–white divide.

Since the 1960s, social scientists have increasingly understood race and ethnic consciousness as the basis for the evaluation of group status and the concomitant formation of collective action. Herbert Blumer's theory of race relations as a sense of group position contended that this feeling was critical to the relations between the dominant and the subordinate groups in society. It provided the dominant group with its perceptions, values, sensitivities, and emotions (Blumer 1999 [1958]: 101). More recent

scholarship sees group position as applying to subordinate as well as dominant groups.

Theorists concerned with ethnic mobilization, ethnic economies, and social capital assert that shared notions of ethnic and racial membership underlie forms of trust, political and economic cooperation, and mobilization. In their pivotal work on social capital, Portes and colleagues identify mutual racial or ethnic consciousness as fostering the achievement of common goals. Among these are raising investment capital, encouraging academic achievement, fostering political activism, and stimulating self help philanthropy. At the same time, however, they remind us that social capital can have a downside, such that members of an ethnic or racial group will sometimes disdain assimilation, achievement, and upward mobility as violating group norms. Those engaging in sanctioned behaviors will be seen as disloyal and barred from accessing group based resources.

Race and ethnic consciousness is strongest in societies where populations are clearly divided and scarce and valued resources are unequally distributed on the basis of highly visible racial or ethnic characteristics. Often, the process is initiated as an elite group – such as white slave owners in the antebellum South – unites to dominate a minority population – Africans – using state power to legitimate the social and economic structures that underlie inequality. This, in turn, heightens the consciousness of the oppressed group, leading to conflict.

From the 1960s until the 1990s, several states undertook policies to reduce race and ethnic consciousness and, hopefully, dampen the associated resentment and conflict. This frequently involved the engagement of two pronged policies that encouraged assimilation and minimized racial, ethnic, and gender differences in the distribution of jobs, education, and other social goods, while simultaneously fostering group consciousness through affirmative action and the implementation of multicultural programs that advanced the maintenance of language, identity, political incorporation, and religious practice. Michael Banton (1997: 65) offers an interpretation of this apparent paradox, asserting that individual goal seeking reduces group consciousness and promotes assimilation, but certain goals (like public goods) can be attained only by collective action.

However, following the downfall of the Soviet Union in 1990, which resulted in the obsolescence of state socialism (a major alternative to ethnic and racial bases of identity), the outbreak of terrible ethnic conflicts in the Balkan region, and the events of September 11, 2001 a decade later, many states became much more cynical about their ability to manage the negative manifestations of race and ethnic consciousness through tolerance and moderate state support. Instead, majoritarian movements from the US and the Netherlands to Zimbabwe and Iran asserted that major social conflicts are best resolved by privileging an idealized version of these states' cultural, religious, racial, and national roots, while restricting immigration and making few concessions on behalf of the cultural dispositions of religious, ethnic, and racial minorities.

In her provocatively titled book *World on Fire* (2003), legal scholar Amy Chua argued that, at least for the short term, the correlates of western modernization – the expansion of free markets plus democratization – will amplify rather than reduce ethnic conflict. This happens because under economic liberalization, the enhanced affluence of ethnically distinct minorities contrasts dramatically with the dire circumstances typically encountered by the local majority. As a result, entrepreneurial “outsiders” including South Asians in Fiji, Chinese in Malaysia, Jewish “oligarchs” in Russia, and whites in Zimbabwe and Bolivia have been subject to the vengeance of impoverished but politically empowered majorities. Consciousness of the differences between haves and have nots activates retribution and may provoke the exit of highly visible targets.

Given the multiform nature of ethnic and racial identities in a globalized world marked by economic transformations, transnational ties, border crossing social and religious movements, and increasing access to communication and travel, it appears likely that forms of ethnic and race consciousness will continue to be both complex and volatile social forces in the coming years.

race and ethnic etiquette

Charles Jarmon

Forms of etiquette exist in nearly every society where different racial and ethnic groups are separated by extreme differences in economic wealth, political power, or social status. They

are most developed in caste or caste like societies, in which the lower status racial or ethnic groups are enslaved or belong to economically exploited or subjugated groups. In these situations the patterns of etiquette regulate interpersonal relations between the higher and lower status groups, functioning as codes of behavior designed to maintain the status quo (or a state of harmony within it) within which the more privileged groups benefit. Sociologists and other social scientists have studied the emergence, practice, and impact of these codes on population groups in countries around the world, including the US, India, Brazil, South Africa, Spain, Germany, Australia, and the countries of the circum Caribbean (Dubois 1899; Reuter 1927; Park 1928; Doyle 1937; Myrdal 1944; Cox 1948; Frazier 1957; Sowell 1983; Bell 1992; Marable 2005). In any given society, the unique complexity and changes in the codes must be understood in terms of its own history and the currents of broad social and cultural change affecting it both from within and without.

Blacks have lived in the US for nearly 400 years, and for most of this period were enslaved. When freed after the Civil War the approximately half million freemen were unprepared educationally and economically to compete in a society still inclined to continue their subjection. The majority remained in the South, living in small towns or on farms as tenants along the rural black belt. They were forcefully united, to use a term from van den Berghe (1967), into an “exploitative symbiosis.” Others migrated to the ghettos of Northern cities. This is the historical context from which broad patterns of racial and ethnic etiquette developed. This relationship appeared to have been more important after slavery, reflecting a state in which blacks had to struggle against economic dependency and subservience. Because it fostered mutually restricted associations on personal and professional levels between blacks and whites, the racial etiquette prevented free communication between the groups and so created an illusionary world within which both claimed to understand one another, despite their different interests and expectations within the status quo. Thus, sometimes, when protests over adverse circumstances disrupted the peaceful environment in the community, leading white citizens would often

express their amazement. For many of them, blacks on their own would naturally not feel offended by not having the privilege to vote, to sit on local councils, to be able to run for political office, to be treated equally in social intercourse and in places of public accommodation, or to have their stories told in the local newspaper in a dignified manner. Outside the exceptional personal relationships, some of which are well documented in the literature, etiquette prevented discussion of such matters.

Whatever friendliness blacks possessed towards whites, and vice versa, was constrained by deeply institutionalized codes. Again, exceptions existed. Certain relations were taboo (e.g., dating and marriage) and these taboos were enshrined in ideology and protected by custom and law. This is clearly evident in their development in the Southern slave states as well as in the apartheid system of South Africa, which in many instances began on egalitarian terms between Native Americans and Europeans in the former, and between Africans and Europeans in the latter. The doctrine of racial supremacy provided the white slave owners in the US with a rationalization for enslaving Africans, after the experiment failed with Native Americans. In post Reconstruction America, it provided a basis for perpetuating a legal system of discrimination against the freed African Americans.

Major court decisions before and after the period of slavery established in law the anti-democratic practices that inveighed against the humanity of the slave and ex slave. The role played by custom, as a basis for regulating and controlling black-white relations, centered on how the two groups got along together under the circumstances of both situations – slavery and legal and *de facto* segregation – in that they were often forced, out of economic necessity, to live and work in close physical proximity, but socially isolated one from the other. Just as the formal legal decisions were established to repress blacks and to keep them submissive, the patterns of etiquette emerged as an informal system to keep them in their place; they were embodied in the rituals and ceremonials of everyday life and reflected the accommodation between blacks and whites.

If one had grown up in a Southern city during the 1940s and 1950s, one would have witnessed the patterns of etiquette practiced in enforced

segregated churches, schools, workplaces, homes, and on buses and trains; the proscriptions against personal relationships and sexual unions and marriage; the submissive and deferential manners of contact in public places; and in the injustice rendered by the legal system. The institution of the patterns of etiquette fundamentally derived from the strategies of the ruling class of whites to maintain the economic and political dependency of blacks, and they were prepared to invoke the force of the law or to resort to extra legal means to punish violators.

The patterns of deference symbolized in much of the behavior of blacks towards whites depended on the nature of the relation involved. For example, black males interacted deferentially with white males and avoided close personal contact with white women (this latter patterned behavior is denoted in the 1955 case in Mississippi involving the murder of Emmett Till, who allegedly whistled at a white woman); white males avoided working under black male supervisors, but would pursue personal relations with black women; and black and white children played together until the age of puberty, but avoided one another as adults. Black communities, however, developed ways of mitigating such experiences, one of which was by developing parallel social systems apart from those established by whites. These were found in black churches, schools, lodges, dance halls, music, art, literature, and humor. However, this does not represent the totality of the reaction of blacks to the codes supporting slavery and discrimination. Many rebelled in slavery by escaping with the Underground Railroad and emigrating to the North as far as Canada, with many joining the abolitionist movement against the system of slavery; others refused to remain in the country and escaped to Haiti; and many died in failed insurrections protesting against the dehumanizing system. Much of the scholarly literature on the subject of etiquette has generally focused narrowly on the psychological trauma, or on adaptive ways to prevent it, through examining the various forms of accommodation by blacks in subservient positions in the black-white relationship (Johnson 1943; Aikiss 1944; Frazier 1957; Grier & Cobbs 1968). There are notable exceptions to this approach (Morris 1986; Scott 1997). The popular media tended to highlight stereotypes depicting the

acceptance by blacks of their position in the system. Neither has devoted sufficient attention to their protests and struggles against living under such debasing conditions.

In the US today the traditional patterns of etiquette are breaking down in the wake of enormous changes, including the urbanization of blacks; the *Brown vs. Board of Education* desegregation case; the Civil Rights and Black Power movements; the social reorganization of workplaces, where many blacks perform similar work as whites and interact with them as peers; and in other public places, where, through daily association, different attitudes and perceptions have helped to redefine black-white relationships. The new generation of African Americans has not learned the old patterns of deferential behavior and the younger generation of whites do not expect it. We are observing similar patterns of change associated with recent protest movements in such countries as Brazil and France. In the broadest sense, this suggests that the traditional patterns of etiquette, as means of social control, have lost social and political legitimacy. Sociologists must develop new conceptual approaches to explain a different set of circumstances in racial and ethnic relations.

race and ethnic politics

Mario L. Small

The sociology of race and ethnic politics examines the impact of political factors on the status of racial and ethnic minorities, and the impact of ethnicity and race on politics and public policy. The field has investigated political movements, voting rights, immigration laws, internal migration patterns, the judicial system, citizenship, and, recently, ethnic identity.

Throughout American history the struggle over the political rights of racial and ethnic minorities has been intertwined with the nation's economic and demographic growth, and neither can be understood without the other. Through the nineteenth century, legal slavery guaranteed the US a large, unpaid labor force that established the country's economic superiority. In the nineteenth, twentieth, and twenty-first centuries this economic strength has been sustained by large waves of low-skilled immigrants accepting very low wages for hard labor, from building railroads and canals, to fitting pipes and erecting steel and concrete buildings, to

gardening, caring for children of middle class families, cleaning toilets in hotels and office buildings, and washing dishes and delivering meals in restaurants. As the country has shifted from an agricultural, to a manufacturing, to a service economy, the labor of ethnic minorities has been central at every turn. Many of the political conflicts of the nation have emerged as these ethnic and racial minorities demand equal protection under the law and equal political participation.

NINETEENTH CENTURY FOUNDATIONS

After the Emancipation Proclamation of 1863 the presence of free African Americans threatened the political and economic superiority of white Southerners. The end of Reconstruction brought the beginning of the Jim Crow era, as disgruntled white Southerners sought to retain the separation between blacks and whites. State legislatures throughout the South enacted laws requiring racial segregation in public facilities such as restaurants, theaters, and buses. Legal and illegal methods were employed to keep blacks from voting, such as the poll tax and the imposition of literacy requirements for a population that had been legally denied education for centuries. This era also saw the emergence of the Ku Klux Klan, a clandestine political white supremacist group that, through public lynching, fire bombing, cross burning, and death threats, terrorized the black population. The result was a widespread disenfranchisement of African Americans.

During this period the rest of the country was in the midst of a major industrial expansion, spurred by technological innovation and fed by the western expansion. Immigrants from Asia and Europe flocked to the country for work in the railroads and other industries and to search for higher incomes. Soon, anti Chinese sentiment throughout the country, and especially in California, grew to the point of motivating legislative action. The Chinese Exclusion Act of 1882 suspended immigration of Chinese laborers for 10 years, and later, in 1904, suspended it indefinitely. This was the first major law to restrict immigration on a large scale. It also targeted a single ethnic group, not only

restricting immigration but also establishing ineligibility for naturalization.

By the turn of the century it was clear to sociologist and essayist W. E. B. Du Bois (2003) that "the problem of the twentieth century" would be "the problem of the color line." Du Bois was referring to conflicts between people of all ethnic backgrounds, whom he saw in a persisting conflict over political and economic rights as the country faced unprecedented levels of racial and ethnic diversity. These conflicts inevitably involved questions of immigration and citizenship, which were often inextricably linked with questions of race.

By the 1920s the racial anxieties of the country were codified into law. The Immigration Act of 1924 restricted immigration based on national quotas aimed explicitly at maintaining a racial balance tilted toward whites of Western European heritage. The Act restricted the number of immigrants each year, favored immigrants from Western Europe, limited the number of immigrants from Eastern and Southern Europe and from Africa, and barred immigrants from Asia. Germany, for example, had a quota of more than 50,000 immigrants a year; Greece, 100 immigrants; the entire African continent (excluding Egypt), 100.

While Du Bois's predictions about inter racial political conflict had proven increasingly accurate, his greatest concern as a sociological researcher was the status of African Americans. His theory about the conditions of African Americans was both a framework for understanding the present and a prescription for improving their future. For Du Bois, political disenfranchisement of blacks and their economic deprivation went hand in hand. Blacks who were segregated were unable to use the political system to secure the resources required for their education and economic development. In this, he famously disagreed with Booker T. Washington, former slave turned educator, who believed that the best way for blacks in the South to overcome poverty and destitution was to ignore the question of racial segregation and focus on self education and building their own institutions from the ground up. Du Bois argued that resisting segregation and fighting for their political rights were indispensable; for him, economic development without political incorporation was impossible.

THE TWENTIETH CENTURY

The combination of the South's dwindling sharecropping economy, segregation, institutional discrimination, and political disenfranchisement prompted many African Americans to begin to look north for greater opportunities. The industrial expansion of Northern cities began to look extremely attractive to a population that had always been concentrated in the South. This was especially true given that factories, now significantly deprived of low wage immigrant labor, clamored for laborers. The first half of the twentieth century saw the Great Migration of blacks to the industrial centers of the Northeast and Midwest, to cities such as Chicago, New York, Detroit, Philadelphia, and St. Louis. This decades long migration produced high concentrations of African Americans in the inner cities of the North.

It also laid the foundation for the most significant moment in race and ethnic politics in the US of the twentieth century, the Civil Rights Movement. This movement was the largest and most sustained civil rights collective mobilization in the nation's history, aimed at eliminating legal segregation and enforcing the constitutional rights that guaranteed equal political participation. The movement took many forms, including collective protest in the form of sit ins, boycotts, lawsuits, and non violent civil disobedience, which often resulted in violent repression by the state.

Several key events marked the successes of the movement. Racial segregation had been upheld by the Supreme Court in *Plessy v. Ferguson* (1896), which held that "separate but equal" facilities for members of different races were constitutionally acceptable. After a series of challenges by lawyers from the National Association for the Advancement of Colored People, the Supreme Court in *Brown v. Board of Education* (1954) ruled that separate educational facilities were inherently unequal. Segregation suffered an additional blow with the passing of the Civil Rights Act of 1964, which outlawed discrimination in hotels, restaurants, theaters, and other public accommodations, or segregation on the basis of race, color, religion, or national origin. Finally, the Voting Rights Act of 1965 enforced the guarantees of the 15th Amendment that no person shall be denied a

vote because of race or color, outlawing Jim Crow disenfranchisement tactics such as literacy requirements for voting.

That year also saw the passage of a law that radically altered the nation's approach to immigration. The Immigration Act of 1965 eliminated the quota system in place since the 1920s, such that the main factor in determining selection for admission was occupation. In addition, a central clause in the Act gave preference to those who had family in the US. This clause precipitated the large wave of immigration of Latin Americans, Asians, West Indians, and others, which continues today.

RACE, CLASS, AND POLITICS

The 1960s were pivotal. According to Wilson (1987), the Civil Rights Movement and Affirmative Action policies had succeeded in opening opportunities for African Americans during the 1970s and 1980s. The most resourceful African Americans were able to attend better educational institutions, work at better jobs, earn higher salaries, and move to the suburbs. In effect, the Civil Rights Movement contributed to the creation of a large African American middle class.

However, this growth also left a concentration of poor, low skilled blacks in segregated inner cities. Many of the African Americans who first migrated to the Northern cities had found work in manufacturing industries, such as car companies. By mid century, the large employers in the manufacturing sector had started to move to the suburbs in search of cheaper land and greater profits. The cities had begun major shifts from manufacturing based economies to service based ones, developing high concentrations of low skilled blacks unable to find work. Limited occupational opportunities, increasing crime and incarceration, and financially strapped school systems reliant on a weaker tax base only worsened the prospects for this group. Wilson called this group the underclass.

Scholars debated the relative significance of race and class extensively. Wilson argued that economic factors, demographic shifts, and the political success of the Civil Rights Movement led to the creation of an underclass. However,

Massey and Denton (1993) argued that this theory, based on the political economy, ignored the impact of persistent racial discrimination and residential segregation. They argued that by focusing on class, Wilson had ignored the persisting significance of race. Discrimination by lenders, steering practices by real estate agents, legal covenants restricting home sales to minorities, and poor enforcement of anti discrimination legislation made it difficult for blacks to find homes in neighborhoods with good schools and low crime rates. In fact, they argued, despite the important political gains of the Civil Rights Movement, segregation has persisted over the last half of the twentieth century.

Despite their disagreements, theorists of both political economy and residential segregation agreed that without intervention the problems of the underclass were likely to perpetuate themselves. So did lawmakers. The last decades of the twentieth century saw determined efforts by both conservatives and liberals to address inner city poverty, and especially to reform the welfare system. Though these arguments were about public policy and the status of the poor, they were couched in explicitly political and racial terms, as images such as the "welfare queen" were used to discredit the welfare system. Conservatives tended to argue that the inner city poor remained in this condition due to a weakened value system and absence of work ethic, or because the welfare system discouraged work. Liberals tended to argue that racial discrimination and poor labor market prospects were at fault. This debate culminated in the Personal Responsibility and Work Opportunity Act (PRWORA) of 1996, which toughened eligibility requirements. Women with children seeking government or welfare aid faced time limits and work requirements in order to receive assistance.

PRWORA, riding the most recent wave of anti immigrant sentiment, also denied public assistance to legal immigrants, who were now in a position of paying taxes to support government benefits for which they were not eligible. Later laws allowed limited assistance to immigrants who had entered the country before 1996. Anti immigrant sentiment persisted through the end of the twentieth century. In California,

voters in 1994 approved Proposition 187, which denied education and medical attention to undocumented immigrants, though the measure was later deemed unconstitutional.

This period also brought about the rapid growth of identity politics and a heightened discourse around immigrants, ethnic minorities, and national identity. On college campuses this was evident in the proliferation and growth of ethnic studies programs, modeled on the black studies programs started in the 1960s. Debates over the definition of an American, and over the identity of immigrants, and their children, have been ubiquitous in the media, books, theater, and the arts. Individuals increasingly claim more than one racial identity, and the 2000 Census for the first time allowed respondents to mark more than one race. In addition, immigrants increasingly live a transnational existence, sending large remittances to their home countries and participating in home country politics. Countries, in turn, have increasingly allowed immigrants to claim more than one nationality, such that many may vote in the US and in their home countries.

IDENTITY POLITICS WORLDWIDE

Throughout the world the interaction of race, economics, and politics has become intertwined with the problems of immigration and citizenship, as ethnic identity continues to shape political struggles. In some countries, particularly in Western Europe, rapid immigration from Africa and the Middle East has produced reactionary opposition in the receiving countries and organized mobilization for political and citizenship rights among immigrants. Recently in France, after a small incident in which two immigrant youths died electrocuted in a subway station after being chased by the police, the country experienced the most serious and extended period of civil unrest since the 1960s. The unrest was concentrated in the poor suburbs of the city among politically disenfranchised, primarily immigrant youths with high unemployment rates. In other countries the colonial legacy of placing traditionally distinct and opposing ethnic groups under a single rule has resulted in violent, long lasting strife as former colonies

became nation states. In Rwanda, the genocide of 800,000 Tutsis in the mid 1990s can be traced directly to the efforts by majority Hutus to wrest control from Tutsis of the resources of the new nation state after its independence from Belgium in the 1950s. Many of the continuing political struggles have been both ethnic and religious, as fundamentalist religious movements, particularly among conservative Christians and Muslims, enter the political fray in increasingly organized fashion, whether through the media, through grassroots political organizations, or, in extreme cases, through violent attacks. Despite the heterogeneity of these ethnic political conflicts, rarely can they be understood independently of the large and small scale economic issues surrounding them, whether it is the supply of labor, the control of natural resources, or individuals' yearning for stable employment at home or abroad.

race (racism)

Pierre L. van den Berghe

The term "racism" widely entered the social science vocabulary in the 1930s, as part of the Boasian reaction against the social Darwinism of the late nineteenth and early twentieth centuries. Ruth Benedict, a student of Franz Boas, was one of the prominent early users. By the 1950s and 1960s, a broad consensus developed as to what racism meant, namely, an attitude or theory that some human groups, socially defined by biological descent and physical appearance, were superior or inferior to other groups in physical, intellectual, cultural, or moral properties. It was clearly understood that "races" were socially defined, differently in different societies, but according to physical phenotypes, such as skin color, facial features, or hair texture.

Racism, so defined, was differentiated from ethnocentrism, also a belief or theory of inequality between human groups, but where that inequality was ascribed to some aspect of culture, such as moral values, religion, language, or "level of civilization." Ethnocentrism, i.e., a preference for one's own cultural group, was held to be universal, but not so racism. The latter was generally ascribed to European expansion, imperialism, colonialism, and chattel slavery in the nineteenth century, and associated with Fascism and Nazism in the twentieth century.

During this earlier social science consensus, racism was also clearly kept analytically distinct from discrimination, segregation, and other features of systematic inequality between ascribed groups. Racism was defined as an attitude, a prejudice, a theory, in short, an ideational system held in individual human minds. Discrimination, segregation, ostracism, and so on, were treated as forms of behavior which included or excluded certain groups, and which were frequently, but not necessarily, associated with the racist beliefs of their practitioners. One could be an unprejudiced discriminator, or, conversely, a prejudiced non discriminator. Behavior was held to be a function not only of beliefs, but also of sanctions. Unprejudiced discriminators could be found in racial caste

societies, like apartheid South Africa. Conversely, where discrimination is punished, prejudiced individuals often refrain from discriminatory behavior.

This state of conceptual clarity did not last long. It gradually disintegrated under repeated attacks, mostly from the left, starting in the 1970s, and continuously escalating until the present. In a first stage, the distinction between race and ethnicity was increasingly confounded. Since race was socially, not biologically, defined, and since ethnicity was often based on a theory of common descent, the distinction between the two was held to be spurious. Explicitly or implicitly, authors began to use the two terms interchangeably, to the detriment of analytical rigor. Often, race was defined away as ethnicity, but, conversely, ethnocentrism was frequently denounced as racism. The term "racism" was increasingly used as an invective of ever widening scope.

On a second front, the distinction between belief and behavior, between prejudice and discrimination, came under growing assault. The key moment here was the rapid acceptance of the concept of "institutional racism," hailed by many as a great analytic advance, when, in fact, the only advance was in an ideological agenda. Institutional racism referred to the structural inequalities between racial and/or ethnic groups, in short, to the consequences of behavioral discrimination. These were said to be independent of individual attitudes, indeed, to have a self-perpetuating institutional life of their own. Attitudes were asserted to be irrelevant to the existence of institutional racism.

In brief, the double distinction between race and ethnicity, and between attitudes and behavior, was now defunct, so that almost any statistical difference between any two ascribed groups could now be termed "racism." Intention did not matter. (By analogy, any structural difference between men and women was now labeled "sexism.") The stage was now set for the transformation of racism from a relatively precise analytical concept to an elastic term of opprobrium applied to almost anything one disapproved of. Lucid analysis of complex multicultural and/or multiracial societies all too often yielded to ideologically inspired mush.

The ultimate extension of the concept of racism occurred during the last 10 or 15 years. Explicit refusal to take race into account, and profession of an ideology and practice of "race blindness," are now often held to be a novel and subtle form of racism. If you say race matters, you are, by definition, a racist. If, however, you say race does not matter, you are a racist as well, because race really does matter. Thus, for instance, opposition to race based "affirmative action," on the ground that it uses a racial criterion to produce racial discrimination, now qualifies as neoracism. Racism and anti racism are neatly equated. The latter is merely a cryptic form of the former.

What are we to make of all this sociologically constructed confusion? Underlying the evolution of the concept of racism is a deeply contradictory "liberal" ideology. On the one hand, statistical differences between ascriptive groups based on race or ethnicity are declared illegitimate, or, at least, suspect, and therefore subject to remedial action, including policies based on the very criteria which constitute the foundation of the differences. One seeks to abolish or reduce differences by reinforcing and entrenching the criteria of group membership that underlie these differences. On the other hand, liberal ideology in multicultural and/or multiracial societies extols and celebrates "diversity." On the face of it, it would seem that one can not simultaneously eradicate differences between ascribed groups and extol them. At best, one can try to destigmatize existing differences and reduce their adverse consequences.

That said, social science theory and ideology – the two, by the way, are often hard to distinguish – must face two stubbornly persistent realities.

First, whenever two or more ethnic and/or racial groups have formed a common society (by conquest, slavery, or voluntary immigration), the result has, with few exceptions, been some degree of hierarchy and social differentiation between groups. Some groups are more powerful or affluent; groups tend to aggregate spatially; and an ethnic division of labor often sets in. Try to imagine a US society, for instance, where diamond cutters, taxi drivers, and basketball players would each have a proportional representation of Jews, Sikhs, and African Americans.

The elusive search for proportional group representation in every aspect of education, employment, residential distribution, and so on, often brings massive state intervention. The latter is not only doomed to failure in most cases, but frequently boomerangs. Such attempts have often consolidated group distinctions and exacerbated conflicts. This is not to say that ethnic or racial hierarchies are immutable. They can be rapidly overturned by revolution, for instance. But the proportional representation society is a utopia.

Second, one of the greatest human universals is that most people show a strong preference for others who are like themselves, and that the main fault lines of these preferences have largely followed the social boundaries of race and ethnicity. Indeed, these fault lines have been formed by these preferences. Whenever a phenomenon is universal in our species, it begs for an explanation that is not purely based on social constructionism.

Sociobiology has provided an answer for the universality of preference for one's "own kind," and for resistance to sharing scarce resources with unrelated others. Evolution by natural selection has predisposed us (as well as countless other species) to favor others to the extent that we are biologically related. By doing so, we have maximized our "inclusive fitness," i.e., the representation of our genome in successive generations. We are predisposed to favor kin over non kin, and close kin over distant kin. Ethnic or racial groups are simply extensions of kinship. Ethnocentrism and racism are nepotism writ large.

Almost all cultures have normatively *reinforced this genetic predisposition*. They have regarded familism, nepotism, and ethnocentrism as normal, expected behavior, even if a few cultures have sought to control and limit them. Any culture that seeks to counteract nepotism faces an uphill battle. Perhaps the best social policy would be one that accepts the reality of nepotism, ethnocentrism, and racism, but seeks to contain them as preference for one's own kind, and to prevent their extension into hatred of others. *The latter does not follow from the former.*

Any sociology that claims to be a science of human behavior cannot continue to ignore the

biological bases of that behavior, and explain it purely in social constructionist terms. Of course, we constantly construct and reconstruct our social reality, but not in a biological vacuum. Genes and culture complexly interact to produce behavior and social structure.

race and schools

Thomas F. Pettigrew

Race and schools become a social issue when educational opportunities are differentially available to members of diverse racial groups within a society. Educational discrimination has a variety of effects that often lead to interracial conflict. Since education is a major means of social mobility, discrimination in this domain forces the less favored racial groups to occupy lower status jobs and receive less income. Such results form a vital component in a wider system of racial oppression, as in South Africa during apartheid and the state mandated segregation in the American South.

Racially segregated schools are the hallmark of racial discrimination in education. As under South Africa's apartheid and the South's segregation, separate schools allow for vastly fewer resources to be provided for the oppressed race. Indeed, racially separate schools are so central to systems of racial oppression that they are tenaciously maintained in the face of efforts to end them. The protracted and only partially successful efforts to end segregated schools in the US provides a striking illustration.

Public schools did not emerge in the American South until late in the nineteenth century, and these early schools were for whites only. Black schools came later after formal Southern state laws for racial segregation had been sanctioned in 1896 by the US Supreme Court in *Plessy v. Ferguson*. Homer Plessy, who had one black great grandparent, had been arrested for riding in a rail car reserved for whites under a new Louisiana law. He sued and claimed the law unconstitutional. The High Court rejected his plea. Only Justice John Harlan, a former slaveholder, dissented with his famous assertion that "our Constitution is color blind." While it involved railroad seating, this decision was promptly translated by the white South into separate schools as well. Although *Plessy* established the formula of "separate but equal," Southern schools became very separate and unequal.

It took 58 years before the High Court would overturn *Plessy*. By 1950, in two graduate education cases, the meaning of "equal" went beyond mere parity in brick and mortar terms to include such intangibles as faculty reputation and general prestige. The decisions prepared the ground for *Brown v. Board of Education* four years later to hold separate facilities to be inherently unequal. But implementing this unpopular decision in the hostile Southern US proved difficult.

Critical to the acceptance of mandated social change that runs counter to dominant public opinion is the perception of inevitability. The responses of the white South to the varying firmness of the High Court's rulings illustrate the point. With an uncompromising, nine to nothing decision in *Brown*, the Court in 1954 generated a strong sense of inevitability even in the Deep South. But in 1955 the Supreme Court retreated in its implementation order to

a vague "all deliberate speed" formula (*Brown II*). This formula returned the enforcement of desegregation back to Southern federal district courts without guidelines. Only when this weak order undermined the sense of inevitability did Southern politicians become uniformly defiant and pro segregationist organizations gain momentum. The opposition now believed *Brown* could be effectively opposed. *Brown II* is not solely responsible for the violent opposition that followed. But its vagueness contributed to the resistance by eroding the strong sense of inevitability that had prevailed.

Consequently, the region's school desegregation did not take hold until the federal courts lost patience between 1968 and 1973 (Orfield 1978; Orfield & Eaton 1996). This brief period saw court orders achieve sweeping gains – especially in the recalcitrant South, but also in the cities of the North and West. By the 1970s the South had more racial desegregation in its public schools than any other region. But this process ended abruptly in 1974 when the Supreme Court reversed direction. In *Milliken v. Bradley* the Court by five to four struck down a metropolitan solution ordered by a district court to remedy the intense racial segregation of Detroit's public schools. What makes this decision so regressive is that such remedies are the *only* means available to desegregate the public schools of many of the nation's largest cities (Orfield & Eaton 1996; Pettigrew 1981). More over, between district segregation is now by far the major component today in metropolitan school segregation (Clotfelter 2004). Decisions of the High Court from 1974 into the twenty first century continued this trend, and allowed racial segregation of the public schools to return not only in the South but also throughout much of the US.

In short, *Brown* was largely reversed without the High Court ever stating that it was overturning the famous decision. By 2000, black children were more likely to be attending majority black schools than at any time since the 1960s; 70 percent went to predominantly black schools and 37 percent to schools with 90 percent or more black students. The greatest retrogression during the 1990s occurred in the South, the region that had previously witnessed the greatest gains (Orfield 2001). And Latino school children became more educationally segregated

from white children than African American children (Orfield & Eaton 1996).

Supporting this retreat from desegregated schools, the sociologist James Coleman claimed in a highly publicized speech that urban interracial schools were impossible to achieve because desegregation causes massive "white flight." It led, he claimed, to whites fleeing to the suburbs and leaving minority concentrations in central city cores. This research had serious weaknesses and its policy recommendations ignored metropolitan solutions (Pettigrew 1981).

The white flight thesis is actually far more complex than Coleman claimed (Pettigrew & Green 1976). Some whites did move from large cities when school desegregation began. However, this movement was neither universal nor permanently damaging. Some cities without any school desegregation also experienced widespread white suburbanization. Other cities experienced little such movement at the time of desegregation. And where so called white flight to the suburbs did occur, it constituted a "hastening up" process; within a few years the loss was what would have been expected without desegregation (Farley et al. 1980).

But does school desegregation improve the life chances and choices of African Americans? From the 1970s to the 1990s, black high school completion rates rose sharply. While less than half finished high school at mid century, by 2000 the figure approached that of white Americans. During these same years, the mean difference between black and white achievement test scores steadily narrowed. White scores were improving, but blacks who entered school during the late 1960s revealed especially strong gains – when extensive school desegregation began. But these positive trends stalled and were even reversed by the late 1990s once the federal courts allowed resegregation. Yet these trends are only suggestive, since other factors were also influential – notably, rising black incomes and such effective national educational programs as Headstart.

More to the point, did school desegregation expand opportunities for African Americans in the long term? An array of sociological studies tracked the products of desegregated schools in later life to find answers (Pettigrew 2004). With social class controlled, black children from desegregated schools, when compared with

black children from segregated schools, are more likely later (1) to attend and finish majority white colleges; (2) to work with white co workers and have better jobs; (3) to live in interracial neighborhoods; (4) to have somewhat higher incomes; and (5) to have more white friends and contacts and more positive attitudes toward whites. Similarly, white products of desegregation have more positive attitudes toward blacks than comparable whites from segregated schools. In short, desegregated education prepares black and white Americans for an interracial world.

These positive lifetime effects of desegregation do not primarily reflect test score gains. More important is the fact that desegregation enables African Americans to break through the monopoly that white Americans have traditionally had on informational flows and institutional access. Sociologists have identified several interrelated processes underlying this phenomenon (Pettigrew 2004). These processes mirror the harsh fact that life chances in America flow through white dominated institutions.

Desegregation involves interracial contact. Intergroup contact is one of social psychology's best established theories. A comprehensive meta analysis found that 95 percent of 714 independent samples with 250,000 subjects show that intergroup contact reduces prejudice (Pettigrew & Tropp 2006).

Desegregation teaches interracial interaction skills. Given the nation's racist past, neither black nor white Americans are skilled in interracial interaction. The products of desegregated schools have the opportunity to learn these skills. Their anxiety about such interaction is reduced. This is highly useful for both blacks and whites, for it contributes to their willingness to enter biracial environments and their acceptance in these situations.

Desegregation erodes avoidance learning (Pettigrew 1964). After facing discriminatory treatment, some black Americans learn to avoid whites. But this reaction has negative consequences. It closes off for ghetto dwellers the better opportunities that exist in the wider society. And, like all avoidance learning, it keeps one from knowing when the situation has changed. Desegregated schooling overcomes such avoidance.

Desegregated blacks gain access to formally all white social networks. Information about colleges

and jobs flows largely through formally all white networks. This process does not require personal friendships. Weak interpersonal ties are the most informative, because close friends are likely to possess the same information (Granovetter 1983). Interracial schools allow black students to gain access to these networks.

Thus, although not popularly recognized, the racial desegregation of American's public schools has led to positive outcomes. But the resegregation of the nation's schools in the twenty first century threatens to retard and even reverse these beneficial processes.

While America's racial scene has many unique features, social research in other nations suggests that similar intergroup processes operate in schools throughout the world. Additional research is needed, but the separation of groups in schools and other societal institutions, whether the groups are racial or not, appears to have comparably negative effects. In addition to thwarting beneficial intergroup contact, intergroup separation triggers a series of interlocking processes that make group conflict more likely. Negative stereotypes not only persist but are magnified, distrust accumulates, and misperceptions and awkwardness typify the limited intergroup interaction that does take place. The powerful majority comes in time to believe that segregated housing, low skilled jobs, and constrained educational opportunities are justified, even "appropriate," for the minority.

Intergroup schools have proven to be one of the needed antidotes for combating these negative processes – from Northern Ireland to the Republic of South Africa.

race/ethnicity and friendship

Will Tyson

Race and ethnicity are important factors in friendship formation. People tend to form friendships with others who live near them and who occupy similar social positions, belong to the same organizations, and are like themselves in terms of attitudes, values, and behaviors. Race and ethnicity are often cues of these similarities; therefore, race and ethnicity structure friendship formation (McPherson et al. 2001). People are likely to associate with others of their own race if the racial composition of the populations and distribution of members of a race throughout substructures of the population provide opportunities for same race friendships to form.

Researchers have found evidence that race and ethnicity influence various types of relationships, ranging from marriage to workplace relationships to friendships to mere discussion networks (McPherson et al. 2001). These studies show that interracial relationships occur less often than would be expected given the available opportunities for them. Structures such as families, workplaces, organizations, and neighborhoods bring people together as kin, co workers, members, and neighbors, but they do not ensure the formation of strong ties or close friendships (Feld & Carter 1998).

A recent Brown University study finds that interracial friendships are no more common in the United States than they are in post apartheid South Africa, probably because elements of apartheid are found in America. Massey and Denton (1993) coined the term "American apartheid" to describe the unique residential hypersegregation of blacks across large metropolitan areas in the United States. Scholars have referred to residential segregation as the "structural linchpin" of race relations in America (Bobo & Zubrinsky 1996). People of different races generally do not live close to each other, so interracial interaction and interracial friendships are not as common as they might be otherwise.

Lack of proximity contributes to social distance between people of different races. Zipf (1949) asserts that people are willing to expend little effort toward establishing ties outside their local area. People with low interracial contact in their local area are more likely to be attracted to those they perceive to be similar to themselves, probably through racial cues. Growing up in predominantly white neighborhoods can teach blacks and other minorities to forgo racial cues and choose friends based on similarity to themselves on more attitudinal dimensions (Korgen 2002: 73). Interracial contact within neighborhoods is often a result of racial preferences. Blacks prefer to live in mixed neighborhoods, but few whites accept living in a neighborhood that is more than 20 percent black (Massey & Denton 1993). In fact, whites generally do not want to live near blacks, even when controlling for socioeconomic status (Steinhorn 2000).

Those who form interracial friendships may face social sanctions from same race friends. Blacks with a white close friend overwhelmingly report disapproval from black friends, family, or

acquaintances. Whites with a black close friend report generally positive reaction to their interracial friendships, but these reactions seem to imply that black-white friendships are a novelty and provide false evidence of harmony between blacks and whites in America (Korgen 2002).

Black-white racial tension in America has led to the current research emphasis on black-white friendships, but interracial tension between white, black, Latino, and Asian people in society is an emerging area of scholarship to complement research on black-white conflict. Classic research by Bogardus (1959) and consequent follow up studies continue to suggest that the social distance between whites and blacks is greater than the distance between whites and people of other ethnicities. When given an option, whites prefer to associate with Latinos and Asians instead of with blacks (Bobo & Zubrinsky 1996). A Latino or Asian person with a third grade education is more likely to live among whites than a black person with a doctoral degree. With higher intermarriage rates with whites compared to blacks, native born Latinos and Asians are assimilating while blacks have not been able to integrate fully (Steinhorn 2000). Blacks often face social pressures to end interracial friendships with white peers, but black peers typically accept friendships with Asians and Latinos (Korgen 2002).

Few social arenas promote social interactions between people of diverse racial and ethnic backgrounds, so a great deal of research on multi ethnic interracial friendship takes place in educational contexts, specifically in colleges and universities. Fifty years of desegregation in American education since *Brown v. Board of Education* has provided researchers with social settings in which to study how diverse people interact and form friendships. Multicultural universities emphasize the importance of diversity in bringing people together to encourage positive interracial contact. Administrators believe that positive contact in cooperative environments leads to positive attitudes and positive interracial relationships. Critics of increasing diversity claim that it leads to conflict, while its proponents claim that the university plays an invaluable role in promoting interracial friendships among students who bring their own individual friendship experiences and expectations to the college setting.

Research shows that interracial interaction in an egalitarian setting such as a university can both promote and discourage interracial friendship. Administrators seek to increase racial and ethnic diversity in hopes that positive interactions among young people of similar age, intelligence, and academic background in residential, social, classroom, extracurricular, and co curricular settings will lead to interracial friendship. Critics of affirmative action and other policies that seek to increase diversity often emphasize self segregation among college students as evidence of negative consequences of multicultural universities. Minority students may feel marginalized in their campus surroundings and seek out friendships with other students of their own race (Tyson 2002). The term "self segregation" implies that minority students segregate themselves from their white classmates despite sufficient opportunities for contact and friendship formation with white students around campus. Critics of affirmative action and other programs that promote diversity often do not recognize that white students also fail to take advantage of opportunities to form friendships with minority students.

Current and past research suggests that people will form friendships with others with similar behaviors and characteristics. Future research should continue to explore interaction among people of different races and ethnicities in situations in which friendship development is possible. This research should examine the similarities among these people across multiple dimensions such as proximity, psychological characteristics, background, and experiences and how these similarities contribute to friendship formation despite racial and ethnic differences.

race/ethnicity, health, and mortality

Parker Frisbie and Robert A. Hummer

Few issues are of greater importance for a society than the health of its members. And, based on the US Department of Health and Human Services Healthy People 2000 and 2010 reports, few issues are of greater concern than race/ethnic differentials in health and mortality in the United States. Any discussion of this topic places us squarely at a crucial interface of sociology (especially social demography) and social epidemiology. Although health (or morbidity) and mortality clearly are biological phenomena, one point of general agreement across these disciplines is that race/ethnicity is properly conceived as a sociocultural construct, not a genetic one. That is, we assume that if all race/ethnic compositional differences could be

controlled, race/ethnic disparities in health and mortality would vanish – or at least be greatly reduced. A useful definition of an ethnic group is “a collectivity within a larger society having real or putative common ancestry, memories of a shared historical past, and a cultural focus on one or more symbolic elements defined as the epitome of peoplehood” (Schermerhorn 1970: 12). It is from this vantage point that the American Sociological Association (ASA) has endorsed and encouraged the continuation of research on race disparities across a wide range of topics (ASA 2003, as cited by Takeuchi & Williams 2003).

The current race categories (self reported) most often found in US data are white, black (or African American), Asian, Pacific Islander, and American Indian/Alaska Native. More specific identifiers may be reported. For example, Asians may identify as Chinese, Japanese, Filipino, etc., and Pacific Islander individuals may identify as Hawaiian, Samoan, etc. Although the small size of many of the subgroups often makes it necessary to collapse data into a broader category, finer grained distinctions are useful because of the well documented heterogeneity within the larger categories. Hispanic identity is treated separately, so that the “race” categories become non Hispanic white, non Hispanic black, and so on, and Hispanics (or their component subgroups) are treated as one of a larger set of “race/ethnic” categories. Data may be retrieved and reported for certain Hispanic subpopulations (e.g., Mexican, Puerto Rican, Cuban). Definitional matters have become even more complex since the Office of Management and Budget began to allow respondents to identify with more than one racial category.

INTELLECTUAL CONTENT AND ANALYTIC DIMENSIONS

The health of groups that are disadvantaged socially, economically, and/or politically is often compared to non Hispanic whites, which means a comparison of minority groups with the majority. This body of work becomes closely linked with social stratification in that group specific disadvantages and advantages are described and then attempts are made to understand the factors

that explain them. A voluminous literature throughout the twentieth century compared the health and mortality of the black and white populations (or, in the earlier, more limited data, whites and non whites). With few exceptions, this research reported excess mortality and poor levels of health among blacks in comparison to whites. More recently, research on Hispanic groups, particularly the Mexican origin population (i.e., both Mexican immigrants and US born Mexican Americans), has been greatly expanded, and increasing attention is being paid to Asian and Pacific Islanders (APIs) and American Indians. In general, morbidity and mortality rates are highest for blacks. Puerto Ricans and American Indians also have poorer overall health and higher mortality rates than do non Hispanic whites. The same is true for Pacific Islanders, including Hawaiians. The health and mortality profiles of most Hispanic groups are similar to those of non Hispanic whites, while most, but not all, Asian groups have superior health and higher life expectancies compared to all other race/ethnic populations.

Differential access to socioeconomic (SES) resources has been found to be critical in helping to explain health and mortality differences between race/ethnic groups, although in most cases residual differences between groups remain even after SES factors are taken into account. Further, certain Hispanic groups, particularly Mexican Americans, were found to have overall mortality rates similar to those of the non Hispanic white majority. This near parity has been termed an “epidemiologic paradox” due to the disadvantaged risk profiles of the former populations (Markides & Coreil 1986). A number of other risk factors, including disparities in access to preventive and curative care, stress produced by discrimination, behavioral differences, nativity, and religiosity have also been linked to the health and mortality differences between the majority and race/ethnic minorities and continue to be a major focus of theory and research.

The study of race/ethnic variation in health and mortality encompasses a broad spectrum of health and mortality outcomes, beginning with the analysis of race/ethnic patterns of fetal loss all the way through investigations of disability and mortality among the oldest old. Throughout the life course, the topics of investigation

vary depending on the outcomes most relevant by age group. During infancy, research often revolves around differential birth outcomes (i.e., birth weight and gestational age), as well as age and cause specific infant mortality. Throughout childhood (when mortality rates are at their lowest), research typically analyzes health and development outcomes such as differential levels of asthma, childhood obesity, exercise patterns, and even academic outcomes across groups. During adolescence and young adulthood, the focus often shifts to health and sexual behavior patterns, as well as the accidental and violent causes of death that characterize this age group and that have been shown to be higher among most minority groups in comparison to non Hispanic whites. Studies during adulthood are often geared toward patterns of chronic disease, the development of disabilities, and premature mortality. Finally, older adult studies typically focus on active life expectancy, disability, and cause specific mortality.

As with much empirically based research in sociology, investigations of these topics have become more and more complex over time with the development of sophisticated individual level surveys, record linkage across surveys, and heightened computing power. Much early work dealt with aggregate units of analyses (e.g., county rates), but with the advent of richer vital statistics data sets and specialized surveys, micro level comparisons of race/ethnic variation in health and mortality moved to center stage. Currently, considerable emphasis is being placed on multilevel research in which the effects of both individual risk factors and contextual (e.g., neighborhood) variables on race/ethnic disparities are explored. Changing patterns across time is another major analytic dimension – one that has been given impetus by the increasing diversity of the US population as immigrants come to constitute an increasing share of the total US population.

CURRENT SUBSTANTIVE EMPHASES

Perhaps the most prominent conceptual model for health inequalities among race/ethnic groups is based on the premise that social inequities give rise to disparities in health and mortality. Specifically, the ability of individuals

to reduce the risk of disease and death “is shaped by resources of knowledge, money, power, prestige, and beneficial social connections” (Link & Phelan 2002: 730).

Research has begun to focus on the implications of dramatic advances in the treatment and prevention of disease guided by the proposition that, as improvements in health care and technology lead to overall diminution of the risk of morbidity and mortality, relative disparities between race/ethnic populations will tend to widen. For example, while the overall levels of infant mortality have dropped, the relative gap between white and black infants (as indicated by the black–white rate ratio) has grown over the past two decades. This perspective follows directly from the fundamental social causes paradigm, as some substantial portion of this growing black–white inequality appears to have resulted from the greater survival benefits that accrued to white infants in the case of two of the five leading causes of infant death: respiratory distress syndrome (RDS) and sudden infant death syndrome (SIDS) after the introduction of perinatal care innovations designed to reduce risk of infant death from these conditions (Frisbie et al. 2004).

It has long been known that the health and mortality outcomes of immigrants and of infants born to immigrant mothers from virtually every country of origin tend to be more favorable than those of their US born co ethnics (e.g., Hummer et al. 1999) – even though immigrants are typically disadvantaged with respect to access to the formal health care system and often in terms of SES. The most frequently offered explanations for the superior health and survivorship of immigrants include positive selection of migration for the most robust individuals and cultural buffering. Some authors have suggested that the paradox is a data artifact (as described below). In any event, the health and mortality advantages of immigrants appear to erode as individuals spend a longer period of time in the United States, a finding consistent with the notion of “negative acculturation,” although the relative lack of access by immigrants to the formal health care system represents a plausible alternative explanation.

While a number of social factors are associated with race/ethnic disparities in morbidity and mortality, a central question continues to

be: what are the mechanisms through which race/ethnicity is related to health and mortality outcomes? As an example, consider the effects of SES. Compared to their more affluent counterparts, persons of low income will often lack the resources to access high quality medical care, healthier residential environments, and occupations that involve a low risk of illness and injury. Even so, race/ethnic disparities in health and mortality often persist even after rigorous controls for individual level measures of socioeconomic status. One potentially fruitful avenue involves the study of differential accumulation of stress for race/ethnic populations created by discrimination and residential segregation.

METHODOLOGICAL ISSUES

One set of methodological challenges revolves around the identification and measurement of race/ethnicity itself. Issues such as changing race/ethnic identities over time by individuals (e.g., as in the case of the growing number of individuals in the US who have identified as Native Americans since the 1960s), inconsistent reporting of race/ethnicity for individuals depending upon who reports the information, and the growth of multiple race/ethnic reporting make even seemingly simple descriptions of race/ethnic patterns of health and mortality a major methodological challenge.

Studies in which immigrant characteristics are featured face the problem of a rapidly changing race/ethnic composition and increasing group diversity of the US population that is associated with a series of changes in immigration law since 1965. Circular migration between the US and other nations, particularly Mexico, poses a related methodological difficulty. To illustrate, longitudinal studies of mortality in the US often "statistically follow" individuals who were interviewed in sample surveys through matches to identifying information on death certificates. If sampled individuals leave the country, they become "statistically immortal" because their deaths will never be recorded in the US vital statistics. Some recent investigations of this issue report that Mexican immigrant adult mortality in the US is probably underestimated. However, even the most careful

adjustments show favorable Mexican immigrant mortality patterns in light of their disadvantaged social and economic status (Elo et al. 2004).

Differential reporting, as well as misreporting, of health on social surveys by race/ethnicity can also create analytical difficulties. There remains concern about the extent to which the often used respondent reports of health reflect clinical reality, but a number of evaluative studies indicate that self reported health is closely related to both morbidity and mortality.

Analysts that hypothesize socioeconomic based differences to be the root of many race/ethnic health and mortality disparities regularly adjust for available measures of SES, such as education and income. However, such conventional measures, while helpful, are limited in that they fail to tap into many other dimensions of SES, such as wealth, quality of education, and access to health insurance.

FUTURE DIRECTIONS

Fruitful future directions for research in this substantive area include at least the following. Additional research is needed that sheds light on the mechanisms through which social attributes and characteristics "get into the body" and lead to higher risks of morbidity and mortality. Some important findings have emerged regarding the effects of stress associated with race/ethnic disparities in SES and quality of life, but a greater degree of collaboration between social science and public health/medical researchers should be encouraged. In sum, both the "social" and "medical" models seem clearly necessary, but neither alone is sufficient.

A fair degree of progress has been made through multilevel (or contextual) research in which the effects of both micro and macro level variables on race/ethnic differences in health and mortality are explored, but considerable expansion of this research agenda is needed. This will require more data sets constructed specifically with multilevel analyses in mind.

Additional studies are needed regarding the explanation for the superior health and survival of immigrant members of most race/ethnic groups. Those who embrace "negative assimilation" as an explanation must confront the fact that, while we have some useful measures of

cultural attachment (e.g., continuing to use language of place of origin), there is a virtual absence of measures of cultural content. To illustrate, the culture of Hispanics is not the same as that of Asians, which, in turn, is not the same as that of European immigrants. The most likely explanation may well be positive selection of migration, but demonstration of the validity of this interpretation would seem to depend on development of data sets that capture important characteristics of immigrants at both origin and destination – as has been accomplished by Landale and associates in the study of Puerto Ricans (Landale et al. 2000).

The importance of panel surveys and the leverage that such data sets provide for inferring causality are well known. Perhaps less obvious is the importance of temporal effects that occur over the life course and intergenerationally. For example, morbidity and mortality risk in adulthood may be affected both directly and indirectly by birth outcomes and later child well being. Policies designed to enhance child health can be expected to have beneficial effects in adulthood (Hayward & Gorman 2004: 87).

Finally, a greatly expanded research agenda is needed that explores the relationship between advances in health care and a widening gap between race/ethnic groups. It is ironic and unacceptable that relative (and in some instances, absolute) race/ethnic disparities in health and mortality have followed in the wake of overall advances in health care. Thus, race/ethnic health and mortality differentials remain a pressing cause of concern.

racial hierarchy

Miri Song

Racial hierarchies are systems of stratification premised upon the belief that some racial groups are either superior or inferior to other racial groups. A racial hierarchy in which white Europeans were deemed innately superior to all other "races" in virtually every respect was crucial for imperialist expansion in all parts of the world, as well as for the creation and practice of slavery. Without the stated belief that white people are superior – intellectually, spiritually, artistically – than non white people, it would not have been possible to subordinate and dehumanize conquered peoples.

Sidanius and Pratto (1999) argue that the means by which group based hierarchies,

including racial and ethnic hierarchies, are established and maintained, are similar across social systems. Nevertheless, there is no one definition or indicator of racial hierarchy (or inequality) which is used consistently in different countries.

Systems of ethnic and racial stratification have differed historically, not only in terms of the groups involved, but also the complexity and the magnitude of the distinctions made between them. Racial hierarchies in societies with a relatively high degree of intermarriage, such as in Brazil or other countries in Latin America, can be subtle or denied to exist altogether. By comparison, the workings of formal institutionalized systems of racial stratification, as existed in South Africa prior to 1990, or under slavery and Jim Crow in the US, were clear cut and transparent. In the former South Africa (though this is only the most paradigmatic and contemporary historical example of racial hierarchy), Africans were deemed inferior to both "coloreds" and whites, and they lived in segregated townships as lesser beings. In all aspects of their lives – economically, politically, and socially – whites were indisputably at the top, Africans at the bottom, and the "colored" population comprised a formal intermediate category.

In the US today, there appears to be a fairly widespread view, both among many academics and the wider public, that white Americans are at the top of a racial hierarchy, African Americans at the bottom (with sporadic reference to Native Americans as an equally oppressed group), and groups such as Asian Americans and Latinos somewhere in between (Bashi & McDaniel 1997). Many analysts in the US believe that the historical legacy of slavery is fundamental in explaining the relatively disadvantaged status of many African Americans today. Feagin (2000) argues that white Americans have simply expended much less time and energy in exploiting and oppressing other groups such as Asian Americans and Latino Americans. In addition to arguments about their distinctive historical treatment and experiences, African Americans have fared badly according to various socioeconomic indicators, such as educational attainment, housing, and income. In the US, black families earn about 60 percent of what white families earn and survive on roughly 12 percent of the wealth of average

white families. As individuals, their life spans are 6–7 years shorter than whites. Both in the past and in the present, African Americans have often been the victims of horrific racial attacks.

Most conceptions of racial disadvantage and oppression in the US have to date relied upon a rather unitary (i.e., anti black) understanding of racism and racial disadvantage – though there is now significant research into the class differentiation of African Americans. In recent years, a growing number of studies have begun to investigate the specific racialized experiences of other minority groups. For example, social psychologists researching the effects of racism have begun to question whether models of racial identity based on the experiences of African Americans (the group most studied regarding the effects of racial prejudice in the US) are adequate to understand the racial and ethnic identities of other groups, such as Latino and Asian Americans.

Although forms of both overt and covert discrimination and prejudice are still all too prevalent in the US and Europe, many countries are no longer characterized by rigid sociopolitical constraints, but rather by a gradual modification of the social and economic parameters dividing white and non white peoples. While there is considerable agreement about the persistence of white power, privilege, and racism, the question of which groups do and do not constitute disadvantaged ethnic minority groups is now more contested than ever. Among other factors, significant demographic changes, such as intermarriage, as well as diverse flows of immigration, are unsettling longstanding understandings of hierarchy in many western contemporary societies.

The ways in which debates about racial inequality get framed in the first place depend a great deal upon the specifics of each national context, with their distinctive histories of colonization and settlement, the specific mix of various minority and majority populations, discourses about racial inequality and minority experience, and state policies concerning "integration" or multiculturalism. Particular racial paradigms are associated with specific national contexts and cultures.

In Britain, unlike the US, most research has (until recently) stressed the *commonality* of

experience of ethnic minorities in relation to the white majority, suggesting a common disadvantaged status in relation to the housing and labor markets, racial abuse, and certain forms of social exclusion and marginalization. This may be because, in Britain, many South Asians and African Caribbeans have shared in common the history of British colonialism in the Indian subcontinent, the Caribbean, Africa, and South Asia and came to Britain in the post war period to work in predominantly unskilled or semi skilled jobs as disadvantaged minorities.

Turning to France, Silverman and Yuval Davis (1999) note that Jews and Arabs have long been central to theorizations of racism in France, and this model has tended to eclipse the black/white paradigm more commonly found in Britain and the US. Furthermore, the political culture in France militates against the specification of ethnic difference and origins, based upon the orthodoxy that, in France, one does not question a single and indivisible republican citizenship.

In contrast to the US situation (in which a predominantly anti black conception of racism is employed), it is much more common in Britain for analysts to identify a variety of racisms which are flourishing in contemporary Europe, such as anti Jewish, anti Muslim, anti Turk, anti African, and anti Gypsy racism (Cohen 1996). While many British analysts acknowledge that each of these racisms has its own specific history and characteristic features, the implication of such a wide ranging list of racisms, discussed together, is that they are equivalent and comparable.

While some analysts (especially in North America) believe that the concept of a top down racial hierarchy should be retained, pointing to significant differences in the life chances and well being of disparate racial groups, others argue that this concept is simply divisive, contributing to assertions about a "hierarchy of oppression" (Hickman 1998). Rather than argue that some minority groups are more racially oppressed or disadvantaged than others, British analysts such as Mary Hickman and Phil Cohen argue for a complex and pluralistic cartography of racism which would recognize anti Semitism and anti Romany racism alongside the racism experienced by African Caribbeans and South Asians.

Why do claims about racial hierarchy still matter today? Because a great deal is at stake. Groups which successfully claim an oppressed status can gain both moral and material capital. Belief in the existence of a top down hierarchy can also shape group relations, public policy formation, and political alliances. The question of whether some groups are worse off than others is highly pertinent at a time when there is growing recognition of multiple forms of racisms and racial oppression.

The concept of racial hierarchy is suggestive of a "big picture" of how disparate groups fare. In both the US and Britain, analysts' references to a wide range of indicators of disadvantage and privilege can make it difficult to assess the *overall* positions and experiences of groups in relation to each other. One of the key difficulties encountered in scholarship about racial hierarchies is the fact that analysts privilege certain indicators of racial disadvantage or well being over others in making claims about the positions of groups in a top down hierarchy. The identification of specific criteria means that we privilege certain social indicators as fundamental, while rendering other markers, problems, and people relatively invisible to public concern and public policy.

Thus there is a lack of consensus in discussions about the criteria one applies in constructions of racial hierarchy, as well as the *methodological* difficulties of measuring and comparing different forms of racial oppression across disparate groups. In comparison with racial prejudice (e.g., in various public places), how relevant are factors such as a group's average family income, the nature of their representation in the popular media, or their participation in politics, for the overall assessment of how a group fares? There are many and different (though in many ways related) dimensions of a group's status and experience. While it is possible that some groups are consistently disadvantaged across a whole range of indicators, it is also possible that a group may fare badly according to some indicators, but may be relatively privileged according to others.

Differential levels of material resources possessed by various ethnic minority groups (including different subgroups of "Asians" and "blacks") surely make a difference to these groups' overall sense of well being and social status. But in recognizing the centrality of

material resources, we must not overlook other areas of social experience which truly give meaning to the idea of "belonging" and social inclusion in the wider society (Song 2003). Nor do material resources guarantee a group's ability to participate fully in society. For instance, the Chinese in Britain have virtually no public presence in the arts or popular culture of Britain, and there is hardly any Chinese participation in political parties in Britain. In this sense, while they are "successful" according to some socioeconomic measures, the Chinese are very much at the margins of British society.

Thus, taking a broader view of social inclusion and exclusion complicates the neat, top down picture one might derive from reliance on socioeconomic indicators alone. The issue of which criteria or indicators are used in claims about the existence of a racial hierarchy is also complicated by the fact that distinctive yet simultaneous hierarchies can occur along various dimensions of experience, whether these be based upon race, class, or gender locations.

Unfortunately, claims about the ordering of groups on a top down hierarchy can encourage politically divisive comparisons between groups. Amid the scramble for scarce group resources, and against a backdrop in which disparate groups may know very little about each other, there can be little room for empathy. Members of disparate minority groups may believe that they are more disadvantaged than others, and these competing beliefs can contribute to inter ethnic tensions.

Given the difficulties that can arise in assertions about racial hierarchies, should we simply jettison this concept in scholarship about "race" and racial inequalities? Most analysts, especially those in the US, would say no – though they point to the need to qualify and refine this concept. We need to remember that the ethnic and racial landscapes of many multi ethnic western societies are undergoing vast and significant change. We are certainly moving towards societies in which the meanings of "race" and ethnicity, the assertions of ethnic and racial difference and experience, and the manifestations of inequality are increasingly complex and varied.

The state, and its national political leaders, also play key roles in the adjudication of conflicts and competing claims among racialized

minority groups. In the US, despite the prevalence of an official multiculturalist discourse which suggests an unproblematic ethnic and racial diversity, major demographic changes have brought blacks, Latinos, and Asian Americans into direct conflict (Kim 2004). According to Claire Kim, through their espousal of multiculturalist discourse, political leaders in the US have actually discouraged Americans from addressing these intergroup tensions. In the course of discussing the notion of racial hierarchy (as a counter narrative to official multiculturalist discourse), Kim argues instead for the notion of "racial positionality" – a concept which allows for the recognition of disparate forms of racial disadvantage, as well as the reality of interethnic tensions.

As stated earlier, a key difficulty in arguments about racial hierarchies is that, given the numerous indicators of well being and disadvantage which can be used (and their potentially complex combination in relation to specific groups), it can be difficult to summarize groups' overall experiences along a monolithic, top down hierarchy. Therefore, in addition to applying the concept of racial positionality, more delimited hierarchies which position groups on the basis of specific indicators of well being or disadvantage (such as poverty or entrance into higher education) are a useful way forward.

racialized gender

April L. Few

Racialized gender is a sociological concept that refers to the critical analysis of the simultaneous effects of race and gender processes on individuals, families, and communities. This concept recognizes that women do not negotiate race and gender similarly. For instance, white women's oppression has been linked with their privilege as white people, but they have not escaped the bonds of sexism. Black women's and First Nation women's oppression has been linked to the struggle of self definition, agency, and collective empowerment. Latina and Asian women's oppression has been linked more to sexism emerging from immigration and multi generational experiences. Historical, social, and geographic context influence the expression, interpretation, and performance of gender relations over the life span of an individual. Multi racial feminists and ethnic scholars have written extensively about racialized gender particularly as it relates to social constructions of family and sexuality.

Racialized gender concerns the study of the influence of socialization practices on the individual. Social environments such as the family, communities, and institutions provide the frame in which experience is interpreted and communicated and the self (e.g., identity) is defined in relation to difference. Social environments impose or limit culturally appropriate cues, scripts, behaviors, and outcomes for individuals through hierarchical raced, gendered, and classed systems of privilege and domination. The development of gender and racial identities

is an important milestone, as an individual's self identity perception has been shown to be instrumental in overriding the effects of harmful, external, stereotyped messages. The family is the primary site for the racial socialization of children and socialization of gender identity. For this reason, scholars have focused on the extent to which ethnic families have performed traditional gender norms (as defined by the majority discourses) and used those norms to organize family responsibilities and to socialize children.

The sociohistorical frameworks of race, ethnicity, gender, class, and sexual orientation are embedded in how the sexuality of ethnic women has been created, reproduced, and disseminated for public consumption. Racialized gender can be observed in the study of sexual images and scripts and body image as it relates to perception of beauty. Multiracial feminists and womanists have identified various sexual scripts and the distinctive identity processes women negotiate due to historical and economic circumstances. For instance, sexual stereotypes for black women in the US have been "transformed" from one context, American slavery, to the current sub context of Hip Hop. Black feminists and womanists have traced how the Jezebel, Mammy, Welfare Mother, Tragic Mulatto, and Matriarch stereotypes have "evolved" into more sexually explicit images and scripts such as the Diva, Gold Digger, Freak, Dyke, Gangster Bitch, Sister Savior, Earth Mother, and Baby Mama (Collins 1991; Stephens & Phillips 2003). A close examination of these stereotypes reveals racialized and sexualized colonial tropes of African primitivism and hypersexuality. Theracist imagery and expectations embedded in these narrowly defined stereotypes of black female sexuality have been constructed deliberately to constrict black women's ability to replace or eliminate negative images of black womanhood.

The concept of racialized gender is also found in comparative research concerning physical attractiveness and body image. Physical attractiveness stereotypes have been found to be the dominant component of gender stereotypes, consistently implicating other components of gender stereotypes. For instance, scholars have observed that white women seem to have a uniform notion of what "beauty" should be, and

their conception of beauty tended to match the culturally popular images of women in the mainstream media. Black women, however, have been found less likely to hold uniform notions of beauty, and far more likely to describe beauty in terms of personality traits rather than physical ones. Parker et al. (1995) conducted a study of African American, Asian American, Mexican American, and white female high school students. They found that white adolescents' conceptions of beauty were much more rigid, fixed, and uniform than those of African Americans, who were much more flexible and fluid in their notions of beauty. The African American girls' perceptions of beauty focused on personality traits and a personal sense of style, rather than a certain "look." Poran (2002) argued that beauty must be reconceptualized as a race experience in order to understand and explore fully the diverse experiences women have in relation to, and within, cultures. She believed that images that convey beauty may hold different meanings for different women. In her study, she found that white women seemed to respond to cultural standards of beauty on the basis of what was attractive to western, white men. Black women initially reported that there was a white defined standard, but then reported Afrocentric characteristics as a beauty standard to pursue. Latina women seemed to have a less straightforward, more complex response to dominant imagery.

There is a need to conduct more empirical research that examines racialized gender. For example, more research is needed to determine how institutions transmit and define "appropriate" gender relations. Second, more research is needed to analyze how class diversity and mobility among different ethnic groups influences the expression, reproduction, or termination of specific gender ideologies and behaviors.

racism, structural and institutional

Mikaila Mariel Lemonik Arthur

When most people think about racism, they think about the concept of individual prejudice – in other words, negative thoughts or stereotypes about a particular racial group. However, racism can also be embedded in the institutions and structures of social life. This type of racism can be called structural or institutional racism (hereafter, institutional racism) and it is significant in creating and maintaining the disparate outcomes that characterize the landscape of racial inequality.

The term institutional racism was first used by Carmichael and Hamilton in 1967 with the intent of differentiating individual racist acts from what we can describe as policies or practices that are built into the structures of various social institutions and which continue to

operate even without the active support and maintenance of individuals. Institutional racism has probably been with us for as long as human societies have been formally or legally divided into races. There are two main types of institutional racism. The first, which can be called "direct," occurs when policies are consciously designed to have discriminatory effects. These policies can be maintained through the legal system (such as in the case of apartheid in South Africa or Jim Crow in the US) or through conscious institutional practice (such as redlining in residential real estate or underfunding urban public schools). The second type, "indirect" institutional racism, includes practices that have disparate racial impacts even without any intent to discriminate (such as with network hiring in workplaces).

Institutional racism continues to affect many areas of life, in particular education, housing, economic life, imprisonment, and health care. Indirect institutional racism also continues to affect the lives of people of color, and because it is unconscious, those who maintain institutional structures and policies may not be aware of its existence unless it is challenged by activists or lawsuits. For instance, the Rockefeller drug laws in New York State, enacted in 1973, include very heavy penalties for those selling or possessing narcotics. These laws were enacted with the intent of protecting communities from the scourge of drug sales, but have led instead to disparate imprisonment of young black men. This is because though individuals of all races use drugs at similar rates, young black men are disproportionately likely to use the particular drugs targeted by the Rockefeller drug laws.

Institutional racism affects people of color in many aspects of their lives. Sociologists and other researchers continue to seek empirical evidence of institutional racism as they study such questions as the black-white test score gap and its effects on college admissions. However, it is much harder for researchers to find evidence of institutional racism than of individual discrimination. This is because it is possible for a set of guidelines to disadvantage a particular racial group while being consistently and fairly applied to all individuals. One of the most powerful tools used to uncover evidence of institutional racism is the audit study method, where testers are matched on all characteristics

except for race and sent to apply for jobs or housing. These studies present powerful evidence of the continued effects of institutional racism. For instance, Pager (2003) showed that white men with prison records and black men without prison records who are matched on other characteristics such as education and prior work experience are about equally likely to be hired for entry level jobs. Similar research has shown that black applicants for home loans or rental apartments are much less likely to be approved, and that people searching for residential real estate are likely to be steered to neighborhoods which match their skin color.

While civil rights legislation banning discrimination both in the public sphere (voting and *de jure* segregation) and the private sphere (universities and housing developments) was passed in the 1960s with the aim of outlawing direct institutional racism, lawsuits are of limited utility when it comes to enforcing such legislation in the absence of concrete evidence of harm to specific individuals (Crenshaw 1995). Another limitation of strategies designed to combat institutional racism is that they may be coopted. For instance, affirmative action was designed as a program to combat institutional racism in education and employment. Lawsuits targeting affirmative action programs, such as *Gratz v. Bollinger* and *Grutter v. Bollinger*, have suggested instead that affirmative action policies themselves are direct institutional racism, since they supposedly provide an advantage to particular racial groups. However, as Justice O'Connor pointed out in her majority opinion in *Grutter v. Bollinger*, institutional racism still limits the access of students of color to selective higher education institutions. Though these difficulties make it hard to find ways to combat institutional racism, analysts suggest that becoming conscious of its existence is the first step. Brown et al. (2003) then suggest that the best steps to take include setting up a formal regulatory apparatus to challenge institutional racism when it exists and to develop policies to deal with the "legacy of disaccumulation" in communities of color.

racist movements

Kathleen M. Blee

Racist movements are organized, collective efforts to create, preserve, or extend racial hierarchies of power and privilege. Such movements explicitly espouse the ideologies of white supremacy and/or anti-Semitism (anti Judaism or hatred of Muslims or Arabs) that were consolidated in the western world in the eighteenth and nineteenth centuries. Manifestations of intergroup antagonism in earlier times, even conflicts that cross what later would be regarded as racial lines, generally are not considered racial movements because these are not based in modern

ideas of race as an essential, biological, polarized, and unchanging attribute of social groups. Denoting as racist only social movements that take place in western societies is a common practice in sociological research, as most scholars regard white supremacy and anti-Semitism as the legacy of ideologies by which European colonists sought to exonerate their brutal conquests and occupations. However, this restriction has been challenged by studies that use the concept racist (or racial) movements to describe subnational intergroup antagonisms in a number of non-western societies, including China, India, Indonesia, and Russia.

Racist movements take a variety of forms over time and in different places. Some arise in response to political opportunities for asserting enhanced racial superiority; others as counter-movements organized to oppose perceived gains by other racial groups. Some recruit sizable proportions of the population, thereby accruing significant influence over state policy or even the ability to elect candidates to political office. Such large racist movements often are linked, overtly or covertly, to right-wing political parties, nationalist efforts, or fascist groups. In other contexts, racist movements are small and politically marginal. These tend to shun mainstream politics, relying instead on violence or terrorist tactics to achieve racist goals.

Racist movements also vary in their ideologies and agendas. Some favor the creation or preservation of racially homogeneous societies, generally through exclusion, expulsion, or extermination of those they regard as racially different. Others promote racial supremacy or separatism within heterogeneous societies. Although movements that promote racial superiority or separatism such as black nationalism or black separatism in the US are sometimes referred to as racist, scholars generally reserve this term for collective efforts that promote white or Aryan dominance because these seek to bolster established racial systems of subordination and superordination. White supremacist, Nazi and neo-Nazi, white power skinhead, Aryan supremacist, and white/Aryan separatist movements are types of modern racist movements.

The ideologies of racist movements typically are quite complex. All have a core belief in racial supremacy or racial separatism, but

this may coexist with philosophies that seem quite antithetical, such as environmentalism, women's rights, atheism, or anti colonialism. The ability to embrace beliefs from widely differing ideologies and social contexts while retaining racism as a central agenda is described as the "scavenger" aspect of modern racism. Racist movements are generally adept at recruiting members by presenting racial solutions to a wide range of non racial social concerns, including anxieties about crime, the quality of children's education, the global economy, or national pride. Such ideological flexibility is why some racist movements with very extreme racial views manage to attract a wide base of adherents.

Until the late twentieth century, racist movements tended to be fervently nationalistic. Racist leaders identified the interests of whites or Aryans as what was best for the nation as a whole and advocated national purges of other races. In the twenty first century, a number of racist movements have rejected narrow nationalist appeals in favor of global racist politics, what some term a movement of "pan Aryanism." The waning of nationalism in these racist movements is due to a variety of factors. Opportunities to spread the influence of racist movements through transnational venues such as the Internet have proven attractive. Also compelling is the global circulation of racist mercenary soldiers and terrorists, as well as a global trade in armaments and other contraband that presents the possibility for enhanced funding of racist movements. Equally important has been the declining support for national governments by racist movements. Many racist movements in the US, Canada, and Europe embrace extreme anti Jewish philosophies, often based on variants of Christian Identity, a racist philosophy that regards Jews as the powerful and literal descendants of the devil. These movements describe western governments as under the control of a Jewish elite, or, in racist terminology, as "Zionist Occupied Governments (ZOG)" and thus as obstacles to racist agendas.

The penchant for secrecy about strategies and future plans that is characteristic of virtually all modern racist movements makes it difficult to predict their future course, but it is likely that they will be small and very violent. In the aftermath of the atrocities of World War II,

particularly the extermination of millions of European Jews through deliberate policies of racial supremacy, overt racist appeals became less legitimate in many parts of the western world, making explicitly racist mass movements less likely. Also, racial hierarchies of privilege and subordination were sufficiently institutionalized in much of the West in the post war period that there was little impetus for mass racist mobilization to challenge existing arrangements. Racist movements that mobilized in the latter half of the twentieth and early twenty first centuries thus tended to be small groupings of white power advocates, neo Nazis, and Aryan supremacists. Except where they allied with political parties in some European and Southern African nations, these movements have had little direct impact on the policies of the nations in which they are located. Instead, some of the most influential racist movements have turned to strategies of violence and terrorism, seeking to disrupt the social order and provoke social chaos, a strategy they describe as instigating an apocalyptic "race war" to eradicate Jews and non whites.

WHY DO RACIAL MOVEMENTS ARISE?

Theories of why racist movements begin and how they attract adherents generally use frustration—reaction or intergroup competition frameworks. Frustration—reaction theory is based in older scholarly understandings of racist movements as collective and irrational expressions of anger by members of one racial group toward members of another. According to this theory, racist movements might accurately target groups that are responsible for their perceived problems, but, more often, they displace anger from the antagonist to a more vulnerable group that serves as a scapegoat and target of collective aggression. The case of Nazism in Germany — especially before the Nazi seizure of state power — often is used as an example of how racist movements emerge as a response to collective frustration. The Nazis, in this formulation, took advantage of the discontent evoked by economic turmoil and the national humiliation of Germany in World War I to build a popular movement. Jews, Roma (Gypsies), and others became scapegoats for collective anger

over Germany's national distress. When the Nazi movement took control of the German state, such sentiments made it possible to unleash a "final solution" of racial extermination, with catastrophic consequences.

A competing and later theory regards racist movements as the product of antagonisms that stem from competition between racial groups for social, economic, cultural, or territorial advantages. Competition theory has been used to explain the rise and fall of such racist movements as the Ku Klux Klan (KKK), a series of largely unconnected white supremacist movements that have appeared and collapsed in the US from the 1870s to the present. The first KKK emerged in the Reconstruction era South. This Klan was a small, loosely organized grouping of rural white men who used terror to bolster Southern white male privileges and combat what they feared to be the growing strength of African Americans and Northern politicians after the Civil War. This Klan collapsed in the 1870s in the wake of federal sanctions and, perhaps more importantly, because whites perceived political or economic competition from African Americans to have waned as the result of racist legislation and renewed white control of the Southern economy. In the mid 1910s, a new Klan emerged in the South, but this KKK movement grew strongest in the cities of the Midwest, East Coast, and West Coast. Competition theory explains the shift in the Klan's base as the result of changes in patterns of interracial rivalry. White Protestants in Northern and coastal states turned to the Klan when they felt threatened by large numbers of Catholic and Jewish immigrants and the migration of African Americans from the South. The second Klan thus used economic boycotts and electoral politics to curb competition and maintain the privileges of white native born Protestants. After the collapse of the second Klan in the late 1920s, subsequent eruptions of the KKK were small and concentrated in the South, emerging largely in response to racial integration of schools.

Competition and, less commonly, frustration-reaction theories are widely used in the study of racial movements, but there are problems with each theory. Frustration-reaction theory has been criticized for reducing social phenomena to individual psychological states, making it difficult to account for the varying

appeal of racist movements in times or places in which people are likely to experience similar levels of anger or distress. Moreover, research on racist movements, even German Nazism, finds that factors other than intergroup hostility are significant in mobilizing people toward racist collective action, and that racist activists are no less logical or rational than others in a similar social context. Frustration-reaction theory also can be circular, using the presence of racist movements as evidence of antecedent collective anxiety. Competition theory is generally more robust for explaining racist movement. This theory suggests that racist movements emerge as the result of economic and political competition among racial groups. The spike in racist movements and racial violence in late twentieth century Europe that accompanied the influx of migrants from former colonies in Northern Africa and South Asia is an example, as is the racist backlash that occurred with post communist economic and political uncertainty in Russia and Eastern Europe. However, counterexamples suggest that competition theory might not be universally applicable. The largest racist movements in the twentieth century US occurred in the 1910s-1920s, 1950s-1960s, and 1980s, times of relative economic prosperity for many whites in which racial competition for jobs and social benefits was relatively low; in contrast, the serious economic depression of the 1930s, with its severe competition for jobs and economic benefits, witnessed comparatively fewer racist movements.

DATA AND METHODOLOGIES

Racist movements pose complicated problems for researchers. Most evident is the danger of studying groups in which violence is common and directed not only at those perceived to be enemies of the movement, but also at allies, even members. Researchers may find it difficult to avoid becoming a target of a violence that tends to suffuse organized racism. Moreover, since racist groups generally seek to avoid public scrutiny and are particularly concerned about infiltration by government authorities, researchers face danger if they are perceived as disseminating negative information about racist groups or as potential government informants.

Another problem for the study of racist movements is that these tend to operate illegally or on the margins of legality. Except in the rare cases where racist movements operate in the political mainstream, visible racist activists also face sanction from family, friends, and employers. Most racist movements thus operate in ways that are difficult for anyone – including authorities and researchers – to trace, creating few documents and attempting to obfuscate the identities, intentions, and activities of their members.

Concerns about researcher safety and the inaccessibility of racist groups have had a pronounced effect on the methodologies used in racist movement studies, especially by shaping the techniques of data collection. Much research on racist movements is based on information made publicly available by racist groups, such as group propaganda, evidence from rallies and protests, and interviews with racist spokespersons. These have proven useful in detailing changes over time in the ideological direction of racist groups and their ability to mobilize adherents for public events. However, the validity of such data is questionable since these reflect what racist leaders deem useful to be disseminated and reveal little about how racist groups actually operate. Such important questions as how racist movements are funded, what alliances exist among racist groups, and how organized racists formulate strategies cannot be addressed with information garnered from racist movements themselves. Moreover, such data tend to overemphasize the importance of self-designated leaders, making it difficult to understand the composition and activities of their overall memberships, which increasingly are composed of substantial numbers, even majorities, of women and teenagers who are almost never regarded internally as leaders or spokespersons for racist groups.

A second source of data on racist movements is government intelligence and information from private anti racist monitoring agencies such as Searchlight (England) or the Southern Poverty Law Center (US). These agencies collect and disseminate information from the public events of racist groups, as well as information acquired through arrests and criminal and civil prosecutions of racist members and groups, and from infiltrators or defectors from the racist movement. Such data have been used effectively

to analyze the strategic and tactical operations of racist movements across the world. Yet the validity of such information too can be questionable since it is often collected to meet the needs or enhance the political advantages of monitoring agencies rather than for purposes of social scientific research.

A third and much less common source of data on racist movements is ethnographic observation of the inner workings of racist groups or interviews with their members. To get access to accurate information while protecting the safety of a researcher requires lengthy and delicate negotiation with racist activists, so these data have only been collected on a small number of racist groups, limited geographical areas, and subsets of racist activists such as women or teen aged white power skinheads. Conclusions derived from analyses of these data may have limited generalizability.

GAPS IN RACIST MOVEMENT RESEARCH

There are large gaps in what is known about racist movements. The difficulty of collecting valid data on secretive and dangerous groups, as well as widespread scholarly aversion to studying loathsome social movements, has resulted in a paucity of research on racist social movements relative to social movements that advocate progressive social change. There is a need for additional research on four important aspects of racist movements.

First, there is virtually no data on global circulation of ideas, strategies, resources, or members of racist movements. It is unclear whether or how racist movements in various parts of the world have coordinated their efforts, or even how the notion of pan Aryan unity has been received across different racist movements.

Second, scholars do not fully understand how and why people are attracted to racist ideas and movements. The theory that adherence to racist groups is a product of individual pathologies or irrational emotions is clearly inadequate, but a clearer understanding of the mechanisms and motivations of racist movement recruitment has not been formulated.

Third, there is only fragmentary evidence about the range of outcomes that are associated

with different types of racist movements. It is unclear, for example, whether the adoption of Christian Identity precepts is likely to precipitate strategies of terrorist violence. It is also unknown whether small, secretive racist groups will prove to be more durable than larger racist movements.

Finally, the connections between racist movements and the social contexts in which they emerge and are sustained needs additional study. It is not enough to assert that racist societies provide the social environment in which racist movements can develop, as there is considerable variation in the extent to which this occurs. Rather, researchers need to explore the mechanisms that link the extreme ideologies of racist movements with the normative and institutionalized racist practices of their societies.

Radcliffe-Brown, Alfred R. (1881–1955)

Bernd Weiler

Alfred Reginald Radcliffe Brown and Bronislaw Malinowski (1884–1942) are generally considered to be the “founding fathers” of British social anthropology. Born into a poor family in Sparkbrook, Birmingham, Radcliffe Brown attended King Edward’s School and worked in a library in Birmingham before being awarded a scholarship for Trinity College, Cambridge, in 1902. At Cambridge Radcliffe Brown, whose interest in the social sciences was allegedly stimulated by his acquaintance with H. Ellis and P. Kropotkin, took his undergraduate work in Mental and Moral Science. Toward the end of his formal education he turned to anthropology, studying with, among others, W. H. R. Rivers, A. C. Haddon, and C. S. Myers, all veterans of the famous Torres Straits Expedition (cf. Kuper 1989: 36–49; Stocking 1996: 306). In 1906, after one year of preparation, Radcliffe Brown went to do fieldwork among the Andaman Islanders, who in the evolutionist framework were supposed to be among the “lowest” peoples on earth. Upon his return in 1908, Radcliffe Brown became a fellow at Trinity College and, as he

wrote in a letter to M. Mauss in 1912, found himself “in complete agreement with the view of sociology put forward in the *Année sociologique*” as well as being “the first person to expound . . . [Durkheim’s] views in England.” Between 1910 and 1912 he conducted further ethnographic research in Western Australia. After World War I Radcliffe Brown, whose ethnography on *The Andaman Islanders* (1922) appeared in the same year as Malinowski’s work on the Trobrianders, led a nomadic academic existence, teaching anthropology at Cape Town, Sydney, Chicago, Yenching, Oxford, São Paulo, London, Manchester, Alexandria, and Grahamstown, South Africa. From the late 1930s, when Malinowski left for the United States and Radcliffe Brown returned to England, to the early 1950s, Radcliffe Brown’s (structural) functionalism dominated British social anthropology. Social scientists influenced by Radcliffe Brown’s teaching in and outside Great Britain include (the early) E. E. Evans Pritchard, M. Fortes, S. F. Nadel, M. Gluckman, I. Schapera, A. P. Elkin, M. N. Srinivas, F. Eggan, R. Redfield, S. Tax, and W. L. Warner.

As a theorist Radcliffe Brown, together with Malinowski, is generally credited for having led the “synchronic and nomothetic revolution” in anthropology, thereby discarding at the same time the theories of social evolutionism and diffusionism. Radcliffe Brown defined social anthropology as the comparative sociology of “primitive societies.” He concurred with F. Boas and his school that the schemes of social evolutionism had often been highly speculative based upon flimsy facts and that anthropology had to employ thorough methods of observation and data collection. In contrast to the Boasians, however, who sought to reconstruct the history of a particular culture or culture area, he argued that the objective of anthropology was to find social laws. The discovery of these laws required generalizing about a particular society’s “social structure,” which was amenable to direct observation, and to bring to light its “structural form,” its recurrent patterns of relationships. In a second step of generalization, one was to compare the “structural forms” of different societies. Radcliffe Brown hoped that this comparative analysis would eventually yield social laws akin to those that had already been found in the natural sciences (Barnard 2001: 70–9).

Radcliffe Brown’s theoretical work is commonly subsumed under the heading of functionalism or structural functionalism. Rejecting the idea that societies are mere agglomerates of fortuitous elements and relying upon the “organic analogy,” Radcliffe Brown emphasized the fact that all communities had to have a certain level of interconnectedness and unity in order to survive. In contrast to Malinowski, who argued that culture was “functional” to the extent that it satisfied individual biopsychological needs, Radcliffe Brown followed the sociological approach of Spencer and Durkheim and defined the function of a recurrent activity, for example a funeral ceremony, as “the part it plays in the social life as a whole” (Radcliffe Brown 1952: 180). Denouncing the search for origins as futile, Radcliffe Brown argued that in order to understand a typical activity or an institution, it was not necessary to know its history and how it had developed over time but to know how it contributed to the continuity of the structure in the present. Despite the later critique of Radcliffe Brown’s work, especially of his anti-historical bias, his disregard of social change, his “oversocialized conception of man,” his all too harmonious depiction of society, the colonialist ideology implicit in functionalism, and the vagueness of his central concept of “structural continuity,” his ideas were formative not only for modern kinship studies and for political and legal anthropology, but also for subsequent functionalist and structuralist theory building in anthropology and sociology. In histories of anthropology, Malinowski is often portrayed as the “culture hero” of fieldwork, whereas Radcliffe Brown is seen as the first truly scientific theorist of British social anthropology whose enduring legacy lies in his emphasis on comparative and generalizing analyses.

radical feminism

Eve Shapiro

Radical feminism arose in the US, Canada, and Britain out of young women's experiences within the civil rights, New Left, and anti war movements of the 1960s. Drawing on de Beauvoir's concept of "sex class" from *The Second Sex* (1952), radical feminism – emerging from what was known in the late 1960s as the women's liberation movement – developed an analysis of women's inequality at the social structural level and was a revolutionary (as opposed to reformist) movement that called for fundamental institutional and cultural changes in society. There were three key beliefs guiding radical feminist analysis and activism. First and foremost, radical feminism argued that gender was the primary oppression all women face in

society. Second, it asserted that women were, either essentially or due to social construction, fundamentally different from men. Third, it held that social institutions and norms rely on women's subordination, and consequently are constructed to maintain and perpetuate gender inequality in all aspects of life, including around deeply personal facets like sexuality and reproduction.

Radical feminism was distinct from the surge in liberal feminist activism committed to fostering change within existing institutions that also emerged in the late 1960s. As Sara Evans documented in *Personal Politics* (1980), during the 1960s women gained experience as activists and were simultaneously faced with sexism within progressive movements. Out of these experiences women formed radical feminist groups such as the Chicago Women's Liberation Union, the London Women's Liberation Work shop, and the Redstockings, seemingly overnight in 1967 and 1968. Within a year there were hundreds of radical feminist groups across the US, Canada, and Britain that combined personal education, public protests, and cultural development. Radical feminism was the most dominant force in the development of feminist activism and scholarship through the mid 1970s and has continued to influence offshoots including cultural feminism and lesbian feminism, and academia in the form of women's studies.

A REVOLUTIONARY MOVEMENT

In her article "The Women's Rights Movement in the US: A New View" (1968), Shulamith Firestone argued that the women's liberation movement has historically been a revolutionary movement. Firestone retold the story of first wave feminist activism as a radical movement, drew historical connections to anti racist and anti capitalist movements, and asserted that the emerging feminist movement was the continuation of this legacy. It was this belief that equality demanded a drastic transformation of social institutions that made radical feminism revolutionary.

Radical feminists theorized that sex class (women as a distinct class unto themselves) was a social phenomenon maintained through violence and social sanctions, and advocated

women's autonomy from men in all aspects of society. Out of this ideology developed critiques of all social institutions, including language, science, capitalism, family, violence, sexuality, and law. These radical critiques examined how institutions maintained inequality and oppressed women. For example, Susan Griffin and Susan Brownmiller both argued that rape was not about sex but about the enforcement of patriarchal control and misogyny. Activists such as Ti Grace Atkinson argued that patriarchal oppression pervaded all aspects of women's personal and public life and that the only path toward equality was a fundamental restructuring of all social institutions.

PERSONAL IS POLITICAL

One of the most important concepts to come out of radical feminism was the idea that the "personal is political." What radical feminists meant by this was that women's intimate experiences of oppression (e.g., within the family) were not isolated experiences, but rather products of institutional inequality. Out of the analysis that oppression affected all facets of life came a number of social movement tactics.

Consciousness raising (CR) groups – small gatherings where women shared their experiences of sexism and developed a collective feminist critique – were a fundamental part of radical feminist organizing. Originating with the New York Radical Women, CR groups quickly became a staple of radical feminism. They were aimed at helping women understand their own experiences through the lens of radical feminist ideology and politicizing them around gender oppression in the process. It was through these groups that issues such as rape, abortion, and sexuality (both heterosexuality and homosexuality) became politicized issues for feminist movements.

Radical feminism also created new movement structures and organizational forms. In an effort to eradicate what were viewed as patriarchal power relations, radical feminist groups developed non hierarchical, consensus based structures and processes. Radical feminist organizations often developed numerous subcommittees to address the many arenas of

social change women's liberation groups saw as central. The Chicago Women's Liberation Union, for example, had more than 20 working groups, including daycare, an abortion referral service, a prison project, a graphics collective, and a newspaper. Radical feminism utilized a number of new social movement tactics, including "zaps," or action oriented protests, guerrilla theater, and the creation of alternative institutions such as women run health care centers, music labels, and mechanics shops.

DEMANDING STRUCTURAL CHANGE

One of the first radical feminist protests was held at the opening of Congress in January 1968. The "Jeanette Rankin Brigade," named after the first woman elected to Congress and led by Rankin herself, brought 5,000 women affiliated with women's peace groups to demonstrate against the Vietnam War. At this protest the New York Radical Women staged a guerrilla theater piece titled "Burial of Traditional Womanhood," and it was at this protest that the phrase "sisterhood is powerful" was first used.

A much more highly publicized protest was held a few months later on the Atlantic City boardwalk during the Miss America Beauty Contest. Joining forces with members of the New York chapter of the National Organization for Women, a liberal feminist organization, radical feminist groups disrupted the Miss America pageant and demonstrated on the boardwalk. Drawing on radical feminist ideology, the street theater performed on the boardwalk drew connections between capitalism, patriarchy, mass media, and beauty myths and catapulted the burgeoning women's liberation movement into the public spotlight. It was out of this protest that the myth of "bra burning" arose, even though no bras were burned. A similar protest was staged in Britain in 1970 at the Miss World competition in London. Radical feminist protesters interrupted the competition shouting "We're not beautiful, we're not ugly, we're angry" and throwing tomatoes and flour bombs at the emcee Bob Hope.

While radical feminist activism was decentralized with no national leadership or organization

as part of empowering all women to be feminist activists and leaders, groups did work together. In 1971 British women's liberation groups held a conference at Ruskin College in Oxford to discuss movement goals and strategies. In the US on August 26, 1970 radical feminist groups across the country participated in "strike for equality" marches to commemorate the 50th anniversary of women's suffrage. Reflecting the exponential growth of feminist movements between 1967 and 1970, 50,000 women marched in New York City, 3,000 in Chicago, 2,000 in Boston, and countless others in cities and towns across the country.

Some of the most significant legacies of radical feminist organizing are the service organizations that grew out of women's liberation groups. Domestic violence shelters were founded in the early 1970s, as were rape crisis centers, feminist bookstores, and women's studies programs. Canadian radical feminists worked through the Women's Legal Education and Action Fund to argue and win a Canadian Supreme Court obscenity case. Echoing the radical feminist analysis that "pornography is the theory, rape is the practice," the 1992 Butler decision ruled that the potential harm pornography could inflict on women was more significant, legally, than freedom of expression. US scholar Andrea Dworkin and lawyer Catherine MacKinnon, who worked to introduce anti-pornography legislation in the US, influenced this legal approach to institutional change.

"GAY-STRAIGHT SPLIT" AND CULTURAL FEMINISM

As Nancy Whittier explored in *Feminist Generations*, an in depth study of the radical feminist community in Columbus, Ohio, by the end of the 1970s, differences between radical and liberal feminisms became less clear as liberal groups radicalized and radical feminism moved toward self help and service organizations. Similarly, Suzanne Staggenborg documented how radical feminist organizations became more centralized and hierarchical in structure over time. Radical feminists criticized this shift toward what came to be called cultural feminism as a diversion from revolutionary change. But

as Taylor and Rupp argued in "Women's Culture and Lesbian Feminist Activism: A Reconsideration of Cultural Feminism" (1993), the development of women focused institutions, community, and culture was a successful means of perpetuating feminist activism in an increasingly hostile environment.

As part of the development of cultural feminism, there was a split within radical feminist communities around sexuality. Sparked by homophobia within feminist movements, nascent lesbian centered feminist theorizing such as Adrienne Rich's "Compulsory Heterosexuality and Lesbian Existence" (1983), and sexism within the gay liberation movement, lesbian identified feminists developed a separate branch of feminism. Lesbian feminism extended radical feminist ideology and argued that gender and sexuality are inexorably linked and work dialectically to reinforce patriarchal power.

SCHOLARSHIP

Guided by radical feminist ideology, scholars such as Kate Millett and Anne Koedt created a body of feminist research that emerged in the 1970s and has continued to the present. Early anthologies documented the emergence and ideological development of feminist movements. This early scholarship focused on reclaiming contemporary and canonic theories from a woman centered viewpoint. For example, drawing on and elaborating Marx's concept of historical materialism, Shulamith Firestone developed a theory of women's oppression and the primacy of sexism in the *Dialectics of Sex* (1970). Other authors focused on substantiating claims about the structural norms that maintain gender inequality. Gayle Rubin's 1975 article, "The Traffic in Women: Notes on the Political Economy of Sex," asserted that kinship and marriage norms functioned to trade women as property in the service of men's social relationships. Similarly, Mary Daly argued in *Gyn/Ecology: The Metaethics of Radical Feminism* (1978) that language itself was patriarchal and that women needed to create new words to replace oppressive language. Much of this research supported the radical feminist belief in fundamental differences between men and women. For example,

Carol Gilligan's controversial book *In a Different Voice* (1981) argued that women make different moral judgments than men, and radical feminists used this to support arguments that women were, indeed, morally superior.

Other feminist scholars documented feminist activism and elaborated ideological tenets. Books such as *The Politics of Women's Liberation: A Case Study of an Emerging Social Movement and Its Relation to the Policy Process* (1975), by Jo Freeman, and Alice Echols's groundbreaking *Daring to Be Bad: Radical Feminism in America, 1967–1975* (1989), helped bridge feminist academic research and activism. More recently, scholars like Belinda Robnett and Verta Taylor have examined radical feminist movements in more detail from a social movement's perspective. Benita Roth argues in *Separate Roads to Feminism: Black, Chicana, and White Feminist Movements in America's Second Wave* (2004) that while earlier case studies have erased or dismissed the involvement of black and Chicana women in radical feminism and other second wave movements, significant numbers of women of color participated in feminist movements.

CRITIQUES

The central critique of radical feminism, which emerged alongside organizing and scholarship, was that theorizing women as a sex class obscured differences between women, especially in terms of race, class, and nation. In *Black Feminist Thought: Knowledge, Consciousness, and the Politics of Empowerment* (1990) Patricia Hill Collins described the interrelationships of oppression as a "matrix of domination" and argued that radical feminism marginalized women of color and poor women and perpetuated classism and racism in the process. This marginalization happened within activism, scholarship, and theorizing. In one of the first and most important anthologies by women of color feminists, *This Bridge Called My Back* (Moraga & Anzaldúa 1981), women of color wrote about the intersections of race, class, gender and nation, feminist movements, and marginalization. Over time, more specific anthologies about Chicana, Asian/Pacific Islander, and black women also appeared, such as

Homegirls: A Black Feminist Anthology (1983), edited by Barbara Smith.

The second significant critique of radical feminism has been the focus on identity and women's difference. Post modern and queer theorists such as Judith Butler and Elizabeth Grosz have asserted that radical feminist ideology essentialized differences between men and women, and in so doing reinforced and reified gender roles and indeed gender itself. Transgender activists have developed similar critiques of radical feminism and argued that attributing traits to essentialist notions of womanhood and manhood reinforces the naturalization of both gender and sex.

Regardless of these critiques radical feminist theorizing has continued to influence feminist activism and scholarship. The institutional legacies, in the form of rape crisis centers, women's studies programs, and community political organizations, continue to thrive, and radical feminist ideology continues to shape contemporary feminist movements.

radio

Tim Crook

Human social life depends upon the constant development and varied uses of modes of communication. Social existence also relies on shared and contested understandings of the world. This necessitates the systematic study of communication and culture, and of their mediation through a variety of channels. The sociology of radio concentrates on the role of the radio medium in this process. Radio is now embedded in a complex intermedia world. It is not a medium that has been substantially substituted by the subsequent development of alternative modes of communication. But the changing nature of communications technology has led to a change in style of content and social function of radio in human communities.

In most societies radio enjoyed a paradigmatic status in the electronic arena prior to the establishment of television. During this time radio content contained a significant amount of speech programming. Following the assertion of television as the dominant form of electronic entertainment and information, radio formats became dominated by music programming. In the post industrial age speech and cultural affairs programming now tends to be underwritten by public/state broadcasting institutions.

The sociological approach investigates the regional, national, and global order in which the radio cultural and communications industries have played an increasingly central role, and the way radio media forms and practices participate in social and political organization and creative expression. It concentrates on understanding the role of radio in contributing to symbolic structures in human interaction, and the specific tasks involved in addressing their changing role in contemporary societies.

The sociology of radio is an interdisciplinary and multidisciplinary process that draws from the arts, humanities, and social sciences. As such, it involves the mapping and testing of concepts and theories in a cartographic intellectual arena marked by many locations of academic contestation. Both quantitative and qualitative methods of inquiry have been employed. In simple terms, the subject oscillates between

qualitative analysis of radio texts, a discourse on the relationship with social, cultural, political, and economic contexts, and social scientific measurements of quantifiable data so that there is an inductive background to deductive assertions.

The sociology of radio is an academic process that is central to the modern subject of media or communication studies. Indeed, it could be argued that an intellectual sociological investigation of radio was a key starting point for studying the nature of human communication in society in the twentieth century.

Qualitative textual analysis borrows from "rhetoric" (the study of oral and written communication), an academic discipline stretching back to the time of ancient Greece and Rome. It was a key subject in the Middle Ages and during the European Renaissance and Enlightenment. The sociology of radio is also influenced by the development of academic disciplines over the last three centuries that interrogated concepts such as public opinion, mass audience, propaganda, information war, and communications media. The paradigmatic age of radio stimulated academics to see the links between radio broadcast content and oral and written communications of social, political, and aesthetic discourse. The study of the electronic medium of radio appeared to stimulate a much more complex interdisciplinary analysis of media and linked sociology with psychology, anthropology, and other subjects.

T. H. Pear of Manchester University appears to have undertaken the first serious academic investigation of the social psychological impact of radio. In research conducted between 1927 and 1931 he focused on the relationship between voice and personality. His methodology would be considered crude by contemporary standards, but it was qualitative and quantitative and conducted in accordance with the prevailing notions of scientific and laboratory discipline. He even had the cooperation of the BBC in broadcasting special performances so that listeners could fill out questionnaires distributed by the BBC's listings magazine, *Radio Times*. He wanted to explore the process of listening to radio drama on the BBC. He approached the project by exploring radio drama from the listener's end, the psychological problems of listening to radio drama, imagining the unseen through experiments connected with radio drama, a discourse

on the issue of radio and talking films, and whether radio broadcasting and listening had any role in the construction of the radio personality. He published his research in *Voice and Personality* in 1931.

In the US, Hadley Cantril and Gordon W. Allport followed up Pear's work in Britain. Again, they concentrated on the social psychology of radio. However, they extended the inquiry with wider sociological concerns. As a result they contextualized radio listening not only from the point of view of radio as a psychological novelty, but also to include issues such as the influence of radio upon mental and social life, the nature of the American radio industry, its institutions, the process of "fashioning the listener's attitudes and opinions," censorship, propaganda, the sponsorship and content of programs, and listeners' tastes and habits. They also conducted experiments concerning voice and personality, sex differences in radio voices, the differences between human speaker and electronic speaker reception, listening versus reading, and whether there were effective conditions for broadcasting. Their approach was practical as well as abstract. They wanted to assess the sociological implications of broadcasting technique, entertainment, advertising, education, and the argument that radio could extend the social environment. This research was published in *The Psychology of Radio* in 1935.

In Britain, Hilda Matheson published a book called *Broadcasting in the Home* University Library of Modern Knowledge series in 1933 that appears to be one of the first sociological discourses on radio's role in twentieth century society. Matheson had been head of talks at the BBC, had commissioned the development of an independent news section, and had background expertise on the role of propaganda as a result of her career in the Security Service (MI5) during World War I. Matheson analyzed the role of radio historically and its social context from the point of view of living speech, public opinion, literature and drama, music, entertainment, education, and its relationship with the state. Her approach was logical and pioneering: "When we talk of the effects of broadcasting, we usually think in the first instance of the effects upon the body of actual listeners – upon

their tastes in music, their general interests, and their social habits. It is obvious, however, that the ripples in the pond reach much further than this." Despite her modest avowal that the text was a mere "brief sketch of broadcasting," Matheson had set out a sociological agenda with an appreciation of the cultural and aesthetic role of radio broadcasting.

One of Matheson's colleagues at the BBC, Charles A. Siepmann, emigrated to the US and took up the sociological baton of analysis with the polemical *Radio's Second Chance* in 1946 and the more academic *Radio, Television and Society* published in 1950. Siepmann declared that his primary purpose was to outline "the history of a cultural revolution and to show what has been discovered by research concerning the effects of radio and television upon our tastes, opinions, and values. The second purpose is to deal with broadcasting as a reflection of our time and to throw light upon the problems of free speech, propaganda, public education, our relations with the rest of the world, and upon the concept of democracy itself" (Siepmann 1950: v). Siepmann widened Matheson's international analysis between UK and US broadcasting and he divided his study between systems and institutions of broadcasting and the social implications of radio in terms of propaganda and public opinion, freedom of speech in theory and practice, radio and education, and world listening. His engagement with television was somewhat peripheral, as by 1950 it was still a somewhat inchoate medium, though expanding exponentially in its social and cultural role in American and British societies.

Among the more influential thinkers who have linked sociological approaches with other disciplines are Harold Innis (1894–1952), associated with the "bias of communications"; Marshall McLuhan (1911–80), who wrote about the concept of the "global village"; and Jürgen Habermas, the German post Frankfurt School sociologist who has highlighted the role of the public sphere as a social zone for the discourse of ideas and expression of a public view. Each of them lived during the so called Golden Age of radio when it was the dominant electronic medium of communication. All three touched on, though did not prioritize, the social role of radio in their writing.

Radio has been both an origin and a bridge for distinctive genres and forms of storytelling across the timeline of human communities. Thus, the television serial was derived from the radio serial, which was derived from the serialized novel published in magazines during the nineteenth century. The use of speech balloons in twentieth century cartoons and comic books was present in Renaissance religious art. The newspaper strip cartoons were both based on and inspired radio serials as an established popular genre of entertainment and comedy.

Moral panics and condemnation of new media forms have followed the popularity of charismatic public poetry in the age of Plato, plays performed in the seventeenth and eighteenth centuries, published romances, “penny dreadfuls,” the “yellow press,” and “muck raking” pamphleteers in the nineteenth century. In the early days of radio there were fears that transmitters could change the weather, make women pregnant, host the souls of the deceased, and induce insanity. States were quick to ration, control, and censor radio broadcasting and reception and there were debates, as was the case with film, television and the Internet, that radio broadcasting could be a causal factor in generating social delinquency, sociopathy, and sexual deviance.

The groundbreaking social science research project into the link between radio broadcasting and social action, perhaps the first mass media moral panic inquiry, was conducted by Hadley Cantril with the assistance of Hazel Gaudet and Herta Herzog between 1938 and 1940. They investigated, quantitatively and qualitatively, the impact of the Halloween broadcast by Orson Welles’s CBS Mercury Theatre of the Air in October 1938. The radio broadcast of the dramatization of H. G. Wells’s *War of the Worlds* appeared to have been a causal factor in wide spread panic and anxiety. Thousands of listeners were unable to distinguish its fictional content from the reality of a news broadcast. The *War of the Worlds* study stemmed from the setting up of the Office of Radio Research with Paul F. Lazarsfeld as director, and Frank Stanton and Hadley Cantril as associate directors. The Rockefeller Foundation made the office’s first grant to Princeton University in 1937. The *War of the Worlds* study was funded by a special grant from the General Education

Board. The field HQ of the research office had been based in New York City, and when it was felt that the project should be relocated to a more local university, it transferred to Columbia University in the spring of 1940. The Office of Radio Research became the most significant center for sociological analysis of radio as a mass medium in the history of the subject and its record of research output is unrivalled. It had the opportunity of investigating radio during its primacy as a mass medium and so historically it is the laboratory control phase without the competition from television that emerged after World War II. Furthermore, the studies centered on the largest and most complex and powerful capitalist society. The research also occurred during a period of extraordinary social human catastrophe. Lazarsfeld and his wife Herzog and many of the researchers associated with the office were German/Austrian Jewish exiles. It is likely their background of Nazi persecution heavily influenced their intellectual and cultural approach. Their study and analysis of US society was dominated by a Marxist critical framework.

The office’s first significant publication was *Radio and the Printed Page* in 1940. The premise of the study was that in less than 20 years radio had just about reached the goal toward which print had been working for 500 years: to extend its audience to include the whole population. The researchers wished to pose these questions: Will radio displace reading? Is the average man as much affected, moved to action, by what he hears as by what he reads? And most important of all, who listens to what? The office based its findings on thousands of detailed interviews held with radio listeners of every type all over the US. The study focused on the conflict of radio and the press and its economic, educational, sociological, and political implications.

Radio Research 1941 published a rich range of sociological analysis. Rudolf Arnheim and Martha Collins Bayne investigated foreign language broadcasts over local American stations, Duncan MacDougald, Jr. analyzed the role of radio and the popular music industry, Theodor Adorno studied “The Radio Symphony – an experiment in theory,” Edward A. Suchman turned his attention to the study of the creation of new music listeners by the radio, and

Frederick J. Meine concentrated on radio and the press among young people. Meine focused on answering three questions: Where do young people get most of their news? What are the factors which influence news consumption? What are the factors which influence knowledge of the news?

William S. Robinson's work on radio and the farmer constituted a complex sociological study. He started with the phenomenon of radio and the rural individual, ways of studying individual effects, interest in national and international affairs, radio as an educational instrument, and the effect of radio and migration from the farm. He extended his study to investigate the issue of controlling rural opinion and action via radio, some social effects of radio in terms of unorganized social intercourse, organized social intercourse, deliberateness of decisions and the social effects of radio, and radio and church attendance.

Rudolf Arnheim had published a qualitative discussion of radio aesthetics in *Radio* published in 1935. His writing was primarily poetic and philosophical and progressed from discussion of issues such as the imagery of the ear and the world of sound, to practical production techniques of direction and distance, spatial resonance, sequence and juxtaposition, and the necessity of radio film. He did touch on sociological questions when analyzing "In Praise of Blindness: Emancipation from the Body," the relationship between author and producer, the art of speaking to everybody, wireless and the nations, and the psychology of the listener.

By 1941 Theodor Adorno had completed a masterful qualitative study of the phenomenon of neo fascist charismatic US radio broadcasters such as Father Charles Coughlan. Adorno focused on the broadcaster called Martin Luther Thomas. *The Psychological Technique of Martin Luther Thomas's Radio Addresses* was not published until 1976 in German and 2000 in English. His study represents a seminal textual analysis of the cultural technique and sociology of using radio to propagandize the listener into social action. Adorno concentrated on the personal element in self characterization of the agitator, Thomas's broadcasting method, the religious dimension of broadcasting and reception, and Thomas's engagement with ideological bait.

Radio Research 1942-43 marked a significant expansion of the center's sociological work on radio in the US. Herta Herzog and Rudolf Arnheim investigated the textual content and reception of daytime serials that constituted the primary form in the talk broadcasting of the time. Charles A. Siepmann began an important study on the role of radio in wartime. This involved looking into the relation between government and industry, the dissemination of information, and the use of radio in furthering understanding.

The head of radio audience research at the BBC, Robert J. E. Silvey, made a contribution on studying radio listening in Britain. Ernst Kris, Hans Herma, and Howard White presented a substantial analysis of German radio propaganda. Radio in operation was represented by studies in program profiling and the industry's use of a system called the Program Analyzer. John Gray Peatman explored radio and popular music. Progress in listener research was represented by Boyd R. McCandless's study on why people did not listen or stopped listening to radio. Alfred Udow and Rena Ross investigated the role of bias in radio broadcasting and Ernest Dichter presented a paper on the psychology of radio commercials.

The Office of Radio Research became a division of an expanded Bureau of Applied Social Research at Columbia University and radio's role in the 1940 presidential election was represented in the substantial quantitative and qualitative project *The People's Choice* (Lazarsfeld et al. 1944). Chapter 14, "The Radio and the Printed Page," investigated the concentration of exposure to radio compared to print publication during the election, and whether radio had a key role in decisions taken by voters. Quantitative analysis indicated people highly exposed to one medium of communication also tend to be highly exposed to other media, there are relatively few who are highly exposed to one medium and little exposed to the other, and people highly exposed at one time also tend to be highly exposed at another time of the campaign. The study sought to pose the question: Which is more influential: radio or newspaper?

The People Look at Radio (1946) and *Radio Listening in America* (1948) involved collaboration between nationwide surveys conducted by the National Opinion Research Center at the

universities of Denver and Chicago and analysis by the Bureau of Applied Social Research at Columbia University. Both these studies investigated the listener's attitude to radio broadcasting, including the content and process of advertising. The research was critical and complex in its conclusions. Lazarsfeld reported in 1946 that "for different groups of the population radio has quite different functions: group tastes and their expectations vary much more than the ordinary listener, and very often the individual broadcaster is aware" (Lazarsfeld & Field 1946: viii). *Radio Listening in America* extended the analysis and confirmed that tastes in radio content differed widely in terms of social and economic status, education, age, sex, and urban or rural existence. Persons in upper income groups, for example, tended to favor serious music and radio forums more often than did people lower on the economic scale. Far more men than women regularly listened to news broadcasts. City dwellers preferred classical music, whereas rural residents were partial to plaintive western music.

Sociological examination of radio became subsumed into a wider communications approach with television becoming paradigmatic from the early 1950s. The key landmarks in the social history of broadcasting are the five volume series *The History of Broadcasting in the United Kingdom* by Asa Briggs and the three volume series *A History of Broadcasting in the United States* by Erik Barnauw. Paddy Scannell and the late David Cardiff began an elegantly written *A Social History of British Broadcasting*. However, this project did not progress to subsequent volumes and it is understandable that Briggs and Barnauw transferred their focus to the social history of television in later volumes.

In recent years there has been a promising development in "radio studies" which is primarily grounded in the disciplines of sociology and cultural studies. The *Journal of Radio Studies* (US) and *Radio Journal: International Studies in Broadcast and Audio Media* (UK) provide an opportunity for peer reviewed papers. Goldsmiths College, University of London offers a defined postgraduate course in "Radio Studies: A Cultural Enquiry," and there is evidence of increased interest in continuing significant research into both the textual form

and contextual social topography of radio broadcasting.

random sample

Roger E. Kirk

A census, which is a survey of every unit in a population, is rarely used to gather information in the social sciences because it is often costly, time consuming, or impracticable. Instead, researchers gather the information from a sample that is assumed to be representative of the population. Such a sample can be obtained by using a *simple random sampling procedure*. The procedure selects a sample of size n without replacement from a finite population of size $N < n$ such that each of the $N!/n!(N-n)!$ possible samples is equally likely to be selected. The resulting sample is called a *simple random sample*. Simple random sampling is a type of *probability sampling*. Probability sampling procedures have three common characteristics: (1) the units that compose the population and the units that are excluded from the population are explicitly defined; (2) every potential sample of a given size that could be drawn from the population can be enumerated; and (3) the probability of selecting any potential sample can be specified. In the case of simple random sampling, each sample has the same probability of being selected and the probability of selecting a particular sample is $1/\{N!/n!(N-n)!\}$. Non probability sampling procedures do not satisfy one or more of the three characteristics. A familiar example of a non probability sampling procedure is *volunteer sampling*. As the name suggests, people volunteer to be in the sample. Television viewers, for example, are frequently encouraged to express their opinion about an issue of the day by calling a 900 number. Those viewers who choose to call the number are a non random sample. Such callers typically have stronger opinions about the issue than non callers.

Simple random sampling has two interrelated advantages over non random sampling. First, randomness avoids bias, that is, a systematic or long run misrepresentation of the population. Second, randomness enables researchers to apply the laws of probability in determining the likely error of sample statistics. A particular random sample rarely yields an estimate of the population characteristic that equals the

population characteristic. However, the expected value of the sample estimate over an indefinitely large number of samples will equal the population characteristic. Furthermore, for any random sample, it is possible to estimate the magnitude of the error associated with the estimate.

Four other sampling procedures also are used to obtain a probability sample: systematic random sampling, stratified random sampling, cluster sampling, and multistage sampling. A *systematic random sampling procedure* is one that (1) selects a unit randomly from the first $k = N/n$ units in a list of the population and (2) selects every k th unit in the list after the initial selection. A *stratified random sampling procedure* divides the population into separate groups, called strata, and then selects a simple random sample from each stratum. The sampling is called *proportional* if the proportions of the sample chosen in the various strata are the same as those existing in the population. The sampling is *disproportional* if the sampled proportions differ from the population proportions. A *cluster sampling procedure* divides the population into a large number of groups, called clusters. A number of clusters are selected randomly to represent the population, and then all units within the selected clusters are included in the sample. The procedure differs from stratified random sampling in that all units within the selected clusters are included. A *multistage sampling procedure* is similar to cluster sampling, but has at least two stages. For example, in the first stage, a random sample of clusters is chosen. In the second stage, units are randomly chosen from the selected clusters.

One of the earliest serious efforts to apply statistical theory to random sampling procedures was made by A. L. Bowley (1913). It remained for J. Neyman to solidify the role of statistical theory in random sampling procedures. In a landmark paper published in 1934, Neyman emphasized, among other things, the importance of random rather than purposive selection of units and extended stratified simple random sampling to the sampling of clusters.

A simple random sample can be obtained in a variety of ways once a list of the units in the population has been made. The list is called the *sampling frame*. To obtain a sample that contains half the units in the sampling frame, a researcher

can flip a fair coin. If the coin toss yields, say, a head, the unit is in the sample. Alternatively, a researcher can record the name or identifying code for each unit in the sampling frame on a slip of paper. The slips of paper are placed in a container and thoroughly shuffled. The first n slips drawn without bias from the container compose the sample. The most common method of obtaining a simple random sample uses random numbers. Tables of random numbers can be found in most statistics textbooks. Computer packages such as SAS, SPSS, and MINITAB and many hand calculators have routines that produce numbers that in every observable way appear to be random. Tables of random numbers contain a sequence of random digits whose terms are chosen so that each digit is equally likely to be 0, 1, . . . , 9 and the choices at any two different places in the sequence are independent. For convenience, the digits in a random number table are often grouped with two digits, four digits, and so on in each group. To use a table to select a simple random sample of size, say, $n = 20$ from a population of size $N = 895$, assign the numbers 001, 002, . . . , 895 to the units in the sampling frame. Select a starting point in the table by dropping a pointed object on the table. Choose three digit numbers beginning at the starting point until 20 distinct numbers between 001 and 895 are obtained. The sample consists of the units corresponding to the 20 numbers selected. This procedure is called *sampling without replacement* because once a number has been selected, the number is ignored if it is encountered again.

rape culture

Joyce E. Williams

Rape culture is a concept of unknown origin and of uncertain definition; yet it has made its way into everyday vocabulary and is assumed to be commonly understood. The award winning documentary film *Rape Culture* made by Margaret Lazarus in 1975 takes credit for first defining the concept. The film's narration relies heavily on jargon such as "rapism" and "phallogocentric society" and is more illustrative than definitive in dealing with rape as depicted in movies, music, and other forms of entertainment. Authors of the popular *Transforming a Rape Culture* define the phenomenon as "a complex of beliefs that encourages male sexual aggression and supports violence against women . . . a society where violence is seen as sexy and sexuality as violent" (Buchwald et al. 1993: v). An earlier definition was offered by Herman (1984), who characterized the US as a rape culture because the image of heterosexual sex is based on a model of aggressive male and passive female. At the other end of the continuum of definitions are efforts to define a rape culture empirically, such as are found in the work of Baron and Straus (1989) and Ellis (1989). Some empirical works on rape theorize its emanation from a subculture of violence, for example societies with high homicide rates also tend to have high rape rates (Amir 1971; Baron & Straus 1989). Other researchers have stressed that social settings such as created by some male gangs or fraternities produce rape prone subcultures (Boswell & Spade 1996; Sanday 1996). Clearly, rape is more common and acceptable in some environments than in others. However, the concept of rape culture inextricably connects rape with the cultural fabric of the *whole* of society.

All indications are that the term rape culture emerged simultaneously from a number of

sources in the 1970s as a part of the anti rape crusade of the women's movement. The concept of a rape culture is socially constructed as a result of feminist consciousness raising over the past three decades. This makes the phenomenon no less real but suggests that the activities and public rhetoric of the anti rape feminists raised public awareness to the point that a large segment of society, and certainly the media, intuitively know what is meant by rape culture. Social scientists, however, still struggle to define the term and most resort to dealing with it operationally or as a cluster of characteristics or variables. The linkage of rape and culture is an interesting one if dissected grammatically. Rape, a noun or verb transitive, is used as an adjective modifying culture, suggesting a deliberate inseparability: all of rape is linked to culture and all of culture is permeated by rape. To link the two words has the intended effect of linking learned behavior and attitudes (culture) in a causal way to non consensual sex (rape). Use of the word rape as descriptive of culture suggests a pattern of behavior created, organized, and transmitted from generation to generation as part of the expectations associated with being male and being female. Rape culture is not an either/or phenomenon but exists in varying degrees, from the institutionalization of rape to its perfunctory punishment as crime. In the most strident form of rape culture, women are the property of men who deny them respect and the right to control their own bodies (Brownmiller 1975).

Although the concept of a rape culture is somewhat murky in meaning, its popularization helped to shift the causal paradigm of rape from psychology to sociology and, cross culturally, to anthropology. Until the 1970s, rape was viewed not as a social problem but as the act of predator against victim, and the "sick rapist" was the most facile explanation. A cultural or societal explanation of rape moved causation from a micro to a macro level. The underlying assumption is clear: rape is not just the problem of individual rape victims who were accosted by sex crazed rapists. Rape is a socially and culturally produced problem and it must be addressed at the societal level. A rape culture is a product of behaviors and attitudes as well as of the institutions supporting those behaviors and attitudes. While the United States is not

the only society to have a rape problem, rape is not a universal problem (Mead 1963 [1935]; McConahay & McConahay 1977; Sanday 1981a), nor is the term rape culture or even rape a meaningful concept cross culturally.

Feminists theorize a direct cause and effect between women's empowerment and rape – societies where women are empowered politically and economically will be characterized by low incidence of rape and the opposite will be true in societies where women lack empowerment. Most feminists contend that rape culture is generated and maintained by a social structure of gender inequality: political, economic, and social. Such a structure allows and enables men, as arbiters of power, to exploit and abuse women – consciously and unconsciously. By contrast, a society where women are strong or equal to men in positions in government and in the financial world, and have been for some time, is a society where women are less likely to be exploited in pornography or by demeaning stereotypes and where rapes against women are infrequent.

Gender equality is more complex than can be represented by drawing a direct inverse relationship between the status of women and rape, as evident in the fact that rape rates sometimes go up even as the status of women improves (Baron & Straus 1989). At least two other variables may intervene: the status of women vis à vis men and the temporal dynamics of male–female gender roles. First, the status of women is meaningful only in relation to that of men. For example, it is not how much women earn but how much they earn in comparison with males, and the same is true of the number of women in positions of decision making power, or of their legal/statutory equality. Second, it is essential to look at the dynamics of the status of women vis à vis men and to know how these dynamics have changed over time or if they are currently in a state of change. It is in the latter case that rape rates will often increase even as the status of women is improving – that is, things will get worse before they get better. There are two explanations for this phenomenon. According to the "backlash theory," as the status of women begins to change, it represents a disruption of traditional male authority and female subordination and men become more aggressive toward women in an attempt to retain their

control, and in the short term rape rates will increase (Baron & Straus 1989; Austin & Young 2000). As Sanday (1981b: 163) put it, "when the cup of life that defines the male world is broken, men organize to protect their traditional rights," but she goes on to cite examples of women doing the same thing when their traditions are threatened. An alternative but related explanation is that as women become more equal, their social and work related activities and movements are less restrictive and they become more vulnerable to a male population whose roles and attitudes have not changed to keep pace with new female sex roles. The activities of the "liberated female" may simply make her more accessible or signify to a traditional male that she is "asking to be raped." Cross culturally, McConahay and McConahay (1977) found a significant positive correlation between sex role rigidity and violence (including rape).

Rape is historically a product of women's lower status and at the same time works as a mechanism to keep women unequal (Sanday 1981a; Baron & Straus 1989). This circularity is no doubt the reason that empirical data fail to show a consistent inverse relationship between rape and women's equality. The concept of a rape culture also represents something of a contradiction in the culture and social organization of the United States: rape is culturally produced and maintained by a culture that then makes it illegal. On the one hand, rape is encouraged if not condoned by popular representations of sexuality and of socially scripted male-female behaviors. On the other hand, rape is a culpable crime although its handling by police and the judiciary is selective and leaves much to be desired (Williams & Holmes 1981). Rape and other forms of sexual assault are legally defined by a governmental entity as (in the case of the US) one of the 50 states. Due in large measure to the success of the anti rape movement, many states have replaced rape laws with more gender neutral and inclusive sexual assault laws. While there are many variations, in general these laws prohibit sexual penetration when it is carried out by force or without consent of the victim (male or female). The exception is statutory rape, where age rather than consent is the determining factor. The old rape laws defined unwanted and forced sex as between a man and a woman and also included a spousal exemption,

which meant that a man could not (by legal definition) rape his wife. Feminists lobbied for and succeeded in changing these laws on the basis of their being designed more to protect women as the property of men than women for their own worth.

A rape culture is characterized by a high frequency of rape and other forms of violence against women, the full extent of which is unknown. Incidents of rape are the lowest when measured by police reports, about 65 per 100,000 females in 2002 (Uniform Crime Reports 2002). A victimization survey, based on a 2002 sample of households, recorded 80 rape victims per 100,000 population over age 12, with just over half of the self reported victims having reported the offense to the police (Rennison & Rand 2003). Other research studies among samples or populations of women put self reports of rape or some form of sexual abuse over a lifetime as still higher (Russell 1984; Koss 1992). Cross cultural and international statistics on the incidence of rape are also available, although comparisons are difficult because of varying definitions and methods of reporting. Using any of these reports, however, the US, compared with other industrialized nations, is characterized by a high incidence of rape and sexual assault (Mayhew & van Dijk 1997; Austin and Young 2000).

A rape culture is characterized by female moral and social responsibility. Women are socialized to assume responsibility for controlling the "naturally aggressive" behavior of men in interpersonal relations and by restricting their own movements and behavior. Failure to meet this responsibility leads to victim blaming of women who are raped if they are deemed of questionable reputation or engaged in activities such as hitchhiking or drinking alone in a bar (Williams & Holmes 1981). This element of a rape culture links the perception of women as the moral guardians of society with a kind of supermacho syndrome, or what Baron and Straus (1989) termed "hypermasculinity." Both females and males are socialized to believe that men are by nature sexual predators. Sexual limits and restraints are to be set by the female because men will "do what men do." When coupled with the all too common myth that women like the aggressive approach from males and even need such aggression to overcome their inhibitions about sex, the outcome is often women who

feel violated and men who are surprised when accused of rape. In the same context, males who hold traditional gender roles frequently see females who violate these roles by the way they dress or behave or the kind of work they do as "asking to be raped" (Malamuth 1981).

A rape culture is a culture of fear for women, one in which girls at a very early age internalize fear and a sense of restriction simply because they are female. As Brownmiller (1975: 15) put it, rape serves as "a conscious process of intimidation by which all men keep all women in a state of fear." Before they have a name for it, girls are socialized to know that something terrible could happen to them. Gordon and Riger (1989) label this as women's "special fear" that limits mobility and, in general, restricts the way they lead their lives. To grow up female in the United States and in some other countries is to internalize a fear unknown to males – knowledge that you can be raped. There is also the knowledge, constituting a part of the fear, that if you are raped you will be subjected to character scrutiny and perhaps blame from others and from the criminal justice system that should be your advocate (Williams & Holmes 1981). This is not to say that men cannot be and are not raped, but they are not socialized to expect it whereas women are. For women rape is part of the "natural environment" (Gordon & Riger 1989). Women are taught to protect themselves against unknown sexual predators by avoiding provocative dress, "unlady like" behaviors and activities, and even association with the "wrong" people, or being in the wrong place at the wrong time. If males fear for their safety, it is not (except perhaps in prison) because of sexual predators.

A rape culture is one in which the media defines and depicts women as secondary and subordinate to males. These negative images range from the most pernicious form of pornography to seemingly innocuous "dumb blond" stereotypes. Research about the influence of the media on rape has focused largely on pornography and, to a lesser extent, on violence in general (Baron & Straus 1989). Perhaps equally important are the more socially acceptable entertainment venues such as magazines, movies, television, and videos that fail to distinguish between the passion of love, the passion of sex, and the passion of power in rape. Even television and radio commercials, music, and print

advertisements still perpetrate stereotypes that women are, at best, weak and, at worst, manipulative. They are portrayed as unable to make decisions, as in need of direction, and as using sex appeal to exploit males. Such images make their way into the popular subconscious and continue to keep women vulnerable and rapeable. Baron and Straus (1989) established a linkage between the circulation of non violent pornographic materials and state by state rape rates. However, they rejected a direct cause and effect relationship in favor of pornography's indirect effect on rape in that it is symbolic of a macho or hypermasculinity culture. On the other hand, feminists such as Brownmiller (1975) link pornography to denigration of women and to the Freudian myth of a woman's rape fantasy that many men choose to believe.

A rape culture includes a spillover impact from other forms of violence – illegitimate and legitimate or institutional. Some researchers report a positive association between homicide rates and rape rates (Amir 1971; Austin & Young 2000). Sanday's (1981a) cross cultural research found that where violence is a way of life, it frequently achieves sexual expression. One example of institutionalized violence is war. Whether preemptive or defensive, war is historically and inevitably linked with rape. Brownmiller (1975) documented this linkage from the crusades through the Vietnam conflict. Rape is a "hallmark of success in battle," a method of retaliation or reprisal against the enemy. Another example of the spillover effect of institutional violence is that of slavery, where rape of black slave women by their white masters and other males associated with the master was routine, and even expected. In fact, slave masters sometimes offered young black girls to their guests or business associates as a favor or part of the household hospitality (Brownmiller 1975).

The major criticism of the concept of rape culture and of the feminist and social learning theories from which it draws is its monolithic implication that ultimately all women are victimized by all men (Ellis 1989). In reality, of course, all men are only potentially rapists. All women are not victims of rape or sexual assault in a physical sense. Symbolically, however, freedom for women will come only when rape is no longer a common element of the culture in

which we live. Women will be free of their "special fear," and the need for labels such as rape culture will disappear when females and males are equally empowered, when a woman's safety is no longer her responsibility alone, and when masculinity is not equated with aggression and passivity with femininity. The concept of rape culture will lose its rhetorical usefulness when violence is a last resort rather than the preferred method of problem solving, when the media find female exploitation no longer profitable, and when rape as a criminal incident and as a personal tragedy becomes rare or unknown. In Sanday's (1981a) research of 95 tribal societies, almost half were categorized as "rape free," that is, rape was rare or unknown. Such societies are characterized by sexual equality, gender role complementarities, and an absence of interpersonal violence. Sanday used Minangkabau, a matriarchal tribal society in Indonesia, as her prototype, although in later research (1996) she expressed concern that Minangkabau was losing its rape free culture to modernization. Non violent, egalitarian, and rape free societies may exist in the present largely as an ideal type. It is, however, an ideal type that represents a goal for the obliteration of rape culture.

rape/sexual assault as crime

Dawn Beichner

Prior to the mid 1970s, the crime of rape was defined by most state statutes in terms of the British Common Law and involved the "carnal

knowledge of a female, not his wife, forcibly and against her will" (Bienen 1983: 140). Legislative reforms, designed primarily to reduce rape case attrition, redefined the crime of rape in sex neutral language and replaced the single offense of rape with a series of calibrated sexual offenses and commensurate penalties (Largen 1987). Definitional changes resulted in an expansive category of sexual offenses, relabeled in such terms as "sexual battery," "sexual assault," or "criminal sexual conduct" (Bienen 1983).

Although there are jurisdictional variations in criminal statutes, the crime of rape is typically categorized as a first degree sexual assault or battery. *Rape* refers to completed or attempted sexual intercourse with another person by the use of forcible compulsion. The concept of *forcible compulsion* may refer to physical force or psychological coercion. The act of forced sexual intercourse may involve vaginal, anal, or oral penetration by the offender, using either his/her body or an inanimate object. This crime may involve heterosexual or homosexual intercourse, as well as male or female victims.

Second and third degree sexual assaults incorporate a wide range of completed or attempted sexual victimizations that are distinct from the crime of rape. These assaults include unwanted sexual contact with another person and may or may not involve the use of force on the part of the perpetrator. Some behaviors that are common in these categories are inappropriate fondling or grabbing; however, these crimes may also involve the perpetrator's lewd or lascivious behavior or speech while in the presence of the victim.

Regardless of statutory classification, sexual victimizations are among the most highly underreported crimes. Thus, given that victims may be unwilling to report their victimizations to strangers – police officers and researchers alike – determining the actual rates of sexual victimizations is highly problematic (Belknap 2001). Although there is no way to determine the exact number of sexual victimizations that are not reported to researchers, the most recent National Crime Victimization Survey data suggests that nearly half (46 percent) of all victimizations are not reported to police (Bureau of Justice Statistics 2003).

The issues surrounding underreporting notwithstanding, there are two primary sources for data on sexual victimizations in the United States: the National Crime Victimization Survey (NCVS) and the Uniform Crime Reports (UCR). Whereas the NCVS is a collection of information from US households for all victims – male and female – age 12 and older for sexual victimizations reported and not reported to the police, the UCR provides data on all completed and attempted forcible rapes and sexual assaults against female victims that have been reported to the police. The NCVS data suggest that there were an estimated 247,730 completed and attempted rapes and sexual assaults in 2002, resulting in a sexual victimization rate of 1.1 per 1,000 persons age 12 or older (BJS 2003). Comparable data from the UCR indicate that 95,136 sexual victimizations against female victims were reported to police in 2002, yielding a rate of 64.8 forcible rapes per 100,000 females (Federal Bureau of Investigations 2003).

A number of noteworthy trends emerge in the NCVS data related to disparities in sexual victimizations based upon victim sex, race, and age. Females are victimized at much higher rates than males; the rate of female victimization is 1.8 per 1,000, compared to the male rate of .3 per 1,000, respectively (BJS 2003). A second trend that emerges in comparisons of female and male victimizations is that females are more likely to be assaulted by non strangers than their male counterparts; sexual crimes against females are generally committed by friends/acquaintances (40 percent), intimate partners (20 percent), or other relatives (7 percent). With respect to victim race, the NCVS data indicate that blacks are more likely to be victimized than whites; the black victimization rate (2.5 per 1,000) is significantly higher than that for whites (.8 per 1,000). Similarly, there are important differences in victimization rates related to age; victims aged 16–19 years have the highest victimization rate (58.2 per 1,000), compared to other categories (i.e., 12–15 years – 44.4; 20–24 years – 47.4; 25–34 years – 26.3; 35–49 years – 18.1; 50–64 years – 10.7; and 65 years or older at 3.4 victimizations per 1,000).

A number of scholars, in a variety of social and natural science disciplines, have attempted to explain what compels perpetrators to commit

sexual victimizations. Generally, rape and sexual assault theories may be partitioned into three main categories: evolutionary/biobehavioral, feminist/sociocultural, and integrative. *Evolutionary or biobehavioral* explanations of sexual assault are derived from the core principles of biology, and more specifically, the process of natural selection (Jones 1999). Basically, evolutionary theorists consider rape as an aggressive copulatory tactic in response to natural selection pressures for males (Ellis 1989: 15). *Feminist or sociocultural* perspectives, on the other hand, posit that sexual gratification is not considered the prime motive for action; rather, sexual assault is seen as the use of sexuality to establish or maintain dominance and control of women by men (Ellis 1989: 11). Major proponents of this perspective acknowledge gender differentials in power and emphasize the role of socialization and culture in perpetuating sexual assault, asserting that sexual violence is learned and reinforced by societal themes which posit the male role as dominant over the female (Stock 1991: 68). *Integrative theories* of sexual assault posit explanations that encompass components of both evolutionary/biobehavioral and feminist/sociocultural theories, usually emphasizing one perspective over another.

rapport

C. Richard King

Rapport is best understood as a set of practices and problems in qualitative research describing how simultaneously to get along with one's informants and get information from them. Specifically, it refers to the establishment of good relationships between interviewers or ethnographers and their research subjects. Rapport covers a range of moral and methodological concerns at the heart of the social inquiry, including empathy, immersion, participation, friendship, honesty, collaboration, trust, exploitation, negotiation, and loyalty.

Rapport should not be read as a synonym for friendship, though researchers may become friends with those with whom they work and play. Certainly a means to deeper understanding, it is not, however, an instrumental circuit under the control of the researcher, but something informants, in part, must give (up). And while terribly desirable, even ideal, it is not an end, but a beginning. At root, rapport is a social relationship, an achieved outcome and continuous process emerging from human interaction. It describes a context or connection that makes people feel comfortable enough to open up, be themselves, and share unknown aspects of their lives. In this light, ethnographers and interviewers often conceive of rapport as an ineffable bond, the trust and intimacy they share with their informants. Ideally, this bond binds the two together, granting researchers the capacity

to capture the humanness of the other and render it in empathetic, if not internal, terms, while creating a safe space in which informants may set aside pretension and confide hidden truths and unappreciated experiences. Far from selfless, then, rapport remains a pathway to information and the foundation for interpretation. Qualitative researchers regularly talk about establishing rapport as a means to gain access, a way to get into a community, and subsequently get better, truer, more authentic accounts from informants.

Rapport demands reciprocity, risk, and responsibilities. Qualitative research, rather than an extraction of information or one way transfer of data, hinges on sharing and collaboration, human interactions and meaningful, if always unequal, exchanges of knowledge and affect. In this context, rapport emerges when scholars and subjects give of themselves, committing one to another. Informants contribute stories, experiences, commentary, and connections with others, while interviewers and ethnographers affirm, validate, and give voice. Rapport demands, moreover, that both researchers and their informants take risks. To create safe spaces, they must make themselves vulnerable, opening themselves, reaching beyond expected boundaries, and exposing parts of themselves often kept hidden. Finally, rapport takes shape and persists only in contexts in which participants remain accountable to one another, at once honest and forthcoming. The notion of commitment acts (Feldman et al. 2003) captures each of these elements. In the field or the interview session, a researcher must join, ally, or commit to her informants. These might be small gestures such as hanging out and completing mundane tasks unexpectedly. These might be grander endeavors, for instance refusing to cooperate with the police. Or these might be more long term, as when a black urban community over time comes to welcome a white ethnographer because she lives with them in poverty. Big and small, spontaneous, unspectacular, and daring, such displays and deeds make real and material a researcher's commitment to his subjects, binding one to the other and ultimately contributing to the establishment and maintenance of rapport.

As a consequence of intersubjective and instrumental elements, rapport has long presented qualitative researchers with a series

of dilemmas. These might be productively grouped together under the headings of distance, difference, and deceit.

Many scholars have struggled with how close to get to their informants. Researchers have long been warned about the dangers of going native – that is, of losing the detachment essential for balanced and penetrating insights. They once struggled with how to immerse themselves in a community while remaining objective and how to be intimate and alive in the field without threatening their subsequent analyses. For a time, perhaps for many still, rapport has encouraged scholars to get close, to get along, and to get information, but not confuse these processes with relationships that might alter or distort their findings. Hence, rapport mediates the troubling tensions some locate at the heart of qualitative inquiry.

At the same time, the ideal of rapport has forced researchers to reflect upon the promise and limitations of difference for social inquiry. Specifically, they have argued over whether alterity or identity is more important for the cultivation of rapport.

Until quite recently, difference between scholar and subject was preferred in qualitative research. Not only was it held that encountering the unfamiliar would foster enhanced objectivity, and hence more reliable findings, but it was also posited by many that the gap between self and other could actually facilitate the establishment of rapport, unfettered by conventional assumptions and social arrangements. Perhaps most importantly, uniting these arguments was the belief that strangeness fostered greater insight because informants will reveal more to an interested and empathetic outsider. As a black informant told Rhodes (1994) during her work in Britain: "I wouldn't have had a talk like this with another black person. I can discuss these sorts of things more easily with you. With a black person, you would just take it for granted." Nevertheless, critics have countered that being an outsider can limit access and empathy, making intimacy and analysis more challenging, unless or until scholar and subject find a common ground of experience or circumstance, often through acts of commitment.

In the wake of struggles for racial, sexual, and gender equality and reflective of a broader postmodern trend in social inquiry, researchers

increasingly have championed the importance of similarity and identity to the establishment of rapport. This perspective asserts that if scholars and subjects share one or more cultural attributes or social locations, such as gender, sexual identity, race, or spirituality, it will be easier for them to build an open, honest, and empathetic relationship. Researchers can more easily enter into and gain acceptance in such contexts, while also understanding their informants and making them more comfortable. Consequently, they have an advantaged position that enhances their access and understanding. Critiques of the matching of scholar and subject on the basis of race, gender, and other socially ascribed features have highlighted a number of weaknesses with this position. First, it assumes that trust is established through rather superficial qualities, such as skin color or language, when in fact the connections between researchers and informants is much more complex and processual. Second, it essentializes experience and identity, suggesting, for instance, that women will bond with women because they are women, when in fact issues of class, education, age, sexuality, or race might individually or collectively work to make it harder for specific women to trust a female interviewer or ethnographer. Third, and worse, for many researchers striving to establish rapport from the inside, there are greater expectations and in turn heightened pressure on them to act in accordance with local norms. Perhaps what the personal struggles and professional debates about difference and identity reveal most fundamentally about rapport is that there is no secret formula or sure way to achieve it. Instead, as the concern over getting inside and being inside illustrates, establishing trust, fostering openness, and gaining access always emerge out of the expectations, interactions, and interpretations of researchers and their informants.

Even if one can find comfortable ways to negotiate questions of difference and distance, rapport poses a third, arguably more vexing, problem: to what extent does the cultivation of trust and the maintenance of productive connections with informants mandate that researchers deceive them? Scholars routinely hide aspects of themselves from the people whom they study. Keeping one's sexual identity, religious values, or political views hidden can be crucial as

researchers seek to secure access and intimacy. Such lies of omission make it possible for their informants to talk openly and honestly, and if they were told it is likely that the kind and quality of research conduct would suffer. Less frequently, but not uncommonly, researchers have opted to lie about their objectives, background, and everyday lives to foster trust, honesty, and openness. While such falsehoods may be productive, granting scholars access to individuals and information, they unsettle the ethical compact at the core of social inquiry.

In many respects, rapport posits that it is desirable for researchers to bond with those they study, cultivating compassionate understandings of their beliefs and behaviors. Indeed, rapport remains productive as long as ethnographers approach the people they study empathetically, sharing political and social commitments, no less than interpersonal attachments. Once researchers begin to think critically, to study up, to disagree with, or even dislike the people they study, rapport begins to lose its luster. The emotive and intellectual bonds facilitating trust, collaboration, and identification at the core of rapport become uneasy when one focuses on relationships of domination and dehumanization or studies those who participate in or benefit from hurting other informants in a social field. Researchers have rightly asked how they can and should approach repugnant others. Several alternatives have been suggested as a means to get beyond the limitations of rapport. Some have insisted that critique replace compassion at the heart of social inquiry, making rapport less attractive or feasible, while encouraging novel points of departure and forms of engagement (Springwood & King 2001). Others have proposed that scholars confront their subjects, forcing them to engage individuals they belittle, demonize, or harm (Wieviorka 1993).

Undoubtedly, rapport will continue to anchor qualitative inquiry, even as technological innovations, such as the Internet, and novel questions encourage sociologists to rethink it. Indeed, rapport will continue to matter to scholars and subjects precisely because it mediates moral and methodological concerns, as well as the tensions between intersubjectivity and interpretation, central to qualitative research and the social worlds it struggles to comprehend.

ratings

Geoff Lealand

Ratings is a term with wide currency, used in activities as diverse as judgments about standards of hotel accommodation to judgments of the economic health of corporations or nations (such as the Standard & Poor's Financial Strength Ratings). In contemporary media, however, the term ratings has more specific meanings, especially in respect of television, radio, and film, but there is also considerable ambiguity and confusion in its use and application.

Movie ratings, placed on films by regulatory bodies or industry self regulation, are widely used across the globe to determine parameters for admission or guidance about content. They

do not measure audiences (as in the box office), but guide or control Motion Picture Association of America (MPAA) and the national audiences according to their eligibility to see sexual, violent, or language content. In the United States, for example, the movie rating system, jointly administered by the Association of Theater Owners, assigns movie ratings ranging from G (General Audience) to NC 17 (No Children 17 and Under).

Such American ratings cannot be legally enforced; they are strictly voluntary and carry no force of law. Nevertheless, it can be argued that they have acquired quasi legal status in that they provide movie theaters with a premise to restrict admission. In other countries, they have clearer legal power. In the United Kingdom, for example, the ratings provided for films by the British Board of Film Classification (BBFC) can be enforced by local authorities, and there have been cases where local councils have attempted to contest BBFC ratings. BBFC ratings for videos are legally binding. In Singapore, all films to be distributed and exhibited are subject to ratings imposed by the government controlled Media Development Authority (MDA), with no intermediary rating between PG (Parental Guidance) and NC16 (No Children Below 16).

The different application of movie ratings across the world means that in countries where there is significant government control of the circulation and exhibition of film, ratings are equivalent to direct censorship; in other cases, they are formal or informal guidelines. It can be argued, however, that even when ratings are not legally enforceable, they are still instrumental in encouraging industry self censorship in film production and distribution. The imperatives of obtaining a box office friendly MPAA rating can determine funding decisions, shape film content and marketing, and define the eventual audience. Shaping a film project to receive a G rating, for example, will mean that least objectionable content will be privileged, plot and narrative will follow an established and safe formula, and marketing is shaped to match the film to a broad, cross generational audience of adults and children.

Conversely, a film with an NC 17 MPAA rating is regarded as box office poison as it effectively excludes the highly prized teenage

market. Producers and distributors put great effort into avoiding such a rating. In 1999, for example, Paramount Pictures, as the distributor of the animated feature *South Park: Bigger, Longer, and Uncut*, successfully appealed the original NC 17 rating, in favor of a more box office friendly R rating.

Because, in the United States, movie ratings operate as a system of classification rather than as formal censorship, there is a long established and continuing tension between social norms and artistic and/or commercial freedoms. In July 2004, for example, a study conducted by the Harvard School of Public Health pointed to a decade long "ratings creep," which had "allowed more violent and sexually explicit content into films, suggesting that movie raters have grown more lenient in their standards" (Waxman 2004). Other commentators have argued that the presence of such content merely reflects broader social changes or attitudinal shifts.

Newer media technologies such as the Internet and electronic gaming have embraced ratings. The Entertainment Software Rating Board (ESRB) has designed games ratings information for video and computer game content, which provide ratings symbols (recommended age appropriateness) and content descriptors (indicating elements in a game which may trigger a particular rating). Rating symbols range from EC Early Childhood to AO Adults Only, and content descriptors describe content such as Alcohol Reference and Sexual Violence (www.esrb.org). A World Wide Web consortium (W3C) determines standards for rating systems and rating information through the Platform for Internet Ratings (PICS), to counter the problem of minors accessing adult content on the Internet (msdn.microsoft.com/workshop/security/rating/ratings.asp).

Radio ratings, gathered through annual or half yearly surveys of radio markets, are instrumental in constructing league tables which set advertising rates. In television, ratings have two major applications. The January 2000 compulsory insertion of the content blocking V chip in all new TV sets sold in the United States enables a TV Parental Guidelines system modeled after the MPAA rating system. Programs are encoded by broadcasters and are detected by the V chip. Championed as a government response to a perceived problem (television

violence), this technological fix appears to be little used and largely ineffectual.

Television ratings provide the primary source audience measurement, assigning value to audience demographics (factors such as age, gender, economic class, and area). Such measurement is carried out by global, specialist research companies, with Nielsen Media Research (owned by the Dutch conglomerate VNU) dominating the North American market. Given the imperatives of contemporary television ("delivering audiences to advertisers" in respect of commercial television; justifying broadcasting fees or sponsorship in respect of public service or non commercial television), reliable audience measurement is critical. Peoplemeters (electronic diaries) are placed in a representative sample of television viewing homes. The cumulative, self reported viewing of these homes constitutes the official television audience, determining popularity of programming and channels as well as modifying the television audience. There have been challenges from academic critics (Ang 1991; Lull 1998) who argue, for example, that observed behavior often contradicts the claims of ratings measurement. There have been industry criticisms of measurement distortions, viewer exhaustion (or "button burnout"), and the difficulties of measuring viewing in an increasingly fragmented and diversified media environment. Nevertheless, ratings continue to prevail, for they provide a continuous and viable means of providing tidy measurement, packaging, and institutional control of audiences.

rational choice theories

Brent Simpson

Rational choice theories explain social behavior via the aggregated actions of *rational* or *purposive* actors. The actors are rational in the sense that, given a set of values and beliefs, they calculate the relative costs and benefits of alternative actions and, from these calculations, make a choice that maximizes their expected utility. Rational choice models assume that the range of alternatives open to actors is constrained by the environment or by institutions within which they make their decisions. In their purest form, these theories also assume that actors possess complete information about their values and the various courses of action through which they can pursue them. Actors collect, organize, and analyze this information prior to making a decision. Thus, rational choice theories are means–end theories. That is, they describe the means or rational calculus through which actors go about obtaining their desired ends, or values.

Rational choice theory received its first formal treatment in economics, where it has long been the dominant paradigm. More recently, rational choice theory has become one of the dominant approaches in political science and has made a number of inroads into psychology and sociology.

RATIONAL CHOICE SOCIOLOGY AND LEVELS OF EXPLANATION

The introduction of rational choice into sociology has generated a fair amount of controversy, and debates about the place of rational choice approaches in sociology are ongoing. The position sociologists take in these debates is determined in part by whether they subscribe to *methodological individualism* or *methodological holism*. For methodological holists and the majority of methodological individualists, the objective of sociology is to explain macro level social systems. (Other methodological individualists seek to explain the workings of micro level social systems.) The two disagree on whether these social systems can be explained solely with

other social systems (the holist position), or whether the theorist must “come down” to the micro level to explain the effects of one social system on another with reference to individual actors that comprise these systems (the individualist position).

All rational choice sociologists subscribe to some form of methodological individualism. The methodological individualist position holds that a theory must begin by stating how a social system (e.g., law or religion) affects the options available to individuals and how this (limited) range of options, in turn, affects individuals’ decisions. The theory must then build back up to the macro level by describing how individuals’ choices “aggregate” to impact a second system level variable (e.g., economic development).

Much of the individualism/holism debate – and, by extension, the debate surrounding rational choice theory – is set against the backdrop of sociologists’ attempts to clearly distinguish the discipline from other social sciences, especially economics and psychology. Advocates of methodological individualism and rational choice theory claim that obscured in these debates is that most ostensibly holist approaches actually incorporate individual level assumptions (Heckathorn 1997). Because these micro assumptions are left implicit, however, the theories only give the appearance of being holist. From this point of view, these explanations could be made more precise (and the individualist–holist debate resolved) if holists simply stated their individual level assumptions more explicitly.

While all rational choice theorists subscribe to some form of methodological individualism, not all methodological individualists are rational choice theorists. That is, some maintain that sociology needs a model of the actor, but oppose models based on rational choice principles. Others claim that rational choice theory is currently the most explicitly stated model of the actor, thus making it the best choice for a scientific sociology. These scholars often point to the success of rational choice theory in other social sciences as evidence that it should be adopted by sociology. While proponents of this position may concede that there remain important problems with the application of rational choice

models, they maintain that the model simply needs refining.

There are important overlaps between the issues that lead some scholars to view rational choice theory as in need of a tune up and those who view it in need of a complete overhaul. Some of these problems concern the *means* assumed in the rational choice approach (the rationality component), while other problems have to do with the *ends* typically assumed in applications of rational choice theory, i.e., that individuals are motivated by self interest. Broadly speaking, research on the means assumptions is most closely associated with the work of psychologists and decision theorists. Sociologists have contributed much more to debates and research on the ends assumed in rational choice explanations.

MEANS

One of the main criticisms of rational choice theory (from all corners of social science) is the extensive cognitive and computational demand it places on actors. Decision scientists have shown that rather than judiciously gathering data about all possible courses of action, as rational choice theory assumes, humans greatly simplify their social worlds. For instance, instead of calculating the implications of all possible courses of actions, we generally consider a much smaller range of possible actions than are actually available to us, or simply act out of habit. When we do collect information about alternatives, we do not organize and process that information according to the dictates of rational choice theory. Instead, the organization and processing of information is subject to systematic cognitive biases. For instance, we often exaggerate the likelihood of events consistent with our beliefs and downplay inconsistent information. Similarly, we generally assign higher subjective probabilities to desirable outcomes than is warranted by a prudent assessment of the facts. That is, wishful thinking often short circuits rational deliberation.

Decision scientists have directed attention to developing more realistic models of decision making. *Bounded rationality* models recognize that humans are only capable of gathering, organizing, and processing a finite amount of

information, and that much of this activity is subject to cognitive biases. Thus, these models replace the complex calculations assumed in traditional (unbounded) rational choice models with heuristics or rules of thumb.

One of the best known bounded rationality approaches is Simon's (1982) *satisficing* model. In contrast to the maximizing principle assumed to guide decision making in unbounded rationality approaches, the satisficing model assumes that an individual sets an aspiration level and then surveys various courses of action one by one. Once the individual happens upon a course of action that meets or exceeds the aspiration level, she stops surveying and selects that course of action.

Various learning and reinforcement models are also included under the bounded rationality rubric. These models eschew the optimization assumption of rational choice models in favor of reinforcement principles. Thus, these models assume that actors repeat choices that were rewarded in the past and avoid those that were punished. Like other bounded rationality approaches, learning models have been successfully applied to phenomena that do not readily lend themselves to traditional rational choice explanations. For instance, it is difficult to explain why a rational actor would shoulder the costs entailed in casting a vote in a large national election when the likelihood that the vote would be the deciding one is not significantly different from zero. Yet many do vote in these elections. Satoshi Kanazawa has used a learning model to explain voter turnout. The model assumes first that a citizen perceives a link between her decision (to vote or abstain) and the outcome (the preferred candidate wins or loses). That is, these outcomes are experienced as *reinforcers* or *punishers*. Thus, whether a person votes in a given election depends on whether the person voted in the previous election, and whether the person's preferred candidate was elected. Under specified conditions, this learning model is a good predictor of voter turnout patterns.

Successful applications notwithstanding, there are problems with bounded rationality models. For example, while there is little doubt that learning models more accurately reflect recurrent decisions than unbounded rationality approaches, they are generally silent about

decisions made in novel situations. This is because actors have no past actions from which to make choices in new situations. Similarly, some contend that bounded rationality models are often left underspecified. For example, to make predictions, the satisficing model must specify the point at which the actor will suffice (the actor's aspiration level) and exactly how the actor selects among alternatives to consider. But many contend that the specification of these parameters depends on the type of decision being made, and is context specific. Thus, a common criticism is that the increased realism of bounded rationality models is too often accompanied by a decrease in precision.

Some rational choice proponents argue that it does not matter whether the rationality assumptions closely match human behavior. The most important issue to these scholars is predictive power. If the rational choice model generates more precise predictions across a wider range of situations than alternative approaches, rational choice is the preferred theory. More generally, those taking this position contend that actual behavior need not coincide with rational choice axioms, so long as it results in outcomes similar to those that would obtain if it did.

Summing up, behavioral decision theorists have made much progress toward understanding the nuances of human decision making, and how it differs from the assumptions of rational choice theory. The question for many is whether these understandings can be developed into models with the level of specification and generality of unbounded rationality approaches.

ENDS

At least since Weber, sociologists have been interested in the study of values. Although an explicit focus on values waned when functionalism fell out of favor, sociology has recently witnessed renewed interest. This can be attributed in part to debates about the place of rational choice theory in sociology.

Rational choice theory is officially silent on what actors value. In practice, however, rational choice theorists almost always assume actors are motivated by self interest, narrowly defined to include only material wealth (and, less commonly, power and prestige). In fact, the

assumption that actors seek to maximize their wealth and nothing else is so common in rational choice approaches that many mistakenly believe narrow self interest to be axiomatic, rather than a "default" auxiliary assumption.

Some justify the assumption that actors pursue only material wealth by noting that wealth can be exchanged for valued immanent goods. When it can, these scholars contend, rational choice theory can safely use wealth as a proxy for these other ends. Others justify the typical value assumption on the grounds that it works well when predicting macro level outcomes. For instance, Hechter (1994) notes that while there is generally variation in what actors value in a specific situation, this (micro level) variation cancels out when decisions are aggregated to predict systemic outcomes. If so, under certain conditions, the typical value assumption may be sufficient for predicting aggregate outcomes.

Although some lines of research in rational choice sociology have fared well by employing the typical value assumption, many see a need to develop more realistic models of values. But the introduction of values into rational choice theory faces two hurdles, one measurement related and the other theory related.

Measuring values. At first glance, measuring values seems straightforward: simply ask people what they value. But such surveys pose a number of problems. First, people often conceal their true values in order to give off particular impressions to researchers or to others. Additionally, research shows that people may not always know what they value. Because of these problems, some researchers have focused on developing inferential approaches to ascertaining values.

One inferential approach, the *revealed preference method*, asks respondents to choose between pairs of goods. Assuming values are stable (which is not always the case), these revealed preferences can then be used in conjunction with the means assumptions of rational choice theory to predict outcomes in future choice scenarios. While such inferential methods are an improvement over survey measures of values, they can be much more expensive. Furthermore, inferential methods may sometimes be subject to some of the same problems as survey measures. For example, a respondent may make choices that are not consistent with his or her value sets in order to make a good impression.

Explaining values. Sociologists generally trace values to some combination of natural selection, ecological conditions, and a person's memberships in various groups and social categories. These various sources are assumed to create a hierarchy of values. At the base, natural selection generates values essential to reproduction and survival (e.g., securing food and shelter). While evolutionary logic typically leads us to expect common values, other evolutionary theorizing leads us to expect, for example, sex differences in values. For example, Kanazawa (2001) has argued that males value wealth, power, and prestige more than females, tracing this difference to the different reproductive strategies males and females have evolved to pursue. He notes a rare point of agreement between evolutionary logic and feminist sociologists' critiques of rational choice theory – that the “typical value assumption” in rational choice sociology is more applicable to males than females.

At the next level, ecological conditions are expected to generate societal differences in values. As societies respond to unique historical and environmental conditions, sets of values are likely to emerge that are relatively similar within and different between societies. For example, sociologists have pointed to trust differences between Japanese and Americans. On average, Americans place a higher value than Japanese on trusting strangers, while Japanese prefer to stick to lower risk, long term relations. Toshio Yamagishi and his associates have traced these different values to societal differences in social networks and group organization.

Finally, at the highest (and most personal) level are those values that result from a person's membership in a unique set of groups and social categories. As suggested by Georg Simmel, because every person is affiliated with a unique set of groups, each can be expected to subscribe to a unique set of values. From this perspective, *ceteris paribus*, the fewer overlapping group (or category) memberships two persons share, the more distinct value sets will be.

While persons undoubtedly select group affiliations based on existing values, sociologists have demonstrated how groups and categories influence the values to which people subscribe. For example, Melvin Kohn and his colleagues showed that the different occupational roles of working class versus middle class persons

tend to generate different value systems. Compared to the middle class, working class persons tend to place greater weight on values such as neatness and obedience. Middle class persons, on the other hand, tend to place greater weight than members of the working class on values such as happiness and curiosity. Moreover, Kohn showed that these different values get passed down from one generation to the next. The effect of these values, once transmitted, can be to channel offspring into occupations similar to their parents.

Research by Frank et al. (1993) demonstrates how social categories such as college major can influence values. Specifically, they found that economics majors seem to satisfy the typical value assumption (i.e., place greater weight on self interest) better than non economics majors. They traced this difference to economics majors' continual exposure to rational choice theory and its typical value assumption. These results, like Kohn's, have important implications for how institutions and organizations pass on certain values.

An important question for rational choice sociology is how to synthesize such disparate findings from values research into a formal, coherent model of values. Only a few efforts have been directed toward this end. For instance, Lindenberg's (1992) *social production function theory* distinguishes universal goals (physical and social well being) and the instrumental goals that humans pursue to achieve these ultimate ends. For example, actors may pursue status and affection as means to social well being. At a higher level, the theory specifies alternative routes to each instrumental goal.

The alternative routes (or higher order goals) through which a given individual can pursue instrumental and ultimate goals are determined in large part by the groups and institutions to which she belongs. For instance, Kohn's research shows us that those in working class occupational roles adopt values instrumental to success in working class jobs and, ultimately, to their physical and social well being. Members of the middle class, on the other hand, adopt values more conducive to success in their occupations.

Social production function theory and related approaches give us a picture of humans as rational agents who pursue various (socially

sanctioned) routes to ultimate and instrumental ends in a cost effective (optimizing) manner. While such models are certainly a step in the right direction, much work remains in effectively integrating theory and research on individual differences into a formal model of values.

APPLICATIONS

As noted earlier, much rational choice sociology has focused on explicitly theorizing multiple levels of analysis. This is especially evident in two lines of sociological work that have strong roots in rational choice theory, network exchange theories (Willer 1999) and social dilemmas research (Kollock 1998). Thus, these two areas are offered as illustrations of rational choice sociology.

Network exchange theories predict interpersonal power from actors' locations in exchange networks. Exchange networks are special cases of social networks in which ties represent exchange opportunities. It is these differential exchange opportunities that generate power differences. A key insight of network exchange approaches is that power differences are not simply a function of the number of potential exchange partners a person has. Rather, exchange networks have important distal properties, such that an individual's power may be determined not only by her number of partners, but also by her partners' partners, her partners' partners' partners, and so on. While network exchange theories give special attention to these structural level variables, they also incorporate micro level assumptions about individual preferences and bargaining strategies.

The network exchange approach provides a clear illustration of multilevel theorizing for the following reasons. First, it demonstrates the important role of structural constraints on individual choices, thus clearly linking down from the macro to micro level. Second, it accounts for individual preferences and bargaining processes that occur at the micro level. Finally, it explains how bargaining and negotiations at the micro level aggregate back up to the macro level to generate power differences. In so doing, it provides a guide for explicitly modeling both structural and individual levels of analyses (Markovsky 1987).

Rational choice theory also has had a major impact on sociological research on social dilemmas. Social dilemmas are situations that pose conflicts between individual and collective interests. Several features of rational choice theory make it a useful theoretical tool for analyzing such problems. First, rational choice theory explicitly focuses on actors' interests. In so doing, it commits the analyst to a careful distinction between the interests of individuals and the interests of the groups to which they belong. By extension, rational choice theory's focus on the aggregation of individual choices makes clear how the rational pursuit of individual interests can lead to disastrous outcomes at the system level. Well known examples of how individually rational outcomes produce collective disasters include overfishing and nuclear armament buildups. Because social dilemmas pose such important social problems, and because rational choice theory is well equipped to model such situations, many rational choice theorists consider the study of social dilemmas and how actors solve them the central task of sociology.

THE FUTURE OF RATIONAL CHOICE SOCIOLOGY

While rational choice theory has made important inroads into a number of areas of sociology, its status in the discipline as a whole remains uncertain. One indicator of sociologists' disparate views on the status of rational choice theory is its treatment in introductory texts. There, statements on rational choice theory and its place in sociology run the gamut: some texts contain no mention of rational choice theory in any of its variants (Macdonald's *Sociology*); others mention rational choice approaches to specific topics but omit the general rational choice approach (Lindsey & Beach's *Sociology*); others maintain that rational choice theory is the unifying theory in sociology (Stark's *Sociology*).

In short, there is currently very little agreement about the status of rational choice theory in sociology, and about what it should be. Heckathorn (1997) suggests that the reluctance of many sociologists to embrace rational choice theory is paradoxical because the approach differs very little from traditional mainstream sociology. To the extent that there is a

difference, he suggests, it is that rational choice theory makes explicit what much of sociology leaves implicit: a model of the individual.

Others praise the precision of rational choice theory for a different reason. They suggest sociologists should view rational choice principles not as accurate reflections of reality, but as explicit baselines against which to measure more realistic alternatives. This position is illustrated by research described earlier that refines the means and ends typically assumed in rational choice models. More generally, it is doubtful whether so much progress could have been made on departures from rationality if social scientists did not have an explicit model of rationality. Similarly, the ubiquitous simplifying assumption that humans are wealth maximizers has provided a convenient baseline against which to measure the conditions under which human behavior is guided (however rationally) by a broader range of values. If present trends continue, we can expect psychologists and decision theorists to work on further refinements to the means component of rational choice models while sociologists will proceed with developing richer models of the ends to which boundedly rational actors aspire.

rational choice theory: a crime-related perspective

Jeffrey A. Bouffard and Kelly Wolf

As an explanation of crime, the rational choice perspective in essence argues that would be offenders consider the potential costs and benefits before deciding whether to engage in crime. To be accurate, there is not a single, well defined rational choice theory, but rather a series of models that attempt to explain criminal events and/or criminality. The rational choice perspective in criminology has evolved largely from two previous and complementary explanations of human behavior. One of these is the classical school of thought characterized by the Enlightenment scholars Cesare Beccaria (1764) and Jeremy Bentham (1789). These early philosophers proposed that individuals would refrain from offending out of fear of the potential punishment that would result from such behavior (this is also the conceptual basis for the deterrence perspective in criminology). The rational choice perspective on crime also has more recent roots in a second explanation of human behavior, specifically, the attempts of economists to explain consumer purchasing decisions based on a consideration of the perceived potential utility of a product.

Both perceptual deterrence (focused on the perceived rather than objective likelihood and severity of punishment) and the rational choice perspective share several assumptions about

human nature. Specifically, both agree that individuals have “free will,” they are hedonistic and utilitarian, and they will be dissuaded from offending by a consideration of potential costs. Unlike the deterrence perspective, however, rational choice includes a specific focus on the rewards of crime. Thus, while deterrence considers only potential sanctions, rational choice draws attention to the weighing of costs and benefits within the offending decision. Because of their shared assumptions, some have suggested that rational choice is simply an expansion of the deterrence perspective, while others see rational choice’s focus on benefits as a substantial divergence from deterrence.

Rational choice explanations of crime also have more recent roots in the field of economics. During the 1960s and 1970s, economists became interested in expanding their work on decision making to include a consideration of criminal behavior. The most noted proponent of this view of rational choice in criminology is Gary Becker, who proposed a “subjective expected utility” model of rational choice. This “economic” approach to offender decision making assumes that individuals strive to maximize their gains (i.e., utility) from crime while minimizing their costs and other efforts/risks. It also proposes that would be offenders engage in relatively complex deliberations involving their perception of the certainty (likelihood) and severity (utility or value) of the costs and benefits of crime. This approach also attempted to assign monetary values to all relevant costs and benefits of crime, comparing the dollar values of these consequences in modeling the offender decision making process.

Overall, the rational choice perspective on crime conceives of would be offenders as more or less rationally weighing the expected costs and benefits of criminal conduct before acting. The rational choice perspective has also assumed that individuals were at least minimally rational and able, for the most part, to make these types of calculations. Most models of decision making from this perspective, however, seem to acknowledge that individuals possess “bounded rationality.” That is, individuals are not “purely” rational, but rather only seek generally to maximize their gains, even though their behavior may not appear overtly “rational” to others. The bounds on the extent of this

rationality are imposed by factors such as the availability of information on potential consequences, the individuals’ cognitive abilities, time pressures on the decision itself, and other factors that have an impact on the ability to adequately consider various consequences.

TWO RATIONAL CHOICE MODELS

Most of the research and theorizing to date has focused on one of two main rational choice models of criminal decision making. The subjective expected utility (SEU) model proposed by Becker (1968) suggests that crime will be more likely if the individual’s perceived expected utility (expressed in monetary terms) for criminal behavior is greater than the expected utility of some legal alternative. This model is often represented mathematically with the following formula:

$$EU = pU(Y - f) + (1 - p)U(Y)$$

where EU represents the expected utility from the behavior; p = the probability of punishment (the certainty of the costs); Y = the anticipated benefits of the behavior; f = the anticipated punishment; and U = the “utility” (the severity) of costs or benefits.

Other criminologists have taken issue with the complex mathematical nature of the SEU model for several reasons, including the deliberative approach to decision making it implies. According to Cornish and Clarke (1987), would be offenders are unlikely to go through such a deliberative, calculating mental process when making a decision. Instead, they propose a more “informal” model of rational choice in which offenders evaluate costs and benefits in a manner described as “rudimentary” and “cursory” (Cornish & Clarke, 1987: 935). This model of decision making is based on “decision diagrams” in which various individual (e.g., temperament, past experience) and situational factors (e.g., needs, available alternatives) influence the evaluation of potential courses of action.

This informal rational choice model, originally developed to aid thinking about situational crime prevention, is also presented as an explanation of both criminality and criminal events.

In fact, proponents of this informal rational choice model suggest it can explain several components of criminality, including the decisions to become involved in crime, to continue such involvement, and eventually to desist from crime. The informal model is also used to explain several aspects of the criminal event decision, including the choice of particular crime targets, offense types, and offense methods. In addition, the informal model takes into consideration the impact of several other individual and situational factors that may impact the offending decision itself. Supporters of this model point out that this type of flexibility is needed because the content of offending decisions is crime and individual specific, and that inclusion of these influences on decision making allows rational choice to explain multiple types of crimes, including those more “expressive” crimes which may appear irrational and even unplanned to others. They also point out that these crime types are not well explained by economic versions of rational choice.

RATIONAL CHOICE RESEARCH

Most criminological research on rational choice has examined the effect of various costs and benefits on offending decisions, commonly using one of three methodologies. First, ethnographic approaches have been employed that involve interviewing known offenders about their past decision making processes. This line of research has discovered various facts about offender decision making, for instance, that residential burglars attend to such factors as the ease of entry to a house when considering where to commit their crimes. Second, some longitudinal studies have examined self reported offending and related that offending to perceptions of costs and benefits assessed at another time period. Finally, a large amount of research has used either simple hypothetical offending questions (e.g., how likely is it that you would commit a burglary?) or more detailed hypothetical scenarios depicting brief, fictional stories about potential offending situations to elicit intentions to offend and relate those intentions to the perception of various consequences. The detailed hypothetical scenario design has been relatively commonly employed, at least

partly because it avoids the issues of incorrect temporal ordering that plague some longitudinal studies while providing more consistent context for the would be offender’s decision than the simple hypothetical offense question design, thus minimizing measurement error. Research using all three of these design types has generally found support for the rational choice contention that the perception of various costs and benefits impacts the decision to offend.

The potential costs of criminal conduct commonly proposed by rational choice authors as relevant to criminal decision making include, among other things, the possibility and severity of formal legal sanctions, lost legitimate opportunities forsaken by criminal behavior (like the loss of a job or being removed from school), and various informal costs, such as social censure, loss of the esteem and emotional support of loved ones, and any potential loss of self respect. The benefits which have typically been considered by rational choice researchers are somewhat more limited but include such considerations as perceived material or financial gains, acceptance by peers or any enhancement of respect that may accrue from others as a result of engaging in criminal behavior, and even an individual’s emotional state such as feelings of excitement, pride, or satisfaction from committing a crime. Several studies have looked at feelings of anticipation, excitement, thrill, and arousal state as benefits of crime. Jack Katz (1988), in particular, has written about the “sneaky thrills” that some individuals may perceive as benefits of crime, engaging in the behavior simply for the “thrill” of getting away with something deviant rather than for material gain.

CRITICISMS AND FUTURE DIRECTIONS

Some critics have suggested that rational choice theories have essentially added nothing new to the field of criminology, as other theories, such as social learning and social control theories, already suggest that individuals are responsive to the consequences of crime (e.g., censure from family or friends). However, proponents of rational choice theories argue that the perspective offers several advantages over other theories, including that it calls needed attention to

the issue of “choice” in crime, it focuses attention on the decision making process itself, it attempts to explain several crime decision points, and anticipates that many other factors may have an impact on the offending decision. The rational choice perspective also recognizes that crime is not a unitary concept and that explanations of crime must take into account the offense specific and individualized nature of offending decisions.

Finally, despite its advantages, some authors have recently criticized the hypothetical scenario design commonly used to test rational choice propositions because researchers using this design present a potentially limited set of researcher derived consequences to participants. Bouffard (2002) proposes that individuals be allowed to develop their own consequences in response to hypothetical offending scenarios, so that researchers can more accurately determine the full range of individually relevant and crime specific consequences that influence offending decisions.

Additional challenges to those testing the rational choice perspective remain. For example, research is needed to examine the factors that may contribute to “bounded rationality,” in addition to emotional states and substance abuse, which have been examined to date. In addition, research using the hypothetical scenario design has typically used student samples and has not yet demonstrated that what is known about decision making generalizes to actual offenders.

rational choice theory (and economic sociology)

Thomas J. Fararo

Two major themes are part of the tradition of sociological analysis as it relates to economics. One theme concerns the sociology of economic phenomena, while the other concerns the relationship between economic theory and sociological theory. The first theme is the central focus of economic sociology, and the second has been a central focus of sociological theory in its phases of development. The two themes are closely connected. In recent decades, economists have endeavored to apply their theoretical approach to a wide variety of social phenomena very much in the domain of sociological research, such as religion and the family. Such “economic imperialism” has been met with some controversy and with opposition that includes a kind of reverse

invasion, in which economic sociologists delve into the details of economic phenomena traditionally within the purview of the discipline of economics, e.g., the behavior of markets. In this mutual invasion of territories, economic sociologists criticize economic theory for postulating a “hyperrationality” on the parts of actors that is unreal and therefore misleading in its derived consequences even in regard to economic phenomena. Thus economic sociology itself is a major domain in which the controversial interplay of the disciplines occurs.

In the classical phase of sociological thought, both Pareto and Weber migrated from economics to sociology. Both were trained in and produced contributions to economics before they each arrived at the conclusion that the approach of economic theory was too narrow to contain their aspiration to develop a more generalized analysis of society. Each accepted the idea that a sociological approach required a foundation in what we can call, following Parsons (1949 [1937]), “the action frame of reference,” including the idea that human action is purposive and involves normative elements. But each theorist moved beyond the idealized rational action of economic theory. As Parsons later put it, the task was to provide an analysis of the residual category of non rational action. Pareto invoked sentiments that motivate behavior that is then rationalized after the fact. Weber set out a very useful roster of four types of action, only one of which corresponds to the postulated action of economic actors in neoclassical economic theory. First, he distinguished between two types of rational action: instrumental rational action, as in consumer or producer choices, and ultimate value rational action, in which an actor’s choice results from some inner sense of duty that must be undertaken regardless of the costs. In addition, Weber noted the empirical significance of two other types of action: traditional (or habitual) action and affectual (or emotional) action. He was not unaware that the instrumental rational type could play an important baseline role in social analysis, but cautioned that the other types could not be neglected in sociology.

When Parsons elucidated these and other shifts from the “utilitarian” type of theory in which he embedded the economics that Pareto and Weber had transcended in their respective theoretical approaches, he went on to define

“the rational unit act” as a *special case* of a more general concept of the unit act, a basic unit of action as a process in which actors attempt to realize their ends in situations that include constraints. In his later writings, as well, Parsons treated economically rational action as a mode of action that he characterized as “institutionally motivated,” i.e., as linked to social roles in a social structure defined in normative cultural terms. This differs from the logically more primitive desire to optimize gratification that already occurs in infancy but that is channeled through social processes into various forms – such as those of Weber’s typology. Similarly, firms and customers are not fundamental entities of social theory but rather types of collectivities and roles that are characteristic of a modern economy with its particular historically emergent institutions. So economic theory, as it had developed in the last few centuries, was a scope restricted branch of the general theory of action, both in regard to its rationality postulate and in regard to its assumptions about the social environment of economic action.

In short, it is fair to say that for most contemporary sociologists, “rational choice theory” is the theory of instrumental rational action (Weber) employing a rational unit act special case of action (Parsons) that excludes non rational sentiments (Pareto).

Parsons also combined his general action framework with functional analysis based upon systems thinking. The culmination of this approach was a study in the integration of sociological and economic theory (Parsons & Smelser 1956) that formed one phase of the development of economic sociology. The key theme in the book is that economic theory is a special case of the theory of action, with the economy as a special type of social system.

However, later theorists such as Coleman (1986) argued that in taking the path of functional analysis, Parsons had not really followed up on the logic of generalizing economic theory. The basis for Coleman’s critique is that microeconomics, the home base of rational choice theory, is actually a *micro-macro* theory. Its aim is not a detailed and accurate analysis of individual choices. Rather, its goal is to explain the behavior of market phenomena, especially the price system that allocates goods and services in modern societies. Rational choice is a

postulated property of the individual or collective actors at the micro level of households and firms whose aggregated behavior leads to the market outcomes. The theory in microeconomics consists of logical derivations of the macro level outcomes from postulates about acting units, idealized as instrumental rational actors. Parsons's theory, whatever its merits, did not proceed in this manner and therefore failed to truly explain the macro level phenomena of concern in sociology on the basis of a presumed generalized action theory. While Parsons was appreciative of the role of mathematics in science, he did not attempt to emulate the mathematical methods of economic theory in its representation of mechanisms that enable the micro-macro linkage to be explicitly made.

In contrast to Parsons, some more recent sociologists have adopted a mode of theorizing that is inspired by rational choice theory. Lindenberg (1992) has defined and defended a methodological strategy of gradual movement from initial simplicity to more complex models that extend the realism and scope of the simpler starting models, employing actor models of the type employed in economic theory. This extension of scope aspect of sociological rational choice theory, along with the methodological features of idealization and approximation in the construction of theoretical models, are key aspects of rational choice theory as employed in economic sociology and more widely within contemporary social science. In this type of theoretical strategy, the key problem shifts from the nature of the act to the nature of the mechanism that combines the numerous acts into the eventual social outcome. Perhaps in some cases it is simply a surface feature of social life, as in elections in which votes are counted by some authorized agency. But in other cases, social interactions and social relationships among the actors mediate the outcome, e.g., as in a social exchange process of vote trading among legislators.

More or less explicitly, Coleman (1990) has followed the strategy outlined by Lindenberg. Purposive action is the key assumption and rational choice is the idealized form of it for the sake of analytical tractability. For instance, purposive action is represented as based upon a maximization of expected utility. This is part of Coleman's effort to employ the mathematical approach that Parsons bypassed. For instance,

what is called general equilibrium theory in economics is a mathematical theory of a system of interdependent markets in terms of the simultaneous determination of prices on all markets. Coleman employs the theory as a generalized exchange model for use in sociology. This effort can be reconstructed as having two phases. The first phase simply employs the same mathematical theory used in economics but with a more generalized vocabulary, e.g., *actors* instead of firms and households and *resources* instead of commodities. Two types of relations link actors and resources: *control* (generalizing ownership) and *interests* (as parameters of the utility function). In the second phase, the formal apparatus is scope extended by including representations of such features of real exchange systems as barriers to trade and social relations among actors.

Subsequently, in an overview of rational choice theory in relation to economic sociology, Coleman (1994) argues for the superiority of the theory in comparison with other sociological perspectives on grounds of its explanatory strategy of methodological individualism, its principle of optimization at the actor level, and its explicit and refined concepts dealing with macro level outcomes such as social equilibria. Referring mainly to his own work, he adds to features inherited from neoclassical economics some further developments of the ideas in a social direction, including the concept of social capital and the analysis of conflicts over rights in the formation of constitutions, and he goes on to discuss some applications of the theory in economic sociology. One of these applications is the theory of the design of economic organizations with sensitivity to emergent informal social systems that may act to support or to counter the objectives of the design. Other applications include the use of the concept of social capital to explain how immigrants build and expand specialized niches of economic activity and the analysis of collective behavior in the economy, such as panics, "bubbles," and crashes, by reference to the same type of mechanism – concatenation of rational choices – that explains other market phenomena.

Nevertheless, most economic sociologists are not committed to the application of rational choice theory. Rather, the tendency is to view rational choice theory as based upon a defective

vision of society insofar as it presupposes a set of independent actors, each with a given utility function. Where do these utility functions come from? How independent are the choices? What economic culture is presupposed? These sorts of questions about the transport of the economic method into sociology express a deep skepticism about the use of rational choice theory as a foundation for research in economic sociology. If actors are socially located in positions in social structures, the very meaning of social structure as pertaining to social relationships suggests research to investigate the *connections* among actors as significant features of the explanatory task of economic sociology. For instance, in a certain production market, firms may be closely studying each other's behavior for clues as to volume and quality of production they should plan upon in order to survive and prosper in the market, as in the treatment of markets as social structures in the sense of network analysis (White 2002). To be sure, at least to some degree – although never with complete information – acting units may make rational choices, but the patterning of relationships among the firms is part of the explanation of the choices.

In response, the advocates of rational choice models as parts of an overall explanatory micro–macro theoretical strategy would point out that their approach involves not just a micro–macro link, but also a macro–micro link. The latter “locates” actors in situations within a given macrosocial context, providing a basis for postulating their relative control and interests in various resources as well as institutional constraints on their action. Thus, they would argue that the focus on social networks and other forms of social structural relationships between actors is not excluded by the sociological rational choice approach; on the contrary, it is very much a part of the overall explanatory strategy. Contributions that aim to reconcile rational choice theory and structural analysis in sociology as a whole, and in economic sociology in particular, are on the agenda of research in this area.

It should be noted that sociologists who adopt the rational choice theoretical strategy are not exclusively or even mainly concerned with economic phenomena, and this is one aspect of the cross purposes that may account for the current situation. Theorists such as Hechter (1987) are

interested in the general problem of social order as understood within a tradition that goes back to Thomas Hobbes with his Leviathan solution in the form of a central authority as a necessary condition for order. In this context, rational choice theorists in sociology have emphasized an important obstacle to the translation of social values into social order, namely, the free rider problem, and proposed mechanisms that overcome the problem.

rational legal authority

Dirk Bunzel

According to German sociologist Max Weber, rational legal authority represents a form of legitimate domination, with domination being the “probability that certain commands (or all

commands) from a given source will be obeyed by a given group of persons" (Weber 1947: 324). While this probability implies a certain interest on the part of those obeying in the effects of their compliance, such interest can be diverse, and individuals may act upon calculated self interest, habituation, affection, or idealistic orientations. For domination to endure, however, it depends on the belief in the legitimacy of the command and its source. Accordingly, Weber distinguishes three types of legitimate domination. Charismatic authority rests upon a belief in the extraordinary, sacred, and/or exemplary qualities of the person commanding, while traditional authority calls for submission to those who are privileged to rule by historical convention. In contrast, rational legal authority differs in its unique combination of impersonality, formality, and everyday profaneness (*All taglichkeit*). It rests upon "a belief in the 'legality' of patterns of normative rules and the right of those elevated to authority under such rules to issue commands (legal authority)" (Weber 1947: 328).

Significantly, Weber conceptualized legitimate domination ideal typically, thus producing a theoretical idealization that simplifies or accentuates those aspects of social evidence he deemed significant, regardless of their concrete empirical correspondence. Existing modes of authority will therefore most likely constitute hybrids, with one of the three forms of domination prevailing. It is precisely its status as an ideal type, however, that allowed Weber to place rational legal authority at the center of his theory of capitalist development and occidental rationalization.

Historically, rational legal authority unfolded from the medieval monasteries and evolved along with capitalist production, the administration of growing populations within defined territories, and reformist religious movements in late Renaissance Europe. Inspired by these developments, a new mode of governance emerged that was founded on general and formal systems of rules and regulations and on a systematic conduct of life. At the societal level, such governance derived from the implementation of positive rational law (*Satzungsrecht*) and rational administration within a bureaucratic state apparatus. The impersonal rule of formal and universally applied law – a law that was

systematically created (*gesetzt*) by professionally trained jurists – replaced arbitrary rule and privileges and thus established the equality of contractual parties as a legal basis of capitalist market economies. Simultaneously, administrative rights and duties were delegated to public officials. These would neither inherit nor own their hierarchically regimented offices, would comply with formal rules and regulations, would produce and act upon written documents, and would be recruited according to expertise. In so doing, they would put an end to the personal, arbitrary, and more haphazard conduct of patriarchal or patrimonial rule and would constitute a more efficient form of administration: bureaucracy. Hence, rational jurisdiction combined with governmental bureaucracy would render the modern state into an archetype of rational legal authority. At an individual level, the *vita communis* practiced in medieval monasteries instigated a systematic conduct of life that would culminate in the doctrines of Calvinism, which commanded thrift, duty of work, and inner worldly asceticism. This methodical approach to life generated both the entrepreneurial attitude of early capitalists and the work ethic demanded of free laborers. Consequently, economic, political, and ethico religious elements formed an "elective affinity" to bring about a rationalization of production, government, and life conduct that was unique in its occidental roots and that has since become imperialist in tendency.

The innate ambivalence of the principles that constitute rational legal authority provoke ambiguous and, occasionally, conflicting consequences. In Weber's conceptualization, rational legal administration is most effective and efficient the more it operates along the lines of formal rationality, thus excluding any substantive values and eradicating personal emotions, sentiments, or ideals. While such impersonal procedure promotes impartiality and equality, it may also advance rigidity and aloofness. Similarly, the loyalty shown toward rules and regulations discourages developing personal integrity and responsibility as opposed to reliance on an external framework of rules – a fact that tends to provoke rampant formalization and dependence on written evidence, thus compromising efficiency. Formalization, in turn, supports routinization and homogenization. While the latter

promote calculability and predictability, they are also notoriously prone to rigidity. Finally, the coalescence of impersonality, adherence to rules and procedure, and formalization subjects virtually all spheres of life to an anonymous but stringent order of formal rationality. However, this process of rationalization has looted modern society of its magic, amazement, and intimacy.

Not surprisingly, then, rational legal authority and its archetypical materialization, occidental bureaucracy, have stimulated much debate. Most commonly, they have been charged with ethical poverty and with provoking irrational consequences. Weber himself was well aware of potential dangers, and in a rather dystopian vision he predicted that ongoing rationalization would create an “iron cage” of obedience (*Horrigkeit*) to imprison the modern individual. Others went even further, identifying overexposure to instrumental rationality, the blind following of rules, and the disregard for substantive values such as empathy or compassion as producing a “bureaucratic personality” that – inspired by a perverse sense of duty and obedience – was capable of partaking within the greatest crimes against humanity. Finally, the very efficiency Weber ascribed to bureaucratic administration has been questioned in the wake of recent neoliberal campaigns that prescribe private ownership and markets as antidotes to “red tape” and inflexibility. Against such criticism, other authors have pointed out that privatization and marketization have not increased efficiency but, instead, have created a politicization of civil service and a prioritization of measurable short term gains at the expense of integrity, loyalty, and fairness. Refuting the moral absolutism and romanticism of the critics, they stress the significance of bureaucratic administration for the development of democracy, long term sustainability, and social equality.

While state bureaucracies and hierarchical organizations may have given way to informational networks and embryonic industries, while sovereign subjects may experience a “corrosion of character,” and while the diversity and contingency of “life orders” are increasing, rational legal authority has changed its face, but it has not withered away. Rationalization of production, consumption, and life pursuit is still prevalent, as cathedrals of consumption, supranational institutions, and lateral careers demonstrate. In

fact, where rational legal structures have retreated – be it in international disputes, in ethnic and religious affairs, or in industrial relations – brute power or even violence seems to prevail. Perhaps McDonaldization rather than bureaucratization is the dominant form these days; yet still, our saturated selves rely upon “civilization” within somewhat more “fancy” iron cages.

rationalization

Zeynep Atalay

It is likely that the concept of rationalization is most often linked with the work of Sigmund Freud on psychological defense mechanisms. However, while such usage is not unknown in sociology, the concept is most often associated with the work of Max Weber and his followers. For Weber, rationalization occurred only, at least to its fullest extent, in the modern West. Other parts of the world, for example India and China, failed to rationalize to any great extent because of barriers there such as basic idea systems and structures that were antithetical to rationalization. On the other hand, there was a series of factors in the West that expedited the development of rationalization in that region of the world. The best known of these factors is the role that the Protestant ethic played in the rise of rational capitalism, but Weber made it clear that this ethic was but one of many distinctive characteristics in the West that made rationalization possible. Furthermore, the rise of capitalistic society was only one of many manifestations of rationalization that also included the rise of the bureaucracy as an organizational form, and of the modern state, corporation, military, university, and church. While Weber saw all of these, and more, as undergoing a process of rationalization, he was careful to avoid a general model of rationalization and to outline the ways in which each of them rationalized.

Weber's thinking on rationalization is based on his analysis of the basic types of rationality,

only one of which – formal rationality – emerged in the modern West. In Weber's terms, *practical* rationality involves the utilization of pragmatic, calculating, and means ends strategies in order to pursue mundane ends and overcome the obstacles to their pursuit that exist in everyday life. *Theoretical* rationality refers to the employment of abstract ideas and conceptual schemes to describe, elucidate, and comprehend empirical reality. *Substantive* rationality is involved in decision making that is subject to the values and ethical norms of the particular society. *Formal* rationality, which became ubiquitous in the modern West, involves decision making in accordance with a set of universal rules, laws, and regulations. It is only in the West that formal rationality emerged and became pre dominant. And it is that type of rationality that lies at the base of the rationalization process.

Rationalization constitutes the centerpiece of Weber's general sociology, as well as his sociologies of religion, law, bureaucracy (rationality also lies at the heart of his methodology for the social sciences), the city, and so on. Everyday life is rationalized, and while that brings with it great advantages such as increased efficiency, it also leads to a variety of negative consequences such as disenchantment and alienation. Most generally, Weber feared the development of an "iron cage" of rationalization that would increasingly enslave people and from which it would be increasingly difficult to escape.

In the domain of authority systems, rationalization involved the replacement of traditional and charismatic authority by rational legal authority in which rulers' legitimacy stems from achieving their position on the basis of following a series of legally prescribed steps such as an election. In the religious realm, the process involved, among other things, the professionalization of the clergy and the production of a systematic body of religious knowledge. Law also involved professionalization, this time of lawyers, and it was transformed from a system dominated by the traditions of common law into a systematized, generalized, and codified set of universally valid legal principles.

Bureaucracy plays a key role in Weber's sociology and can be seen as the paradigm of the rationalization process. The bureaucracy is an organizational form that is rationally designed to perform complex tasks in the most efficient

way possible. The critical features of bureaucracy, according to Weber, are specialization of work, hierarchy of offices, technical competence in decision making process, rationally enacted rules and regulations, the impersonal character of the administrative staff, and the recording of any decision making in writing in a filing system. The task oriented character of the western bureaucratic organization promotes efficiency. Specifically, it limits the unpredictable and partial nature of personal decision making and levels social and economic differences by offering an impersonal and impartial mechanism for decision making.

Although Weber saw the ideal typical bureaucracy as an efficient system, he did not fail to note the substantial irrationalities that are inherent in it. Weber was unmistakably conscious of bureaucracy's dehumanizing and alienating potential, as reflected in his view that formal organizations reduce the human being to "a small cog in a ceaselessly moving mechanism" (1978: 988). Bureaucracy, which is all but indissoluble once it is established, applies the same set of abstract rules to individual cases and limits the autonomy of the individual. Therefore, the domination of bureaucracy is likely to result in injustices given the fact that the particularity of cases is not taken into consideration in rendering decisions. Another of the irrationalities associated with the bureaucracy is that while it is supposed to operate efficiently, the fact is that it often suffers from inefficiencies and, as a result, often fails to accomplish the tasks that it exists to perform. Finally, of course, the bureaucracy can represent a clear case of the kind of "iron cage" Weber feared and that was described brilliantly in the novels of Franz Kafka, especially *The Trial* and *The Castle*.

Overall, Weber offered a world historical theory of rationalization in which he attempted to account for why that process emerged in the West and not elsewhere, as well as for its great advantages and numerous disadvantages in comparison to less or non rationalized systems.

Weber's German colleague Georg Simmel also theorized about rationalization, although it has a far more limited role in the latter's work. In *The Philosophy of Money*, Simmel (1978 [1907]) sets out to deal with money as an abstract and universal system that provides a fundamental model of the rationalization

process. Money, as the symbol of abstract social relations, exemplifies the declining significance of the individual (and subjective culture) in the face of the expansion of objective culture, which is associated with intellectual rationality, mathematical calculability, abstraction, objectivity, anonymity, and leveling. Furthermore, the impersonal nature of exchange relationships, which are facilitated by the monetary system, imposes a progressively more rationalized system on individuals. As is true in Weber's work on rationalization, Simmel emphasizes the importance of quantitative over qualitative factors, as well as growing intellectuality, in the modern rationalized world.

Also of note is Karl Mannheim's thinking on rationalization. Mannheim borrows heavily from Weber (and Simmel), and develops a similar view about the rationalization of society. Resembling formal rationality in his work is the concept of functional rationality, which he sees as growing increasingly ubiquitous and coercive over people. Instead of substantive rationality, Mannheim deals with substantial rationality, which fundamentally involves people's ability to think intelligently. He sees the latter as being undermined by the former. Mannheim develops a rich set of ideas about rationalization, as well as an elaborate and useful set of concepts to deal with it. For example, he sees an increasing trend toward self rationalization and self observation in which people are seen as better able to control themselves rationally rather than being controlled by functionally rational systems.

Inspired by the work on the rationalization of the modern western society, especially that of Weber, critical theorists associated with the Frankfurt School criticized the consequences of the growth of rationality, or instrumental reason, for modern society. In response to early Marxian theorists who accorded the economy centrality in their analysis of the modern world, neo Marxists of the Frankfurt School were committed to the analysis of culture, especially cultural repression and the decline of individual autonomy in modern society. In this perspective, the repression produced by rationality replaces economic exploitation as the dominant social problem. As elaborated by Adorno and Horkheimer, the rationality of capitalism is consolidated through the decline of individualism, and that has made it more difficult to achieve the

goals of the Enlightenment. Marcuse (1964), in *One Dimensional Man*, inspired in part by Weber's rationalization theory, focused on the relationship between technology and rationalization. Marcuse contended that formally rational structures have replaced more substantially rational structures and that capitalist society has become one dimensional, in the sense that it is dominated by organized forces that restrict opposition, choice, and critique. Although there appears to be democracy, liberty, and freedom, society prevents radical change since it is able to absorb criticism and opposition, and to render these criticisms futile.

Habermas agrees with Weber that the development of modern society is driven by an underlying logic of rationalization. However, he maintains that this has a dual quality. In his view, Weber fails to distinguish between instrumental and communicative rationality, which corresponds to different patterns of development in modern society: technological and moral progress, respectively. Rejecting the pessimism of Weber, Adorno, and Horkheimer, Habermas argues that the concept of the "iron cage" gives too much weight to the importance of instrumental rationality in modern society. Rather, in his view, the development of both instrumental and communicative rationality can produce not only unprecedented technical achievements, but also the kind of humanity that can utilize those advancements to better itself rather than being enslaved by them.

The concept of rationalization has profoundly affected the direction of social theory, perhaps most notably theories of state formation, governmentality, organization, politics, and technology. The concept has also triggered debates regarding the central issues of the contemporary world such as the culture of consumption. Ritzer's McDonaldization thesis, in particular, illustrates the continuing importance of the Weberian notion of rationalization as it extends it into many new domains, especially consumption, popular culture, and everyday life.

Ratzenhofer, Gustav (1842–1904)

Bernd Weiler

Besides Ludwig Gumplowicz, the Viennese born Gustav Ratzenhofer is the best known representative of the so called Austrian Struggle or Conflict School. After only a few years of formal schooling and an apprenticeship as clock maker (his father's business), Ratzenhofer entered the Austrian Army in 1859. In a highly successful military career he rose to the position of a lieutenant field marshal and, a few years before his retirement, was also appointed president of the military supreme court in Vienna. During his time in the army Ratzenhofer acquired a first hand knowledge of the national struggles which were increasingly besetting the Austro Hungarian Empire. His political world view was marked by a tension between the commitment to the liberal ideals of the revolution of

1848 and the conviction that a strong, centralized state was needed to counteract the centrifugal forces in the Habsburg monarchy. Before Ratzenhofer turned to sociology he had written numerous treatises on military history and strategy (e.g., Ratzenhofer 1881) and had also provided an in depth analysis of the peculiar political nature of the Habsburg monarchy (Renhr 1877–8). In 1893 he published his first explicitly sociological work, the three volume *Wesen und Zweck der Politik*, followed shortly thereafter by *Die sociologische Erkenntnis* (1898) and by the posthumous work *Soziologie: Positive Lehre von den menschlichen Wechselbeziehungen* (1907), which contains a number of anti-Semitic and racist remarks. Ratzenhofer was mainly self taught and remained on the margins of Viennese academia throughout his life. One of his few scientific allies in Austria was his fellow countryman Ludwig Gumplowicz, who assumed the role of a mentor and made his name known in the international sociological community. Ratzenhofer died in 1904 on his return trip from the St. Louis Congress of Arts and Sciences where he had presented a sociological paper.

The major intellectual influences on Ratzenhofer were the French Enlightenment, with its emphasis on the universal and inevitable progress of humanity, British empiricism, and the writings of cultural historians such as H. T. Buckle (Oberhuber 2002). Above all, Ratzenhofer was heir to the time honored tradition most famously associated with Heraclitus that “war is the father of all and king of all.” Like many of his contemporaries, Ratzenhofer was impressed by the success of the natural sciences and emphasized that human history was not beyond or above, but part of, nature. Sociology’s prime task was to uncover the universal laws governing social life (Ratzenhofer 1904). In his late writings Ratzenhofer refined this idea of the unity of nature and history and of the iron regularity of social phenomena into a grand systematic, monistic worldview with metaphysical overtones. Even though he clung to the idea that society was a natural product evolving out of necessity, he still shared the Comtean sociocratic optimism that an understanding of the laws could be used for society’s reorganization.

At the core of Ratzenhofer’s sociology lies the idea that from the very beginning social life had been inherently antagonistic, “absolute

hostility” marking the starting point. In a highly conjectural scheme of social evolution he sketched the various stages through which society had developed, paying (like Gumplowicz) particular attention to the formation of the state through conquest. At each stage the antagonistic character of social life assumed a peculiar form. In contrast to Gumplowicz, with whom he shared many key ideas, the units of analysis in Ratzenhofer’s conflict theory were not the concrete, empirically given groups competing against each other but the diverging “interests” that the sociologist had to abstract from real life. Society was the battle field of “interests,” understood as social forces manifested in groups. Of particular importance were the “general interest,” the “kinship interest,” the “national interest,” the “creedal interest,” the “pecuniary interest,” the “class interest,” the “rank interest,” and the “corporate interest” (Ratzenhofer 1967: 161–85; Small 1905: 252). By introducing the category of “interest” Ratzenhofer, unlike Gumplowicz, was able to argue that within an empirically given group there could be more than one “interest” at work, allowing for more intragroup dynamics, that individuals could partake in more than one group, and that not all potential social forces were always necessarily manifested in the competing real groups. Ratzenhofer’s ideas exerted a great influence on the early American sociologists A. W. Small, L. F. Ward, E. A. Ross, and F. H. Giddings, and especially on the American political scientist and so called founder of pluralism, A. F. Bentley (1967).

Rawls, John (1921–2002)

Mark R. Rank

John Rawls is generally considered the most significant moral philosopher of the twentieth century. His work has had a profound influence upon political philosophy, as well as political science, sociology, economics, social work, theology, and law. For much of his career he was a faculty member in Harvard's department of philosophy.

Rawls's major work was his 1971 book entitled *A Theory of Justice*. In it he details the basic components of a just or fair society. He begins with what he refers to as the original position. Imagine, Rawls states, that "no one knows his place in society, his class position or

social status, nor does anyone know his fortune in the distribution of natural assets and abilities, his intelligence, strength, and the like" (p. 12). Behind such a veil of ignorance, Rawls asks, what would be an acceptable social contract for most people? He argues that individuals in this original position would invariably choose two fundamental principles.

The first is that each of us would want to be guaranteed access to the most basic liberties. These would include "political liberty (the right to vote and to be eligible for public office) together with freedom of speech and assembly; liberty of conscience and freedom of thought; freedom of the person along with the right to hold (personal) property; and freedom from arbitrary arrest and seizure as defined by the concept of the rule of law" (p. 61). Consequently, all citizens, no matter where they fall in society, should be entitled to these rights.

The second principle chosen would be to allow social and economic inequalities to exist, but only under two conditions: (1) "if they result in compensating benefits for everyone, and in particular for the least advantaged members of society" (pp. 14–15); and (2) that offices and positions in society are open to all. The reason that inequalities would be tolerated in the first place is because such inequalities often provide incentives to greater production, which can benefit all citizens. According to Rawls, a just society therefore does not necessitate that the distribution of income or wealth has be equal, but rather that an unequal distribution is to everyone's advantage, particularly those at the lower end of the income distribution. For example, from a Rawlsian perspective, a just society would be one that provides a strong social safety net to protect the economically vulnerable, with the funding for such programs coming through a redistribution of some of the gains earned by those at the middle and upper ends of the income gradient.

These two principles, referred to as the "liberty principle" and the "difference principle," form the core of Rawls's conception of "justice as fairness." In his later work, Rawls elaborated and extended the ideas laid out in *A Theory of Justice*. In particular, his 1993 book *Political Liberalism* dealt with addressing how the liberty and difference principles can exist and be applicable within democratic societies,

given the wide variety of ideological and religious viewpoints within such societies. He argued in *Political Liberalism* and in his final book, *Justice as Fairness: A Restatement*, that his principles of justice should be understood as a political guideline rather than as a moral doctrine. Consequently, the plurality of religious, philosophical, and moral viewpoints within democracies can successfully coexist under a political interpretation of justice as fairness.

realism and relativism: truth and objectivity

Andrew Tudor

Although the doctrine of relativism has a lengthy pedigree in philosophy – conventionally traced to the 5th century BC sophist Protagoras and his “man is the measure of all things” – it was only in the twentieth century that its full force was unleashed. The “linguistic turn,” the “cultural turn,” and the “postmodern turn” all brought with them profoundly relativistic claims. Late twentieth century thought sought to relativize aesthetics, ethics, and even that last bastion of Enlightenment certainty, natural science. But relativism takes many forms, and relativists do not speak with one voice. This is

especially apparent where conceptions of science are concerned, for a very wide variety of relativistic arguments have been marshaled against the conviction that science provides privileged access to the independent, objective, external reality of nature. These range from the various perspectival relativisms that increasingly undermined philosophy of science orthodoxy from within, right through to the far reaching social constructionist relativism of the sociology of scientific knowledge and the so called science wars to which it gave rise.

It was apparent from the Greeks onward that relativistic claims all too often led to paradoxes, regresses, and to problems of self reference. These can take various forms, although the general pattern can be typified by this simple variant of the well known truth paradox. Consider the statement “all truth is relative to cultural context.” In what sense can this statement be true? If it is an absolute truth, as the “all” suggests, then it is its own refutation. But if its truth is (only) relative to cultural context, then there may be cultural contexts in which it is thought false and is, therefore, true. Much energy has been expended over the centuries in dealing with the consequences of such circularity, and while this has been entertaining enough, it has not served to undermine the appeal of relativistic claims. Nor should it, of course, since few serious relativistic positions on matters of truth and knowledge deal in these kinds of absolutes. They tend to recognize, rather, that how we know the world is dependent on both the nature of that real world itself and the conceptual systems through which we seek to understand it. Since Kant, it has been impossible not to recognize the constitutive character of concepts in forming our knowledge. But to what degree are they constitutive? And if they are strongly so, how – if we should and if we could – are we to stop the perspectival regress from theory to meta theory to meta meta theory, and so on? For Kant, of course, the resolution lay with the a priori transcendental categories – the preconditions for all thought. But if we cannot make that transcendental move, how then are we to conceptualize the relation between the terms in which (we think) we know and the real world about which we presume to know, but only from within the terms, languages, and perspectives available to us?

The relativistic issues that arise here – those of alethic, epistemic, and even ontological relativism – are central to radically changing views of science in the modern period. But to assess the impact of these ideas requires some attempt at classification. What is it that is relativized? And relative to what? Such questions have often been the starting point for those concerned to impose order on the somewhat inchoate world of relativistic thinking. Only equipped with, at least, rudimentary answers to such deceptively simple questions is it possible to begin to assess the impact of relativistic thinking on our understanding of science. To commence, then, with the most general, post Kantian classification of the “what” that is relativized, we may distinguish between cognitive, aesthetic, and ethical relativism. Although questions of aesthetic relativism may not be irrelevant to science (at least some scientists are given to speaking of theoretical models in aesthetic terms – the double helix was “pretty,” as Watson famously described it), and although ethical issues clearly cannot be dismissed, it is primarily the family of cognitive relativisms that are of most interest in relation to science. Here we find variously far reaching relativistic accounts of knowledge, truth, objectivity, and the constitution of “reality” offered from a range of relativizing perspectives. Let us consider four such clusters: limited theory based conceptual relativism; radical language based conceptual relativism; cultural and “worldview” relativism; social constructionist relativism.

In the domain of conceptual relativism, the most straightforward, and least problematic for those seeking to defend science from relativistic doubt, are the conventionalist arguments which arose from within the logical positivist tradition. Here, the major relativistic frame was “theory,” and the initial questions raised were most notably those of “theory laden” observation and the consequent necessity for methodological conventions to prevent perspectival regress. As the mid twentieth century “received view” in philosophy of science moved away from the apparent certainties of the distinction between observation and theory languages – at least in part because of the difficulties of drawing that distinction systematically – it increasingly embraced conventionalist solutions to its conceptual problems. Thus, for example, Popperian

falsificationism openly recognized that decisions about the falsificatory significance of experimental results irreducibly involved methodological conventions, even though Popper sought to draw a critical rational line beyond which at least some “conventionalist stratagems” were scientifically unacceptable.

However, the space opened up by this need to incorporate conventionalist decision making was to prove something of a black hole into which more radical relativistic arguments were drawn. Once science’s thoroughgoing reliance on its conceptual schemes was admitted, it became increasingly difficult to prevent the slide toward the more powerful conceptual relativisms. Thus, for example, Quine, having famously rejected the familiar halt to that slide offered by the analytic/synthetic distinction, and having also argued that contradictory evidence could always be dealt with by making adjustments to some other part of the conceptual system, then further extended his thesis in terms of the indeterminacy of translation. Taken together, these arguments appear to lead toward relativistic conclusions, and Quine’s image of knowledge as a “web of belief” which relates to experience only “at the edges” lends force to that interpretation. In a much quoted passage, Quine (1960: 24–5) himself denies that we must therefore “settle for a relativistic doctrine of truth,” claiming instead that “within our total evolving doctrine, we can judge truth as earnestly and absolutely as can be; subject to correction, but that goes without saying.” That may be so, but as the qualification “within” suggests, Quine is clearly espousing a radical conceptual relativism which is consonant with his view of science as “self conscious common sense.”

Although Quine’s conceptual relativism is primarily language based, it is not a great leap from his “web of belief” to the more overtly culture and “worldview” based relativisms. The best known of such approaches to science, of course, is that of Thomas Kuhn in his influential 1962 study, *The Structure of Scientific Revolutions*. At the heart of Kuhn’s analysis lies the “paradigm,” a concept which – whatever Kuhn’s original intentions – has subsequently come to refer to the body of presuppositions, concepts, methods, and acculturated practices which make up “normal science” at any given

moment. The paradigm defines the fundamental terms within which scientists operate – their culture – and all scientific knowledge is in that sense relative to the paradigm. Change, when it comes, is revolutionary change: the entire paradigm shifts when anomalies are perceived to be too important to be ignored and when there is a changing balance of power relations within the scientific community. Paradigms are therefore “incommensurable” in as much as there exists no independent position from which knowledge claims within one paradigm can be assessed in relation to those within another. Much debate has followed on this issue, not least with Feyerabend, but it seems clear that, as far as Kuhn is concerned, lack of direct translation between paradigms does not necessarily mean that they are entirely incomparable. Any attempt to compare them will entail what has been called “Kuhn loss” but, just as we can achieve some level of translation between cultures, so there will still be areas of meaningful overlap between the theories generated within different paradigms.

However one assesses the strength of Kuhn’s own relativism – and commentators do not agree on this – there is no question but that *The Structure of Scientific Revolutions* significantly helped to open up the study of science to more socially and culturally oriented empirical analysis. Prior to the 1960s sociological research into science had ring fenced scientific knowledge itself. However, where Kuhn had led, later sociologists of science were more than willing to follow, a development accelerated by growing interest in social constructionist perspectives within sociology. From this context emerged the sociology of scientific knowledge (or SSK as it likes to refer to itself), the so called strong program in the sociology of knowledge and, in their wake, what became known as the science wars. The strong program aimed to examine the social and cultural grounds for knowledge claims, and is most briefly characterized by its four basic principles as advanced by Bloor (1976). It was to provide causal explanations; to be impartial in explaining both successful and failed knowledge claims; to be symmetrical in using the same kinds of causal explanations for both true and false beliefs; and to be reflexive in as much as it could be applied to sociology itself. Quite how relativist is this perspective

(and, indeed, SSK more generally) is open to some debate. From the point of view of a hard line scientific realist, the strong program is an affront to rationality and to demonstrable scientific achievements in comprehending and manipulating the real world. “No one is a social constructionist at 30,000 feet,” as Richard Dawkins vividly, albeit misleadingly, claimed in a typically vitriolic contribution to the science wars. But many proponents of SSK (including the founders of the strong program) profess at least some degree of realism in their views of science, even if the excessive rhetoric of the “debate” on this issue has too often forced the various parties into untenable positions. It is a measure of how foolish the science wars became that the mildly entertaining Sokal hoax (Sokal had a parody article published in the journal *Social Text*, apparently drawing on relativistic and constructionist approaches to science) has been paraded as somehow undermining relativist and constructionist arguments. Whatever failings may be exhibited by the editorial policies and methods of a journal can hardly count as clinching arguments for or against any intellectual case.

What the Sokal hoax and its aftermath did demonstrate, however, is the antagonistic confusion that has been characteristic of the guerrilla warfare between naïve relativist and naïve realist positions. Boudon (2004) has suggested that relativism more generally is in the process of becoming the new “secular religion,” a development of which he does not approve. Whether that characterization turns out to be accurate remains to be seen, but, in any case, in the science wars we have already seen its fundamentalists at work on both sides.

reception studies

Sonia Livingstone

Reception studies derives primarily from the application of literary theories of textual interpretation to the everyday activities of mass media audiences. Drawing on ideas from the interpretation of the literary texts of high culture, reception studies argues that media texts must also be interpreted, made sense of, worked on by their audiences. Reception studies began in the 1980s in reaction to the predominant conception of audiences as passive and – in tandem – of media texts as moving wallpaper occasioning little or no effort of interpretive activity. For, ever since the advent of mass media over a century ago, the major theories of the audience have been strongly influenced both by sociological theories of ideology and hegemony and by social psychological theories of media effects and attitudinal or behavioral change. The result has been an image of the audience as homogeneous, vulnerable, and easily manipulated in the face of a powerful and all pervasive mass media. Reception studies has sought to critique each element of this image, proposing instead that audiences are active, heterogeneous, resourceful, motivated, and even resistant in their responses to mass media texts.

Since its inception, reception studies has mapped out a theoretical and empirical program of research on the “active audience” for mass media, establishing an influential strand of audience research, together with a series of innovations in both theory and methodology (Livingstone 1998).

Most importantly, in media and communication research emphasis shifted from the structuralist analysis of meanings “in” the text to an analysis of the process of reading a text, where the meanings which are activated on reading depend on the interaction between text and reader. Reception theorists (from both the American reader response and European reception aesthetic traditions) argue that an implied or model reader (i.e., an ideal decoding strategy, inscribed in the conventions of medium, genre, or address) is encoded into the text. This “model reader” is an implicit set of assumptions detectable within the structure of a text which render the meaning of the text fundamentally open or unstable, depending on the actual interpretive contribution of “real readers.” This in turn depends on what Eco (1979) termed the “textual competencies” required to decode the text. However, as the empirical reception context may not meet this specification of the ideal reader presumed in the construction of the text, and, moreover, it may provide alternative interpretive resources, reception studies became an empirical project focused on audiences, linking their interpretive activities to both text and context.

In retrospect, the success of reception studies in challenging and changing dominant theories of audiences merits a more complex explanation than simply the extension of a theory from high to popular culture, although this innovation gave reception studies its conceptual starting point. But the literary approach is not primarily an empirical one, and what was striking about the early reception studies was the enthusiasm with which researchers began conducting empirical projects on audience’s reception of mass media (mainly television) texts, rather, that this was the response of social science to a new idea, it being strongly felt that one could no longer simply assume that audiences would automatically interpret media texts as either their producers or their critics blithely supposed. Hence, the ways in which audiences

interpreted media texts was recognized as an empirical question, one that demanded the combined analysis of media texts with media audiences (e.g., see readings in Brooker & Jermyn 2003). This in turn required the development of new methods of research – not just looking for measures of impact or effect, but rather seeking to uncover the interpretive processes of diverse audience members in particular cultural and social contexts, and so methods such as focus group interviewing, discourse analysis of audience talk, and ethnographic observation have become particularly prominent.

Within social science approaches to media audience, several distinct strands of research seized on the potential of literary approaches to interpretation, resulting in what is variously termed “reception studies,” “audience reception studies,” or work on the “active audience.” These include, perhaps most importantly, the cultural studies interest in the production and reproduction of mass produced meanings, centering on the twin analysis of encoding and decoding of media texts, with decoding taking place in specific yet influential social contexts of everyday life (Morley 1992). But the uses and gratifications perspective, which asked not what media do to audiences but what audiences do with media, also found resonances in reception studies, as did the social cognitive and social constructivist approaches in social psychology, concerned with the micro analysis of people’s interpretive processes. Two approaches gave a more politicized welcome to reception studies – one, critical mass communications research, was interested in the possibilities of audience critique and resistance to dominant ideological messages; the other, feminist media studies, was concerned to challenge the typically gendered image of the passive audience as housewife by reevaluating audiences in more active and critical terms.

In integrating these different strands, reception studies has taken a range of approaches over recent years, while developing further as researchers respond to new empirical challenges, particularly those posed by different cultural contexts (resulting in a comparative, cross national program of research for reception studies), and by new forms of “audiencing” (Fiske 1992) resulting from changing texts and technologies (e.g., public participation in talk

shows, reality shows, and media events; audiences as fans joining in and acting out, rather than simply watching, the text; engagement with emerging or hypertext genres online or across multiple media). In so changing, reception studies has both gained in strength and encountered some problems. One problem has been the temptation to overclaim audiences’ abilities to resist or rework the text so as to avoid the dominant message. Also problematic has been the ethnographic turn evident across much of the social sciences, for reception studies has expanded the focus on the reception context to the point where audiences’ interpretive engagement with the text itself has become more marginalized; thus reception studies merges with audience studies more generally, and the specific strength of reception studies which stressed the empirical reception of specific textual features, conventions, genres, or codes receives less weight in current studies of audiences.

Nonetheless, the key arguments of reception studies have now become paradigmatic in sociological studies of mass media, namely: (1) that audiences must interpret what they see even to construct the message as meaningful and orderly, however routine this interpretation may be; (2) that audiences will diverge in their interpretations, generating different understandings from the same text; and (3) that the experience of viewing stands at the interface between the media (and their interpretations) and the rest of viewers’ lives, blurring into the everyday so that watching television is no longer to be denigrated or neglected as an automatic, passive, standardized phenomenon.

recidivism

Paula Smith

Recidivism refers to reoffending, or the repetition of criminal acts by a convicted offender. The term is derived from the French word *récidiver*, and based on the Latin word *recidivus*, back,” to denote a relapse into prior criminal habits. Recidivism is an important consideration for modern penologists as a large proportion of incarcerated offenders in most countries are classified as recidivists. Studies in several countries across North America and Europe, for example, indicate that between one half and two thirds of inmates have served previous sentences (Bonta et al. 1992; Farrington 1992). According to Langan and Levin (2002), a recidivism rate as high as 70 percent has been reported within three years of release for inmates in the United States. Research also indicates that recidivists tend to have lengthier criminal histories, and the recidivism rate appears to be highest for those convicted of property offenses (Bonta et al. 1992; Langan & Levin 2002). Women are much less likely to recidivate than men (Bonta et al. 1992).

The measurement of recidivism is plagued by a number of conceptual and methodological issues that affect how statistics are interpreted. Recidivism is most often defined as an official record of reoffending behavior (e.g., rearrest, reconviction, reincarceration, technical violation of parole or probation condition, readmission to secure hospital, etc.). Official records are impacted by a number of factors, however, and inconsistencies in the interpretation of results have culminated in much misunderstanding and controversy. Several commentators (see Skogan 1977; Bartol 2005) have noted

that official records tend to underestimate the incidence of criminal offenses as many crimes are unreported, or undetected, by law enforcement agencies. As an alternative, self report studies (e.g., respondents are asked what offenses they have committed and how often) as well as national and regional victimization studies have been used to estimate recidivism rates. Moreover, recidivism rates also depend on how and when reoffending is measured. At the most basic level, certain measures of recidivism (e.g., reconviction, reincarceration) provide a more conservative estimate of reoffending in comparison with others (e.g., rearrest, technical violation of parole or probation condition). To illustrate, not all individuals who are rearrested are reconvicted, and not all individuals who are reconvicted are reincarcerated. Thus a measure of recidivism based on reconvictions would give a more conservative estimate than a measure based on rearrest. In addition, the severity of new convictions may or may not reflect the severity of the offenses actually committed (e.g., consider the effects of plea bargaining). Other methodological issues that limit the comparative value of statistics on recidivism include differing post release follow up periods (i.e., lengthier follow up periods generally produce higher estimates of recidivism than shorter periods), varying data sources (e.g., official records versus self report data), unrepresentative or small samples, regional disparities in legal and procedural codes, as well as the discretionary decision making practices of law enforcement agencies. All estimates of recidivism should be interpreted in light of how and when reoffending was measured.

A variety of statistical methods are used to calculate recidivism rates. Two of the most common are: (1) the *frozen time method*, or the calculation of the cumulative percentage of offenders who have recidivated after a specified follow up period; and (2) *survival rate analysis*, or the estimation of the probability and rate of recidivism (i.e., time to reconviction) for different cohorts of offenders (Lievore 2004).

Reducing recidivism is, arguably, the primary goal of correctional agencies that aim to rehabilitate offenders. As such, recidivism is often the criterion of interest in assessing future risk, and in evaluating the effectiveness of correctional interventions. Several meta analyses

have identified numerous causal or functional variables as robust predictors of recidivism. These variables are referred to as *risk factors* and are subdivided into two categories: (1) *static*, or immutable, risk factors (e.g., age, gender, criminal history); and (2) *dynamic*, or malleable, risk factors (e.g., pro criminal associates, substance abuse). Research indicates that high risk offenders (i.e., those with an increased likelihood for recidivism) can be reliably distinguished from low risk offenders through actuarial assessments of both static and dynamic risk factors. Furthermore, dynamic risk factors are prime treatment targets given their amenability to change, and the likelihood of future criminality is substantially reduced when such offender characteristics are altered. Several meta-analyses (e.g., Gendreau et al. 2000) have identified the following dynamic risk factors as the most robust predictors of recidivism: (1) pro criminal attitudes, values, beliefs, and cognitive emotional states; (2) pro criminal associates; (3) personality and temperamental factors, including weak self control, impulsivity, and adventurous pleasure seeking; (4) problematic circumstances in the domains of marital/family relationships, education, employment, and leisure/recreation; and (5) substance abuse. Meta analyses have also demonstrated that other attributes once regarded as important treatment targets (e.g., low self esteem, personal distress, depression, and anxiety) are relatively weak predictors of recidivism (Gendreau et al. 2000).

recognition

James J. Chriss

One of the more notable trends in the human sciences of late is a growing concern with reflection, reflexivity, and reflexive or reflective practice (Sandywell 1996). Wilhelm Dilthey is most directly linked to the concept of reflexivity as it has developed in hermeneutics, phenomenology, existentialism, and other interpretive theories in sociology. Dilthey's thought is located within the line of German idealism beginning with Kant and especially Hegel, the latter of whom is famous for the dialectical method. Hegel had attempted to overcome the dualism of subject/object by conceptualizing Spirit (*Geist*, or mind) as a triadic structure composed of *subjective Spirit* (thesis, or Spirit in itself, i.e., the pure subjectivity of the individual); *objective Spirit* (antithesis, or Spirit for itself, the subject projecting onto the outer world itself, for itself); and *absolute Spirit* (synthesis, or Spirit in and for itself, whereby Spirit returns to itself) (Tolman 2001: 184).

From Mead and later as codified by Blumer, the symbolic interactionist perspective posits reflexivity as an essential human capacity, one that is vitally important to the development of the self and the sustenance of everyday social interaction. Consistent with this position, Vaughan and Sjöberg (1986) argue that the capacity for social reflexivity is the most essential characteristic of our humanity. The human ability to reflect on ourselves and our social location and situation gives us all, potentially,

the power to shape social reality even as we are being shaped by it. This is in essence our humanness: the ability, through a mindful and reflective consciousness, to transcend particular settings.

Vaughan and Sjöberg value subjectivity as a moral good and suggest conversely that oppressive social conditions which treat persons as objects reduce them to subhuman or non human status. It is interesting to note, however, that from another theoretical perspective, under specifiable conditions it is actually necessary to render persons as objects *before* they can become subjects. This, of course, refers to the Hegelian dialectic. It seems here we have a fundamental contradiction between the hermeneutic approach, which suggests that self and self consciousness arise only under liberative social conditions in which reflexivity is assured, and the Hegelian or dialectic approach, which suggests that the self and subjectivity arise just as readily out of oppressive conditions whereby, for a period of time at least, selves are treated as objects. On its face, this contradiction or disagreement is traceable to the split between Kant and Hegel over transcendental reason, or the ultimate grounding of understanding and interpretation.

For Kant, the universality of judgments acts as the transcendental ground of reason. In making this move, Kant limited knowing to the objects of possible experience, shared collectively, and declared that noumenon, the thing in itself, behind appearances was unknowable. Hegel's main objection to this line of thinking is that by separating the appearance from the thing in itself, Kant was in effect imbuing reason with too much power. In essence, reason has no limit, because it is reason and reason alone that is able to discern the presumed distinction between appearances and things in themselves. But what makes a limit a limit always includes knowledge of what is on both sides of it. As Gadamer (2000: 343) explains, "It is the dialectic of the limit to exist only by being superseded." Like the dialectic of master-bondsman, subjectivity arises out of the limits imposed by objectification; it does not emerge necessarily in and for itself. Kant's separation between appearance and the thing in itself makes transcendental reason the arbiter of reality. But rather than absolute reason, self consciousness for Hegel

arises only out of the difficult battle to be recognized by the other.

This issue of recognition has come to the fore especially within political and social theory over the conceptualization of social justice or the "good life" more generally. Indeed, over the years across modern western society and increasingly among the so called developing and less developed nations, social movements have arisen based upon group demands for recognition of the unique identity or cultural attributes such groups are claiming for themselves. Further, these demands for recognition are grounded in the claim that the dominant culture and major social institutions of society (especially the polity and economy) have systematically ignored and injured members of these groups through their failure to provide mechanisms for assuring members' full participation in society.

Charles Taylor (1994: 25) argues that groups that perceive that they are being misrecognized or not recognized at all are suffering real damage insofar as persons in the wider society are routinely mirroring back to members of these groups confining, demeaning, or contemptible images of themselves. This distorted image of the self leads to a host of problems in the living conditions and life chances of members of misrecognized or unrecognized groups. For example, feminists claim that patriarchal societies operate in such a way as to socialize women into internalizing a depreciatory image of themselves. Likewise, for centuries whites have projected a negative image onto blacks, and these powerful cultural scripts and practices have made it virtually impossible for blacks to resist adopting a deleterious self image.

With the rise of the modern welfare state, citizens' demands go beyond those based on economic hardship or political injustice. Now, above and beyond claims being made on the basis of "citizen" or "worker," within constitutional welfare states persons are making identity or recognition related claims on the basis of gender, race, ethnicity, age, disability, sexual orientation, marital status, and so forth. This progression in the change of western politics could be interpreted as a slow but inexorable move toward incorporating greater reflexivity into law and policy. Many things "taken for granted" in earlier times are being looked at in

different ways and are subject to reflective critique or appraisal pertaining to the treatment of persons, objects, other living entities, and the environments within which they are situated. Examples include “green politics,” the animal rights movement, and economic reparations to African Americans for American slavery.

The idea that the development of the welfare state, as well as more recent claims for recognition by a growing number of persons and groups, is spurred on by a growth in reflexivity and heightened awareness about the plight of the other, is made explicit in John Rawls’s (1971) theory of justice. Through the process of reflective equilibrium, that is, by reflecting on their own situation and placing themselves in the shoes of the less fortunate in society, persons come to an understanding of the justness or goodness of welfare as institutionalized and enacted within government policy.

We must be cautious, however, in equating too easily the notions of rightness or goodness on the one hand, and justice on the other. As Nancy Fraser (2001: 22) points out, questions of distributive justice and rights are typically aligned with Kantian *Moralität* (morality), while questions of recognition and “the good” are aligned with Hegelian *Sittlichkeit* (ethics). Norms of justice are thought to be universally binding, thus consistent with Kant’s categorical imperative, while claims for recognition of difference involve qualitative assessments of the relative worth of various cultural practices which cannot be universalized, thereby maintaining consistency with Hegel’s dialectic. Fraser attempts to bring these two divergent impulses together in a more comprehensive theory of justice that incorporates both redistribution and recognition. Specifically, she suggests that recognition ought to be treated as a question of *social status*. Here, what is required is not recognition of group specific identity – which tends to cause difficulty insofar as such claims of identity get entangled in ethical considerations of the various claims made by various groups – but rather the status of group members as full participants in social life. Hence, misrecognition or non recognition is no longer seen as distorting group identity, but rather is seen as causing the social subordination of group members to the extent that they do not enjoy full participation in ongoing group relations, as peers alongside

those not similarly misrecognized. Fraser’s (2001: 24) “status model” aims, then, to overcome subordination “by establishing the misrecognized party as a full member of society, capable of participating on a par with other members.”

From the perspective of the status model, misrecognition arises wherever social structures or cultural norms or practices distort interaction so as to impede parity of participation. In many ways this is similar to the position of Vaughan and Sjöberg (1986). To reiterate, Vaughan and Sjöberg assert that the right to human status is fundamental, and that to achieve human status social conditions must be present that facilitate social reflexivity. Lacking such social conditions, persons would be cut off from self actualization or their own subjectivity, in essence being treated merely as subhuman “objects” within the social system.

There is seemingly good evidence of a growth in claims for recognition among various groups in society, and these recognition claims go beyond the more longstanding strategy of seeking economic reparations for the historical harm done to these groups (whether because of slavery, colonialism, internment, racism, classism, heterosexism, sexism, and so forth). The ongoing waves of juridification culminating in the modern welfare state and beyond, as outlined by Habermas (1987), seem to point to an opening up of reflexive awareness on the part of legislators and citizens about past and current mistreatment of certain groups and persons. With regard to recognition claims per se, the recognition or acknowledgment of this mistreatment amounts to a new view that persons deserve respect and should be assured full participation in society as fellow human beings (Honneth 2001; Walby 2001).

Even as we move seemingly toward a “one world order” under globalization, there is evidence of powerful countermovements – resembling something like a new tribalism – as more and more groups are making claims of collective identity based upon any number of attributes or statuses, for example, gender, religious affiliation, sexual orientation, citizenship status, ethnicity, and so forth (Gamson 1995: 2; Bendle 2002: 8). There appears to be a proliferation of social movements in which members seek recognition for identities that are disvalued or

overlooked by legislators and/or the general public. This is the essence of current political and sociological concern with recognition, reflexivity, and identity (Douzinas 2002).

reconstructive analyses

Phil Carspecken III

Reconstructive analysis refers to a specific method of analyzing qualitative data based primarily on principles from universal pragmatics and critical theory, but employing adapted insights from hermeneutics and structuralism as well. It is used to study meaning and symbolically structured forms of experience at many different substantive levels: from analysis of singular meaningful actions to the analysis of themes and discourses that distinguish an entire culture or subculture. It is a non empiricist, interpretive method because its object of inquiry – meaning – is not objective in nature. Participants' intuitive knowledge is first grasped tacitly by the researcher through some combination of maeutic interviewing, participant observation, and/or stimulated recall. Analysis then proceeds based on hermeneutically guided understandings of the tacit knowledge routinely employed by participants, in order to reconstruct (put into explicit discourse) what was formerly implicit. The standard by which to determine successful or unsuccessful reconstructions resides in the intuitive knowledge of one's subjects, who should recognize the researcher's formulations as being accurate.

The historical roots of reconstructive analysis can be traced to Habermas's use of the expression "reconstructive sciences" during the 1970s for distinguishing a methodology that had already been in use within subfields of linguistics, logic, analytic philosophy, and developmental psychology (Habermas 1976, 1979, 1982). Inferences used to move from data to research findings are neither deductive nor inductive in these sciences, but rather use a process called "explicitation" by Brandom (1994). The term "explicitation" is roughly synonymous with "reconstruction," though the former refers to everyday processes of making

implicit understandings explicit while the later emphasizes the more theoretically guided efforts of a researcher. The researcher learns the underlying “structures” (generative rules, interpretive schemes, cognitive or moral schemes, logical relations) intuitively and implicitly in the way her subjects understand them through a process resembling the “hermeneutic circle,” though theoretically informed by a concept of “cultural typifications” (Carspecken 1996, 1999), and then moves the implicit understandings into explicit, reconstructed formulations with the help of universal pragmatics, structuralist semantics, and empirical contingent pragmatics.

The reconstructive sciences identified by Habermas differ from “reconstructive analysis” partly because of the effort of the former to seek out universal structures, rules, and normative orders. Reconstructive analysis makes use of universals in the pragmatics of communication to do research on particular and contingent structures of meaning, though nothing in principle bars reconstructive analysis from making contributions to the quest for structures universal to human communication. The universal structures of pragmatics include the internal relation of criticizable validity claims to meaning and the division of validity claims into objective, subjective, and normative categories – each of which is intrinsic to all meaningful acts (Habermas 1976, 1979, 1982). Reconstructive analysis makes use of this pragmatic theory of validity in the development of the concept of a pragmatic meaning horizon (Carspecken 1996, 1999), which includes a validity horizon, an identity claim, and an empirical contingent pragmatic shell as structures of every meaningful act. For meaningful acts that employ language, a level of semantic structure is also part of the pragmatic meaning horizon. The researcher uses this theory of meaningful action to build from analyses of micro level actions to cultural themes, discourses, and other macro and meso level sociological phenomena. Results of such analysis can then be further analyzed with the use of systems theory to examine the relation between macro and meso level cultural themes and non cultural features of society such as economic systems, formal legal organizational structures, and political orders and laws.

The theory of meaning central to universal pragmatics and reconstructive analysis alike takes implicit, pragmatic structures to be fundamental, with semantics and empirical contingent pragmatic structures having a secondary status, reducible to pragmatics. This means that the reconstruction of meaning is most closely achieved through the explication of validity horizons. All representations of meaning semantically, symbolically, artistically, and so on never reach a full one on one correspondence with the meanings represented. In other words, all representations of meaning resulting from reconstructive methodology will implicate additional implicit and holistic understandings to make any sense. Though these also may be reconstructed this results in an unending chain of representations and meta representations, each still dependent on an implicit horizon of understandings to make sense. The precision of reconstructive analysis can be continuously refined in this way without an end ever being possible to reach. The implicit understandings chronic to meaning are intersubjectively constructed and ultimately rooted in expectations of how others will understand an act and act next themselves. Such expectations are within culturally normed boundaries. This has consequences for reconstructive analysis that are explained below.

MEANING, CONTEXT, SETTING, AND CULTURAL TYPIFICATION

Reconstructive analysis employs a model of meaningful action that includes a number of key elements. People interact meaningfully through a process of taking the position (with or without much awareness) of other subjects in the situation. Meaning is therefore constituted intersubjectively. Other subject positions have an assumed status enabled through cultural typifications and a normative infrastructure referred to as the interactive setting. This means that position taking need not be (and often is not) accurate. The researcher will have an interest in attaining both accuracy in taking the positions of others in an interaction and in grasping and then articulating the typification and setting infrastructures that her participants use to position take with each other. The first goal of the

researcher, then, is to position take as her subjects do.

Meaningful acts are therefore always contextually dependent, in that they build features of cultural typifications and specific normative infrastructures into their constitution. A meaningful act is understood in this approach to deliver a holistic meaning that is analytically divisible into many various components. Components are distinguished along a temporal dimension pertaining to the assumptions made by actors regarding shared understandings about actions just gone by as well actions likely to come next. This pertains to interactive syntax in relation to the setting infrastructure.

A paradigmatic dimension also distinguishes components of meaning with the major divisions pertaining to a culturally contingent pragmatic structure through which the act is delivered, a semantic level of structure, an existential identity claim, and a validity horizon. The concept of "structure" here refers to many levels of implication between categories and rules having a variety of inference relations between them (similarity and contrast relations, metaphor, analogy, homology, binary, hierarchy, material implication). These are instantiated as claims by the meaningful act. Thus, structures can vary from act to act because they are reproduced or slightly altered by ongoing action.

MEANING FIELDS

Actors in everyday life do not understand each other simply and straightforwardly, but rather understand a bounded field of possible meanings with every act. The researcher learns to understand fields of meaning as the subjects do, and the boundaries of such fields. Thus, the concept of meaning field is another tool key to reconstructive analysis. Meaning fields are implicit to understanding and cannot be exhaustively formulated, but central themes of interpretation can be articulated so as to specify the boundaries of possible meaning. Central interpretations within a single field will display a conjunctive/disjunctive structure and are formulated with "OR," "AND," and "AND/OR" connectives between them.

VALIDITY HORIZON

Because meaning ultimately depends upon implicit, pragmatic understandings, there is no way to represent it directly and completely. Hence the most direct way to reconstruct meaning is to specify the horizon of criticizable validity claims constituting it. This is because the validity claims constituting a meaningful act pertain directly to the implicit intersubjective assumptions used by actors to try to make themselves understood and to respond to each other. Reconstructing the validity claims results in what is called the validity horizon in reconstructive analysis. A validity horizon is the most precise articulation of meaning, but because it is a semanticization of something that is at root pragmatic and implicit, it is a fallible interpretation and must be supported by the responses of one's subjects to it.

A validity horizon articulates claims along two dimensions: a dimension of discrete distinctions between Habermas's three fundamental validity claims plus a category for identity claims, and a dimension of continuous distinction from foregrounded portions of meaning to backgrounded portions. The "identity claim" is added to Habermas's three validity claims. Identity claims are chronic to all acts though often not foregrounded, and they consist of claims to being a certain type of person and not other types of persons, given a cultural repertoire of possible identities (which itself will have reconstructable structure). In general, the foreground of the validity horizon consists of the validity claims emphasized by the actor, while the mid regions and backgrounds of validity horizons are assumptions that must be understood for the foreground to make sense. Mid and back regions of the horizon are often not within the full awareness of actors, but can be drawn out with maieutic techniques.

SEMANTICS

One can examine semantic structures unique to a culture or discourse by focusing on key lexical items and the structures of implication necessary to understand these items as one's subjects do. Lexical structures have terms that implicate

each other in various ways: through homologies, oppositions, relations of similarity, analogies, hierarchies, and metaphors. Reconstructing both the terms and the relations of implication between them is necessary. Semantic structures are ultimately understood to deliver meaning through delivering validity horizons.

CULTURALLY CONTINGENT PRAGMATICS

Meaningful acts also employ culturally contingent pragmatics, which include such things as (giving a list at diverse levels here): roles, intonations, gestures, facial expressions, pacing, power relations between actors, interactive infrastructures pertaining to the sequencing of acts, and many other things. Pragmatic features of meaningful action also implicate structures. For example, the contribution of something like intonation to meaning depends upon implicitly understood differences and similarities with other intonation patterns. Pragmatic structure is claimed with each act and involves relations of exclusion, complementarity, and contrast to characterize them. There are even pragmatic metaphors and allusions. But pragmatic structures are all implicit and para linguistic, in contrast with semantic structures. Once again, the bottom line for an analysis of meaning, in this case with a focus on pragmatic structures distinguishing a discourse, culture, or subculture, is the validity horizon.

USES

Mastery of the validity horizon method of analysis is used for many purposes, including the reconstruction of general cultural themes, ideologies, discourses, small group cultures, and dyadic normative infrastructures. It is a method helpful in analyzing culture at many diverse levels and in many diverse contexts. Findings then allow for further analysis of the relation between the cultural forms revealed and non cultural features of social life.

Because reconstructive analysis emphasizes the criticizable validity claims of everyday life, it is an appropriate method for critical inquiries. Validity claims typical to one's participants can be examined and critiqued in their own terms

because validity claims always include, necessarily, certain claims to universality (Habermas 1982) and bear a relation to the existential identity claims of actors which put validity claims of all types in relation to ontological needs for valid social identities, self actualization, autonomy, and freedom (Carspecken 1996, 1999).

redlining

Rachel Dwyer

Redlining is a form of discrimination in credit markets where banks and financial institutions identify entire neighborhoods as too "high risk" for financial investment in both residential and commercial property. Financial institutions "redline" neighborhoods for a number of reasons including the physical characteristics of the housing stock and undesirable location, but most important has been the presence of minority, especially black, residents. Racial redlining occurs not only because of the correlation of

race with indicators of financial risk, but also because investors interpret the racial category itself to signal risk apart from the quality and prosperity of the neighborhood on other measures. In short, redlining is a critical form of community disinvestment that occurs when resources (e.g., home mortgages, insurance, home improvement loans) are made unavailable to residents because of the high proportion of ethnic or racial minorities living in their neighborhood, regardless of objective socioeconomic characteristics (e.g., wealth, income, age of housing).

Social historians argue that while discrimination against minority neighborhoods occurred throughout US history, redlining became standard practice in the 1930s. The collapse of the housing market during the Depression and the development of new financial instruments led to increased concern with assessing neighborhood risk. Jackson (1985) found that government agencies were crucial in the institutionalization of redlining during this period. A New Deal agency created to halt widespread foreclosures by giving loans, the Home Owners Loan Corporation (HOLC), developed detailed "Residential Security" maps that categorized neighborhoods by risk and interpreted any minority presence to increase hazards for investment, placing all black neighborhoods into the highest risk category. HOLC coded the highest risk category red on the maps, originating the term redlining. While the HOLC maps represent some of the most striking evidence of redlining in the 1930s, Hillier (2003) argues that the practice predated the maps, and many other housing market actors were actively creating their own rating systems and maps at the same time (both in dialogue with HOLC and separate from it), including the financial services industry, which used them to decide where not to invest, and the Federal Housing Administration (FHA), which used them to decide where not to insure investments.

Neighborhood risk assessments profoundly influenced the post war housing boom. In fact, the well documented suburban bias of the FHA derived in some measure from the agency's judgment that almost any central city neighborhood – even if inhabited by whites – could potentially become minority and thus was higher risk than suburban areas ("protected"

by restrictive covenants and other forms of racial discrimination). The disadvantages of US cities in the post war political economy can thus be interpreted to be in part a form of redlining on a large scale.

Routine use of redlining by both industry and government persisted until the 1960s and 1970s, with devastating consequences for cities and minority neighborhoods. Starved of commercial and residential capital, the physical stock in redlined neighborhoods declined and urban areas were disinvested. Redlining thus created the conditions it supposedly merely identified, degrading the financial health and quality of properties in minority neighborhoods regardless of their starting position. Redlining not only resulted from racial segregation, it also worsened it by blocking wealth accumulation among minority households, contributing to persistent poverty by foreclosing job creation, and making integration against the financial interests of white households.

Civil rights activism in the 1960s and 1970s resulted in laws that made redlining illegal, including the Equal Credit Opportunity Act in 1974. These laws (combined with community action to ensure their enforcement) increased access to credit and investment in some minority neighborhoods in the 1980s and 1990s (Immergluck 2004). Study and monitoring of redlining were facilitated by the passage of the Home Mortgage Disclosure Act (HMDA) in 1975, which required annual reports from lenders, producing an invaluable source of data for researchers.

Despite progress made since the civil rights legislation, there remains substantial disparity in the level of investment in minority compared to white neighborhoods. Yet there is debate over the degree to which the credit disadvantage of minority neighborhoods is due to ongoing racial redlining, or whether instead it is simply the result of the correlation of race with reasonable, objective measures of risk used by financial institutions (Goering & Wienk 1996). In an exhaustive review of this literature and analysis of the methodological issues raised, Ross and Yinger (2002) conclude that both individual mortgage discrimination and racial redlining did still occur in the 1990s, even if financial institutions were not as blatant in their methods as in earlier decades.

Others have challenged the terms of the debate over whether the assessment of risk in neighborhoods involves racial discrimination. First, scholars point out that even if minority neighborhoods receive less investment as a result of poor performance on objective measures of risk and not overt racial discrimination, policies of risk assessment are discriminatory in their *consequences*. This “disparate impact” can not be ignored, not least because it is in large part the legacy of past redlining that makes many neighborhoods higher risk on objective measures.

Second, an even more ambitious critique draws on economic and organizational sociology to question the very conception of “objective” risk used within financial services companies. Stuart (2003) argues that risk assessment cannot be interpreted solely as an objective matter, determined through rational analysis. Instead, he argues that risk is socially constructed within particular organizational structures with particular histories and imperatives. In the taken for granted practices of institutions and industry conventions, policies perpetuate racial discrimination and redlining even when not explicitly framed in racial terms. Stuart demonstrates that because they subscribe to a fundamentally flawed (and outdated) theory of economic organization, regulations and studies that define racialized policies only as the most overt differential treatment miss the many more subtle ways that real estate practices are racially discriminatory (see Gotham 2002 for a related argument).

Another important area of recent scholarship is study of alternative and new forms of redlining in financial services. Squires (2003a) has detailed the prevalence of “insurance redlining,” where properties in minority neighborhoods are denied insurance, a prerequisite for obtaining a mortgage. Predatory lending is also increasingly interpreted to be a form of redlining where minority neighborhoods are targeted for investment, but on highly unfavorable terms that drain resources from communities perhaps even more effectively than denial of credit (Squires 2003b). Changes in the financial services industry and its regulatory framework made predatory lending much more prevalent in the 1990s, and other changes (including the rise of electronic banking and automated underwriting, industry consolidation, and the

proliferation of lending instruments) may significantly impact the incidence of redlining in ways social science has only begun to explore.

Analysis of redlining has become increasingly difficult, however. Because of changes in the industry since the passage of the reporting legislation, HMDA collects fewer data from a smaller percentage of lenders than in the past (Holloway & Wyly 2002). In addition, whole segments of industry like property insurance have never been required to report. Thus, just as the institutional terrain has become more complex, the data have become less reliable.

Even with the data difficulties, social science must keep pace with the industry and push for better government data collection as well as seek new sources of data on the financial services market. It is important that redlining continues to be studied, against the tendency in the literature to focus more on individual discrimination than on the geographical dimensions of credit inequality. Despite some progress toward integration, the profound link between race and space in US metropolitan areas will persist into the foreseeable future, including in the historical legacy and continuing incidence of redlining.

reference groups

Kristine J. Ajrouch

The term reference group denotes a cluster of social psychological concepts pertaining to the relationship between individual identities, social norms, and social control. Reference groups may constitute a group into which individuals are members, as well as those groups to which one does not belong. The utility of the term lies in its ability to provide an explanation as to how social groups influence individual values, attitudes, and behavior.

Muzafer Sherif articulated early applications of reference group theory in the 1940s. At the time, understanding of human behavior focused on subjective interpretations and classic behaviorism regarding the relationship between the individual and his or her environment. Sherif instead started moving away from subjective interpretations by introducing the concept of “frames of reference” to highlight the significance of the individual actively striving to gain acceptance into a group. Sherif’s work challenged prevalent thinking; his contribution included emphasis on relationships between people, underscoring group dynamics for understanding individuals. One important aspect of Sherif’s thinking for reference group theory is the notion that reference groups do not

automatically constitute membership groups. The link between individual identities and reference groups is determined by the context within which individuals interact with groups. Perhaps his most significant contribution is that Sherif presented a way to understand social group influence on the individual as well as to discern those situations when such influence does not shape the individual.

Reference groups have also been useful in understanding the development of identity boundaries, particularly concerning ethnicity and adaptation among children of immigrants. Many scholars interested in second generation immigration highlight the tensions that exist between the ideals of two conflicting reference groups, that of the immigrant culture and that of dominant American society. The values and behaviors of each reference group provide powerful socializing forces on the children of immigrants. Thus, inquiries into identity development often seek to determine to what extent each group serves as an audience in front of whom the second generation acts to achieve acceptance. For instance, in a recent study focusing on adolescent children of Lebanese immigrants living in an ethnic community, Ajrouch discovered the usage of two terms representing reference groups – boater and white. A boater is the term second generation adolescents ascribe to immigrants. It signifies that the immigrant has not yet acquired the “American” cultural habits with which the adolescents identify, including fluent, unbroken English and clothing that reflects current American fashion trends. A white represents members of dominant American society, and has both positive and negative aspects. The positive dimensions include access to education and privilege. The negative dimensions include a lackadaisical attitude and no sense of obligation, commitment, or responsibility. As adolescents describe themselves, defining their identity, they reference these groups to designate who they are not, and portray themselves as somewhere in between. Attitudes about who one is stem from comparison with those one would like to emulate as well as comparison with those with whom one does not want to associate.

The use of reference groups has had enormous impact on the development and use of measures in the social sciences. Self report measures of social, psychological, and biological

phenomena including attitudes, behaviors, and physical well being invariably are influenced within a context, by social comparison. For example, inequalities in society may be as much a product of subjective interpretation involving an individual comparing his or her situation to a group or category as they are a consequence of objective, observable differences. The reference group concept has furthermore served to highlight the potential confounding effects of group comparison research, especially concerning cross cultural studies. Building off the awareness that most people's self understanding results from how people compare themselves with others around them, and in particular others similar to them, the suggestion emerges that different groups have diverse standards by which evaluations are made. Moreover, shifting evaluations may occur depending on the context. Thus, analyses that seek to compare mean scores from different cultures (who invariably have different referents) risk the threat of misleading results.

The areas in the social sciences to which the concept reference group applies have expanded over the years, demonstrating its utility for understanding a variety of social phenomena. Initially developed as a theoretical concept by which to illuminate the effect of social context on human attitudes and behavior, the term has recently shown its value as a means by which to explain social processes ranging from identity development to methodological fallacies. The application of the reference group concept will continue to illuminate the ways by which context influences the individual.

reflexive modernization

Jens Zinn

Ulrich Beck introduced the term reflexive modernity (also called second modernity) by explicitly demarcating himself from postmodern approaches which would imply that current developments go beyond modernity (Beck et al. 2003).

He first outlined his argument in *Risk Society* (published in German in 1986 and in English in 1992) and later developed it further. The central thesis is that modernity has transformed itself by the radicalized application of the core concepts of modern industrialized society (also called first modernity or simple modernity). Central principles (e.g., the distinction between nature and culture or science and politics), as well as basic institutions (e.g., the gender division of labor, the traditional family, the normal model of the life course), have been transformed into a new modernity.

Since "reflexive" often causes misunderstandings Beck has repeatedly emphasized that it does not mean that people in today's society are more self conscious than in the past. It indicates rather a heightened awareness that mastery of nature, technique, the social, and so on is impossible.

Originally, Beck (1992) developed the concept of reflexive modernization referring to the

occurrence of a risk society and growing institutional individualization. New risks would occur as unexpected side effects of industrialization that take place in nature (e.g., climate change, depleted ozone layer) and as technical catastrophes (e.g., accidents in Bhopal, Chernobyl, *Challenger*). They would erode the belief in the managability of nature by science and thereby politicize risk decisions. Additionally, individualization processes would release people from traditional institutions, which at the same time erode and became supplanted by secondary institutions (e.g., the labor market, the welfare state, mass media). Individualization demands individual decisions where routines and traditions prevailed before.

Reflexive modernization resonates in the discourse on social change in Britain. Beck et al. (1994) critically discussed social change in modernity. While Lash emphasized the cultural aspects of these changes ("risk culture"), Giddens prefers the expression "institutional reflexivity" and emphasizes growing individual self awareness and self responsibility, which lead to more political considerations regarding a "Third Way" in politics. Beck developed his theoretical considerations in the direction of a general theory and tried to specify the changes more empirically. He broadened the concept of social change from "risk" and "individualization" to a general change of central institutions and principles of first modernity into a reflexive modernity.

The multiplication of boundaries (or attempts to draw boundaries) is introduced as a central criterion to identify the change from first to reflexive modernity (Beck et al. 2003). For example, instead of one identity linked to a specific cultural background there is the possibility of several identities referring to different (often contradictory) backgrounds without the necessity to decide for one or the other. The result is in many respects a change from a so called either/or society to a this as well as that world. Boundaries between nature and culture, life and death, knowledge and superstition, us and others, expert and laymen, for example, become blurred.

Although many of Beck's observations are acknowledged, the theory itself is still contested. It is criticized as often being too general to explain concrete behavior. It is faulted for a

lack of empirical evidence and whether it can be empirically tested at all.

reflexivity

Mats Alvesson

Reflexivity can be broadly defined to mean an understanding of the knowledge making enterprise, including a consideration of the subjective, institutional, social, and political processes whereby research is conducted and knowledge is produced. The researcher is part of the social world that is studied and this calls for exploration and self examination. A reflexive researcher "intentionally or self consciously shares (whether in agreement or disagreement) with her or his audiences the underlying assumptions that occasion a set of questions" (Robertson 2002: 786).

The recent interest in reflexivity has been linked to the influence of postmodernism and poststructuralism whose insights have drawn attention to the problematic nature of research, the dubious position of the researcher, the crisis of representation, and the constructive nature of language, as well as an admission of the fact that there is no "one best way" of conducting either theoretical or empirical work. Reflexivity is about dealing with "a sense of uncertainty and

crisis as increasingly complex questions are raised concerning the status, validity, basis and authority of knowledge claims" (Mauthner & Doucet 2003: 417).

Leading philosophers of science and intellectuals have struggled with issues similar to those brought forward by the "reflexive turn" for a long time. The work of Kuhn (1970) has been vital in raising questions around the limits of scientific rationality and progress. Popper (1969: 95) cast doubt on the objectivity of the single researcher, whom he described as "often very biased, favouring his pet ideas in a one sided and partisan manner." Popper declared his faith "upon a critical tradition which, despite resistance, often makes it possible to criticize a dominant dogma." Much work on reflexivity expresses similar interests, but tends to be skeptical of Popper's belief in the community of scholars jointly producing scientific objectivity. Instead, this work typically takes ideas of constructionism and the linguistic turn(s) seriously, and rejects or downplays the possibility or ideal of objectivity.

Postmodern thinking, critical studies, feminism, and interpretive and other qualitative work more generally all cast doubt on the idea that "competent observers" can "with objectivity, clarity, and precision report on their own observations of the social world." They also challenge the belief "in a real subject" who is "able to report on his or her experiences" (Denzin & Lincoln 1994: 11–12), and typically go much further than writers such as Popper by problematizing the pillars of the scientific project. Informed by the linguistic turn, such researchers have increasingly stressed the ambiguous, unstable, and context dependent character of language; noted the dependence of observers and data on interpretation and theory; and argued that interpretation free, theory neutral facts do not exist but, rather, that data and facts are constructions that result from interpretation.

VARIETIES OF REFLEXIVITY

There are reasons to draw attention to the varieties of reflexivity: rather than talking about reflexivity, we should perhaps refer to *reflexivities*. Most texts emphasizing reflexivity seem to propose one – possibly "The" – form of

reflexivity as different authors favor a particular approach. For some, it is the researcher self and the personal experiences of the research process: "reflexive ethnographies primarily focus on a culture or subculture, authors use their own experiences in the culture reflexively to bend back on self and look more deeply at self–other interactions" (Ellis & Bochner 2000: 741). For others, it concerns the cognitive aspects around construction processes in research (Glaserfeld 1991). For still others, reflexivity revolves around language, inviting the investigator "into the fuller realm of shared languages. The reflexive attempt is thus relational, emphasizing the expansion of the languages of understanding" (Gergen & Gergen 1991: 79). Other versions of reflexivity revolve around the research text and authorship (Richardson 1994), theoretical perspectives and vocabularies and what they accomplish (Rorty 1989), or the empirical subjects "out there" and how their voices are being (mis)represented (Fine et al. 2000).

For some authors, reflexivity is intimately connected to the broad intellectual stream of postmodernism and/or radical social constructionism. This may imply a broader set of considerations, for example, postmodernism is frequently associated with the indecidabilities of meaning, fragmented selves, power/knowledge connections, the problematic nature of master narratives, and problems of representation, providing an ambitious set of themes for reflexive work. Again, for others, reflexivity means the breaking of the logic associated with a particular stream – reflexivity involves confronting dataistic, interpretive, critical, and postmodern lines of reasoning and challenging the truths and emphasis following from each of these (Alvesson & Skoldberg 2000).

The spectrum for reflexivities is probably endless. Five major versions – these can be referred to as positions or practices – indicate the most common ones and are described below.

Destabilization. This form of reflexivity is inspired by the work of Derrida and Foucault and emphasizes the "negative" or "dangerous" aspects of knowledge claims.

In different ways, Foucault and Derrida encouraged the exploration of the shortcomings and limitations of claims to knowledge, creating rather than revealing the truth. The production of knowledge, particularly positive versions that

try to establish “the truth,” leads to a certain, in a sense, arbitrary version of the social world, with associated power effects, that neither reveals nor distorts the truth but, rather, creates it. All knowledge projects are thus dangerous, insofar as any version of truth carries with it a particular configuration of political privileges and should therefore be closely interrogated. The means to do so lie with postmodern theoretical and epistemological assumptions that see social reality as ambiguous, fragmented, and contested, and temporarily held in place through the operations of certain discourses (Rosenau 1992). Accordingly, reflexive researchers try to undermine the idea that research is ultimately a progressive path toward universal “truths.” Reflexivity means keeping a skeptical eye on how the phenomenon under study is being ordered by the researcher’s use of discourse – or the discourse’s use of the researcher.

Combining alternative perspectives. Instead of treating epistemological positions as manifestations of metaphysical principles, as some people taking the paradigm idea seriously tend to do, using the paradigms reflexively involves seeking out anomalies among them “in a way that is mindful of the historically and politically situated quality of our reasoning. By becoming more practically reflexive about the conditions of the theorizing, we move away from an external and seemingly authoritative form of analysis and towards an immanent, self consciously situated form of critique” (Willmott 1993: 708). Accordingly, researchers use tensions among different perspectives to expose different assumptions and open up new ways of thinking.

Rorty (1989) warns about being convinced of the superiority of a final vocabulary, and suggests what he refers to as an ironic way of reasoning – where the researcher is highly aware that the vocabulary in use is not the only one possible or not necessarily the superior one. The reflexive researcher can draw upon a set of alternative perspectives – transcending a strictly paradigm bound position – to draw attention to the limitations in using a single frame of reference and, in so doing, provide new insights about limitations as well as possibilities in the use of a specific perspective or sort out which is “best.” It is the *accumulation* of these perspectives that amounts to reflexivity, not the adoption of one to undermine another. In this regard,

reflexive practice is more a matter of bricolage, where different perspectives help to understand otherwise “incomplete” research.

Voicing and representation in fieldwork. Rather than just going out there to find out what is going on – and go through the seemingly linear route of planning the study, collecting data, and then analyzing data – the precarious, messy, political, subjective, and basically non rational process of fieldwork is viewed as calling for reflexivity. Struggles to speak authentically about the “Other” call for careful consideration of what is happening here and what the researcher is doing in relationship to the Other (and vice versa). A focus on the researcher as subject recognizes that the researcher is part of the research project, a subject just like any other that is constructed in and through the research project: we do not simply “bring the self to the field” so much as “create the self in the field” (Reinharz 1997: 3). As a result, it is incumbent on the researchers to present the details of their particular experiences and interests – to declare the authorial personality and to acknowledge their participation. Another element is that, being reflexive, researchers tend to divulge the steps they have taken in order to present their work as respectable research – to confess their sins by way of extensive personal disclosure.

Narration and representation in textwork. A key theme for many “reflexivists” is a change of emphasis in research from fieldwork to text work. Over time, the researcher has become less of a neutral, objective social scientist who reports faithfully and accurately on the activities of research subjects, and instead has taken on a more “modest, unassuming style” while struggling “to piece together something reasonably coherent out of displays of initial disorder, doubt and difficulty” (Van Maanen 1988: 75). The resulting crisis of representation weakens researchers’ voices and, especially, their claims to report reliably on the experiences of research subjects. In short, “writing up the results” is viewed as an extremely difficult and contested enterprise. This calls for reflexivity.

One key theme here concerns the self critical questioning of how the researcher convinces, how literary tropes, seductive narratives, and rhetorical devices are used to show how, by hiding behind the cloak of science, researchers take steps to produce authoritative accounts.

Another theme relates to how to produce “better” representations or narratives, by being more creative and experimental in writing. Reflexivity is here associated with how various literary techniques are employed to open up space for the Other in research accounts through the self-conscious use of writing techniques by using fiction, drama, narrative, and metaphor (e.g., Richardson 1994). As a result, an array of practices such as reflexive ethnographies, literary autoethnographies, narratives of the self, first person accounts, and lived experience have been employed. These devices have been used in particular in feminist work.

Sociopolitical contingencies. Another version of reflexivity views the problematic relationship between the knowledge creating process and the produced knowledge in terms of the sociopolitical context of research. It is thus not the individual researcher – as a subject ordering the world, using a particular perspective or theoretical vocabulary, doing fieldwork or textwork – nor the relationship between researcher and research subject but the societal context that imprints the researcher as well as the research outcome. Relativism is not necessarily a matter of researcher subjectivity, but can be seen as the outcome of a social and highly intersubjective theoretical, methodological, or cultural position (Bernstein 1983).

Social processes shape knowledge through control embedded in the research process, meaning that the researcher can construct “knowledge” only in the context of a particular research community and society. The norms and conventions of the research field, the struggle for position and resources, the adaptation to the criteria of prestigious journals and publishers are all seen as elements shaping research and calling for reflexive scrutiny (Hardy et al. 2001). Such is also the case with societal cultures and traditions, with fashions and other macro elements exercising a directive force on research. One can here see how the reflexive project is not an outcome of progression and added insights in social science, but is associated with the trendiness of postmodernism and the linguistic turn, which are perhaps contingent upon the developments of capitalism into a system less concerned with the production of “substance” than with the free flow of signifiers and images around marketing and consumptions.

Reflexivity as a theme, then, can be understood in the context of career options and moves associated with new fashions in social science as well as with broader societal trends toward deobjectivization, providing space for a reflexive turn.

CRITIQUE OF REFLEXIVITY

Some commentators believe that reflexivity may encourage narcissism and self-indulgence. Critics worry about excessive reflexivity turning the self “into a fieldsite” (Robertson 2002: 786), and making the text and author maneuvers the key issue at the expense of the research subjects. Reflexivity may become a dead end rather than a route to more thoughtful and interesting social studies. As such it may fulfill more ceremonial purposes of legitimation – similar to the methods section in academic papers where quantitative and qualitative research is disciplined by neopositivist templates and (mis)represented as highly rational, linear, coherent, controlled, and based on a clear (but fundamentally misleading) division between framework, researcher, and data. There are other risks and costs associated with practicing reflexivity – it takes time, brain power, and text space, and perhaps leads away from conventional theoretical and/or empirical work.

Whether reflexivity encourages more thoughtful and realistically assessed and framed research or leads to ceremonial exercises, whether it makes researchers more sensitive and creative in theory, field, text, and political work or takes attention, energy, and time away from what has traditionally been seen as the core activities in research will, of course, vary. Possible outcomes and tradeoffs between ideals are among the worthy themes of acts of reflexivity.

refugee movements

Courtland Robinson

Refugee movements are defined as the involuntary migration of people across international borders as a result of generalized conflict and disorder, or of more particularized threats of persecution and physical insecurity. The concept of “refugee” generally is treated as one category within a broader typology of forced migration, which includes involuntary movements both within and across international borders and encompasses other categories such as internally displaced persons, development displaced persons, and trafficked and smuggled persons.

While, in common usage, refugee may refer to people fleeing their homes due to any number of threatening situations, the prevailing international legal definition of refugee, endorsed by 145 member states of the United Nations General Assembly, is an individual who, “owing to a well founded fear of being persecuted for reasons of race, religion, nationality, membership of a particular social group or political opinion, is outside the country of his nationality and is unable or, owing to such fear, is unwilling to avail himself of the protection of that country.” In 1969, the Organization for African Unity adopted the UN definition but added that a refugee is also a person who has fled his or her country “owing to external aggression, occupation, foreign domination or events seriously disturbing public order.”

Related to the definition of a refugee as a person crossing an international border to escape persecution or conflict is that of the asylum seeker, an individual who has a claim to be a refugee. Whether that claim is real or fraudulent, and whether it is accepted, rejected, or ignored by a state authority, it is the claim to refugee status, and the protection thus entailed, that distinguishes the asylum seeker from other categories of migrants.

In 2003, the number of refugees was estimated at 11.9 million people, the majority of whom were from the Middle East (4.4 million), Africa (3.2 million), and South and Central Asia (1.9 million). Of these, about half are female and about 45 percent are under the age of 17. More

than 80 percent of refugees are from developing countries and more than two thirds have sought refuge in developing countries. More than 7 million have been living in camps and settlements, “warehoused” for at least 10 years or more.

Asylum seekers, who numbered 600,000 in 2003, are primarily from developing countries though they principally are seeking asylum in Europe and North America. While most refugees and asylum seekers find themselves in limbo for extended periods, some manage to find a more durable solution in the form of permanent resettlement or voluntary repatriation. In 2003, however, only 54,000 refugees were offered permanent resettlement in another country. A much larger number – at least 925,000 in 2003 – voluntarily returned home, although more than 50,000 were forcibly repatriated.

In describing his “kinetic model” of displacement, which borrowed the “push” and “pull” factors of traditional migration models and adapted them to refugee movements, Egon Kunz (1973) said that he used the term kinetics rather than the more general term dynamics because refugee movements lacked inner direction but were instead propelled, like billiard balls, by external forces and frictions. More recent conceptualizations of refugee movements, and forced migration in general, largely reject the notion that refugees are like billiard balls and, instead, emphasize that their paths reflect complex patterns of volition and choices made in the face of often poor information and worse odds.

While theories and concepts of migration previously described types of movements in dichotomous terms – push versus pull, “distress” versus “livelihood,” voluntary versus involuntary – more recent approaches promote the idea of a continuum, proactive at one end and reactive at the other end, between which varying degrees of choice and coercion are involved.

Even the distinction between international and internal migration, one involving movement between nation states and the other within a state, has been blurred in two ways with respect to concepts of forced migration in general, and “refugeehood” in particular. The first is that growing attention is being paid to populations

who are internally displaced by conflict, disasters, and development projects. In 1998, the UN Commission on Human Rights agreed to define internally displaced persons (IDPs) as “persons or groups of persons who have been forced or obliged to flee or to leave their homes or places of habitual residence in particular as a result of or in order to avoid the effects of armed conflict, situations of generalized violence, violations of human rights, or natural or human made disasters and who have not crossed an internationally recognized State border.” It further noted that the right to protection from arbitrary displacement extended to those displaced by development projects. The number of people internally displaced by armed conflict, generalized violence, and human rights abuse has been estimated at more than 23 million in 2003. Development projects displaced an estimated 10 million people per year in the 1990s.

The distinction between refugees and internally displaced persons, for some, is not of conceptual significance, however much it matters from a legal or policy perspective. Whether a person is displaced internally or externally may be of issue to a state, but in terms of the experience of those displaced, the commonalities outweigh the differences. For others, crossing an international border in flight from conflict, persecution, and insecurity is a definitive event, compounding the physical vulnerability of displacement from home and familiar surroundings with displacement into a foreign jurisdiction within which the refugee has no rights and protections as a citizen.

Several definitions of refugee attempt to bridge this gap between internal and external displacement. Matthew Gibney (2004) defines refugees as people who need a new state of residence because returning home or staying where they are would subject them to persecution or physical insecurity. Emma Haddad (2004) suggests that the main criterion for refugee status is the breakdown in the state–citizen relationship, while crossing an international border should not be a defining factor.

There is another way in which national borders have become increasingly blurred. Decolonization in the 1960s and 1970s led to “imperial” diasporas – the Portuguese from Africa, the French from Algeria and Indochina,

and the Dutch from Southeast Asia – and to the movement of non European peoples, including Indians and Chinese, originally imported as “colonial auxiliaries” or “middleman minorities.” Waves of labor migration, as well as refugee populations and internally displaced persons, have experienced repeated expulsions and migrations to the point where they have come to form transnational communities, defined by Stephen Castles (2003) as groups based in two or more countries that engage in recurrent, enduring, and significant cross border activities, which may be economic, political, social, or cultural in character.

The formation of transnational communities or networks has been spurred by the forces of globalization, which seek to open borders for the movement of goods and a regulated flow of labor migration while closing borders to irregular and unwanted migration flows. The demand for labor in the North, coupled with restrictive entry policies, has stimulated new forms of organization in the “migration industry,” which rely on transnational companies, communities, and networks to move people by whatever routes prove most efficient. The development of trafficking and smuggling networks has given rise to a \$6 billion industry moving an estimated 4 million people per year, the majority of whom are women and children.

The definition of the term “refugee” will always be shaped by those who use it. The perspective of governments will emphasize a narrower, legalistic definition in value of security at the borders and state sovereignty within them. The perspective of institutions like the United Nations will emphasize a definition that recognizes state sovereignty while valuing protection for persecuted individuals. Academics will value a definition that is at least adequate to the task of distinguishing who is a refugee from who is not, in such a way as to promote better understanding of the phenomenon.

How would refugees define themselves? The answer may be nearly as varied as the millions of people who, depending on the circumstances, might call themselves or be called refugees. The plurality of experiences and the evolving forms and dynamics of displacement make the pursuit of a comprehensive approach or a unitary definition ever more elusive.

Richard Black (2001) notes that the study of refugees and other forced migrant populations is always intimately connected with policy developments. This practical orientation can be a strength, by focusing on humanitarian consequences and avoiding overly abstract theorizing, but it can also be a weakness, leading to research that is ahistorical, reactive, and narrow. New, more holistic approaches to the study of refugee movements seek to build interdisciplinary and comparative understandings of such topics as the political economy, gender dimensions, and causes of refugee movements, as well as the dynamics of mobility and of settlement.

refugees

Steve Loyal

In international law “refugee” refers to individuals who are residing outside of their country of origin and who are unable or unwilling to return because of a well founded fear of persecution on account of race, religion, nationality, membership of a particular social group or political opinion.

The term derives from the Latin *refugere* – to flee – and is believed to have first been applied to the Huguenots who fled France in the seventeenth century. Its modern legal usage follows the UN General Assembly’s establishment of the United Nations High Commission on Refugees (UNHCR) in 1950. Within a system of nation states with fixed borders, and a burgeoning Cold War rivalry, the UNHCR’s principal aim was to guarantee and provide international protection and assistance to individuals who had become displaced by World War II. By becoming signatories to the 1951 UN Convention, nation states agreed to grant special protection on an international basis to citizens of a state that could not guarantee their human rights and physical security. This remit for protection was later extended beyond Europe to encompass refugees from all over the world, as the problem of displaced people became more global, with the signing of the 1967 Bellagio Protocol. There are currently 137 states that are signatories to both the 1951 Convention and Bellagio Protocol.

The Convention defines a refugee as any person who, “owing to a well founded fear of being persecuted for reasons of race, religion, nationality, membership of a particular social group or political opinion, is outside the country of his nationality and is unable or, owing to such fear, is unwilling to avail himself of the protection of that country; or who, not having a nationality and being outside the country of his former habitual residence ... is unable or, owing to such fear, is unwilling to return to it.”

There are, however, a number of conceptual distinctions within refugee discourse. People who are forced from their homes for reasons outlined in the 1951 UN definition of a refugee, but who remain within the borders of their

own country, are known as internally displaced persons (IDPs), of which the UN estimates the number to be 25 million. By contrast, those who seek refugee status outside of their own state of origin must make an application to the country where they arrive and are referred to as asylum seekers. Hence, an asylum seeker is a person who is seeking asylum on the basis of his or her claim to be a refugee. Refugee status may be granted to asylum seekers following a formal legal procedure in which the host country decides whether to grant refugee status or otherwise. Although those who are not accepted as refugees may be deported, in some cases they may be given leave to remain on humanitarian grounds. If, however, the applicant is successful in gaining refugee status, he or she is granted certain rights that are often similar to the citizenship rights of indigenous nationals. These include freedom of movement, the right of refoulement, which outlaws the forcible return to the country of origin from which persons have sought refugee status, and basic social and economic rights. Refugees are in turn expected to obey the laws and regulations of the host country. This in turn raises questions concerning their assimilation or integration within the host nation.

The 1970s witnessed both a shift from the post war inter European migration and a rise in the number of asylum seekers and refugees from Asia, Africa, Latin America, and the Caribbean. According to the UNHCR, the number of refugees has grown considerably over the last 20 years. In 1984 it is estimated that there existed 10.7 million refugees. This figure almost doubled to 20.6 million by the end of 2002, reaching a peak in 1994, with 27.4 million refugees. The causes of this increase in numbers are diverse. Coinciding with increasing restrictions on labor migration and a global recession in the 1970s were improved travel and communication, which facilitated migration generally. However, more specific factors included the instability of developing or third world states following decolonization, and a rise in civilians fleeing civil wars or ethnonational, tribal, and religious violence. Thus the breakup of the Soviet Union and the former Yugoslavia engendered protracted ethnic conflicts, the latter producing over 2 million refugees, with over 400,000 going to Europe. However, the single largest ethnic group remains the 2.7 million

Palestinians, who are not designated as refugees but fall under the United Nations Relief and Works (UNRWA) agency.

Although some governments have remained tolerant of refugees and their plight, the majority, especially within Europe, have reacted to the increase in numbers of asylum seekers and refugees by enacting a series of restrictive policies and practices aimed at their deterrence. Such measures have often been reinforced, if not engendered, by negative media portrayals of refugees as “bogus” and as responsible for increasing unemployment, housing/health crises, or rising crime levels. This, in turn, as part of a vicious cycle, has fueled xenophobic public opinion. The restrictive measures of states have included the tightening of border surveillance and narrower definitions of refugee status – often placing the burden of proof on the asylum seeker. Together with the disappearance of borders within Europe, allowing the free movement of various Europeans citizens, the enactment of stricter coordinated policy to prevent the entry of non EU nationals – such as that effected by the Schengen Agreement (1995) – has been referred to as part of an attempt to create “Fortress Europe.” However, despite these actions, migration continues to occur to Europe.

The rising numbers of asylum seekers and refugees, as a specific type of migration, has also raised problems concerning how to conceptualize processes of migration. In contrast to the dominant rational choice theories of migration, which postulate individuals rationally weighing the costs and benefits of leaving one area for another in order to maximize their utility, refugee movement is often conceptualized as “forced” or “impelled.” Discussions concerning refugees refer to involuntary migrations that distinguish between the forced movements of refugees and the free movements of economic migrants. They also look to the political sphere rather than to economic forces as explanatory factors. Such conceptualizations raise questions concerning agency and structure, as well as the very accounting practices that determine what is “chosen” or “forced.”

regression and regression analysis

Stephen E. Brown

Regression is a statistical technique for writing an equation to predict the values of a dependent (y) variable from values associated with one or more independent (x) variables. An important caveat, however, is that predictive success does not imply causality, as prediction is only one of the criteria for establishing causality. The most rudimentary regression form is ordinary least squares (OLS) linear regression. In addition to estimating the association with the independent variable(s), such an equation also incorporates a constant (alpha), or value of y when x is equal to 0, and an error or disturbance term (epsilon) comprised of variation in y not accounted for by the remainder of the equation. The better the fit of the equation, the more variation in y is explained, as reflected in the value of R squared. As the explained variance of the equation increases, ability to predict values of y associated with any particular values of x (or sets of x in multiple regression) is enhanced. That is, as the explained variance in y increases, the prediction error of the equation is reduced until an equation that explains all variance in y (R squared = 1.0) would perfectly predict y for any set of x values and

have an error term of 0. Conversely, as prediction error of the equation increases, explained variance declines until the prediction of the equation offers no improvement over the mean of y as the best predictor of values of y for any level of x . A regression or slope coefficient (beta) is calculated for each x variable and represents the predicted change in y values for each unit change in the value of x . This coefficient may be positive or negative and is multiplied by the level of x for which y is being predicted. The greater the absolute value of the regression coefficient, the steeper the angle of the line (right angle for positive; left angle for negative) that best describes the relationship between x and y . Thus the generalized form of the regression equation is as follows:

$$Y = \alpha + \beta(X) + \epsilon$$

In multiple regression the equation is extended to incorporate additional x variables.

Regression is closely wedded to correlation, but is more useful to the analyst because the correlation coefficient is limited to the statistical significance and strength of the relationship, while the regression coefficient facilitates prediction. Both coefficients are typically examined in conjunction with one another, however, and cannot be understood in isolation from the other. Unfortunately, neither establishes causal direction which is required for drawing causal inferences. The coefficients are bivariate when one dependent variable is regressed on one independent variable. The immense value of regression in analyzing social data, however, lies in the multivariate relationship that entails one dependent variable that the equation defines as a function of two or more independent variables. Such a multiple regression equation allows scrutinizing social factors by estimating coefficients that simultaneously control for the effects of all other independent variables entered in the equation. This serves as a tool for identifying spurious relationships and allows the researcher to sort out the relative association of the independent variables. Moreover, all of this can be accomplished with modest sample sizes.

There are several forms of regression, each resting on certain assumptions that are reasonably met in some research scenarios, but not in others. The OLS regression model is appropriate for analyzing data comprised of

one continuous and normally distributed dependent and one or more continuous independent variables, as well as resting on several other assumptions. It is considered a quite robust technique, meaning that it is such a powerful statistical model that the various assumptions can be relaxed to a considerable degree without appreciably distorting estimates of the coefficients. It is widely accepted, for example, that categorical variables may be included as independent variables through dummy coding schemes (1 = member of the category, 0 = not a member of the category). The OLS regression model also assumes linear relationships between the independent and dependent variables. Similarly, the assumption of a linear relationship between the independent and dependent variables is often addressed by undertaking transformations of the independent variables to fit the data to a straight line.

Not only is regression a very useful statistical technique in its own right, it is also at the center of a family of statistics referred to as the general linear model. These techniques all explain variation in the dependent variable as a function of the distribution of values at different levels or categories of the independent or predictor variables. Thus principles of regression are important to fully comprehend simpler techniques such as analysis of variance and correlation. In addition, multiple regression lies at the foundation of most contemporary advanced statistical techniques such as logistic and probit regression models that accommodate binary dependent variables, survival models that assess time to an outcome, and poisson models to study non-normally distributed rare events and a variety of other specific scenarios.

regulation theory

Bob Jessop

Regulation theory is a distinctive paradigm in critical political economy. It originated in Europe and North America in the 1970s in response to the emerging crisis of the post war economy and it has since been applied to many other periods and contexts. Its name derives from its French originators, who describe it as *la théorie de régulation* or *l'approche en termes de régulation*. Similar ideas were also developed by other schools. The core concern of all such work is the contradictory and conflictual dynamics of contemporary capitalism considered in terms of its extra economic as well as economic dimensions. In highlighting the extra economic aspects of accumulation, regulation theorists draw on, and provide links to, other social sciences. Regulation theory was influential in economic, urban, and regional sociology in the 1980s and 1990s. This was partly because of its Marxist roots and partly because of its general heuristic power in organizing research on a wide range of sociological themes.

Regulation theory has many intellectual precursors. Nonetheless, as it is conventionally understood in economics and also became influential in sociology, this approach was developed in the mid 1970s by a few French heterodox economists whose work is collectively identified as the Parisian School (Aglietta 1979; Lipietz 1987; Boyer 1990). Two less well known and relatively minor French regulation schools date from the 1960s and 1970s and analogous approaches, based on different theoretical starting points, emerged elsewhere (Jessop & Sum 2006). Thus, regulation theory is not so much a single, unified paradigm as a broad research program in economics with major implications for other social sciences. Its several schools examine the role of extra economic as well as economic factors in securing, albeit for limited periods and in specific economic spaces, what they regard as an inherently improbable and crisis prone process of capital accumulation. Overall, while well aware of the invisible hand of market forces in this regard, regulation theorists also explore how extra economic factors embed profit oriented, market mediated

capitalist production in the wider society and help to tame, displace, and defer its contradictions and class conflicts. This process is associated with alternating periods of relatively stable expansion and crisis induced restructuring, rescaling, and reregulation. For, precisely because capitalism's contradictions and conflicts can never be fully mastered, crises will provoke a trial and error search process to find new ways of regularizing capitalist expansion.

Starting from real social relations in specific historical periods rather than from the abstract, transhistorical, rational economic man (*homo economicus*) favored in orthodox economics, different regulation schools share four goals: (1) describe the historically specific institutions and practices of capitalism; (2) explain the various crisis tendencies of modern capitalism and likely sources of crisis resolution; (3) analyze different periods of capitalism and compare their respective accumulation regimes and modes of regulation; and (4) examine the social embedding and social regularization of economic institutions and conduct through their articulation with extra economic factors and forces.

The dominant Parisian School introduced four key concepts to analyze different forms of capitalism. First, an *industrial paradigm* is a model that guides the development of the technical and social division of labor (e.g., mass production, flexible specialization). Second, an *accumulation regime* is a specific pattern of production and consumption that can be reproduced over a long period. For example, Fordism, which derives its name from Henry Ford, who is generally acknowledged as the pioneer of the moving assembly line and high wages, is based on a virtuous circle of mass production and mass consumption. Third, a *mode of regulation* is an ensemble of norms, institutions, organizational forms, social networks, and patterns of conduct that can stabilize an accumulation regime. Parisian theorists generally analyze it in terms of five dimensions: (a) the wage relation includes topics such as labor markets, individual and collective bargaining, welfare rights, and lifestyles; (b) the enterprise form includes corporate organization, the main source of profits, forms of competition, interfirm linkages, and links to banking capital; (c) the dominant form of money, the banking and credit system, the

allocation of money capital to production; (d) the state, considered in terms of the institutionalized compromise between capital and labor, forms of state intervention; and (e) international regimes, including the regulation of trade, investment, and monetary flows and the political arrangements that link national economies, nation states, and the world system. Fourth, when an industrial paradigm, accumulation regime, and mode of regulation reinforce each other enough to promote continued expansion, the resulting complex is analyzed as a *model of development*.

Regulation theory originated to explain a chronic economic crisis in advanced capitalism that emerged in the 1970s. This was unexpected because it followed “30 glorious years” of post war economic expansion when policies based on an institutionalized compromise between big labor, big business, and big government seemed to have abolished savage economic crises, to have routinized class struggle, and to have moderated ideological antagonisms. Regulation theorists described this system as Fordist and offered various explanations for its crisis. For example, it was attributed to the exhaustion of the growth potential of mass production, to satiated demand for mass consumer durables, to a tax and expenditure crisis of the post war state, and to growing levels of internationalization, which allegedly undermined the scope and effectiveness of national economic and political regulation. Depending on how the main cause(s) of this crisis were identified, regulation theorists proposed different solutions. These included *neo Fordism* based on intensification of the Fordist labor process; *flexible accumulation* based on increased flexibility using flexible equipment; and an initially ill specified *post Fordism* marked by a new industrial paradigm, accumulation regime, and mode of regulation. This implied the need for changes not only in economic organization but also in extra economic institutions and behavior, including education and training, the science and innovation system, lifestyles, spatial organization, and state forms and functions. Some early work had assumed a quasi automatic transition from a crisis ridden Fordism to an effective post Fordist accumulation regime and mode of regulation. Later work explored the difficulties involved in the search for solutions to the crisis within the existing

Fordist model and/or for alternative models of post Fordism and also described the obstacles to consolidating post Fordist accumulation regimes and modes of regulation. More recently, it seems agreed that post Fordism has, as its positive content, a globalizing knowledge based economy that is being realized on many different scales of economic, political, and sociocultural organization.

Regulationist analyses of Fordism and its crisis appealed to many critical social scientists in the 1980s and 1990s. They used regulation theory to explore the social as well as economic dimensions of the Fordist labor process, new forms of class conflict, stages and varieties of capitalism, new social movements, the distinctive economic geography of Fordism, urban forms and urban crises, and changes in the state. The loss of taken for grantedness of the national economy and the national state associated with the Fordist period has allegedly led to three interrelated changes in economic policy: (1) a shift from the primacy of national states in determining economic and social policy to a multi scalar approach based on multiple supra national, national, regional, and local political actors; (2) a shift in the primary mechanisms to coordinate the economic and extra economic conditions for capital accumulation from the typical post war bifurcation of market and state to new forms of network based forms of policy coordination that cross cut previous “private public” boundaries and that involve “key” economic players from local and regional as well as national and, increasingly, international economies; and (3) a shift from policies concerned with full employment and social welfare to a stress on full employability and personal responsibility. All three changes are reflected at local or regional level in the development of “entrepreneurial” cities and regions.

Regulationists also argue that the crisis of Fordism leads to spatial restructuring (Amin 1995; Lauria 1997). They assume continuing mutual adaptation between accumulation regimes and urban development. For example, Fordist cities were marked by (1) single storey production facilities, which are well suited to mass production and depend on cheap fuel and road transport; (2) low density (sub)urbanization based on mass private and public transport – enabling the normalization of nuclear family

households, which consume many consumer durables, buy bigger ticket items on credit, and depend on automobility; (3) municipal reformism and urban planning designed to promote the role of cities as centers of consumption as well as production; and (4) regional policy concerned to secure even economic development based on spreading mass production industries and their growth dynamic. Unsurprisingly, then, the crisis of Fordism also had a big impact on cities. This is said to include growing fiscal problems that made it harder to sustain the infrastructure needed for Fordism; the hollowing out of cities through a flight to the suburbs; a new spatial division of labor with low cost jobs moving abroad or to more peripheral regions; and increasing social problems due to deindustrialization, rising inner city unemployment, and racial tensions. It is claimed that the Fordist economic and political regime has failed and, if cities and regions are to escape the effects of this failure, they must modify economic strategies, economic institutions, modes of governance, and state forms. These must be redesigned to prioritize "wealth creation" in the face of international, interregional, and intraregional competition because continued growth is necessary for social redistribution and welfare.

One response to these problems is the rise of entrepreneurial cities and public private partnerships to replace the Fordist pattern of municipal socialism and managerialism. "Entrepreneurial cities" actively promote the competitiveness of their respective economic spaces in the face of intensified international, inter and intraregional competition. This may involve little more than a defensive, deregulatory "race to the bottom," but it can also involve offensive, supply side intervention to upgrade a wide range of extra economic as well as economic conditions considered essential for cutting edge competitiveness. One effect of these varied policies is that, in contrast to Fordism, post Fordist policies tend to promote uneven development and growing polarization between prosperous and crisis ridden cities. Los Angeles was once regarded as the archetypal post Fordist city on the basis of its supposedly post industrial economic profile, spatial organization, social heterogeneity, and patterns of social exclusion (Scott & Soja 1994). But other types of post Fordist city have also been explored (Brenner 2004). In any case, there are

major continuities between Fordist and post Fordist cities, thanks to the impact of the built environment, automobility, and single family households.

Regulation theory remains a progressive research program (for Parisian work, see Boyer & Saillard 2002). Some early critical historical and econometric work challenged the validity of the initial analyses of Fordism and its crisis and criticized the whole approach on this basis. Mainstream social scientists criticize its one sided concern with the economic logic of capital accumulation and neglect of other dimensions of social life. Conversely, fundamentalist left wing critics have claimed that regulation theory implies that capitalism is inevitable (because crises are always eventually overcome) and thereby supports reformism rather than acknowledging the need for the overthrow of capitalism. Regulationists have responded to these and other lines of criticism by refining their concepts, developing new analyses, and reasserting the contradictory nature of capitalism (Boyer 2004; Jessop & Sum 2006).

Reich, Wilhelm (1897–1957)

Ken Plummer

Wilhelm Reich was a controversial theorist of the early and mid twentieth century who attempted to wed the ideas of Freud and Marx through a radical theory of the “sexual revolution” (a term he coined in the 1920s). His Marxism led him to the Communist Party in Austria, and to being a member of the Psychoanalytic Society. These organizations were at mutual odds, and Reich was soon expelled from both.

Reich’s theoretical work combined a social theory of sex economy – an economy which may hinder, gratify, regulate, or promote sexuality – a theory of characterology, and an account of both personal and social change due to orgasmic liberation. He provided a critique of the contemporary society, which he saw as creating a fascist, authoritarian character, machine like and subservient to the existing social order. For Reich, political analysis was equated with sexual liberation.

At the core of his hydraulic theory, Reich argued that it was “sexual energy which governs the structure of human feeling and thinking . . . it is the life energy *per se*. Its suppression means disturbance of fundamental life functions” (1969 [1935]: xxv). From the working of the libido, Reich stressed the development of character analysis. His most famous (notorious) theory stressed the existence of the orgone, a pale blue liquid that needed regular discharge through sexual relations. For societies and individuals to function well, all individuals should have regular orgasms. His ideas spiraled out of

control, and eventually took off into wild fancy. For instance, Reich produced a famous box, something like an original, old fashioned wooden telephone box lined with metal, that could capture orgasms: the orgone energy accumulator. This could improve “orgiastic potency” and mental health. Despite these eccentric views, much of Reich’s work is seen as providing a useful, critical, and synthesizing social theory.

Reich analyzed *The Mass Psychology of Fascism* (1931) through a consideration of Polish field anthropologist Bronislaw Malinowski’s *Sexual Life of Savages* (1930) (indeed, Reich and Malinowski became friends). Malinowski’s fieldwork had suggested the existence of societies that were largely matriarchal, where adolescents were allowed to be sexually free. Sexual pleasure was encouraged. By contrast, Reich suggested that much of history had been dominated by sex repressive, patriarchal societies. Societies had moved from sex affirming (with a matriarchal, natural, genital love life and little social hierarchy) to sex negating (predominantly patriarchal with a compulsory marital bond and strong social division).

In a sex repressive society (which Reich saw as widespread), a character armor was formed that was characterized by rigidity and control, represented in physical muscular rigidity which needed breaking down. The family and socialization were themselves a “conveyor belt” of “authoritarian personalities.” In *The Invasion of Compulsory Sex Morality*, Reich outlines armoring through marriage, childhood subervience, the creation of the mass individual, and the lack of rebellion, backed by every reactionary institution. As he says: “All this, taken together, means the ideological anchoring of the existing, authoritarian system in the character structure of the mass individual, thus serving the suppression of life” (1971 [1932]: 165). The character armor revealed itself in muscular tensions and gestures; through the wider therapy of “vegetotherapy,” the orgasm reflex could break out.

For Reich, adult neuroses could be found via compulsive, monogamous, bourgeois marriage. Humans were naturally polygamous. When there was polygamy, concerns such as rape, sadism, prostitution, pedophilia, and sadomasochism would be replaced by true orgiastic potency.

Reich was born in 1897 in Dobrzynica, Galicia, part of the Austro Hungarian Empire. Much of his life was lived in the shadows of psychoanalysis and Marxism. He published *The Function of the Orgasm* in 1927, moved to Berlin in 1930, and subsequently fled from Germany in the 1930s, living briefly in Denmark, Norway, and Scandinavia before settling in the US in 1939. Here, some of his more extreme ideas came to fruition and led him to be seen in his last years as variously a genius, criminal, mad man, and eccentric. He died in 1957 at Lewisburg Penitentiary, serving a sentence for the distribution of orgone accumulators in violation of the US Food and Drug Administration.

Parts of Reich's theory can be found in the works of philosophers such as Marcuse, Fromm, and Adorno (the Frankfurt School), who saw how repression may well lead to a restrictive and authoritarian society. In the 1960s, for a short while, Reich was a guru of both the student and countercultural movements on account of his advocacy of the need for full orgasmic sex for good functioning and for the slogan Make Love Not War. He features in the writing of Alan Ginsberg, Jack Kerouac, and William Burroughs; is mocked somewhat by Woody Allen with his "orgasmotron" in the film *Sleepers*; and had a serious film made about his life and work, Makavejev's *W: Mysteries of the Organism* (1968).

reification

Rob Beamish

In general, reification refers to the act (or its result) of attributing to analytic or abstract concepts a material reality. Through reification people regard human relations, actions, and ideas as independent of themselves, sometimes governing them. People frequently reify the abstraction "society" into an entity and give "it" the power to act. Society does not act – people do. Reification is an error of attribution; it is corrected by eliminating the hypostatization of abstractions into things or agents.

For phenomenologists, reification is a potential outcome of the social construction of reality. To enter the lifeworld, human expression and subjective intention are externalized through "objectivation" where they become part of a socially constructed reality. Language is the common vehicle, although objectivation occurs through various symbolic forms.

Reification occurs when people understand objectivations as if they were non human or suprahuman things and act "as if they were something other than human products – such as facts of nature, results of cosmic laws, or manifestations of divine will." Reification indicates we have forgotten our "own authorship of the human world" (Berger & Luckmann 1966: 89). A reified world is a dehumanized one.

In Marxist sociology, reification is conceptualized differently. Reification is created by the "fetishism of commodities" where "the social character of labor appears as the objective (*gegenstandliche*) character of the products themselves." To the producers, "the social relations of their private labors appear as what they are, not as the immediate social relations of people in their labors but as thingly (*sachliche*) relations of people and the social relations of things" (Marx 1922: 39). The producers' own social movements "possess for them the form of a movement of things (*Sachen*) under the control of which they stand rather than the producers controlling it" (p. 41).

Here, reification – *Verdinglichung* (ver con noting a process; *dinglich* "thingly" – thus "thingification") – is a real social process whereby the social relations among producers

do become “thingly.” Their social relations really are those of commodities (and their value). Human characteristics matter little; one’s “properties” as the bearer of commodities, especially labor power, do. This thing like relation of commodity production dominates the workers actually engaged in production.

Reification links to Marx’s early concern with alienation, where the products and production process under private property are separated from and stand against their human producers. It is a real social process that must be overturned to put social production under the control of its immediate producers.

Lukács (1971) argued that reification created false consciousness, thwarting a spontaneous, workers’ class consciousness, supporting Lenin’s argument for a revolutionary, vanguard party. Other Marxists, like Gramsci and Korsch, argued that workers would, amid the contradictions of commodity production, break through reified, commodity fetishism and force social change.

relational cohesion theory

Omar Lizardo

Relational cohesion theory was designed to explain when and how people involved in exchange relations become committed to their

relationship. This extensive research program was developed by Edward Lawler, Jeongkoo Yoon, and Shane Thye and has become one of the most cumulative research programs in sociological social psychology (Lawler & Yoon 1993, 1996, 1998; Lawler et al. 2000). The theory predicts that dyads embedded in equal power relations within exchange networks are more likely to engage in repeated exchange relations than dyads embedded in more unequal power arrangements. These frequent successful exchange episodes are, in turn, predicted to lead to a higher frequency of experience of positive emotions. When individuals attempt to ascertain the source of positive and negative feelings, relational cohesion theory predicts that these positive feelings are interpreted as a product of the relationship by way of an attribution process. This serves to make the relationship a cognitively salient object (“setting it off” as distinct from other alternative relations) and to imbue it with positive affect. Thus the relationship becomes an independent object of emotional attachment for the individual, which helps create perceptions of their relation as a cohesive unit. This perceived *relational cohesion* is thought to result in a host of behavioral outcomes associated with relational *commitment*, such as staying in the relationship even when alternatives of equal value become available, starting new ventures with the current partner, and expressing positive regard for the partner in the form of unilateral gift giving.

Relational cohesion theory began (Lawler & Yoon 1993, 1996) as an attempt to establish the conditions under which repeated exchange within dyads would lead to higher (or lower) rates of commitment. The initial insight of the theory at this stage consisted of the connection between the relative power differential within dyads and the probability of successful completion of exchange opportunities, which, in turn, led to more instances of commitment (answering the *when* question). Lawler and Yoon theorized that if agreements are more likely to occur when partners are more open to making concessions and when they are not subject to terms of agreement that they consider unfair, then equal power dyads should be able to complete more exchange opportunities than dyads in which one partner has an overwhelming power differential in relation to the other. Following Emerson

(1981), the theory conceptualizes and operationalizes power in terms of power-dependence theory: A is more powerful than B if A is less dependent on B than B is on A. Dependence is a function of the number of alternative exchange opportunities made available to A and B in the exogenously given network of connections between all of the actors and the distribution of resources throughout the network. Thus, A is more powerful than B if (1) she has a larger number of alternative exchange partners or (2) given an equal number of partners, A's partners are able to offer more valuable resources than B can offer. In this theory, power is conceptualized in structural terms, as a potential *capability* (i.e., the capacity to exclude a given number of potential partners from an exchange in a negatively connected network) inherent in the network, and is distinct from specific instances of *power use* (i.e., the actual act of exclusion). Thus one position may have a lot of power but display very few instances of power use. Equal power is more likely to lead to commitment due to the higher likelihood of completion of successful exchange. Exchanges between equal power dyads are less likely to exhibit concessions and more likely to feature satisfactory terms than unequal power exchanges.

STRUCTURAL COHESION

While initially (1993) using a simple equal power/unequal power distinction to predict frequency of exchange and relational commitment, Lawler and Yoon (1996, 1998; Lawler et al. 2000) later generalized this classification by introducing the concept of *structural cohesion*. In contrast to relational cohesion, structural cohesion is defined as the structural potential for instrumental cooperation in an exchange relation. Instrumental cooperation exists in an exchange relation when each actor is more likely to benefit from achieving agreement in that relation than by resorting to one of her alternatives. Lawler and Yoon further differentiate between the total power inherent in a dyad (the *sum* of the power of actor A and actor B) and the relative power of the dyad (the *ratio* of the power of actor A over that of actor B). In Lawler and Yoon's formulation, structural cohesion is a positive (curvilinear) function of the total power

of the dyad and a negative function of the relative power of one actor over the other. Thus, maximum structural cohesion should exist on equal power dyads with high total power. Lawler and Yoon (1996) reason that agreement is easier to reach when power inequality is low (one actor is prevented from taking advantage of the other, which results in refusals to reach agreement) and total power is high (which results in greater expected benefits for both parties). Further repeated mutual agreement increases actors' mutual dependence.

Commitment in relational cohesion theory is defined as the attachment that the individual feels to a collective entity, such as a relationship, a group, or an organization. Attachment in this sense can involve a wide variety of interests, from purely instrumental interests (when the actor is interested in an inflow of valued material resources that the relationship makes possible) to emotional and normatively mediated attachment. When the actor is committed to the collective due to the perceived costs of leaving the relationship, she is said to be instrumentally committed. When the actor remains in the relationship largely due to an emotional attachment, she is said to be affectively committed to it. Finally, when the actor remains in the relationship because such membership is normatively sanctioned and perceived by the actor as an obligation that she must fulfill, she is said to be normatively committed to the collective. Relational cohesion theory highlights the role of emotional commitment as an explanatory mechanism that sheds light on why actors are likely to stay in certain frequently activated exchange relations. The theory highlights a process whereby a relationship initially based on purely instrumental motives and commitments comes to acquire expressive value and is transformed into one founded, at least partially, on emotional and cathectic sources of commitment. A common behavioral indicator of commitment is based on Kanter's concept of "stay behavior" or forgoing forming new partnerships even when these become available. More recent empirical tests of the theory have come to highlight other more expressive indicators of commitment (i.e., gift giving).

In order to tackle the *how* question, relational cohesion theory posits an affective mechanism: the completion of a joint task (such as an

exchange agreement) is seen as a mutual accomplishment which makes the participants feel good, by giving them an "emotional buzz." Frequent successful interactions result in a consistently generated stream of mild and shortlived positive emotions. These positive emotions unleash an attribution process, which culminates in the relationship being considered the source of the positive emotions. Lawler and Yoon (1993, 1996, 1998) draw on a psychological model of emotions known as the circumplex model. The circumplex model distinguishes between two principal dimensions of emotional experience: pleasure and arousal. Arousal can be positive or negative, while pleasure can be present or absent. Lawler and Yoon treat interest/excitement as a positive form of arousal that is distinct from pleasure. Interest/excitement is a motivational state of curiosity and fascination; it is equivalent to feeling energized, while pleasure is closer to feeling satisfied. Interest/excitement is based on expectation of future rewards, while pleasure/satisfaction is a product of rewards received. Experimental evidence has shown that pleasure/satisfaction is a more consistent product of exchange frequency and predictor of relational cohesion than interest/excitement. Lawler and Yoon see these two emotions as representative of different attitudes to social exchange, one backwards looking and focused on rewards already obtained (pleasure) and the other forward looking and focused on anticipated accomplishments (interest). They theorize (1996) that it is a possibility that pleasure is more strongly connected to routine, less complex joint tasks, while interest is a more consistent product of complex, non routine exchange contexts.

Relational cohesion theory is built on an impressive empirical record, which has repeatedly confirmed its basic premises. Laboratory studies have shown that structural cohesion leads to higher frequency of exchange, and that the effect of exchange frequency on relational commitment is primarily mediated by positive emotions and the effect of the latter on the perceived cohesiveness of the relationship by the participants. Empirical tests of the theory have also uncovered new findings, such as a possible alternative pathway toward commitment by way of the reduction of uncertainty (the traditional explanation of commitment in

exchange theory), and a small residual direct effect of frequency of exchange on commitment that does not operate through the affective pathway (interpreted as an operant conditioning effect). A recent refinement and empirical assessment of the theory (Lawler 2001) showed that indeed two alternative pathways toward commitment do appear to exist, but the uncertainty reduction path toward commitment *does not* operate by inducing greater relational cohesion, and does not affect the more expressive forms of commitment behavior. Further, positive emotions lead to higher levels of cohesion which result in more commitment even after the effect of predictability (as a measure of uncertainty reduction) has been held constant. However, predictability of the relationship does have a direct effect on the most risky indices of commitment (such as engaging in a new joint venture with a high probability of defection on the parts of other participants), indicating that predictability might have a basis in trust. Thus, there appears to exist a *dual process* which leads to different forms of commitment: a trust based cognitive process that goes from frequency to predictability to willingness to engage in risky new ventures, and an emotion/cohesion based process that produces stay behaviors and expressive forms of commitment behavior.

Relational cohesion theory goes beyond the standard view in exchange theory that commitment is a direct effect of uncertainty reduction processes (Emerson 1981). In the traditional view, actors are motivated to search for stability and predictability in exchange relations, since exchange contexts are characterized by the basic trust dilemma where actors cannot be sure of the motives of their exchange partners, and thus leave themselves open for potential malfeasance on the part of their partners at every exchange opportunity. To this largely cognitive non emotional account of the process of commitment, relational cohesion theory adds an emotional component (Lawler & Thye 1999): the completion of successful exchanges, beyond serving to reduce uncertainty, is an independent source of positive emotions which come to be attributed to the exchange relation itself. Thus, from the actor's point of view, the exchange relation comes to be an independent source of emotional gratification, and thus becomes a valued object in itself.

The theory has its classical roots in the work of George Homans, and in the power-dependence exchange theory of Richard Emerson (1981). From Homans, relational cohesion theory draws its key insight connecting rates of interaction and positive sentiments. From Emerson, the theory takes its specific form as an *affect theory of social exchange* (Lawler 2001), which conceives of the network of exchange opportunities (the initial setup determining who can exchange with whom) as the primary exogenous factor which brings certain pairs of actors to interact more frequently than others. The theory draws on another wing of the classical tradition, the social constructionist work of Berger and Luckmann on the conditions that produce "incipient institutionalization." In relational cohesion theory, the process that results in the relationship acquiring an objective standing from the individual's viewpoint is analogous to the process of institutionalization from repetitive behavioral patterns outlined in Berger and Luckmann. Finally, the connection between affect and the process through which social relationships come to acquire an objective, constraining force on the individual harks back to Durkheim's pioneering connection between joint ritual activity, emotional arousal ("collective effervescence"), and the emergence of the group as an overarching, independent social reality. This connection between affect, arousal, and emotional energy is also present in Collins's neo Durkheimian theory of interaction rituals, which see these repeated sets of affect producing interactions as the microfoundation of larger social orders.

The theory has a host of implications and explanatory utility in terms of accounting for real world phenomena. The most obvious application of the theory is to the explanation of the stickiness of transactions in real world markets, which, in contrast to the neoclassical image of disconnected actors that come together for one shot transactions and which have equal probabilities of interaction with any exchange partner, show instead that exchange transactions tend to increase the probability of future transactions, and that actors become involved in exchange relations and come to regard them in terms that go beyond the purely instrumental benefits that they bring in. Further, the theory can also be used to explain when and how people

become attached (and disengaged) from real groups, organizations, and networks (Lawler 2001), thus forming the basis for a general theory of group commitment and affective attachment to collectivities.

reliability

Robin K. Henson

Reliability refers, at a general level, to *consistency* of measurement. Consistency can be conceptualized somewhat differently for different forms of reliability estimation, but in all cases reliability is focused on whether a measurement yields consistent results.

Such consistency is critical to research practice, where variables must be operationalized

and measured in some fashion. For example, the measurement of socioeconomic status can be operationalized as average family income, whether a child receives a reduced lunch rate at school, education level of parent, or by other variables. Regardless of the way in which the variable is defined, however, it must be measured with consistency within the research study such that the scores obtained reflect dependable characterizations of the units of observation (e.g., people, families) on the variable of interest. In the example above, if a head of household does not know his or her average family income, he or she might simply guess at an estimate. Conversely, another head of household in the same study may give an accurate average family income. In such a case, the variable is not being consistently measured across the units of observation.

There are three dominant measurement theories that can be used to conceptualize reliability of scores: *classical test theory*, *generalizability theory*, and *item response theory*. In research practice, however, it is much more common for researchers to employ the classical test theory framework than the other two methods, at least in part due to ease of use and historical precedence (Hogan et al. 2000).

In classical test theory, sometimes called *true score theory*, a score is perfectly reliable only when the obtained score is measured without error. A practical ramification of this idea is that variables in the social sciences are seldom, if ever, measured without error. The assessment of socioeconomic status, as noted above, can have inconsistency (i.e., error) in how family income is reported. Researchers investigating parenting self efficacy must wrestle with how to measure this construct, with full knowledge that their measurement will not be perfect.

Theoretically, however, there is a reliable measure of both of these variables, and therefore, the true score is a function of the obtained score and some degree of error, as indicated by

$$X_T = X_O + \text{error}$$

where X_T is the theoretical true score and X_O is the obtained score from a given measurement. Of course, within a given study, only the obtained score is available, and the true score is not directly known.

An observation's true score can be thought of as the theoretical average obtained from an infinite number of independent assessments of the same person with the same assessment (Allen & Yen 1979). Therefore, for any measurement occasion that is less than perfect, an obtained set of scores will contain variance that is true score variance (measuring the trait of interest) and variance that is due to error (factors inhibiting trait measurement, e.g., randomness in responses due to fatigue). These two variances (σ^2) yield the total score variance of the observed scores, such that

$$\sigma_{\text{OBSERVED}}^2 = \sigma_{\text{TRUE}}^2 + \sigma_{\text{ERROR}}^2$$

In classical test theory, non systematic errors (e.g., fatigue effects, random guessing) lower the reliability estimate because they increase the amount of variance in the observed scores that is due to factors other than trait measurement. However, systematic errors (e.g., consistent fatigue effect across the sample such that similar errors are made) are not considered measurement error and can increase the reliability estimate because of their systematic nature.

In this framework, then, reliability (r_{XX}) can be conceptualized as the ratio between the true score variance and the observed score variance:

$$r_{XX} = \sigma_{\text{TRUE}}^2 / \sigma_{\text{OBSERVED}}^2$$

If all of the variance in the observed scores is due to true score differences, then the reliability would be perfect (1.00). Unreliability is introduced to the degree that the observed score differences are due to factors (i.e., error) other than true differences.

In generalizability or G theory, analysis of variance methodology is employed to partition the variance of the observed scores into more than just two portions. The primary advantage of G theory lies with its ability to determine more specific sources of measurement error and the interaction between sources of measurement error. Once these sources of error are determined, then the researcher has a better idea on the degree of error in his or her data, and the potential reasons for that error. This is much different than the classical test theory perspective, where error is not simultaneously differentiated as originating from different

sources (e.g., error due to test items, error due to time of measurement).

In item response theory (IRT), focus is not on the true scores or what constitutes the variance of the observed scores, but rather on the latent trait of interest. That is, it is the unobserved trait that theoretically causes the responses of a given person on a given test, and therefore the estimation of this latent trait is more central to the concept of reliability than the observed or even the true score.

IRT has significant advantages over classical test theory through its advancement of item and test information functions as a replacement of classical concepts of reliability. These information functions speak to reliability of measurement based on the ability of an item or test to discriminate among test takers along various levels of the latent trait of interest. In general, greater levels of information on the functions indicate greater precision of measurement, and by extension, greater reliability.

Generalizability theory and item response theory notwithstanding, reliability continues to be most often conceptualized using the classical theory, and there are several ways to estimate reliability in this framework, including test retest, alternate forms, internal consistency, and interrater reliability. Each of these methods attempts to separately account for measurement error due to different sources. It should be noted, however, that this is not the same as the ability of G theory to account for multiple sources of measurement error (and their interactions) simultaneously.

Test retest reliability assesses the consistency of measurement across time, or stability. This estimate is obtained by giving the same sample of subjects the same measure, with the two assessments separated by some period of time. The amount of time that is needed between the measurement occasions depends on many factors, and it can vary from as little as a week to as long as multiple years. Most often a few weeks is the time interval used. The test retest coefficient is obtained by simply correlating the two sets of scores using a correlation coefficient such as Pearson r . If the measurements are consistent across time, then this correlation should be strong and positive. The degree it is not is the degree of measurement error due to time of assessment.

To estimate *alternate forms reliability*, two different assessments which presumably assess the same trait of interest are given to the same group of subjects. The resulting scores are then correlated to determine the degree of equivalence between the alternate forms.

Internal consistency reliability is the most common form of reliability estimate, and it can be computed based on a single administration of a measure to a single group of subjects. There are various formulas for its estimation, but the most frequently employed of these is Cronbach's alpha (α). Internal consistency assesses the degree that a test's individual items are consistent within themselves and therefore are an appropriate sampling of items from the domain of all possible items that could be used in the assessment. Because of this focus, Cronbach's alpha tends to increase (greater reliability) when (1) the items responses are highly correlated, (2) the total score variance is large, and (3) there are a large number of items on the test. An alpha coefficient of 1.00 would indicate perfect reliability due to item sampling, and a coefficient of 0 would indicate a lack of reliability.

Interrater reliability addresses whether multiple judges can rate subjects consistently between themselves. Again, there are multiple ways to compute interrater reliability, ranging from the simple correlation between raters' scores to more complex statistics such as *Cohen's kappa* or the *intraclass correlation* (ICC). The ICC can also be employed for other reliability situations.

Regardless of the method of estimation or the measurement theory used, reliability is best considered as a function of obtained scores rather than as a function of the test itself. This is because the same test, when administered to different samples, can yield reliability estimates that vary. To some degree IRT overcomes this sample dependence by placing focus on the latent trait of interest and the item information functions. However, even with IRT, it is the obtained scores on items that are assessed for reliable information, not the test itself.

The meta analytic approach of *reliability generalization* (RG) makes this point explicit and also has great value for evaluating how reliability can change from sample to sample. Originally developed by Vacha Haase (1998), RG explores how reliability can change from study

to study and attempts to determine whether certain study or sample features can predict this variation. Reliability generalization studies have also served to highlight the great frequency with which research authors fail to report reliability estimates for their obtained scores, which represents a noteworthy flaw to a research study (Vacha Haase et al. 2002). Instead, many authors rely on reliability estimates from prior studies or the test manual (a process called *reliability induction*), which unfortunately may not be applicable to the current data. In sum, reliability is a critical element to any research study, and therefore its estimation is central to the research outcomes of interest.

reliability generalization

Tammi Vacha Haase

Reliability generalization (RG) is a measurement meta analytic method proposed by Vacha Haase (1998) characterizing score reliability across multiple administrations of a measure as well as identification of study features predictive of measurement error variation. RG identifies (1) the typical score reliability for a given measure, (2) the variability in score reliabilities across administrations of a given measure, and (3) which features of the measurement protocol do and do not explain or predict these variations in score reliability. Reliability generalization is similar to the theoretical concepts of validity generalization. Meta analysis of validity coefficients were the precursors to validity generalization, which began in the late 1970s to test whether the validity of scores for a given measure or set of related measures was generalizable. Meta analysis was the testing of the hypotheses of "situation specific validity."

In validity generalization inquiries, studies are used as the unit of analysis, and means, standard deviations, and other descriptive statistics are computed for the validity coefficients across studies. The validity coefficients across studies may also be used as the dependent variables in regression or other analyses. In these analyses the features of the studies (e.g., sample sizes, types of samples, ages of participants) that best predict the variations in the obtained validity coefficients are investigated. The same premises and methods utilized in validity generalization studies can be applied to explore score reliability – that is, reliability generalization.

Unfortunately, it is all too common to read about "the reliability of the test" or hear statements such as "the test is reliable" (Thompson 2003). Such statements contribute to the confusion and misunderstanding of reliability. Many have written about the confusion, attempting to clarify that scores, not tests, are reliable. For example, Pedhazur and Schmelkin (1991: 82) write: "Statements about the reliability of a measure are . . . inappropriate and potentially misleading." Thompson (1992: 436) summarizes: "This is not just an issue of sloppy

speaking – the problem is that sometimes we unconsciously come to think what we say or what we hear, so that sloppy speaking does some times lead to a more pernicious outcome, sloppy thinking and sloppy practice.” Thus, RG is based on the suggestion that scores, not tests, are reliable or unreliable. In addition, RG assumes that the reliability of scores on the same instrument will change from study to study, and characteristics of participants and other study features will influence reliability coefficients. This is in contrast to the classic test theory (Lord & Novick 1968) that stated increases in observed score variance result in increases in score reliability, and the assumption that the error variance remains constant in the two populations or, equivalently, that changes in observed score variance are caused solely by changes in true score variance. RG studies address this issue directly as attempts are made to explain variation in the scale dependent error variance in addition to, or instead of, attempting to explain variation in the scale free reliability coefficient.

Thus, reliability refers to the results obtained with an evaluation instrument and not to the instrument itself, as an instrument itself is neither reliable nor unreliable. The same instrument can produce scores which are reliable and other scores which are unreliable, as reliability is dictated by scores on a test for a particular group of examinees at a specific time. As an example, use the Beck Anxiety Inventory (BAI). This instrument lists 21 symptoms of anxiety, including descriptors such as feeling hot, unable to relax, dizzy, and face flushed. Individuals rate how much they have been bothered by each symptom during the past week by checking a 4 point likert scale, from “not at all” to “severely.” In research study 1 and 2 the dependent variable is anxiety, as measured by the BAI. In the first study, all participants, who are all currently being treated at an inpatient facility for anxiety, complete the BAI. All scores were 3s or 4s; reliability analyses of these scores indicate the alpha coefficient is 0.6961. In a second study, participants are from an outpatient clinic; some are being treated for anxiety, others are not. The BAI scores vary, with some participants indicating a high degree of anxiety, others moderate, and still others reporting little or no symptoms of anxiety. The alpha coefficient for this group of participants is 0.9975.

This example illustrates – using the same instrument – that there were very different reliability coefficients. In this particular example, the instrument, number of participants, and even type of study were similar. What changed was the population or setting of the participants – and even that was only changed from an inpatient to an outpatient setting. That is, the participants themselves will have an influence on the score quality. “The same measure, when administered to more heterogeneous or more homogeneous sets of subjects, will yield scores with differing reliability” (Thompson 1994: 839).

This example also illustrates that a large total score variance led to high alpha coefficients. The more heterogeneous the group (outpatients in this example), when compared to a more homogeneous group (inpatients being treated for anxiety in this example), led to a higher alpha coefficient (0.9975 versus 0.6961). This has implications for individual studies, as reliability of the data actually being analyzed directly impacts results and interpretation. The practical effects of low score reliability may include underestimated effect sizes and less power to find statistical significance.

RG studies have been conducted in which the standard error of measurement (the square root of the error score variance) was employed as a primary dependent variable (Yin & Fan 2000). Alternatively, Shields and Caruso (2003) presented a new methodology in which the true and error variance in each sample were partitioned prior to analysis. Then the study and sample characteristics are allowed to have their effect on score reliability through their differential relationships with true and error variance. Thus it can be determined not only which study and sample characteristics affect score reliability, but also to what extent they do so by affecting the amount of true score variance, or the amount of error variance, or both.

Since the original article (Vacha Haase 1998), more than 30 RG studies have been published. Scores on instruments such as the Meyer's Briggs Type Indicator, Coopersmith Self Esteem Inventory, Career Decision Making Self Efficacy Scale, Revised Children's Manifest Anxiety Scale, Alcohol Use Disorders Identification Test, and MMPI, as well as concepts such as teacher self efficacy and the “Big Five Factors” of personality, have been explored.

Future directions include the continuing use of RG methodology to explore score reliability of a multitude of instruments and constructs. This opens the door for the potential for completing meta meta analyses (i.e., the meta analysis of RG studies), as described by Vacha Haase et al. (2002).

religion

Roberto Cipriani

The concept of religion is based on an idea of reality which goes back to the beginnings of humankind and provides an explanation for

the existence of itself as well as the world surrounding it. Since the beginning of history, the idea of religion has manifested itself in diverse forms, across human societies. These forms, which constitute bodies of knowledge, beliefs, and social institutions, form an ordered, operative system. In Durkheimian terms, a religion gradually emerges as the members of a particular tribe or society build a system of beliefs and rites that bind them.

From barely conceived ideas, beliefs and practice proceed toward more elaborate systems (there are many "sacred" scriptures or oral traditions that are accepted, orthodox, and acknowledged), and, from informal interpersonal relationships, toward collective events (ceremonies which are more or less fixed at ritual level where it is possible to experiment and to reinforce the agreement between individuals, cognitive attitudes, and subsequent behaviors).

It would be misleading, however, to begin with just one definition of religion as it would be far too recent with respect to the birth of religions in general, and those which are considered historically organized (dating back many millennia before the beginning of the Common Era). However, the main reference is Marcus Tullius Cicero, who lived in the first century BCE. In his *De Natura Deorum* (*The Nature of Gods*) (2, 72), the concept of religion was linked to the Latin verb *relegere*, to reread, read over, to read repeatedly; to consider something with diligence; to check constantly what is important for the correct veneration of the gods.

The ancient Romans carried out their rituals with great precision and accuracy and their gestures and rites were consolidated in tradition. It could be said that their rituals had great respect for the law, and orthopraxis, to create a bond of loyalty with the past and not because of any predisposition of the soul. It is for this reason that religion was seen as a necessary response and reaction to unfavorable signs from the gods. Substantially, it was necessary to ingratiate one self with the gods by carrying out the right actions that would win their favor. Not surprisingly, the art of divining was well developed and its practice was used to obtain the necessary information to understand which way the gods were oriented with respect to an individual or to a particular action.

Another variant, again of Latin origin, of the meaning of the term religion goes back to the original interpretation of the word *religare*, that is, to tie, attach, unite, or conjoin. This meaning suggests a relationship, a bond, but also an obligation, a commitment, or a submission. Evident in this relationship is the position of superiority assumed by the divinity, who functions as the obliger with regard to the human subject, who is consequently the obliged. Additionally, one of the strongest bonds between people and gods is created when making a pledge, that is, when a person makes a promise to a divinity upon the realization of a wish. If, then, after the pledge has been made the wish comes to fruition, the obligation toward the divinity is then fulfilled and the connection between the person and divinity is canceled out (although there will be further occasions where the pact can be renewed). The real effect though is a continued association: when a pledge is respected, there is concrete evidence of the human demonstrating faith, that is, loyalty and hope.

As mentioned, the etymology of the term religion can be traced to the Latin *religare* and has been attributed to the Christian writer Lactantius, who lived in the fourth century CE. According to this African writer, the bond between humans and God exists because humans recognize their creator and therefore obey, follow, and express *pietas*, that is, a sense of duty, devotion, and respect which is then duly returned by God in the form of justice, clemency, and divine benevolence. The central problem nevertheless persists, and it is that of fine tuning a sociological definition of religion, one that is metaconfessional, universalistic, scientific, and whose results in theoretical and empirical research in the field of the social sciences of religion are precise. In this sense, and in order to maintain a scientific non judgmental attitude, it appears useful to opt for an approach that is not instrumental (in Habermas's terms). Therefore, it is useful to begin from some of the empirical data which embody the various contemporary religions.

THE PRINCIPAL CHARACTERISTICS OF RELIGIONS

In the so called primitive religions, the religious relationship is essentially manifested

between humans and nature, and consists of forms of pantheism (which means that divine presence is found in every part of the human environment). God is seen to be operating in every facet of reality. A different approach can be seen in the modern form of Hinduism, which, with its Vedas tradition, has its beginnings probably in the third millennium BCE, if not earlier, and has developed a more universalistic outlook compared with its past form. There have been tendencies toward embracing all believers in God, irrespective of their faith.

With *Mahatma* (the great spirit) Mohandas Gandhi (1869–1948), violence, solidarity, and tolerance became paths toward truth and ethical and political commitment. Central to the concept of Hinduism is faith in Brahman, the supreme being who is also seen as Vishnu, and Shiva, who make up the sacred Trimurti. Brahman is one and all. In every individual there exists the divine and eternal breath, *atman*, and the *karman*, which administers retribution for all acts committed, and deals with the cycle of life and rebirth. In order to free oneself from the vicissitudes of reincarnation, one is to practice self denial, meditate, or be so devout as to embrace the essence of oneness between the infiniteness present in each being, *atman*, and the absolute which is Brahman, the only truth, beginning and end of everything.

In Judaism (originating in the nineteenth century BCE), the core trait is community affluence. Its main reference is the Torah, passed on from generation to generation and which makes up part of the Pentateuch (the five books relating the teachings of God to Moses). Judaism places emphasis above all on one's actions and relies on the alliance with God.

Buddhism (whose beginnings date back to the sixth century BCE) is surrounded by a controversy as to whether it is a religion or whether it should be considered merely as a philosophy. In reality, there are many elements which lead one to consider it a form of religion like any other. Initially Buddhism stemmed from Hinduism and the writings of the Indo Aryan "holy sciences," unlike the Vedas. There was no system of sacrifice nor any concept of a personal God. Later developments in Buddhism led to the beginnings of monastic experiences, the search for perfection, the universalism of the *bodhisattva* (that is, "one whose essence is

bodhi, enlightenment”), to principles of wisdom and compassion for human suffering, as well as a variety of kinds of worship and devotion, together with the pain of existence, detachment from earthly illusions, and the attainment of illumination. For Buddhism nothing is permanent, not even joy or suffering, so that even a moment of joy will only intensify the state of illusion of well being. Buddhism denies the principles of Hinduism: both Brahman as god and *atman* as individual reality. The ultimate objective is to eliminate that which causes pain by creating an awareness of both the transience of reality and the frailty of the human condition. Only by detaching oneself completely can there be freedom from suffering and the cycle of birth–death–rebirth. Morality, meditation, and wisdom are the only roads to control strength of mind along the *eightfold paths* of right faith, right purpose, right speech, right conduct, right means of livelihood, right effort, right mindfulness, and right meditation. This is the way of attaining *nirvana*, a state of being which is beyond good and evil.

Confucianism, which also had its beginnings in the sixth century BCE, involves more of an earthly quest based on human relationships. According to Confucius, divineness was present in the background: the search for God was through humans and their virtues; searching for the answers to the questions regarding the meaning of life, fate, and the question of good and evil. In fact, in Confucianism, human nature is essentially good, so, to maintain this state, one need only keep one’s passions at bay.

In Taoism (whose beginnings date back to the sixth century BCE) the main principle is the *dao* (as with the Buddhist *nirvana*, it goes beyond the notions of good and evil). It is immanent in the universe and in humans and so it is evidence of the identity between absolute and relative. Taoism, a people’s religion, was distinct from Confucianism as the latter was practiced by the elite of the Chinese government. Complementing the *dao* are the concepts of *yin* and *yang*: female and male, darkness and light, passive and active, potentiality and action, within and without. The world is born in five stages which combine with *yin* and *yang*: wood, fire, earth, metal, and water.

In Shintoism (whose beginnings go as far back as the sixth century BCE when the term

shinto was adopted) there is a combination of thought, rites, and institutions which operate at a local level, within villages, as well as at a national level, within a sovereign state, represented by the emperor of Japan. The origins of Shintoism lie within the primordial dualism between male and female represented by the figures of Izanagi and Izanami, who create a number of other beings thus making this a polytheistic religion with a plurality of gods. There is no real difference between God, humans, and nature. The differences between them are barely perceptible. Shintoism is founded on a variety of doctrines, ceremonial practices, places of worship, and hierarchies of priests. Gods (*kami*) are present in mythology (legends dealing with divinities) and appear very powerful and mysterious. The popular *kunitsukami*, earth spirits, are veritable tutelary deities and enjoy greater familiarity and closeness with people. Shintoism also boasts a great number of rituals within the community of its followers.

In Christianity, which was born more than 2,000 years ago, there is one God in three persons: Father, Son, and Holy Spirit. Christ, the Son of God, came to earth, became human, and died on the cross to redeem humankind from original sin, inherited by each human being, according to Christian theology. Over the centuries there have been schisms and separations, and different Christian churches have arisen: Catholic, Orthodox, and Protestant.

In Islam (founded by Mohammed, who died in 632 CE) religion is conceived as *din*, an Arabic term (though Persian in origin) meaning “custom” but also “tribunal.” Islam embodies a sense of faith (*iman*), customary practices (*islam*), and behavior (*aklaq* or *ihsan*). Also fundamental to Islam are the notions of testimony, prayer, fasting during *Ramadan* (the sacred month of Islam), contributing to the social taxation system (*zakat*) and the pilgrimage to Mecca (*hadjj*).

In the so called new religious movements (both in the West and the East), which, in reality, are based on practices and beliefs rooted in a variety of ancient religions, there is a tendency toward the esoteric, toward looking internally (with a certain amount of secrecy). These emphasize the individual needs of followers but without having to deny a universalistic outlook, one expressed through pacifism. There

are, of course, movements of a different nature modeled on magic, therapy, and mysticism.

SOCIOLOGICAL THEORIES OF RELIGION

According to Durkheim, "a religion is a unified system of beliefs and practices relative to sacred things, that is to say, things set apart and for bidden – beliefs and practices which unite into one single moral community, called a church, all those who adhere to them" (Durkheim 1995 [1912]: 44).

In paragraph 1, chapter 5 of Weber's *Economy and Society* (1978 [1922]) the author assures his readers that he will provide a definition of religion but fails to do so because it would merely describe a "peculiar form of behavior within a community." In his writings on the sociology of religions, however, he refers to the "economic ethos of world religions" and describes "systems for regulating human existence" capable of "grouping around themselves a large number of faithful."

The difficulty Weber experienced in defining religion is common to many other authors, who prefer to avoid any involvement that might be evaluative or might risk bias toward a particular view regarding the essence of religion (with reference to Christianity, this was an issue already subject to strong debate between Feuerbach and Marx). The problem consists primarily in finding agreement on the specific contents of religion and these cannot be, from a sociological point of view, those established by the religions themselves given that they are, in their view, the standard and thus come into conflict with the others. Nor can the contents be those defined by sociologists given that any such definitions are necessarily expressed on the basis of their own theoretical and methodological stances. In both cases such a defining operation would seem unnecessary. This debate stems from the actual sphere of study of the discipline itself: some prefer to talk about the sociology of religion and others about the sociology of religions. The latter opt for the expression in the plural in order to avoid their scientific approach being limited to a single religious confession. But, on the other hand, if one talks about religion in the singular, meaning

every religious manifestation and not merely that which is historically dominant in a given geographical context, the use of the expression sociology of religion aims to comprise all those religions which are empirically recognizable in the field of sociological research.

If anything, the most significant and discriminating point is another: whether to take into consideration every experience bearing similarities to those traditionally conceived as religion, that is, recognized as classic religions (including Buddhism, notwithstanding the reservations put forward by some scholars regarding its more philosophical rather than religious characteristics). The issue is important given that the consequences that depend on it are also of importance, that is, whether or not to classify as religion those movements whose religious nature is somewhat more metaphoric than substantial. This, however, does not mean having to search for the essence of religion; rather, it implies picking out those minimal elements which make a social phenomenon a religious fact based on its content, motivations, and customs.

Within contemporary societies there exist metaphorical forms of religion which, especially by way of their reference to values, seem to substitute traditional religious systems: these could, in fact, be defined as "religions of values." We are led to believe that they can replace historical religions. Thomas Luckmann (1967) shares the same view and his *The Invisible Religion* is based on the new "modern religious themes" of individual autonomy, the mobility ethos, self realization, self expression, sexuality, familism, and private life. This series of reference values recalls in some measure the Weberian concept of the "polytheism of values" where variety and sacredness of values are the result of ethical individualism.

Once the way has been opened to include new expressions of religion in the category of what is considered a religion, the number of possible alternatives increases but these all depend very much on the diverse sociological theories of religion. In this context it is important to define as secular religions those ways of experiencing politics, economy, art, science, and so on, as if they were a religion with their respective beliefs, relevant rites, and specific structures. Therefore, a funeral intended to be non religious will actually follow and reiterate those patterns and

procedures of a service in a religious temple; when a political appointment is made, the ceremony takes on the characteristics of a religious liturgy; a street protest has the semblance of an open air religious assembly; and even the opening of new company headquarters has its propitiatory inauguration ceremony.

In order not to confuse and overlap religions, metaphoric religions, secular religion, and other para religious forms, it seems correct to establish some common references, which point out the differences in such a way as to also recognize the affinities. Lambert (1991) rightly made the distinction between a substantive definition and a functional definition of religion where the former refers to the contents of a religion (according to Durkheim, for example, these relate to its beliefs and rituals), and the latter emphasizes the role and the function of religion in society (as is the case for Luhmann, who considers religion useful in facing life's uncertainties). However, within the substantive definitions, the functional aspect is not completely absent and, moreover, elements pertaining to the content of the functional definition cannot be completely expunged. All things considered, the substantive and functionalist perspectives tend to converge in the practical aspects of social life. A careful reading of Durkheim reveals functional aspects of religion while in Luhmann (and even Luckmann) it is possible to find substantive elements of religion. All in all, the belief in God, acts of devotion, the eschatological attitudes (relative to the final destiny for humanity and the universe), and the meaning of life are recurring themes within the religious experience, but none of these represents just one condition without which (*conditio sine qua non*) there can be a religious fact.

In other words, neither the *substantive content related* nor the *functional finalistic* represent the efficient cause (that is, the single determinant which directly and actively produces the effect) and/or the exclusive criterion necessary to recognize the religious feature of a sociological phenomenon. Here is where Aristotle made the clear distinction between material cause (the material of which something is made), formal cause (that by which matter is formed), efficient cause (that which produces a certain outcome), and final cause (the end of the process of development by which something becomes what it is).

The Aristotelic schema provides an answer to the need to both adapt and contemplate, that is, to include aspects of substance and scope both formal and content based.

Classical sociology of religion has opted for more of a substantive stance on religion, whereas modern sociology of religion has broadened its horizons to embrace a functional stance to the extent that it has lost sight of the reference point needed to identify the usual indicators of religious phenomena. Perhaps a less dichotomous solution, one which maintains the contents and does not exclude the objectives, might be considered more adequate for an approach to the research of religion and religions.

From their tasks, sociologists correctly should strive to: identify the religious actuality from within other aspects of social structures; distinguish possible varieties pointing out any connections or divergences; discover any formulations which share consensus as to what is definable as religion; and always bear in mind what is real and not be influenced by ideological and/or personal presuppositions.

Simmel (1997), in the beginnings of the twentieth century, defined the boundaries between the kind of religion which is founded on history and organized as a product of culture, and religiousness seen as an openness to being religious, experienced by the individual as an internal human experience and necessary requisite for a union with God. Equally similar, however affine, is the position put forth, almost coevally, by William James in his reflections on *Varieties of Religious Experience: A Study in Human Understanding* (1902), in which he outlines a fundamental distinction between institutional religion and personal religion. The first is characterized as being ritualistic, well established, corporative, exterior, regulative, theological, organized, and ecclesiastic; the second, however, is oriented more toward interiority, the conscience, sentiment, the non ritual, individuality, experience, the human dimension, mysticism, a direct rapport between souls, between humans and their creator, and lastly, communion from within and dialogue with the divine power.

It is debated whether it is worthwhile proceeding with an empirical analysis of religion when starting with a specific definition of religion in mind, or whether it is better to arrive at

postulating a definition only upon completion of the research. Actually, it is the same problem of having to choose between an approach which presupposes the existence of a preformulated theory with respect to field research and an option which allows the researcher to come up with elements useful in the construction of a theory only after having collected the data. Perhaps the most effective solution is that which sees an initial conceptualization of the theme in question in order to be guided (but avoiding any constraints), and which ought to "sensitize" (in the way proposed by Herbert Blumer). It might be preferable, then, to opt for definitions which are not too rigid, which are open and possibilistic with regard to the outcomes of any empirical work.

If behind a religion there is a history dating back centuries, if not millennia, it would be difficult to deny its status. Such a religion would be acknowledged and accepted to the point of there not being any hesitation to accredit it sociologically. Consequently, in the case of phenomena that clearly belong to a historically rooted religious context, their nature as a religion is therefore accepted beyond any doubt. Even those marginal, dissenting, and minor forms of the great religions of the contemporary world are to be counted as religious forms in their own right.

The problem becomes more complex when qualifying as religious or not those manifestations with no historical precedent and which diverge significantly from the more accredited and accepted religious systems. Obviously, no judgment of a theological or confessional nature can impede these being considered as religious if they exhibit aspects which are commonly accepted as particular to a religion.

Even so, as Émile Poulat sustains (in *Le Grand Atlas des Religions*, 1992), "being able to say what is or what is not religious is not an academic problem: it is a question of politics, a continually renewed social debate, and one which produces countless answers and is divided into two extremes: the theocratic regime and the atheist regime." Undoubtedly, defining that which is religious also assumes a political nature, though this does not solve the basic scientific problem of whether or not to at least produce broad boundaries of the *proprium* of religion. Such boundaries cannot have an

absolute or definitive meaning forever. In fact, religion is part of culture and therefore changes with it and the context in which it develops.

THE SOCIOLOGICAL CONCEPT OF RELIGION

A first criterion for defining religion is derived largely from a metaphysical, meta empirical reference, which recognizes from within some thing (a divine form or superior being with divine characteristics which cannot be subjected to rational or scientific proof) the origin and control of the fate of humankind. Such a criterion, as it stands, is not sufficient as there can be attitudes and behaviors which present themselves as religions though they are not inspired by a God and which find from within nature strength and ubiquitous and creative power equal to that of the divine. Furthermore, even without presupposing the presence of a God, one's existence can be lived in a religious and metaphysical manner by a commitment to oneself, to others in a spirit of profound alterity, and a commitment to the problems of humanity.

A second criterion could be constituted by beliefs and convictions, irrespective of how deep they might be, based largely on spiritual and not material content. A third criterion sees the significant contribution of rituals deeply inspired by faith, and surrender to a divinity or, at any rate, a supernatural being. In a fourth criterion it is possible to contemplate behavioral norms as dictated by a charismatic leader and by its followers and/or on the basis of a series of written texts and the observance of commandments. As a fifth criterion there are the various actions which denote subscribing to defined religious views professed in a clear manner. The personal effort in observing the major principles of a faith, in identifying the coherent religious orientation which should be lived out, more or less, as a basic point of reference and as an ethical principle: this is the sixth criterion.

Religion can be expressed on a level of emotions and feelings. This seventh criterion was widely developed in, and is the fruit of, recent research, both theoretical and empirical, and recalls specifically the new religious tendencies, the so called new religious movements, which are based on the peculiar emphasis of a subject's

aspect. In some cases, as with the eighth criterion, there is a reverential attitude with respect to the divinity and generally that which is sacred. The ninth, a qualifying criterion, is one where even principles, dogmas, and official teachings represent a significant corpus which cannot be disregarded. A tenth criterion is based on the observance of norms and rules considered fundamental and demanding much attention, so much so that oaths are made with respect to these rules.

As can easily be concluded from this simple list of criteria, it is in no way possible to disregard – in the abstract – specific cultural situations. The idea of *religare*, that is, of maintaining a link, is about obligation toward laws, traditions, praxis, but also toward belonging, content of faith, and confessional orientation. At the same time, it can mean belief in God but also rendering service to God.

There still remains a principle for which none of the above criteria completely satisfies the requisites for recognizing something in terms of religion. Otherwise stated, for a group, organization, or movement, it is not necessary to have a precise concept of God, nor to take part in any rites, nor observe dogmas of faith, and not even to respect ethical norms.

The sociolinguistic weight of the term religion should not be forgotten: it originates from the defined framework of the Latin language but it can be applied indiscriminately to every kind of ethnicity. The relationship with the divine, the holy, is undoubtedly a widely accepted notion and has the intent of attributing the characteristics of religion to a specific social phenomenon. It should be noted that its origins are also a limitation: its beginnings and its christianocentric disposition have ideological repercussions which privilege the existence of God, the belief in an immortal soul, and the existence of a universal ethic – prime indicators of a religious fact. If adding to the natural, almost spontaneous characteristics of a religion the preponderant weight of a supernatural religion revealed by God, any scientific activity would be hindered and forced to stop before prerequisites that are loaded with mystery, filled with unfathomable, divine will, and which can not be subjected to any attempt at corroboration through information gathered in fieldwork.

If talking of natural religion as the result of an action of human reason, it belongs more to the realm of theology than that of sociology, even if Hume (fundamentally a deist) is credited with extracting religion from the control of religious institutions, favoring a less conditioned approach.

Unlike the philosophy of religion, the sociology of religion does not attempt to seek out the essence of religion, it does not question whether a spirit exists or not, nor does it assess the justness of any religious aspirations; it simply records its effects in a social context. Moreover, this does not imply that sociology need espouse the idea of necessary atheism, nor that a direct and operational involvement of a religiously militant nature is desirable. It can also be said to be true for any forced choice which is agnostic, indifferent, areligious, as if it were the unavoidable condition necessary to carry out scientific research on religious phenomena. However, any other option would give rise to atheistic religion which is not at all mandatory for scientific research inasmuch as it would lead to the idea of a slide of the unknowability of the divine absolute toward the unknowability of a religious fact purely because it is linked to the divine. Schleiermacher sustained, philosophically, the feasibility of a religion without a God.

But it was another philosopher, Henri Louis Bergson, who, in his work *Two Sources of Morals and Religion* (1932), favored a distinction between static religion and dynamic religion. The former was considered a reduced historical version of the view regarding the survival instinct humans opt for in order to solve the problem of death by inventing divine figures, with a human likeness, and which serve as tutelary deities. The latter, on the other hand, was regarded as not being the work of humans but of God, where humans enter the realm of God in a mysterious way, and allow themselves to be led by their God toward forms of institution and dogma. The characteristics of static religion are more human, earthly, and natural, whereas those of dynamic religion are more metaphysical, superterrestrial, and divine. Bergson is far from the idea of humankind's concerns about the numinous. For him, humans are directed toward a God who is far more than human inasmuch as it is a mysterious superior being,

majestic, irascible, *tremendum* (frightening), and *fascinans* (enchanting).

Indeed, little do these philosophical perspectives influence sociological thought, which tends not to subscribe to a transcendental explanation, does not question objective truth, and excludes itself from any salvific implication of religious activity. That which truly interests sociology is the socioreligious activity humans are involved in within their community and society. Needless to say, a sociological definition of religion cannot be restricted or limiting. It does, however, open itself to every possible aspect within the variety of phenomena that can be identified empirically. It is because of this that it is deeply interconnected with many other forms of social experience, ranging from family to economic life, from political choices to moral choices, from ideology to the meaning of symbols, and from art to technology.

The starting point, hence, is that a sociological definition of religion should be an observation which brings about a necessarily comparative approach between similar religious systems in different societies. This is possible by perhaps identifying connotations which corroborate the idea of a natural religion that is more human than divine in its origins, divided and channeled into different eras and into different societies. In the second half of the nineteenth century, Max Müller pointed out, and not by chance, that the Indo European roots of religion go back as far as the Vedas traditions, and date back even further than the beginnings of Hinduism. He emphasized how the personification of gods was the result of the human tendency to anthropomorphize every phenomenon. Tylor (1871) followed the same line of thinking, stating that the religions of the so called primitive peoples created the roots for every expression of religion that followed, which moved toward animism, then polytheism, and finally monotheism.

Monotheism, in its contemporary forms, bases itself on unicity and the truth of a single God. It offers an opportunity to so called rational choice (or the "new paradigm," tied to Peter Berger's idea of the religious market), applied to the economic model in order to prove that the "one true God" theory works convincingly in the context of the religious market. This happens because it is privileged by the

"exclusive exchange relationship" accompanied by a kind of lifetime guarantee. Hence, the only true God is to be seen as a successful product also because it is a common affair related to groups. But such a point of view necessarily presupposes a supernatural dimension, and this, inevitably, is not applicable to all religions in their manifestations.

In addition, the one, true, convincing explanation would exclude other evidence: religion is able to explain but it also mystifies; it creates peace but also conflict; it consoles and strikes fear; it is governed by an elite few but practiced largely by the masses (this is the point from which the continual contrast between official and popular religion stems). This is not to mention the continuing dialectic between religion and culture, which shapes the attitudes and behavior of social actors.

After all, the two prevailing perspectives are those which compare religion to a relationship between human subjects and a divine being or, contrarily, which insist that the religious dimension is an "earthly" social construct created by social actors in response to needs which are by no means metaphysical but totally human.

From magic to pre animism, from animism to totemism, from fetishism to polytheism, and from mythology to monotheism, the religious processes are many, overlapping, and not necessarily linear or evolutionary, but in general they produce beliefs, rites, symbols, and institutions. The formations which come as a result appear so distinct from one another that every sociologist of religion attempts to give a personal definition of the contents and forms of religion. The result, however, is almost always incomplete, vague, or circumscribed. Therefore a sociological definition of religion is, at most, applicable to a limited context and to a short time frame.

From Kant's social morality to the conception of the universe as seen by Hegel, to the emotions referred to by Schleiermacher, and to the search for security analyzed by Fromm, religion nevertheless constitutes a desire in one way directed to the divine, and yet in another it is addressed to humankind and sometimes toward both. For this reason, one of the most convincing definitions appears to be Geertz's (1973), which explains religion as a system of symbols that provide humankind with an ongoing, realistic, and factual justification through concepts

pertaining to a general order of existence. This final attempt at a definition put forth by Geertz seems to end the diatribe between substantive and functional definitions and that between restrictive and more open perspectives.

Peter Beyer (2001) also searched for a solution by proposing an ideal typical typology (and therefore not empirically verifiable) organized into three meanings: analytical, theological, and popular/official. He rightly observed that the formation and development of some religions (such as Christianity, Judaism, Islam, Sikhism, Buddhism, and Hinduism) are clearer and more noticeable than others (such as Taoism, Shintoism, and Confucianism), although they all share an unquestionable social concreteness. The analytical approach strives to discover similar institutions and attributes in the various religions even when they belong to different periods in history. This approach therefore attempts to identify universal elements in all societies but cannot exclude the fact that there are other forms of religion which do not have such aspects in common. On the other hand, the theological approach, which concerns a universal ontological truth, postulates something which in itself escapes empirical observation in that it deals with a metaphysical reality, but this does not hinder the existence of different kinds of knowledge and forms of communication. Finally, it appears to be quite similar to the religious model within the popular/official views of religion, given these views are not characterized by universality but by what the members of a religious movement or religious organization ask to be considered as religion. In other terms, it deals with a specific form of religion which has its own distinctive institutional traits as well as a series of human experiences. It is no coincidence, then, that religion is a personal affair, which is practiced in groups, but often it is done so independently compared to organized religious manifestations (as proved by pilgrimages or large gatherings, communal liturgies, or local or domestic religiousness).

The different degrees of religiousness, that is, the amount of fervor and commitment in a religion, depend on historical and personal factors which, sociologically, are not easily identifiable and interpretable, for the following reasons: the vast extent of possible religious manifestations; sociocultural influences; economic, political,

and ideological relationships; and emotional, sentimental, and psychological interaction. This web of interferences and relationships does not allow for an aprioristic definition of religion, but nevertheless – as Assad (1993) notes – “there cannot be a universal definition of religion, not only because its constituent elements and relationships are historically specific, but because that definition is itself the historical product of discursive processes.”

On the other hand, Talcott Parsons has seen a number of answers in religion: an answer to humanity's desires (in the sense of salvation versus suffering), to the need for values (in the sense of justice versus injustice), to the affirmation of ideas (truth versus fallacy).

One of the most accredited Chinese scholars of religion, Lü (1998), is of a very different opinion, stating that “religion is a kind of social consciousness regarding superhuman and supernatural forces, and its consequent believing and worshipping behaviors toward such forces; it is the normalized and institutionalized social cultural system that synthesizes this consciousness and the behaviors.” Lü's definition, coming from a non western sociocultural framework, is worthy of particular attention also “for its scientific nature and liberating effect” in an environment, such as China's, which until fairly recently did not favor the development of scientific study of religion (Yang 2004).

Not so easy is that sphere which includes religions and para religions or quasi religions, those which include therapies, systems for healing the body, diets, martial arts, methods of self help, sports, and many more phenomena which describe themselves as religious and which may share some of the characteristics typical of a religion. A distinction can be made between para religion and quasi religion. Para religion possesses some religious features and thus resembles a religion (without giving itself that definition). A quasi religion only barely manifests any affinity with religion. The real problem is not whether to establish what share of religion is present in these phenomenologies, but to ascertain whether any relationships have been established with the entire belief system (including religious beliefs) that each individual controls and manifests.

The variability of religion does not allow for steel cages, peremptory definitions, or inescapable

criteria: "far from being a fixed or unitary phenomenon, religion is a social construct that varies in meaning across time and place" (Beckford 2003). A formulation such as "a patterning of social relationships around a belief in supernatural powers, creating ethical considerations" (Gustafson & Swatos 1990: 10) might be considered efficient: it is synthetic and allows for a great number of scholars from every cultural and intellectual background to share its content. In this case as well, it is also obviously necessary to avoid unfounded empirical absolutes. Intrinsic to this definition is the suggestion not to confuse religion with faith (an individual issue) or morals. In addition, the supernatural is distinct from the transcendent in that the former may possess a characteristic which could be also immanent (in nature, for instance, as strength or as entity), whereas the latter refers to a God. Indeed, religion has a characteristic indicative of action. It possesses its own conceptual vocabulary common to all those who belong; it further more involves subjective experiences which may or may not be extensive or intense. It is clear that no firm, dogmatic definition can be given to religion because of the extreme variability of its manifestations. These can be evaluated and interpreted taking into account the definition of a situation as given by the social actors. In short, a possible operative definition should be "grounded," that is, based on data. A possible starting point for such a definition may even make use of a "sensitizing" (Blumer) characteristic in order to approach the actor's point of view.

The procedure with which a definition of religion is constructed begins with the collection of empirical data, some indicative concepts are put forth, and then strategies for research are established. Accordingly, it would be preferable to have the individual express its orientation. By so doing, both pure descriptivism and theoretical prospectivism can be avoided. And so the researcher operates within the framework arranged contemporarily by the social actors, who create their religion, hence their experiences of religion, and by the sociologist, who constructs her analytical points of view in order to make her observations of religion and religions. There is, in effect, a return of the social actor to the field of religion. The actor is no longer governed by confessional concepts or

concepts that may be irrelevant to the object of scientific research. Both concepts are destined generally to cancel out the social individual's point of view. Also, in order to avoid any impediments and misinterpretations, it is useful for the sociologist of religion to declare explicitly not only personal religious tendencies, but also basic values, choices of behavior, and underlying attitudes.

Within many sociological definitions of religion there is a significant amount of overinterpretation, that is, interpretation that disregards the facts. On the other hand, self definition given by social actors is not the only possible point of reference in that it should be compared with other definitions put forward by other subjects and within different contexts and with different emphases. The task of the sociologist, then, is to scientifically coordinate and recompose the different concepts observed.

To this it is possible to add as a fundamental premise the careful and thorough study of practice, and the value influences which guide it. The most difficult question to solve concerns the distinction (if any) between belief and experience. Nevertheless, it should be taken into account that there are ways of interpreting religion without referring to either: belief without experience and experience without belief, or as Davie (1990) put it, "believing without belonging," or contrarily, "belonging or experiencing without believing."

At this point it should be clear that sociological analysis of religion does not aim to confirm the plausibility of what is metaphysical, transcendent, or supernatural, but rather how men and women of the contemporary world live their personal and social experience of religion. According to his scientific solution, Beckford (2003) suggests experimenting with a socioconstructionist approach to religion, thus tending to analyze "the ways in which human beings express what they regard as religious ideas and sentiments in social and cultural forms," independent of whether or not religion is a socioanthropological need to be gratified in order to solve existential problems (according to Luhmann's indetermination reduction, or Berger and Luckmann's social construction of meaning). Hence, definitions of religion which appeal to common sense would be of little use; indeed, it would be more effective to observe the processes of

the social construction of religion as they happen. If not, any attempts to define what religion is would be destined to fail because they would find no adequate scientific consensus. Nonetheless, typological attempts should be made, with the intent of at least being indicative, sensitizing, and creating awareness. After all, the field is not entirely empty, much has already been sown, while some areas left fallow, it has yielded good fruit, and, with the fertility of cumulative knowledge, research can then begin with an essential point of reference in mind. So, for religion, the following approaches to research can be considered, either separately or combined with other approaches, according to the logic dictated by the individual's experience and chosen method of analysis.

First, religion is composed of interpersonal experiences with other humans and/or with one or more divinities. Such relations are made up principally of convictions (beliefs), sentiments (emotions), principles (values), and practice (rituals, i.e., cultural acts and also actions, whether they occur daily or on specific occasions), all of which are more or less coherently interconnected. The subject's freedom to be unpredictable produces unexpected events as well as one off conjunctions. In the meantime, however, the traditions of historically recognized religions continue to reaffirm their most significant features through notions, precepts, ceremonies, and according to the circumstances of the time and their environment. What does not pertain to sociological research are the questions of whether or not God exists, the immortality of the soul, the cycle of reincarnation, rewarded or sanctioned behavior, life beyond death, or divine revelation to humanity, but each of these elements can be used as a qualifier for whatever religion and can therefore be part of a defining framework (accurately contextualized) although not subject to empirical proof. It goes without saying that none of the religions appears to be a religion par excellence, thus removing any doubt from the use of the wording sociology of religion rather than sociology of religions.

Second, religion is expressed as a connection with the divinity, which gives humans unity, in the universal sense, by means of devotion toward a God, and the respect due to it. Moreover, the object of such veneration becomes sacred, something significantly different,

untouchable, and superior; and great care is taken to observe with deference and reverence every correct rule and praxis according to pre-established precepts.

Third, religion is the manifestation of profound belief; it is professing one's faith; it is not necessarily critical, compared with those concepts of life which have a feature that is cogent and paradigmatic, and accepted almost unconditionally. Faith is expressed indeed by entrusting the values one considers fundamental and unfaltering, and these preside over almost all decisions, however small.

Fourth, religion is fervor, dedication, ongoing practice, devout behavior, and piety; it is religiousness outwardly expressed through recollection, repentance, meditation, reflection, and silence.

These distinctive features of religion are simply a dialogic and open path to be used as a guide for theoretical and empirical research, and not further tokens to add to the great cemetery of definitions of religion.

religion, sociology of

Michele Dillon

The sociology of religion is a core component of the discipline, having a critical place in the classical theorizing of Max Weber and Émile Durkheim and comprising one of the more researched areas of interest among contemporary sociologists (for an introduction to sociological theory and religion, see Cipriani 2000). The sociology of religion is concerned with the multiplicity of ways in which religion is part of human society and thus it focuses on its institutional, cultural, and individual expression across varying social, geographical, and historical contexts. A common typology is to differentiate between substantive and functional approaches to studying religion. The former is concerned with the symbolic contents or meanings contained within a religious worldview and the latter with religion's purposes or functions in society. Following Weber's (1958) analysis of

the doctrinal tenets of the Calvinist ethic, substantive approaches focus on delineating particular religious beliefs, defined in terms of concerns about transcendence and other worldly salvation, and how these beliefs are understood and give meaning to everyday life.

Functionalist definitions, by contrast, give attention to the social implications of religious belief and behavior. Following Durkheim's (1976) analysis of how religious affiliation and commitment serve purposes of social integration and belonging, there is a long tradition in sociology of not paying too much attention to the doctrinal content of belief and its associated meanings, but to how such beliefs impact other aspects of social life ranging from national identity to political, health, and sexual behavior. Unlike for Weber, the content of religion is seen in substantially broader terms and this too follows from Durkheim's definition of what constitutes "sacred things": any things so defined by society or by particular communities, whether they be Episcopalians, Buddhists, pagans, yoga practitioners, or fans of a particular sports team. Clearly, how broadly or narrowly one defines religion matters to the sorts of theoretical questions and research projects sociologists of religion deem relevant.

In practice, however, drawing too sharp a line between substantive and functional definitions of religion runs the risk of missing out on the multifaceted ways in which religion seeps through everyday life. As indeed Weber elaborated, Calvinists' beliefs were instrumental – or functional – to the development of capitalism, and as intimated by Durkheim (in *Suicide*), the content of doctrinal tradition differentiated levels of social integration; although Catholicism and Protestantism were equally opposed to suicide, Catholics were less likely than Protestants to commit suicide, a fact that Durkheim traced to the greater emphasis on social ties emanating from Catholic doctrine as reflected in its structures (e.g., the mediating sacramental role of the priest).

INTELLECTUAL AND SOCIAL CONTEXT

The directions taken by the sociology of religion reflect both the intellectual context in

which the discipline of sociology itself emerged, as well as differences in the national contexts in which sociologists have studied religion. Because sociology grew out of the Enlightenment it took on many of its philosophical assumptions and values. Most specifically, although the Founding Fathers rejected Enlightenment thinkers' emphasis on man as the primary unit of society in favor of a perspective that emphasized the individual's relationality to other people as well as to history and social processes (e.g., capitalism) and institutions, they embraced the Enlightenment values of rationality and scientific method. One consequence of the Enlightenment – and of sociology's scientism – was that it regarded religion as crystallizing the nonrational elements in society and thus delegitimated it as a domain of knowledge and of experience. This had two important and interrelated consequences for the study of religion. One, it led to an elitist and dismissive attitude toward the relevance of religion, a view that regarded religion as the vestige of pre Enlightenment times: a coercive, anti democratic, and hierarchical force that fostered inequality and unenlightened ways of being.

Second, it nurtured the view that even if religion persists as an individual or social phenomenon, it is not a domain of knowledge that is accessible to scientific investigation. Sociology was not alone in cultivating this view; while some cultural anthropologists paid attention to religion as part of their interest in primitive or traditional societies, psychology essentially ignored the place of religious belief in child and adult development, personality, and psychological functioning. In essence, the thesis of religion's inaccessibility to scientific investigation argues that because the existence of God cannot be ascertained, therefore it is of little use for social scientists to dabble in the study of any thing pertaining to religion and that those who do so must surely have a regressive ideological or dogmatic bias. Clearly, this is a remarkably blinkered view of both social science and of religion. While it is generally a good thing for a social scientist, as indeed for the ordinary citizen, to bring a "hermeneutic of suspicion" to what counts as knowledge, expertise, or common sense in society, this hermeneutic should not be directed a priori toward sociologists studying religion as opposed to some other topic.

Religious belief is about belief in a transcendent presence that cannot be verified, but the essence of a lot of the phenomena that sociologists study is equally invisible. Longstanding scholarly debates about how social class can be reliably measured, or how micro–macro linkages should be assessed, point to the complexity of the sociological task as a whole. The sociology of religion is not interested in speculating about or studying the existence of God. It is concerned, rather, with how individuals, social institutions, and cultures construe God or the sacred (following Weber), how these ideas penetrate public culture and individual lives, and with the implications of these interpretations for individual, institutional, and societal processes. Thus, similar to their peers who specialize in other areas of the discipline, sociologists of religion develop conceptually and methodologically valid indicators that they use to investigate theoretically informed questions about religion's meaning and place in society. Standardized indicators include finely differentiated measures of religious affiliation and beliefs, frequency of church attendance, private prayer and religious reading, the self-perceived importance of religion in an individual's life, and personal images of God. A reliable and fairly comprehensive selection of questions is asked in the General Social Survey (GSS), an annual cumulative survey conducted since 1972 by the National Opinion Research Center at the University of Chicago; other useful resources are survey data gathered by the International Social Survey Program (archived at the Zentralarchiv, University of Cologne) and by the Gallup and Pew polling organizations.

At a broad level of generality, the research undertaken by sociologists of religion has been shaped by the societal contexts of the researchers. Specifically, there is a discernible difference in the kinds of overarching questions that have informed European in contrast to American sociology of religion. Reflecting their very different national histories as well as the Enlightenment concern with church–state alliances, European researchers have paid a lot of attention to examining the intricacies of church–state institutional relations and how these impact national cultures and laws and public policies. In the American context, by contrast, with its very different history – religious pluralism and

its associated emphases on religious freedom and voluntarism – much attention has been given to investigating the institutional and cultural dynamics of denominationalism, a defining characteristic of American society (e.g., Herberg 1955).

Another way in which the influence of social context is apparent is in the greater tendency of Europeans to apply a critical neo-Marxist perspective in their analyses of religion (a concern, for example, with the hegemony of the church in society), whereas American scholars reflecting on a very different societal context (of denominationalism and ethnic and religious pluralism) and more strongly influenced by Parsonian functionalism than neo-Marxism, discuss the culturally unifying possibilities and implications of a civil religion – how a nation's founding values and ideals are sacralized in political and public discourse (e.g., Bellah 1967). In sum, scholarly work in the sociology of religion, as is true of all knowledge, is contingent on the particular social and historical context in which it is conducted and the attendant prioritization of research topics and questions is related to the realities of the sociologists' social and institutional environment (e.g., Davie 2003).

SECULARIZATION AND RATIONAL CHOICE THEORY

A dominant theme in the sociology of religion and vigorously engaged by scholars on both sides of the Atlantic is secularization. The term is conceptualized differently by various scholars (for an extensive review, see Tschannen 1991), but for the most part refers to the constellation of historical and social processes that allegedly bring about the declining significance of religious belief and authority across private and public life. The secularization thesis has its roots in the writings of both Weber and Durkheim. Weber predicted that the increased rationalization of society – bureaucratization, scientific and technical progress, and the expanding pervasiveness of instrumental reason in all domains of everyday life – would substantively attenuate the scope of religion, both through the specialization of institutional spheres (of family, economy, law, politics) and as a result of disenchantment in the face of competing

rationalized value spheres (e.g., science). Durkheim, although a strong proponent of the centrality of the sacred to society, nonetheless predicted that the integrative functions performed by church religion in traditional societies would increasingly in modern societies be displaced by the emergence of differentiated professional and scientific membership communities.

The secularization thesis, especially its Weberian understanding, was highly influential in the paradigm of social change articulated by Talcott Parsons and subsequently by modernization theorists in the 1960s who theorized religion's loss of institutional and cultural authority. Most notably, in Peter Berger's (1967) language, religion would lose plausibility and its power as an integrative sacred canopy, or as argued by Thomas Luckmann (1967), become socially invisible. The modernization secularization thesis was widely accepted by western sociologists and though there were some exceptions (e.g., Greeley 1972; Martin 1978), many assumed *a priori* that religion had lost its significance in modern societies despite the ongoing empirical evidence that secularization was not as all encompassing as theorized by its proponents. Various societal factors (e.g., the increased public visibility of religious social movements, such as the Moral Majority in the United States, Solidarity in Poland, and the religious roots of the Iranian Revolution), intradisciplinary theoretical challenges to modernization theory, and greater scholarly attentiveness to the critical importance of nonrational sources of meaning and authority in everyday life (including religion, emotion, and tradition), converged in the late 1970s and has resulted in a more complex and nuanced sociological assessment of secularization.

Contributing to this paradigm reassessment, the application of rational choice theory to religion has resulted in an intense debate about the ways in which competitive religious environments (religious economies) produce religious vitality and church growth (e.g., Finke & Stark 2005). This approach rejects the assumptions of secularization theory as being more appropriate for the historically monopolized religious markets found in Europe, but at odds with the American context of religious pluralism (cf. Warner 1993). In view of the cumulative body of empirical knowledge that exists on religion,

secularization should be understood in terms of a balance between extensive empirical evidence in favor of the continuing sociological significance of religion in the public domain and in individual lives, and the coexistence of these trends with equally valid empirical evidence indicating selectivity in, and reflexivity toward, the acceptance of religion's theological, moral, and political authority. Both sets of trends must necessarily be interpreted with a cautious and differentiated understanding of the nature and place of religion in earlier historical eras and across diverse social contexts, and with greater attentiveness to how the contextual meanings of religion and of religious belief, affiliation, and commitment change over time (Gorski 2003; Hout & Fischer 2002).

CONTEMPORARY RESEARCH

Much of the contemporary research on religion documents the complexity and multidimensionality of religion as it is lived out across diverse contexts (see the contributions to Dillon 2003). Many studies document trends in the continuing significance of religious beliefs and practices, especially in the US (e.g., Greeley & Hout 1999), but also in Europe (e.g., Davie 2000), where the institutional presence of churches is weaker (with the exception of Ireland) than in the United States. It is also apparent that the symbolic vestiges of religion matter even in countries where various indicators would suggest a comparatively greater deinstitutionalization of religion (e.g., Quebec, Italy). Many individuals still value the presence of church rituals in marking significant life transitions (e.g., marriage, death), and participate in pilgrimages and other forms of religious tourism and consumption (e.g., the popularity of Christian rock music and religious theme books and movies), while not necessarily adhering to a denominational identity or to any specific doctrinal teachings.

The cultural hold of religion is also documented in research on the increased prominence of global religious movements (e.g., Pentecostalism, Islam), the continuing attraction of participation in (socially marginalized) New Religious Movements, the increased political legitimacy of faith based social movements, the

significant impact of religion on individual voting behavior independent of other social factors (e.g., ethnicity, social class), and in shaping public policy debates. In many western countries, religiously derived values frame the prioritization of activism on particular issues (e.g., abortion, gay rights, stem cell research) and how they are debated in the public sphere. In some countries, debate centers on the extent to which religious heritage should be formally acknowledged (e.g., the recent European Union debate about its new constitution) and given visibility in institutional settings (e.g., the debate in France about the wearing of Islamic veils and other religious icons in schools).

Much research engages diverse theoretical questions in sociology to address the complexity of religious identity and particular attention has been given to investigating the multifaceted role played by religion in mediating the assimilation patterns of transnational immigrants (Ebaugh & Chafetz 2000). Relatedly, a lot of current research focuses on congregations (local churches/parishes) and the varying impact of this core social unit in building social networks, mediating political activism, and enriching the everyday lives of members (e.g., Ammerman 2005; Chaves 2004). There is also a rapidly expanding body of research documenting the relations between religious behavior and various aspects of social and psychosocial functioning, including social support and physical and mental health (e.g., Ellison & Levin 1998). This research tends to show that there is an overall positive relation between religion and health and social functioning, though the precise mechanisms involved and their life course patterns are still relatively underdeveloped areas of inquiry.

One of the newer areas of study is the attempt to understand the nature of deinstitutionalized religious practices, customarily referred to as spiritual seeking (e.g., Roof 1999; Wuthnow 1998). While there is concern among some sociologists that spiritual seeking may undercut individuals' commitment to others (long a staple of church involvement), longitudinal studies spanning life course and cultural changes suggest that traditional religious participation and newer spiritual practices provide individuals with different but equally positive ways of

carving socially engaged lives (Dillon & Wink 2006).

The overarching methodological challenge in studying religion involves the ongoing monitoring of the validity of existing measures of religious behavior across all levels of analysis (individual, institutional, and societal). In view of the dynamic interplay between religion and society, and the way that changing sociohistorical and cultural contexts impact how religion is construed and practiced, it is important to have conceptually and empirically sound measures that can apprehend the presence and significance of the full range and multidimensionality of public and private religious activity that may characterize a given context. This approach should be sufficiently sociological so that it enables attention to the substantive content of religious spiritual belief, as well as to the mechanisms of how different aspects of religion impact social outcomes (e.g., voting, health, concern for others, violence), while also being sensitive to the comparative geographical and historical breadth necessary to evaluating secularization/religious vitality theses.

At the same time, however, the theoretical challenge is to move beyond the lens clamped on scholarly inquiry by the intellectual legacy of the secularization frame. In this regard it would be fruitful if systematic meta theoretical analyses could result in theoretical generalizations that would point to the micro macro social conditions and contexts in which different types of religious behavior and social outcomes could be identified. More broadly, contemporary sociological theorists (with the exception of Pierre Bourdieu) give little attention to the continuing significance or complexity of religion. Consequently, a challenge for sociologists of religion is to show persuasively that an understanding of a society's religious practices must necessarily be part of any theory that seeks to have relevant explanatory power in today's global, multicultural, risk society.

religions, African

Bernardo Bernardi

African religions are based on oral cultures. They represent the old tradition surviving within a context deeply influenced by monotheistic religions, mainly Christianity and Islam, not only through their various denominations but also by supporting the attack of modern secularism.

To propose a definition of religion with reference to the oral African cultures is no easy matter. Within those cultures, religion does not exist as a distinct domain. Indeed, it is part and parcel of normal culture, i.e., the mode of life implying both the ideological perception of the world and a practical kind of social organization. In such situations, religion possesses a denomination of its own, but it may be only conceived as that particular aspect of any culture including beliefs and rituals. In such a perspective, it would be possible to describe religion as that part of culture, or of social life, connected with beliefs and rituals.

Field research, in direct contact with the people, is the only method that can afford the possibility of obtaining reliable information on the theoretical ideas and the actual practices of the local people. As is known, such a method implies a fluent knowledge of the local languages and dialects so as to allow for an intense observation of people's behavior and personal participation in their mode of life. Cosmological ideas are fundamental, but in order to acquire a proper knowledge of their content, patience and time are required so as to gain the confidence and trust of local people. Every informant is to be

trusted, but in order to gain an acceptable degree of reliability, several other informants are to be approached in order to compare the information received. Field research is considered to be the initiation into the anthropological profession. In other words, it demands a previous theoretical apprenticeship and subsequent practical experience in the field. Such a method is required for every aspect of human culture, but when religion is the matter of research a deeper attention is certainly required, since it involves not merely external ritual practices but intimate and personal involvement as well.

The idea of a divinity, i.e., of some being above nature upon whom life and death are thought to depend, constitutes a common element of religious belief. However, there is no homogeneity in this kind of belief. Normally it is conceived in terms of each mode of livelihood. In order to describe the variety of such a concept, the term *theism* will be used in its ethnological sense. According to this view, it is possible to distinguish a sylvestre theism, a pastoral theism, and an agrarian theism.

Sylvestre theism. This may be better explained by reference to the Bambuti Pygmies of the Ituri forest, who have been studied by Paul Schbesta and Colin Turnbull. The forest is also symbolically conceived by the Bambuti in its global entirety as their protector. If anything goes wrong, if a child is sick or game is scarce, or whether any other malaise occurs, it is a sign that the forest has been offended and is displeased, and therefore the forest must be placated. The *molimo* ritual is then performed in the silence of night, by playing a bamboo flute, normally kept in running water.

Pastoral theism. Shepherds are nomads who, following their herds, take an interest in observing the sky. Not only do they consider the sky as the abode of God, but they identify it with God himself; they even do so with regard to certain atmospheric phenomena. Thus, for the Oromo of Southern Ethiopia, *maq*, the sky, is also *Waq*, God. For the Masai of Kenya and Tanzania, *en kai*, the rain, is also God, *En Kai*. For them, clouds are regarded as a manifestation of God. Thus, black clouds, heavy with rain, a blessing for the pastures, are a symbol of God's bounty; white clouds, which do not produce rain, are regarded as a sign of God's anger;

thunder and lightning are interpreted as a sign of some of God's displeasure.

Pastoral people practice collective kinds of rituals. They gather together, when they need to pray, asking for God's blessing for their children and their cattle as well as for their pastures. The headman or the oldest elder takes the lead. Whilst everyone else in the congregation takes a crouching position, the headman stands up and he leads the prayers, to which the entire assembly responds in one voice, in a mystic atmosphere, *En Kai ai*, my God.

Agrarian theism. Agriculture is the main trait of the Bantu peoples. The Bantu are primarily distinguished as a linguistic family; while they are organized in a variety of social and political systems, they all practice agriculture as their form of livelihood. From the religious point of view, their idea of God is strongly related to creation.

However, it is commonly believed that, after completing creation, God somehow retired, ceasing to take an interest in creatures. As a consequence, he has been defined as a *Deus otiosus*. God's names are normally connected to the idea of creation: *Mungu*, *Mulungu*, *Mumbi*, *Nzambi*, and so forth. Théophile Obenga, a Congolese scholar, has defined Mulungu as an Engineer God.

The idea of *Deus otiosus* is related to the preponderant cult of the ancestors. Ancestors are normally defined as *the living dead*, because they take an interest in their descendants. Every kind of malaise is attributed to their influence, and therefore ancestors are most frequently prayed to. But the main reason that may offend the ancestor is anger or even hatred among relatives and their descendants. How may the latter expect the ancestors' protection if the latter are offended by their behavior? Casting out anger is a necessary presupposition before invoking the ancestors' aid. Notwithstanding the extension of the ancestors' cult, too much emphasis, perhaps, has been given to the idea of God's otioseness. There are times, in fact, especially during severe social crises, when the ancestors are prayed to join with their descendants in prayers to God, for the situation is such that only God's help will be effective.

In the face of mounting secularism, the question "why religion?" is to the point. The first answer that comes to mind recalls the fact that

every religion is essentially therapeutic. Peace of mind is the deepest effect of proper religious practice. But the curing of the body may also be important. If properly conceived and properly practiced, religion may produce an equilibrium of forces, or in case of disease it may give support and even acceptance of a state of suffering. Finally, religion may be a source of inspiration for every aspect of human life. Personal education may be inspired by religion, public life might be sustained by religious inspiration. It is true that, in the past, religious wars for centuries stressed different states' relations. Even today the effects of religious fundamentalism, a phenomenon entirely opposed to religious ideals, are felt.

religious cults

Giuseppe Giordan

The cult is intended to be the concrete form through which man expresses his veneration for a superhuman entity or force whom he believes superior and deems worthy of honor and devotion. With this term, one usually makes a reference to the relationship of dependence and adoration between man and the divine, be it a personal entity, a force of nature, or an ancestor's spirit. The cult therefore is placed in the

center of every religion and carries across the ritual behaviors, which are usually presided over by a special individual believed to be particularly competent for the job: he can be a priest, a wizard, a shaman, or even a member of the group who is believed to be in possession of special gifts.

It is interesting to note, especially for the consequences within the fields of the social sciences in general and of sociology in particular, that the term *cult* shares the same Latin root as the term *culture*: the recognition of man's dependence upon the divine, which he expresses in acts of adoration, supplication, and thanksgiving, forms, develops, and is an expression of different social and cultural contexts. It is precisely the different cultures that create and give meaning to the various ways of structuring the time and space of the cult, hence establishing which cult actions are most appropriate, which times are most opportune to celebrate the feasts, and which significant places to erect temples. The expression of the cult therefore depends upon the conception of man and the deity typical of each social and cultural system; the mutual dependence and penetration of a cult and culture not only allows for mutation of the cult in correspondence of the different historical moments, but also highlights how the expressive forms of a given culture, both at a semantic and symbolic level, give the essential frame of reference to elaborate the cult's actions. In this way a circular process is created, on one hand linking the cult to the expressive forms of a concrete social and cultural context, and on the other underlining how the different forms of a cult influence the development of the social and political life of society.

The semantic passage from religious cult to religious cults testifies to just such a deep bond between religion and the evolution of a social and cultural context in which it is inserted. The expression religious cults tries to describe certain aspects of contemporary beliefs, characterized by the relative loss of influence of traditional religious institutions, which according to Michel (1994) lose the monopoly of meaning, and by the progressive liberty of the subject in building his own itineraries of meaning in a syncretic manner, according to the logic of the *bricolage*.

THE CULT IN THE SOCIAL SCIENCES

The notion of cult has always been at the center of scientific studies of religion, both in an anthropologic and ethnographic setting, as even within sociology its use has often been the source of disputes, especially regarding its relationship, and at times its opposition, to the concept of rites. For some exponents of the historical cultural school, such as Robert Will and Sigmund Olaf Plytt Mowinckel, the cult represents the clearest manifestation of the religious experience, and as opposed to the magical experience that results in rites: if religion manifests man's acceptance of a radical dependence on the divine, magic is man's attempt to control and dominate superhuman forces. Gerardus Van der Leeuw, from a phenomenological point of view, goes beyond the opposition cult religion and rite magic, introducing an equilibrium, represented by the cult, between the human dimension and that of the divine. With Adolf Jensen the superimposition and the identification of the two terms can be seen: the cult and the rite coincide in ritual actions, which are defined as the renovation of a myth of foundation through the experience of being taken by the primordial strength that gives the basis of existence to human culture.

For Durkheim (1965), the cult represented the traditions and the social conditions of a community: the subject of the cult is always the community, and therefore not the individual who finds in the cult the concrete manifestation of his aspirations and religious intentions. Durkheim defines the cult as a system of rites, and differentiates it from the latter because, on top of being a collective experience, it is systematic and stable, while the rite can be individualistic and sporadic, not bound to periodic events of life, such as birth, marriage, or death. According to Durkheim, the peculiarity of religious phenomena resides, other than in their explicit or implicit obligatory aspect, in relation to particular representations that make reference to the sacred, which are nothing more than an allegory of society itself: it is the social world that reproduces the actual symbols, imposing them upon the individual conscience through actions of the cult, which unify the strength of religious beliefs, especially reviving social structures, strengthening the social bond between its members.

The notion of the cult, in anthropology as much as in ethnology and sociology, is strictly connected to the concept of symbol and of belief. According to the intellectualism of E. B. Tylor, magical and religious beliefs are theories which, introducing explanations based on supernatural elements, overcome the limits of empirical explanations offered by observation and common sense. From this perspective, religious beliefs are the intellectual activities that do not differ from man's other intellectual activities within the sciences; if there is a difference, this consists not in the content, but in the attitude towards the theories: while the scientist is open to criticism in the matters of scientific theories, since he is conscious of the possibility of alternative theories, the religious person is instead closed to every type of criticism, because every questioning of the established beliefs is perceived as an error, as a risk of chaos and of sin. The cult is therefore reduced, according to an intellectualistic approach, to a simple instrumental activity without proper value.

In Durkheim's symbolistic approach, religious belief and the cult are not simply theoretic constructions of natural and abstract reason that remain the same through time, then becoming modified only from the quantity and quality of data made available to it: for this school of thought, the general idea and the religious idea in particular are social facts that have social motivations, and therefore are historically determined. Therefore, religious beliefs and the actions of the cult receive their strength and legitimation from their social function: they are constructed by society itself because they are socially shared. Religious beliefs are ultimately a symbol of society, and the power of such symbolic acts that become tangible in the cult is the strength of the society itself, which shares and imposes them on successive generations.

Weber's (1963) contribution goes beyond Durkheim's symbolistic approach, too rigidly sociocentric, to give space, together with social meaning of religious beliefs and of the cult, even for individual interpretation of the subject, who for its own nature is hard to codify and cannot be reduced in an exclusive way to the logic of a functioning society. According to Weber, religious phenomena even have origins in the attempt, on the part of man, to give meaning

to life's tragic events, such as illness, pain, and death. Therefore, the cult and its creed also have the function of controlling and rendering bearable the anxiety that arises in suffering and unexplainable occurrences.

The two attitudes, of Durkheim and Weber, far from being contradictory, show two useful perspectives on interpreting religious beliefs and the cult: these are the fruit of a dynamic that reciprocally integrates both collective and individual meanings. Religion therefore cannot be reduced to an exclusively obligatory and coercive dimension. According to Valeri (1996), it is above all a system of communication, a place where individual interpretations and social structure meet, and it is exactly this communicative role of religion that finds substance mainly in the practices of the cult. The cult can also be thought of in terms of communication between men, the social structure, and the sacred entity. Only within the cult can the relationship between men and the gods become a true relationship, restrained by rules and by most juridical norms, resulting in transformations that are verifiable either on the material or spiritual level. In order to exist the gods need man's continual participation in the cult, so much so that without the cult the gods become insignificant and die. On the other hand, if they are the objects of the cult, the gods are capable of rewarding those who worship them with devotion. Prayer, sacrifice, divination, possession – all make up a complex circulation of messages that constitute a complex communicative structure, which, in the specific space of Jewish and Christian traditions, is the liturgy.

ELEMENTS OF THE CULT

The history of religions, and in particular ethnology and phenomenology, have revealed the multiple forms of the cult where the diverse religious experiences become tangible, highlighting both specific characteristics and common aspects. The religious man, to whichever culture he may belong, chooses precise places and times to enter in relationship with the divine world as well as people and objects that seem particularly suitable for expressing his religiousness with; he separates them from the daily aspects and from the profanity of life to give

them a symbolic value, which is fully expressed in cult and ritual forms.

Both time and space, meaning the feasts and the temples, as well as the people who preside over the cult, become symbolically transfigured once they enter into the religious sphere: such change depends on the fundamental distinction between the sacred and the profane. Durkheim and the French sociology school are credited with the definition of religion based on the division/opposition between the sacred and the profane. Such a dichotomy goes beyond to prove the characteristic absoluteness of the sacred and its complete independence from other types of phenomena, thus reintroducing the distinction between the individual and society. The sacred is in fact a collective representation that classifies and orders the material world not based on natural elements, but on social and cultural conventions. Starting exactly from this dichotomy leads to understanding the various aspects that constitute the cult: temples, feasts, prayers, ministers of the cult, and the rites.

The temple is a privileged place, even if it is not exclusive, where the divine manifests itself; it is a sacred space, separated from profane space, where the cult celebrates. These special areas or religious structures are separate from ordinary space with barriers which can be physical, ritual, or psychological. Sacred enclosures – synagogues, mosques, churches, temples – manifest a discontinuation of space. The same distinction between the sacred and the profane structures time as well, creating the feasts. The religious interpretation of time that is expressed in cultural forms moreover determines the direction and attitude of the believers regarding the meaning of existence. Time can be conceived in a linear way, as a succession of equal instants, or it can be conceived as a progression. Some religions believe time to be circular and therefore static, while other religions perceive it as a degenerative process. The emphasis in the distinction between relativity of historical time and absoluteness of eternal time also differentiates the religious concept of time from the non-religious one. The social distinction between sacred and profane defines the role and functions of the people who can get in contact with the sacred universe. Ministers, according to Weber's indications, are only one of the sacred figures that are appointed for a magical sacred

function; specialists legitimized to perform the acts of cult and with a mediating role between gods and men. The role of ministers, however, is not enclosed inside the religious sphere but, as Douglas (1986) observed, also has a noteworthy relevance in the public scene, since it operates as guarantor of stability in social institutions.

FROM CULT TO CULTS

In recent years it is possible to record a shift from the term cult to cults. Such grammatical passage from singular to plural is the sign of how, in the last few decades, the religious dimension is changing deeply and, at times, in a contradictory manner. On one hand, the secularization process, which many thought to be inevitable and irreversible, was supposed to bring forth a progressive irrelevance of religion. On the other hand, the dynamism of certain religious movements calls for a return of the sacred, although in a very different way if compared with traditional society. The various characteristics of traditional cult, as synthetically described in the previous paragraphs, are creatively reinterpreted and often liberally reinvented.

Weber's renowned thesis, which speaks of society's disenchantment followed by its re-enchantment with religion, is utilized by various authors, such as Peter L. Berger and Niklas Luhmann. For them, religion in contemporary society, far from disappearing, has instead taken on new roles and is fulfilling new functions. It is an evolution which leads the faithful not to refer exclusively to traditional religions, to their coded and immutable heritage of beliefs and symbols, but to undertake a quest founded on the individual's freedom of choice. This transition is defined by Thomas Luckmann in terms of moving from religion to religiousness, while other authors such as Wuthnow (1998), Roof (1999), and Flory and Miller (2000) prefer to use the dichotomy of religion–spirituality. Such a transition of legitimation of religious beliefs from the institution to the individual brings with it changes even on an organizational level. Traditional churches are overcome by small groups, whose variety mirrors the extreme diversity which characterizes religious phenomena in the contemporary era, putting together apocalyptic tensions with mysticism and

spiritualism, or occultism with theosophy and new age.

As Terrin (2001) has observed, starting from World War II, and with a particular acceleration at the beginning of the 1960s, there is a progressive process of religious destructuralization, which led the great traditional religions to lessen their hold over the symbolic boundaries of their belief systems and in the end to the birth of new religions. Such increased circulation of religious symbols, outside their traditional contexts, created a market – a very differentiated market of requests and offers of religious goods. In this context, on the one hand, new figures of religious entrepreneurs arise, such as founders of new cults, spiritual gurus, charismatic leaders, and television evangelists. On the other hand, a new kind of follower was born, who, freed from the control of traditional institutions, constructs his own system of belief, according to the syncretistic logic of *bricolage*.

The new forms of religiousness that have developed in the western world in the last few decades, among which even new cults are found, give evidence of a deep coherence with the typical features of postmodernity. Individualism and pragmatism become the backbone, which guides the way one believes and belongs to a group. This brings forth a great variety in the kinds of adhesion, a personalization of beliefs which are chosen according to their efficacy, an acceptance of belonging to several groups which answer to the need of authenticity, and to the predominance of experience above the objective truth that one is obliged to believe. Immediate needs, arising from perceptions of one's emotions, together with a pluralist and tolerant vision of beliefs, are the testing field for today's various religious options, be they traditional or modern.

The term cults, which usually has a marked negative connotation, is utilized in sociology to designate some of the new religious movements, which embody the characteristics described above. For Robert Wallis, cults are distinguished from other religious organizations by their epistemological orientation and by their more or less difficult relationship with the social contexts in which they are found. While traditional churches and sects ascribe to themselves the exclusive truth of their beliefs, cults are characterized by an epistemological individualism,

which is perfectly in tune with the tolerant pluralism of postmodernity. Hence, followers can exercise freedom of conscience in adhering to (or not) the moral and doctrinal contents, and they consider such freedom as legitimate even for the followers of other religious movements. Both cults and sects find themselves in a controversial tension with society, but while sects demand an exclusive faithfulness and exercise a certain amount of control over their members, cults do not request such exclusiveness, and their tension with their surroundings can be seen mainly as alternative therapeutic practices.

Even Stark and Bainbridge (1985) have distinguished between sects and cults on the basis of the fact that the social organization of the latter is very weak and in some cases completely absent. Further, while sects are born from opposition to, and a break with, the traditional church, cults do not have origins in this contraposition. And, from the beginning, cults are independent of any reference or bond with the ecclesiastic world. This total freedom and independence from any reference to the traditional religious organization even raised doubts about whether cults could be considered proper religious communities. Stark and Bainbridge describe some cults that never organized according to any model of a formal group. One such example is the "audience cult," whose members are connected to each other and with the spiritual guide through the media alone.

Reference to the concept of religious cults within the sociology of religion, however, has not yet found a consensus which would allow an appropriate and agreed upon use. It describes phenomena ranging from forms of paganism to druidism, from Wicca to a variety of movements which put together psychosomatic therapeutic practices with techniques that enhance personal potential. As Pace (2001) has noted, all these movements of renewal and religious revival, sometimes labeled as cults and at other times as new religious movements, strongly solicit the traditional institutions of beliefs, which no longer seem to be able to control the continuity and coherence of their belief systems. It will be the task of the social sciences to find the conceptual instruments able to describe both theoretically and empirically the new situation of contemporary beliefs and, therefore, to offer

a more refined and precise definition of the concept of religious cults.

reparations

Rutledge M. Dennis

Reparations refer to the actions of an aggrieved nation, group, or individual to seek redresses and compensations for the loss of land, money, works of art, jewelry, or other valuable objects, due to the actions of a country, group, or another individual. The claim of those seeking redresses or reparations is that their property was knowingly and willfully stolen and they now seek a just payment for their loss. In the United States the major demands for reparations have been made by Native Americans that they be compensated for the loss of land given them by treaties, but subsequently taken by whites. As a result of the many broken treaties, there are now dozens of claims against the federal government by Native Americans relating to many square miles of land now a part of the urban corridor in the Northeast and New England.

In modern Europe, the first major reparation demand occurred after the defeat of Germany in World War I. As punishment for initiating the war, Germany was forced to compensate the countries devastated by German militarism. This was reparation, which many believe, in its harshness, resulted in Germany's economic collapse, which contributed, partially or totally, to the rise of Hitler and Nazism. During the early stages of World War II, before he entered the "final solution" phase, Hitler launched a national program to deny Jews employment in major institutions and organizations, and seized their land, artworks, jewelry, money and bank accounts, stocks, and other tangible properties. Many of these items and properties were placed in vaults, presented to museums and art galleries, and tagged as possessions of the German government. In some cases the items were sold

to other individuals, kept as family heirlooms, smuggled out of Germany, and sold to museums and art galleries abroad. As the Holocaust became a major Jewish cultural reference point beginning in the 1970s, lawyers were hired to reclaim stolen property, and claims were made against governments and state institutions which sanctioned the theft by knowingly possessing property known to belong to those victimized by the Nazis. The German government has paid billions of dollars in reparations both to German Jews whose lands were confiscated and to the Israeli government.

World War II also precipitated reparation claims by many Japanese Americans against the American government for the confiscation of property after many were placed in internment camps in Oregon, Montana, Washington, and Oklahoma. Though many Japanese Americans were opposed to suing the government for fear of resurrecting latent anti Japanese feelings among the American population, a small group decided to pursue the claims, and in 1983 a nine member Commission on Wartime Relocation and Internment awarded the claimants \$1.5 billion, of which \$20,000 would be given to each internment survivor.

A more contemporary, and even more controversial, reparation issue centers on the desire of a few black American organizations to seek reparation from the United States government for the enslavement of the black population from the early founding of the nation until its demise with the defeat of the South during the American Civil War. Unlike the Native American claim of land stolen or the Jewish claim of reparations for stolen houses, land, artwork, bank accounts, money, and so on, at the heart of the slavery reparation claim is the demand for just compensation for the free labor that contributed greatly to the birth of America's surging worldwide economic power throughout the eighteenth and nineteenth centuries. Moreover, the reality of having been kept in bondage for generations, and later having been "freed" with out land or money, placed the black American population in a greatly disadvantaged position vis à vis other individuals and groups in the society. The thrust of the slavery reparations claims does not focus only on claims against the American government. There are also claims against banks, insurance companies, stock

companies, and other private corporations which profited from the slave trade.

Given the fact that the overwhelming proportion of black Americans can trace their ancestry from slavery, it would not be difficult to make the claim for such a connection. Any serious discussion of the issue must confront the moral question of the relative difference between the theft of land and other tangible property against the theft of one's body and person. There is a point at which property and bodily theft coincide with both Native Americans and Jews: for the former, the theft of land and the forceful imprisonment of Indian "bodies" on federally sanctioned reservations; for Jews, it was both in the theft of tangible property and ghettoization and later imprisonment in concentration camps.

Lacking property as slaves, black Americans had only their imprisoned bodies as objects of commodity in the exchange reparation formula. But the claim cannot be ignored which views the human body as an object in itself, in a way an object more important than land and other tangible properties. Hence, if the body is required to perform free labor, there should be ways of arriving at monetary solutions, for free labor resulted in the production of cotton, rice, tobacco, and other products that were crucial to the economy of the South and the entire nation. Like many Japanese Americans who opposed the Japanese American claim against the US government for compensation for their internment, many black Americans are divided on the issue of reparation. Many, associating it with compensation given European Jews and Native Americans, believe the demand for reparation is just. Others view it as a non issue, a futile effort in light of the overwhelming opposition of white Americans to any idea of reparation. In fact, many white Americans view the idea of reparation as closely linked to the idea of affirmative action, which they oppose.

replicability analyses

Bruce Thompson

Researchers have traditionally but erroneously presumed that statistical significance tests evaluate the replicability of results (Thompson 1996, 2006). But p values evaluate the probability of the sample, assuming the null hypothesis perfectly describes the population, and *not* the probability of the population. Therefore, p values do not bear upon questions of replicability. As Cohen (1994) noted, the statistical significance test "does not tell us what we want to know, and we so much want to know what we want to know that, out of desperation, we nevertheless believe that it does!"

Because isolating relationships that replicate under stated conditions is the ultimate objective of social science research, methods that *do* evaluate result replicability become fundamentally important. Thompson (1996) suggested that result replicability evaluation methods can be grouped into two classes: "external" and "internal" methods. *External* replicability analyses involve true replication via data collection with an independent sample. External replication is the ultimate, best method for evaluating result replicability. However, researchers may not have the luxury of external replication of every study they conduct. *Internal* replicability evaluation methods attempt to approximate real replication studies in various ways. "Internal" evidence for replicability is never as good as an actual replication, but certainly is better than

incorrectly presuming that statistical significance evaluates result replicability. Three internal replicability analyses have been identified: cross validation, the jackknife, and the bootstrap (Thompson 1994). These combine the study participants in hand in different ways to determine whether results are stable across sample variations. Thus, the methods address the extent to which the idiosyncracies of individuals impact results. Individual differences are what make generalization in social science so much more challenging than generalization in the physical sciences, where personality does not impact results.

Cross validation involves randomly splitting the sample into two groups, and then separately repeating the analyses (e.g., regression, analysis of variance) in both groups. If the resulting weights (e.g., regression beta weights) and effect sizes (e.g., R^2) are both identical, the results replicate perfectly. However, if the weights are not identical, replicability must then be empirically investigated by applying the group A weights to the group B data, and the group B weights to the group A data, and quantifying the shrinkage in estimated effect sizes. Thompson (1989, 2006) provides a primer on these methods. Cross validation methods are applicable for all parametric methods, because all these methods (e.g., analysis of variance, analysis of covariance, regression, descriptive discriminant analysis) are correlational (Thompson 2000). However, it must be emphasized that the sampling splitting is the basis for evaluating replicability, and *not* the basis for result interpretation. The analysis for the total sample is most stable and therefore is always the focus of interpretation.

Jackknife methods require that the analysis is conducted using all participants. And the analysis is then repeated when k participants at a time (usually $k = 1$) are omitted from the analysis. Then some additional computations are performed to test for result stability. The jackknife is particularly useful for identifying outliers.

Bootstrap methods create repeated resamples (usually several thousand) in each of which the analysis is repeated. In each resample, exactly n participants are randomly drawn *with replacement* from the original sample, where n is the sample size in the original sample. Thus, participant Kelly's data might all be drawn three

times in the first resample, not at all in resample two, and once in resample number three. Then parameter estimates (e.g., R^2 , beta weights, factor pattern coefficients) are averaged. The standard deviation of the estimates of a given parameter is an empirically estimated standard error for a given parameter. Replicability is suggested when these standard errors are small.

Diaconis and Efron (1983) provide a very readable, non technical explanation of the bootstrap. The bootstrap can be applied with both univariate and multivariate analyses. However, when multivariate bootstrap analyses are conducted, solutions in each resample must be rotated to best fit position with a target solution, so that resamples results can be compared apples to apples (Thompson 1988).

The three internal replicability analyses have different advantages and disadvantages. Only cross validation can be implemented without specialized software. Cross validation is conceptually simple, but different and even contradictory replicability results may emerge for the same data because numerous different random splits are possible for a given data set.

Both the jackknife and the bootstrap are computer intensive methods. Because both are complex and require specialized software, many researchers conducting these analyses will select the bootstrap because it is elegant and combines the participants in so many different ways to evaluate replicability. Software is widely available for implementing the bootstrap on modern personal computers in a matter of minutes.

representation

Rex Butler

Although popularly associated with postmodernism, the idea that the world is a representation goes back to the origins of western thought. In Plato's allegory of the cave, it is said that we cannot see the truth but only a reflection of it. In Descartes's hypothesis of the Evil Demon, it is argued that all we know is merely an illusion produced by another, alien intelligence. And after Descartes there are a variety of philosophical Idealisms, in which it is claimed that the world comes about only as an effect of our will or that the world exists only insofar as it is perceived. In postmodernism, however, these essentially metaphysical speculations are seen to be socially embodied through such mass media as the movies, television, advertising, and the Internet. Thus, a film like the Wachowski Brothers' *The Matrix* is understood at once as a revival of the old Platonic fantasy and a powerful metaphor for our contemporary society of the spectacle. Indeed, in the now celebrated catchphrase of the film, uttered by the leader of the resistance, Morpheus, to the newcomer, Neo, "Welcome to the desert of the

real," the filmmakers even acknowledge the prominent postmodern theorist Jean Baudrillard and his theory of simulation, which is often taken for an argument that the world has become its own representation.

However, as revealed by his own repeated distancing of himself from the film, Baudrillard is not simply to be identified with the condition he analyzes. If he does perceive a world in which all is – or soon will be – representation, his fundamental question is how to think something real outside of this, or how to think this at all. (The same might be said of Jacques Derrida's notorious and much quoted aphorism, "There is nothing outside of the text." Here, too, Derrida's real concern might be understood precisely as the attempt to think that "nothing" outside of the text.) In other words, to generalize and to make a connection between Baudrillard and Derrida and others, we might say that what defines postmodernism is the attempt to think critically about this mass mediated world in which all is representation. How to take a distance on it – the traditional aim of criticism – when the analyst necessarily participates in the same regime of representation as what they analyze, when they can only employ representation against representation? We seek to answer these questions here through an examination of three writers whose work is extremely influential upon philosophically derived accounts of sociology: Jean Baudrillard, Slavoj Žižek, and Fredric Jameson.

Let us begin with Jameson, who for a long time – against its progressive disappearance from the academic scene – has attempted to put forward a Marxist analysis of culture and society. In such early works as *Marxism and Form* (1971) and *The Political Unconscious* (1981) he dealt essentially with problems of literary criticism, as much as anything wishing to make that tradition of cultural critique that comes out of Marx and Engels available to American readers. But in such essays as "Postmodernism and Consumer Society" (1983), eventually expanded to book length as *Postmodernism, or, The Cultural Logic of Late Capitalism* (1991), he sought to apply those arguments originally developed in the context of literature to society as a whole, or what he called "totality." Coming out of the long problematic within Marxist thought of the relationship of the base

(the economic) to the superstructure (the social or cultural), it is in these writings that Jameson first spoke of the various elements that make up contemporary society – in a description that would become extraordinarily influential – as reversible, commutable, exchangeable. That is to say, the problem Jameson is grappling with in these later writings is that there is no “finally determining instance” of the economic, no underlying truth of society, but only a series of free floating, seemingly independent elements that on closer inspection each turn into the other, as in a Möbius strip. As he writes in *Postmodernism*: “So it would also seem in the postmodernist debate, and the depoliticized bureaucratic society to which it belongs, where all seemingly cultural positions turn out to be symbolic forms of political moralizing, except for the single overtly political note, which suggests a slippage from politics back into culture again” (Jameson 1991: 64; see also 152). Every thing in this sense is representation, or to use the German word Jameson often takes up, *Darstellung*; although it would be, as Jameson admits, not the representation of any original, but rather the endless deferral or displacement of any original.

It is this conception of society as a series of linkages and encodings, of translations between the most apparently disparate fields, that licenses some of Jameson’s more spectacular readings of well known cultural objects: in the essay “Modernism and its Repressed” he reads the French New Novel in terms of European colonialism; in the last chapter of *Marxism and Form* he reads 1950s sci fi as a fantasy of alienated labor; in “Historicism and *The Shining*” he reads Stanley Kubrick’s *The Shining* as treating class in Jazz Age America. The crucial thing to remember in each instance here is that, if it is always in fact a reading of a cultural phenomenon in terms of an underlying social or economic force, absolutely implicit in Jameson’s argument – and the question, finally, is whether this applies just to our postmodernist societies or it is true of all societies – is the possibility of this going the other way. However, to understand this properly – and Jameson is very clear on this – this is not merely to say that we can also read the economic in terms of the cultural, but that we can only grasp the economic in the first place because of the cultural

(and vice versa). It is this Jameson calls the *figural*: the fact that any part of society can only be comprehended by means of its comparison with another. In what looks at first sight like an overturning of the Marxist model of base and superstructure, we would say that no particular category comes first, but only the very relationship between them. In a sense, all the previously constituted fields that are understood to make up society henceforth become metaphors, representations of one another, but without some literal or original that is being metaphorized or represented.

However, to give the argument a final twist, we would say that, if the economic is reduced to merely another in a series of equivalents, it is also what they all have in common. That social force Jameson is trying to put his finger on – postmodernism as capitalism – is both what induces this endless series of exchanges between disparate areas and can be seen only in the momentary connections formed between them. This is again Jameson’s rejection of any kind of a homology between preconstituted areas, which inevitably proceeds for him along the lines of biblical typology (and hence also his distaste for allegory and its modern equivalent for him, structuralism). As he argues in *Marxism and Form*: “The task of a dialectical criticism is not indeed to relate these two dimensions: they are already related ... Rather, such criticism is called upon to articulate the work and its content in such a way that this relationship stands revealed, and is more visible” (Jameson 1971: 406). In other words, it is in these connections themselves and not in what is connected that Jameson believes he can capture the assimilative power of capital, show the process of value being formed and not value as product. (And the value of Jameson’s own work lies in the relationships he makes between different fields, which allow us to see them as though for the first time – say, Robbe Grillet’s novel *Jealousy* and European colonialism, Kubrick’s *The Shining* and American history – beyond any notion of speaking their truth or “reading off” these cultural products against any underlying instance.)

It is again this process of representation that is to be seen in the chapter “How Did Marx Invent the Symptom?” of Žižek’s *The Sublime Object of Ideology* (1989). In this chapter, as its title indicates, a parallel is drawn between the

analysis of the dream by Freud and the analysis of the commodity by Marx. In both – hence the possibility of a certain Freudian Marxism – there is observed a kind of “symptom,” something that is constitutively repressed in order to allow the formation of a system of meaning or representation. That is, with regard to psychoanalysis, Žižek stresses that in Freud’s dream analysis it is not at all a matter of seeing some original latent thought that is then expressed in a manifest content. This would be exactly that deciphering of dream symbolism in terms of preexisting symbols or archetypes that Freud objected to (like that biblical typology Jameson similarly rejects). Rather, what must be thought is the very passage from the latent to the manifest, the refiguring of words and symbols that gives to an often perfectly innocent thought the particular form of the dream. It is this translation itself – which at once is on the surface and deeper than even the most latent thought – that is the unconscious. And the same goes for Marx’s analysis of the commodity form, where it is not a matter of the labor force being exploited insofar as it is not adequately compensated, but of economic exchange producing a certain surplus value, which is the exploitation of labor. It is not some objective value of labor that is subsequently commodified; it is the commodity form itself that retrospectively gives rise to the value of labor in the form of its economic exploitation. As Žižek insists, what must above all be analyzed is not the “secret behind the form but the secret of this form itself” (Žižek 1989: 15). In other words, the “symptom” here, as in the dream, is not some reality that precedes translation or exchange, but is the enigma of exchange itself: what must be excluded from it insofar as everything is to be given a value, a “value” that cannot be accounted for insofar as labor is to be given a value. Or, as Žižek will elsewhere write, what is at stake is the “foreclosing” of the impossible origin of such an all encompassing system of signification or value, in which everything – as in the symbols of psychoanalysis or the commodity in capitalism – is differentially defined by everything else (Žižek 1991b: 197–8). What is at stake is precisely the unrepresentable origins of a system in which all is representation.

We see something like this in Žižek’s well known pop cultural analyses (e.g., his reading

of Alfred Hitchcock’s *The Birds* in *Looking Awry* or Stephen Spielberg’s *Jaws* in *Enjoy Your Symptom!*). In both, Žižek begins by canvassing a number of different interpretations of the films: with regard to *The Birds*, the idea that the birds represent either the fundamental disorder of the cosmos, an imbalance in nature or unspoken family tensions; with regard to *Jaws*, the idea that the shark represents either repressed sexuality, unbridled capitalism, or the threat of the third world against America. That is, in a manner akin to cultural studies analyses, the films are read as bringing out certain tensions and tendencies within contemporary society. But Žižek does not leave it at this, for this apparent state of society can only be seen through these films. Or, to put it the other way around, we undoubtedly have the feeling that in most cultural studies analyses the author already has a certain image of society and simply seeks to illustrate it by means of a film. In fact, in each case here what Žižek wants to do – just as with his analysis of the genesis of value in Marx – is show how this circle of representation actually begins. Ultimately, he suggests, such cultural objects as the birds of *The Birds* and the shark of *Jaws* exert their power – this is the exact meaning of the fetish that he is trying to develop – by hiding through their sheer physical presence the vicious circle implied in the generation of value, by their ability to create the illusion that these various readings really do start with something, that there is something that precedes representation (Žižek 1991b: 106; Žižek 1992: 134). In a sense, even though everything is representation – or, to use Lacan’s expression, symbolic – what Žižek is trying to do by means of these examples is think how this synchronic system of representation, in which each term is defined by its relationship with all others, first comes about.

And for all of his obvious differences from Jameson and Žižek, we see the same thing in Baudrillard. Baudrillard is, of course, well known for his critique of Marxism and the idea of any stable referent behind representation, but in fact he still remains profoundly “Marxist” and, for all of his seeming to do away with reference in his theory of simulation, this is only to mistake the situation he analyzes for his own critical position (the error he condemns in the makers of *The Matrix*, who fail in attributing to

him both the idea that there is no outside to simulation, that there is only the illusory world of the Matrix, and the idea that there is some simple outside to simulation, the counter world of the insurgents led by Morpheus). Indeed, there is a certain “outside” to representation in Baudrillard, which we might call the “Real,” but it is the very form of illusion itself. In the same way as we saw with Jameson and Žižek, it is the fact that all is illusion, that everything can be seen in terms of something else, that necessarily implies some point outside of this, which is at once its origin (the impossibility of explaining how this system of representation began in its own terms) and its end (the possibility of us being able to think the fact that all is representation).

Let us take, for example, the opening chapters of Baudrillard’s *The Transparency of Evil* (1993), entitled “Transaesthetics,” “Transsexuality,” and “Transeconomics.” Baudrillard’s idea here, as with Jameson’s similar idea of transcoding – although, in truth, it is Jameson’s “Postmodernism and Consumer Society” that is indebted to Baudrillard – is that none of these areas (not even economics) is any more fundamental than the others, that none can be grasped outside of its relationship with the others. Rather, each is only already those others: economics is aestheticized; aesthetics is only to be seen today in the form of economic speculation, etc. And yet, for all of this loss of external standards – and this is the kind of “limit” Baudrillard plays on throughout his work – there is still something at stake in pointing this out. There is a certain critical power brought about in remarking upon this equivalence or exchangeability between hitherto disparate areas; it is a kind of perpetual collapse and not a simple equivalence between them that Baudrillard speaks of. In other words, as with Jameson and Žižek, it is the exchange between things and not what is exchanged that is the real subject of Baudrillard’s work, an economy that his own criticism necessarily participates in. It is representation or more precisely representation that is at once the problem to be analyzed and the possible solution to this problem, in an ambiguity that, as Derrida points out, goes all the way back to Plato. And this is to say that postmodernism is not at all a new period, a sudden fall into the world of representation (and certainly

none of the thinkers discussed here make this mistake); the same paradox of representation stretches all the way back to the origins of western philosophy. If anything, we would say that the originality of postmodernism lies precisely in this realization – and that henceforth all thought or critique is bound by this double limit: that it is necessary to think the limits of representation within representation itself; that it is not a matter of thinking what is outside of representation, but of thinking what is outside of it to ensure that nothing is outside it.

repressive hypothesis

Christian Klesse

The publication of Michel Foucault’s first volume of the *The History of Sexuality* thoroughly transformed theoretical thinking around

sexuality. A range of Foucault's longstanding concerns around power, knowledge, discourse, truth, and subjectivity culminate in this text about the genealogy of sexuality in Christian western societies. With this book, Foucault attempted to write the history of sexuality "from the viewpoint of the history of discourses." In Foucault's work, the concept of discourse is intrinsically interwoven with what he perceived to be distinctively modern forms of power. The insistence that modern power is *productive* rather than simply *repressive* is one of the central assets of his novel theory of power. Premodern forms of power were based on the idea of *power sovereignty* or *power law*. They were derived from monarchical techniques of government and drew upon the binary ruler/ruled. From within this paradigm, power is conceived as *negative*. It works through measures such as censorship, prohibition, prevention, exclusion, or spectacular forms of punishment. In contra distinction, power as a modality of discourse is *positive* in that it is productive of social relationships, forms of knowledge, and modes of subjectivity. Moreover, it is more difficult to pin it down clearly or to identify its origin in any particular agent, institution, or social space. Foucault describes discursive power as having a dispersed, contradictory, and all pervasive character.

Foucault (1990) applies this understanding of power to the subject of sexuality in order to challenge what he calls the repressive hypothesis. By questioning the dominant historical narrative of sexual repression, he undermines commonsense views about the interrelationship between power and sexuality. Whereas in the traditional understanding, power is exerted to repress, silence, censor, or erase sexuality, Foucault starts to conceive of sexuality as being an immediate effect of power. From this point of view, the most significant strategies of power in modern societies are not the exclusion of sexuality from discourse, but its regulation through the production of public discourses on sexuality. Foucault identifies an institutional incitement to speak about sex at the heart of western culture (s). It is in the multiplication of discourses on sexuality and the assumption that sex would reveal the truth of our innermost selves that the power–sexuality relation is realized. Thus, Foucault speaks of "confessional power" to designate this "putting into discourse" of sex

in the Catholic tradition of confession or the secular discourse of psychoanalysis.

With his insistence that power is productive of sexuality rather than repressive, Foucault attacks the basic assumptions of sexual liberationism that had a strong hold in the New Left, the counter culture, and the feminist and lesbian and gay social movements throughout the 1960s and 1970s. Foucault suggests that it would be naïve to assume that it is possible to revolutionize society by fighting off sexual restrictions and freeing our repressed natural sexual selves. Discussing the repressive hypothesis, he occasionally refers to the "Reichians" in order to characterize the discourse that he wishes to challenge. The German psychoanalyst and communist Wilhelm Reich emphasized the instrumentality of sexual repression through state, churches, and authoritarian family structures for class domination in capitalistic societies. As a theorist and activist, Reich was a core figure in organizing the so called *Sexpol* movement, a working class (youth) movement for class struggle and sexual liberation in the late 1920s and early 1930s. *Sexpol* had a short history. It was allowed to work within the ranks of the GCP only until 1932, when Reich was excluded from the party and some of his controversial publications were banned. The ideas of Reich gained an enormous popularity in the revival of sexual liberationism in the 1960s and 1970s, when the Freudo Marxist theories of Herbert Marcuse were widely endorsed in progressive social movement contexts.

Like other historians of sexuality, Foucault emphasizes the enormous relevance of medico psychiatric discourses for shaping modern thoughts on human sexuality throughout the eighteenth and nineteenth centuries (Weeks 1990). The notion of sexuality was produced in this period through an engagement of early sexologists with sexual deviance or "perversion." What was previously seen as a sin or temporary aberration in Christian canonical law became reinterpreted as a matter of character or mental pathology. In sexological discourse the sexual norm was carefully defined in a process of increasing specification of sexually perverted types. This provides the backdrop to Foucault's famous thesis of the "invention of homosexuality." The "homosexual," according to Foucault, came into existence as a form of being through

the self affirmative appropriation of these sexological knowledges in a kind of "reverse discourse." Sexuality, consequently, presents (nothing more than) a discursive formation, a power/knowledge configuration, or an apparatus in the service of power.

Foucault coined the term bio power to conceive of the strategies of modern nation states to regulate human life through expert techniques. He describes the working of bio power on two levels: the "anatomopolitics of the body" (i.e., disciplinary power governing sexual identities and acts) and the "biopolitics of the population" (the regulation and control of the life of the population, through statistics, eugenics, demographics, etc.). In light of the concept of bio power, sexuality can be understood as a "technology of government." Since Foucault ascribes a wide range of meanings to the concept of government, he also applies it to phenomena not directly linked to political and bureaucratic processes. In its most generalized meaning, government designates the "conduct of conduct." This definition does not only refer to the conduct of others, but also the regulation of our own conduct in the "relation to ourselves." At this point, Foucault's writing on sexuality conjoins with his critical work on subjectivity.

While Foucault's work on sexuality chimes in well with the historicizing and anti essentialist arguments advanced within social constructionist scholarship, it also points beyond it. His method of critical genealogy opens up a set of new and different questions aiming to explore the (historical) context of the emergence of certain social and sexual phenomena. In that he conceives of the sexual subject as an effect of discourse and power his work further contains an anti identitarian element that has fueled the deconstructive endeavor of recent queer theorizing (Halperin 1995).

The pathbreaking influence of Foucault's thought notwithstanding, a range of criticisms has been leveled against his work on sexuality. Although being primarily concerned with the complexity of power, he failed to address the centrality of gender and race to the biopolitics he studied. Some have further complained that his thesis of the ubiquity of power would not be helpful to theorize agency or resistance and that his claim that "there is no relation of power without resistance" would at best be

tautological. Foucault tried to address the latter issue in his work on ethics in volumes 2 and 3 of *The History of Sexuality*. Here he claims that the imperative within classical Greek ethics to "take care of yourself" would bear the potential for a non prohibitive ethics based on the "techniques of self stylization" or an "aesthetics of existence." Foucault labels these practices alternately "practices of freedom" or the "government of self." It is an issue of contention in how far this work stands in an unbridgeable tension with his earlier claims. A high degree of ambivalence certainly remains.

republicanism

Peter Murphy

Republicanism presents an idealized version of a republic. This is a state where no single person (such as a monarch) rules. Usually, this means a written or unwritten constitutional order that distributes the power of the state among different persons and offices, and then organizes those persons and offices into a functional whole. Republics ideally combine the power of the one, the few, and the many with the aim of minimizing personal rule. Republicanism seeks to replace the unchecked personal authority of an arbitrary or despotic ruler with the carefully balanced impersonal authority of a city state or federal legal system.

The term republic is Roman. The Roman Republic began its history when the city state expelled its kings. Kingship was equated with despotism, and republicanism signified opposition to tyranny. In order to rule without a king, Rome instituted a set of balances of power between executive office holders, classes, and councils (the Senate, the People) in the state. Council type rule depended on public debate about common matters. It replaced rule by fiat or diktat. The concept of a balance of powers prefigured the modern idea of a constitutional separation of powers.

The ancient Greek city states did much the same things as Rome, beginning around the same time in the eighth century BCE. The Greeks, though, invented the idea of federalism, unfamiliar to the Romans. The Greek idea of a federation of states became the basis for the great modern republic, the US. The Greeks theorized extensively about their innovations – notably in Plato's *Republic* and Aristotle's *Politics*. These theories had their roots in pre Socratic ideas of the equilibrium and

proportionality of powers – the key idea of any republic. The great Roman statesman Cicero later synthesized these theories in his *Republic*, a canonical text for republicanism for 2,000 years.

The Roman Empire and Christianity eclipsed ancient republicanism, though republican ideas like the rule of law survived for centuries in late antique administration and urbanism and in Christian natural law. Republican ideas reappeared with the rebirth of Italian city states by the twelfth century – notably Florence and Venice. These cities were based on forms of collective rule. The Florentines Leonardo Bruni and Machiavelli produced important theories of the Italian city republic, in part stimulated by their reading of ancient sources.

The Dutch revolted against Spain in the seventeenth century, and created a republic based on a federation of seven provinces. Although this period produced some brilliant thinkers (Grotius and Spinoza), no great treatise on republicanism was written, though key ideas – of the freedom of the seas and of states based on the natural rights of life and liberties of movement and property – were added to the republican corpus. The Dutch pioneered liberal republicanism.

When the American colonies rebelled against the English Crown, American thinkers ransacked history for models of republics. They were intimately familiar with Sparta, Athens, Rome, Venice, and the Dutch Republic. They also drew on Commonwealth ideas (James Harrington, Henry Neville) and Whig ideas (Shaftesbury, Burke) circulating in England. Whig and Commonwealth ideas were para-republican – models of regal republics in which the Crown was a limited element in a constitutional state. In the thought of the Americans Thomas Jefferson and James Madison, multiple threads of historic republicanism coalesced into a new model that combined familiar features (opposition to despotism, rejection of monarchy, constitutional balance, free speech, rule of law) with startlingly new elements, including a written constitution enforced by an independent court and an ambition to build a republic on a massive scale.

Republicanism originally was the worldview of individual city states. The Greeks experimented with federations of cities. The Dutch

developed the idea as a federation of provinces. The Americans were more adventurous still: they thought of their union of states as an “empire of liberty” that regularly enlarged itself by adding new states and by making treaties and alliances with other states. The greatest treatise produced on the American republic was Hannah Arendt’s *On Revolution* (1973).

In the modern age, many countries toppled their monarchies and replaced them with elected or unelected presidents and called themselves republics. But these republics bore little resemblance to the models of historical republicanism whose practical expression was limited to the US and Whig Commonwealths like Australia.

reputation

Gary Alan Fine

Reputation, as a social scientific concept, refers to the existence of a socially recognized persona: an organizing principle by which actions of a person (or group, organization, or collectivity) are linked into a common assessment. On one level a reputation constitutes a moral gestalt that is linked to a person – an organizing principle for person perception. However, reputations are more than this social psychological claim: they are collective representations, enacted in relationships. In this, the opinion that one

individual might form of another often differs from a shared, established image. Reputations are embedded within social relations, and, as a consequence, reputation is connected to forms of communication, tied to a community.

Social identification and reputation operates in several domains: personal, mass mediated, organizational, and historical. While reputations often begin within circles of personal intimates, they spread outward. First, people create and share the reputations of those who exist within their social circle – friends and consorts. Personal reputations are of immediate consequence, because the actions of those in our social world have the potential to shape our lives and interaction outcomes. People are concerned with the repute in which they are held because of the options that reputations open and close, and because reputations permit us to evaluate our selves in particular ways: those identities that we can select. Further, these public reputations directly affect how we come to see ourselves: a reason we attempt to shape our behavior when with those whose opinions matter to us (Vinitzky Seroussi 1998). People engage in forms of self presentation and impression management to modify their images in the eyes of others. As a result, “status” has been a central concept of sociology from Max Weber on, whether personal standing or group position.

Second, the media help to determine who we should know and care about. In addition to individuals who are famous by virtue of their formal institutional roles (e.g., political leaders), this space is populated by “celebrities”: figures that by virtue of their prominence in the central institutions of society are deemed worthy of shared attention (Gamson 1994). Even if we recognize the thinness of our knowledge, the celebrity of these figures connects us to each other and provides an unthreatening space to converse about vital social matters. We feel that we know these celebrities (O. J. Simpson, for instance) and can speculate on their motives. The discussion of the sexual appetites of former President Clinton, and whether he suffers from a “sexual addiction,” is part of this personalizing of “great men,” as is the debate over whether these intimacies matter as to his performance of affairs of state. This discussion results from media choices, an enlarged emphasis that is a

function of what Daniel Boorstin (1961) has labeled the "graphic revolution," referring to the increased visual displays of public figures, emphasizing their immediacy.

Public figures are legitimate topics of conversation among audiences who have never met them, but who consider them "known." Their reputations are used in interactional transactions among strangers: strangers to them and often strangers to each other. We have the right to judge these figures, even though we are not familiar with them personally. This is a form of "parasocial interaction" (Caughey 1984).

Not only do individuals have reputations, but so also do organizations. Organizations develop reputations that influence their effectiveness (Fombrun 1996). Even if not always known to the wider public, CEOs characterize their companies in the business community. What we know of Apple, Disney, General Motors, and Time Warner parallels in important ways what we know of persons. The dramatic growth of the public relations profession since the 1920s testifies to the need for reputation specialists to shape organizational images. Ratings of professional schools or consumer product evaluations are part of this process.

Finally, history, constituting narratives of linked biographies, serves as a more formal and sedimented version of reputation work. Citizens learn of the reputations of others through institutionally sanctioned knowledge. History represents "settled" cultural discourse about the past, determined by experts as important for people to be culturally literate. This knowledge is acquired through the social institutions of the school and the media. Reputational history provides lessons necessary for citizenship. Historical knowledge is not merely a technical skill, but a moral aptitude, necessary for public involvement. History is narratives as taught; collective memory is how such narratives are recalled. When reputations are too hotly contested by rivalrous parties, schools and other institutions simply ignore the battles or attempt to pacify them, creating non controversial versions of the American Civil War, segregation, or treatment of American Indians.

In one sense, a person without reputational knowledge could function well in social domains; yet, this individual would not really "belong" to the polity. Whether or not people

choose to embrace the consensual moral evaluation of great figures, as revolutionaries and progressives often refrain from doing, they should at least be aware of what they are rejecting.

Reputations attempt to teach how citizens should think about those issues that confront them. People share memory by virtue of what they have been taught about others, and by what these others are supposed to "mean." As sociologist Charles Horton Cooley (1966 [1918]: 342) asserted, "Fame may or may not represent what men were, but it always represents what humanity needs for them to have been."

The analysis of reputations is closely linked to the examination of collective memory or social mnemonics (Olick & Robbins 1998; Fine 2001), and builds on cognitive sociology, social movements research, and the sociology of knowledge. Major figures in this tradition include Charles Horton Cooley, Maurice Halbwachs, Karl Mannheim, and more recently Barry Schwartz, Kurt and Gladys Lang, and Pierre Nora. As research questions become more sophisticated, other linkages will be explored with political science, psychology, organizational studies, as well as extended historical and comparative analyses.

residential segregation

John Iceland

Residential segregation refers to the differential distribution of groups across space, and is usually thought of in terms of the degree to which various groups reside in different neighborhoods. People are residentially segregated across a number of dimensions, including age, socioeconomic status, and (the focus here) race and ethnicity. It is commonly thought that differences in residential patterns across racial and ethnic groups reflect social distance.

Residential segregation, particularly when resulting from discrimination, has negative consequences for minority group members. Residential segregation limits residential choice, constrains economic and educational opportunities by limiting people's access to good schools and jobs, serves to concentrate poverty in disadvantaged neighborhoods, and contributes to social exclusion and alienation. Residential segregation also affects the nature and quality of intergroup relations in society: segregation reduces contact between groups and both causes and reflects polarization across communities.

HISTORICAL TREATMENT OF RESIDENTIAL SEGREGATION ISSUES

The residential patterns of minority groups in the US have been the object of study for many decades. W. E. B. DuBois, for example, documented the residential patterns of blacks in Philadelphia's seventh ward in his 1899 book, *The Philadelphia Negro*. Another example is Louis Wirth's *The Ghetto* (1928), which compared the similarities between the Jewish ghettos in Europe and those in New York and Chicago. Taeuber and Taeuber (1965) note that new immigrants to the US in the nineteenth and early twentieth centuries were by and large

poor and poorly educated. They often lived in ethnic enclaves in low rent districts. As the immigrants and their children accumulated financial resources and knowledge of opportunities, many left ethnic enclaves, often to be replaced by new immigrants.

This process of residential assimilation, however, did not apply to the large waves of black migrants from the South to the North in the early and mid twentieth century. African Americans faced a range of social, economic, and residential barriers that were higher than those that immigrants faced. In the South, segregation was enforced by whites with the Jim Crow system. In the North, segregation developed because of white dominated real estate practices and because of the violence directed toward blacks who entered formerly white neighborhoods.

With the decline in immigration in the 1920s and 1930s, studies on segregation in the decades after World War II tended to focus on the segregation of blacks from whites. Studies such as Taeuber and Taeuber's (1965) volume on *Negroes in Cities* provided an impressive and thorough examination of general patterns of black-white segregation and the role of social and economic factors in producing these patterns. Throughout the first six decades of the twentieth century, segregation between blacks and whites in metropolitan areas actually increased, largely due to continued racial polarization and white suburbanization over the period.

Massey and Denton (1993), among others, built upon this tradition, and discussed the extreme levels of racial stratification in American metropolitan areas, and described how racism and discrimination perpetuated high levels of segregation. *American Apartheid* focused on black-white segregation, though other work by Massey and Denton examined the segregation of other groups from whites as well.

With the rapid growth of the Hispanic and Asian populations in the US since the 1960s, in response to changes in immigration policy, there has been growing attention paid to the residential segregation of these groups in American society. It is likely that future research on racial and ethnic residential segregation will increasingly focus on the residential patterns of multiple groups.

RECENT PATTERNS AND TRENDS IN SEGREGATION

While Taeuber and Taeuber (1965) and others described how black–white segregation increased through the early and middle part of the twentieth century, trends in subsequent decades have been characterized by moderate declines in such segregation. A 2002 Census Bureau report (Iceland et al. 2002) examined the residential segregation of various groups across all US metropolitan areas using a variety of measures and found that declines in African American segregation over the 1980 to 2000 period occurred across all dimensions of segregation. Despite these declines, residential segregation was still higher for African Americans than for the other groups. Hispanics were generally the next most highly segregated, followed by Asians and Pacific Islanders, and finally American Indians and Alaska Natives. Asians and Pacific Islanders, as well as Hispanics, tended to experience increases in segregation over the period, though results varied by measure used. Increases were generally larger for Asians and Pacific Islanders than for Hispanics.

Residential segregation tended to be higher in larger metropolitan areas and in those with large minority populations. While the Census Bureau report thoroughly documented various basic patterns and trends in residential segregation, it did not discuss the factors causing these trends.

INTERNATIONAL RESEARCH

Residential segregation has been receiving greater attention in countries around the globe, in large part due to continued high levels of international migration (and improvements in data, methods, and computational resources for studying segregation). Europe and Canada, for example, have been experiencing growth in their minority populations, and this has been accompanied by concerns about the assimilation (social, economic, and residential) of these groups in society. Thus, we are likely to see a growing body of research on residential segregation in a comparative international perspective in the coming years (e.g., White et al. 2003).

CAUSES OF RACIAL AND ETHNIC RESIDENTIAL SEGREGATION

Two broad theoretical perspectives have been used to explain patterns and trends in residential segregation in the US: spatial assimilation and place stratification. According to the spatial assimilation model, which is often used to explain settlement patterns of immigrants or migrants, newcomers settle in fairly homogeneous racial/ethnic enclaves within a given metropolitan area. This may be due to migrants feeling more comfortable with and welcomed by fellow co ethnics and the fact that minority members may simply not be able to afford to live in the same neighborhoods as more affluent whites. According to this model, individuals eventually convert socioeconomic gains over time into better housing, and this leads to higher levels of integration with whites.

In contrast to the spatial assimilation model, the place stratification perspective holds that a group's residential patterns and integration into society depend on the group's position in the social hierarchy. The dominant group (non Hispanic whites) is at the top of the hierarchy, and other groups follow in some order, depending on prejudices and preferences of society at large. Negative stereotypes, for example, reduce openness to integration with certain groups, and blacks tend to be perceived in the most unfavorable terms.

Thus, many have argued that the spatial assimilation model simply does not hold for all groups, especially blacks, in part because prejudices lead not only to avoidance of particular groups but also to racial discrimination. Discriminatory practices include racial steering by real estate agents, unfair mortgage lending patterns, and even in some cases physical attacks when moving into white neighborhoods.

Both theoretical perspectives have received some support from past research. For example, Iceland (2004a) has found that higher socioeconomic status blacks, Hispanics, and Asians are less segregated from non Hispanic whites than their lower socioeconomic status counterparts. Immigrants also have higher levels of segregation than the native born of a particular race group. Nevertheless, findings also indicate that race still plays a large role in determining

residential patterns, especially for African Americans.

METHODOLOGICAL ISSUES

Residential segregation has been studied extensively with a variety of measures. The main methodological issues involved in analyzing racial and ethnic segregation revolve around the definition of racial and ethnic categories, geographic boundaries, and segregation measures.

Race and Ethnicity

The way in which racial and ethnic groups have been defined has changed over time. Residential segregation indexes generally rely on official government definitions, given that the data needed to calculate indexes come from the decennial census. In 1790, the first decennial census of the population, information was collected about whites and blacks only. Over time, data on other groups were collected, often reflecting changing social views of race. In the 2000 census there were five race categories: White, Black, American Indian and Alaska Native, Asian, and Native Hawaiian or other Pacific Islander. Individuals could also identify with more than one race, in contrast to previous censuses. Hispanic origin was gathered in a separate question.

In practice, the minority groups most studied today are African Americans, Hispanics, and Asians. Examining the segregation of the American Indian population, and particularly trends over time, is challenging due to the relatively small population of this group, as well as changing patterns of self identification among American Indians.

Geographic Areas

Residential segregation typically describes the distribution of different groups across smaller areal units within larger areas. Thus, to measure residential segregation, one has to define both the appropriate larger area and its component parts. The most common larger geographic unit chosen is the metropolitan area, which is a reasonable approximation of a housing market.

They generally contain at least 50,000 people, and in 2000 there were 331 of them in the US. The smaller unit chosen is typically the census tract, which was originally designed to represent neighborhoods. Tracts typically have between 1,500 and 8,000 people, with an average size of about 4,000. Using smaller component units, such as census defined blocks, tends to yield higher segregation scores, as smaller units tend to be racially more homogeneous than larger ones.

Segregation Measures

The two most common measures of segregation are the dissimilarity and isolation indexes. The dissimilarity index is a measure of evenness, and it ranges from 0 (complete integration) to 1 (complete segregation). It describes the proportion of a group's population that would have to change residence for each neighborhood to have the same race ethnic distribution as the metropolitan area overall. The isolation index is a measure of exposure, and also ranges from 0 to 1, with 1 indicating the highest level of isolation. It basically indicates the probability that a typical minority group member would come into contact with another minority group member in a metropolitan area.

Many other segregation measures have been developed and used by researchers. In 1988, Massey and Denton compiled 20 existing measures and identified five dimensions of residential segregation: evenness, exposure, concentration, centralization, and clustering. *Evenness* describes the differential distribution of subgroups of the population. *Exposure* measures potential contact between groups. *Concentration* refers to the relative amount of physical space occupied by a minority subgroup. *Centralization* indicates the degree to which a group is located near the center of an urban area. *Clustering* measures the degree to which minority group members live in contiguous areas. A more thorough discussion of these dimensions and various issues related to measuring segregation can be found in Massey and Denton (1988) and Iceland et al. (2002).

Finally, other measures of segregation are continually being developed, such as *multigroup*

measures that allow researchers to consider multiple racial and ethnic groups, geographic levels (e.g., metropolitan area or regions), or dimensions (race, class, age) simultaneously. It is likely that these measures will become more popular in the coming years.

resocialization

Linda Morrison

Resocialization is a process of identity transformation in which people are called upon to learn new roles, while unlearning some aspects of their old ones. The need to learn new roles may result from voluntary or involuntary changes in status. When the role requirements of the new status conflict with an individual's earlier or primary socialization, the process of resocialization may be necessary. This process often requires an unlearning of internalized norms, values, beliefs, and practices, to be replaced by a new set which is considered appropriate to the new role.

Resocialization most often occurs when an individual is called upon to adopt a new specialized status, often in adulthood. Thus it is sometimes referred to as adult socialization. Examples include joining the military or a religious order; training to become a doctor, lawyer, or police officer; becoming a prisoner; or being hospitalized for mental illness. In each case, a person is required to take on a new identity as a professionalized or institutionalized self, and must adopt new ways of relating to both self and others. Behaviors and values that were considered normal in ordinary society are seen as deviant and undesirable in the new situation and must be unlearned. In addition, many of the new behaviors and values are considered deviant on "the outside." For these reasons, the person's previously socialized self becomes an obstacle to achieving the new identity and status. In order to make this transition, role and identity transformations are required.

In the classic formulation, the resocialization process occurs within the context of "total institutions." Goffman (1961) describes the features of these special environments (e.g., prisons and mental hospitals), in which a person is removed from the ordinary everyday world and resocialized in a social context which encompasses all or most of an individual's daily life. In this controlled environment, individuals are stripped of their social identities through "mortification processes" and socialized into new relationships with their peer group and a complex hierarchy of ranking and power.

Ordinary social practices are no longer valid. People are ridiculed and punished for acting like their normal selves, and are rewarded for adopting new behaviors and attitudes that are appropriate to the new social setting.

Within total institutions, various forms of mortification practices and degradation rituals operate to break down accustomed realities and weaken the boundaries of existing identities. The inmates or initiates may be stripped, shaved, punished, and humiliated; subjected to painful, stressful, and disorienting events; given new clothing, tools, and responsibilities; and assigned new identities or labels based on membership in a particular group within a strictly hierarchical structure. New practices and values are introduced and enforced in an environment of extensive surveillance and social control. The norms, values, and behaviors of the institutional setting are most successfully reinforced by keeping the incarcerated individuals totally separate from their ordinary environment (the outside) and retraining them into the distinct new role system of the inside. As with childhood socialization, resocialization of an individual occurs in relationship to the status and roles of others. Through relating to these others, in an ongoing process of rewards and punishments, the inmate or trainee will learn the responses and behaviors required by the new social environment, internalizing its acceptable norms, values and beliefs.

Goffman's ideal type of resocialization in a total institution can be used to understand the process occurring in other, less total institutional settings. Settings can vary in relation to their voluntariness, their purpose and goals, their degree of separation from the outside world, the active or passive role of the individual in the process, the level of surveillance and control, and the permanent or temporary nature of involvement. Resocialization in the interest of professional training such as a medical school or police academy, while it involves degradation and subordination of initiates, also holds the promise of an enhanced future status when training for membership is complete. A person in training is socialized into new responses to people and their bodies, to sickness, to crime, to danger, to death. The challenges and humiliations of socialization into a professional identity are difficult but carry substantial rewards. Upon

completion, the person will carry a new identity and will be differently socialized.

Individuals experiencing drug rehabilitation programs, imprisonment, and psychiatric treatment may not experience actual transformation of identity, but may resist and maintain their core identity, especially when contact with the outside is maintained or eventual return is promised. Active reconstruction of the self in certain contexts may be contrasted with a more passive or receptive condition. The amount of personal initiative, privacy, and choice can also be seen to vary according to setting and individual. Brainwashing of cult members or prisoners of war could be seen as the extreme case of resocialization and loss of the original self in transformation to the new status and role.

In a non voluntary therapeutic environment, the individual may gain permission to leave the facility only when his or her identity has been sufficiently transformed by being there. This includes rehabilitative treatment for substance abuse, as well as psychiatric treatment. The person who enters the facility is defined as deficient; denial of this definitional reality is proof of continued deficiency. Through the mortification, deculturation, and rebuilding process described by Goffman (1961), the therapeutic milieu is designed to shape inmates into a new status/role combination, including incorporation of a prescribed set of preferred norms and values. When their behaviors and beliefs are deemed acceptably transformed, including display of sufficient respect for the rules and the status hierarchy, then release may be secured. The new social role of reformed addict, or psychiatric patient, will define their status upon release back into society. In such circumstances, it is possible to maintain one's core identity to varying degrees, and undergo a process of change in combination with a newly reconstructed presentation of self in order to meet the requirements of the program and gain release to the outside. This is a form of resocialization, learning new roles, without a true transformation of identity.

In a training environment, the new identity is acquired through modeling the behaviors of those who are superior in status, though subservient and submissive behaviors must be maintained for an appropriate length of time.

After showing adequate preparation at appropriate intervals, the deserving initiate will go through a status enhancement ritual to reach the next level, and corresponding changes in role behaviors will be learned, always in relation to others in higher, lower, or peer status positions. In turn, the individuals moving through this pathway assist in shaping the behaviors of others entering the statuses below them. Eventually, the graduation or credentialing ritual will reward the long period of degradation, subordination, and obedience to authority with a full status transformation, and ultimately an identity transformation as well. To become a doctor rather than a medical student, an officer rather than a cadet, or a priest rather than a seminarian, is to transform one's identity in relation to others as well as to the self. To fully enter the new status and associated roles, a person must experience the self in a new way and relate to "ordinary" persons (their own former status) differently, as well as to others in related statuses. One's core identity has been transformed and enhanced, or transformed and degraded.

For individuals in environments designed to treat or punish, the basic value of the self is diminished as a result of entering the status of prisoner, patient, or addict. As noted above, the goal of the institution is to transform the deviant self, participation is less voluntary, and the object is to produce conformity or reduce deviance. Once resocialization occurs, when return to society is gained, the individual still carries a stigmatized identity on re entry: that of ex mental patient, ex con, or ex addict. Ritual reincorporation into the community is rarely attained, and the new position is seldom celebrated. This is an important distinction between forms of and outcomes of resocialization.

Clearly, the purpose of resocialization helps to determine its nature. Whether a suspension of previous identity or a transformation to a new identity is achieved, or something in between, will depend on multiple factors. Oversimplification of the resocialization process leads to a misunderstanding of its complexity, and of the complexity of human beings in relation to themselves and to one another.

Identity construction involves individual and contextual factors of agency, resistance, and choice; awareness of these factors in the context

of resocialization allows a more nuanced understanding of the process.

resource mobilization theory

Bob Edwards

A renaissance of social movement research occurred in both North America and Europe during the 1970s as a then younger generation of scholars sought to understand the emergence, significance, and effects of the social movements of the 1960s (see Jenkins 1983; McAdam et al. 1988; Dalton et al. 1990). On neither side of the Atlantic did the received academic wisdom of the 1950s and 1960s view social movements in a

favorable light. In the US, the most hospitable theories treated social movements as temporary disequilibria soon to be reintegrated into smoothly functioning social systems. In Europe, "new social movements" theory formed around the core problematic of explaining the origins, identity, and cultural significance of newly emerging social change constituencies (Melucci 1980). By contrast, resource mobilization theory tended to take the existence of such constituencies for granted in order to explain how they mobilized effectively to pursue desired social change. Both resource mobilization and new social movement theories are variants within the broader conflict paradigm in sociological theory. Resource mobilization predominated in the rapidly growing sociological subfield of social movement research (Gamson 1968, 1975; Oberschall 1973; Freeman 1975; McCarthy & Zald 1977; Tilly 1978; McAdam 1982; Morris 1984; Zald & McCarthy 1987; Staggenborg 1988; Tarrow 1994).

The organizational entrepreneurial branch of resource mobilization theory (RMT) reoriented social movement analysis by taking the analytical insights of organizational sociology and extending them by analogy to social movements. More recent exemplars of this perspective include Minkoff's (1995) analysis of women's and race/ethnic organizations, Smith et al. (1997) on transnational social movement organizations, Andrews's (2005) study of the impact of the Civil Rights Movement, and a special issue of *Mobilization* edited by Caniglia and Carmin (2005). From this perspective a social movement is a set of preferences for social change within a population. Individuals who share those social change preferences are called *adherents*, while those who contribute resources of various kinds to help the movement mobilize are *constituents*. Those who watch from the sidelines are *bystanders*. A key analytical issue for RMT is understanding how social movements turn bystanders into adherents and subsequently adherents into constituents, and ultimately mobilize constituents to active participation. Such tasks of mobilization are undertaken most often by *social movement organizations* (SMOs).

In their classic formulation, McCarthy and Zald identified a trend in US social movements toward the increasing significance of large, formally organized SMOs deploying professional

staff to pursue the broad social change goals of their constituents. Early RMT was closely associated with the trend toward professionalization and debates over its impact were a focus of much research (Staggenborg 1988; Andrews & Edwards 2004). Yet, while many SMOs are quite large with professional staffs and substantial resources, most are small, less formally organized groups operating at the local level (Edwards & Foley 2003). At a minimum, an SMO is a named group that undertakes actions to further the social change goals of the social movement.

All SMOs pursuing the goals of the movement comprise a *social movement industry* (SMI). SMIs vary in size, and the capacity of a movement to engage in collective action is influenced greatly by type, amount, and distribution of resources within its SMI. RMT expects that the greater the mobilization capacity of an SMI, the greater its potential for achieving some of its social change goals. The broader *social movement sector* (SMS) is composed of all SMIs and their component SMOs. In leaning on organizational sociology to reorient the study of social movements, RMT holds that SMIs and SMOs differ from governmental and market sector organizations because of watershed differences in goals, their structural location in civil society, and in the varied resources and power they wield. Nevertheless, the SMS has grown dramatically over the last 30 years and has contributed to the increasing social change potential attributed to "civil society" worldwide.

Early formulations of RMT focused on broad patterns of resource availability and paid disproportionate attention to the mobilization of material resources from external sources. By contrast, recent RMT analysts emphasize more explicitly the uneven distribution of resources in a society, and seek to understand how individual and collective actors endeavor to alter that distribution in order to direct resources to social movements. In other words, RMT is becoming more explicitly a partial theory of overcoming resource inequality. Thus, questions of general resource "availability" have shifted toward questions of specific means of resource access.

Two longstanding debates about resource access center around whether social movements obtain their support primarily from internal or external sources and the closely related question

about the extent to which external supporters constrain movement goals and activities. Recent developments in RMT seek to reframe this debate in several ways. Research has made it clear that social movements and individual SMOs generally obtain their resources from a combination of internal and external sources. All but the very smallest SMOs gain access to resources by multiple means. Four mechanisms of resource access are particularly important: self production; aggregation from constituents; appropriation/cooptation; and patronage (see Edwards & McCarthy 2004).

Self production. A fundamental mechanism by which social movements gain access to resources is to produce those resources themselves through the agency of existing organizations, activists, and participants. Movements produce social organizational resources when they launch SMOs, develop networks, and form issue coalitions. They produce human resources by socializing their children into the ways and values of the movement, or by training participants and developing leaders. Movements like those for civil and human rights have produced out of their struggle a moral authority that is a powerful resource. Social movements also produce items with movement symbolic significance like T shirts, coffee mugs, posters, art, and even cakes and cookies for bake sales which can be sold to raise money or used directly to promote the movement.

Aggregation. Resource aggregation refers to the ways a movement or specific SMO converts resources held by dispersed individuals into collective resources that can be allocated by movement actors. Social movements aggregate privately held resources from beneficiary and conscience constituents in order to pursue collective goals. Monetary or human resources are aggregated by soliciting donations from broadly dispersed individuals in order to fund group activities, or recruiting volunteers to help with an activity. Yet, social movements also aggregate other types of resources as well. For example, moral resources held by others can be aggregated by compiling and publicizing lists of individuals and organizations that endorse group goals and actions, as is common in the global justice movement currently.

Cooptation/appropriation. Social movements often utilize relationships they have with

existing organizations and groups to access resources previously produced or aggregated by those other organizations. Resource cooptation generally carries the tacit understanding that the resources will be used in mutually agreeable ways. In the US context, churches and church related organizations have probably produced resources most often coopted by social movements from buildings, members and staff, social networks, rituals and discourses or moral authority.

Patronage. Social movements also gain access to resources through patronage. Patronage refers to the provision of resources to an SMO by an individual or organization that often specializes in patronage. Foundation grants, private donations, or government contracts are common in financial patronage. In monetary patronage relationships patrons external to the movement or SMO provide a substantial amount of financial support and usually exert a degree of control over how their money can be used. Patrons may even attempt to influence an SMO's policy decisions and day to day operations. Human resources can be acquired through patronage relationships as when one SMO loans staff to another for a set period of time, as is common in issue campaigns or coalitions.

Despite the obvious centrality of resources to RMT, analysts were slow to develop a clear conceptualization of resources. Analysis and often heated debate focused on a narrow range of material and human resources. Yet, resources important to social movement mobilization are more varied. In recent years RMT analysts have benefited from broader developments in social science and made considerable gains in specifying and differentiating between different types of resources. Five distinct types of resources will be discussed below: moral, cultural, social organizational, human, and material (see Edwards & McCarthy 2004).

Moral resources. Moral resources include legitimacy, integrity, solidary support, sympathetic support, and celebrity. Of these, legitimacy has received the most theoretical attention, and celebrity perhaps the least. Collective actors who most closely mimic institutionally legitimated or "mainstream" expectations gain advantages over groups that fit those expectations poorly. Similarly, celebrity endorsements of an issue campaign can increase media coverage, generate

public attention, and open doors to policymakers and resource providers alike. Moral resources tend to originate outside of a social movement or SMO and are generally bestowed by an external source known to possess them, as in a celebrity lending his or her fame, the receipt of awards like the Nobel Peace Prize by a prominent activist, or the certification by an external credentialing body like the Internal Revenue Service. Nevertheless, some movements succeed in the difficult task of creating moral resources, as was clearly the case with the US Southern Civil Rights Movement or more recently the international human rights movement. Because moral resources can often be retracted, they are both less accessible and more proprietary than cultural resources.

Cultural resources. Cultural resources are artifacts and cultural products such as conceptual tools and specialized knowledge that have become widely, though not necessarily universally, known. These include tacit knowledge about how to accomplish specific tasks like enacting a protest event, holding a news conference, running a meeting, forming an organization, initiating a festival, or surfing the web. This category includes tactical repertoires, organizational templates, and technical or strategic know how required to either mobilize, produce events, or access additional other resources. Specific cultural resources are widely available in a given society, but neither evenly distributed nor universally available. In other words, not every member of a society or social group possesses specific competencies or knowledge that could be valuable to a social movement or SMO. This points to a key difference between cultural and moral resources. Cultural resources are more widely accessible and available for use independent of favorable judgments from those outside a movement or SMO. Cultural resources include movement or issue relevant productions like music, literature, magazine/newspapers, or film/videos. Such cultural products facilitate the recruitment and socialization of new adherents and help movements maintain their readiness and capacity for collective action.

Social organizational resources. There are three general forms of social organizational resources: infrastructures, social networks, and organizations, each varying in its degree of organizational formality. Infrastructures are the

social organizational equivalent of public goods like postal service, roads, or the Internet that facilitate the smooth functioning of everyday life. Infrastructures are non proprietary social resources. By contrast, access to social networks and especially groups and formal organizations can be limited by insiders. Thus, access to resources embedded in them can be hoarded by insiders and denied to outsiders. Such differential access only intensifies existing inequalities among groups in their ability to utilize crucial resources of other kinds. This resource category includes both resources intentionally produced by social movements to further their aims, like SMOs, and those produced by others for non movement purposes but coopted by social movements, like churches, schools, service organizations, occupational groups, or more broadly civil society. The ease of SMO access to resources produced by others for non movement purposes will vary depending on the perceived compatibility of the groups involved.

Human resources. Human resources are both more tangible and easier to appreciate than the three resource types discussed so far. This category includes resources like labor, experience, skills, expertise, and leadership. Human resources are characteristics of individuals rather than of social organizational structures or culture more generally. Individuals typically have control over the use of their labor and human resources and make them accessible to social movements or SMOs through participation. Yet, not all participants offer the same mix of capabilities. SMOs often require expertise of varying kinds and having access to lawyers, web designers, dynamic speakers, organizers, or outside experts when the need arises can be vitally important. Yet, the use value of expertise often depends on the situation. For example, a prominent scientist may have little more to offer than a high school intern if an environmental group needs to restore its web page after a crash. Similarly, a celebrated musician participating in a blockade contributes no additional human resource to the blockade, yet, from the standpoint of the moral resources contributed by the celebrity's presence, the evaluation would be much different.

Material resources. The category of material resources combines what economists would call financial and physical capital including

monetary resources, property, office space, equipment, and supplies. The importance of monetary resources for social movements should not be underestimated. No matter how many other resources a movement mobilizes, it will incur costs and someone has to pay the bills. Material resources have received the most analytic attention because they are generally more tangible, more proprietary, and in the case of money more fungible than other resource types. In other words, money can be converted into other types of resources while the opposite is less often the case.

Combining the four means of access with the five types of resources discussed above specifies 20 specific exchange relationships through which social movements or SMOs acquire the resources they use to pursue their social change goals. The RMT perspective encourages analysts to consider the range of exchange relationships through which specific SMOs, coalitions, issue campaigns, or event organizers mobilize resources. By contrast, the long debate among social movement analysts over the extent to which acquiring resources from external sources constrains the actions of SMOs has been cast very narrowly. From the RMT perspective sketched here, that debate focused almost exclusively on a single exchange relationship – monetary patronage. Yet, the typical SMO, much less SMI, simultaneously manages numerous exchange relationships. Each exchange relationship that makes resources accessible also carries a set of expectations and obligations between the parties, giving each relationship varying potential for social control. For example, the exchange relationship involved in an SMO aggregating small donations from a dispersed list of external conscience constituents will not constrain the group's actions as much as if they received the same amount of money through the monetary patronage of a single large donor, everything else being equal.

restrictive covenants

Jerome Krase

Restrictive covenants are deed restrictions on particular kinds of real estate. For example, they may restrict use of land in a subdivision to residential purposes only and define the maximum and minimum square footage of homes to be built. They might also place restrictions regarding construction of other buildings on the property, as well as control activities that take place within its boundaries, such as rentals. Real estate professionals argue that such legal restrictions give a development a more standard appearance and when enforced, protect property values. Racially restrictive covenants were legally enforceable contractual agreements between property owners and neighborhood associations that prohibited the sale, occupancy, or lease of property and land to certain ethnic and racial groups. While now unenforceable by the courts, racially restrictive covenants had been one of the primary ways by which access to housing had been blocked for racial and ethnic minorities.

During the long history of housing discrimination in the US there have been many ways by which access has been blocked for racial and religious minorities. In the past the major pillars of segregated neighborhoods such as racially restrictive covenants were *de jure* or legal. Since Fair Housing in 1968 even the publication of a real estate ad that indicates preferences, limitations, or other discrimination based on race, color, religion, sex, handicap, familial status, or national origin has been illegal. That is not to say that *de facto* segregation and discrimination no longer exists. "Gentlemen's agreements," informal networks, and other voluntary agreements between realtors and homeowners, and among owners themselves, make it possible for housing discrimination to continue. *De jure* discrimination which is not overtly racial or ethnic for example may also continue in the form of zoning, and in residential developments which are limited to specific incomes, ages, and family status. In this way builders and developers can also perpetuate *de facto* class and racial segregation through the use of non racial restrictive covenants.

Prior to the turn of the twentieth century, legal restrictions on the transfer of and sale of property to people of color were usually contained in individual deed restrictions. After 1910 the use of restrictive covenants became more widespread through the promotional efforts of large "community builders," local real estate boards and national real estate associations, especially the National Association of Real Estate Boards created in 1908. During the 1910s and 1920s, state courts upheld and enforced these racially restrictive covenants and argued that they did not violate the due process rights of non white citizens. Ironically, racial discrimination in housing was also supported by liberal reformers who equated black neighborhoods with crime and other social pathologies. Therefore, it was agreed that the presence of non white residents would decrease property values. Racially restrictive covenants were the primary mechanism used by the emerging real estate industry to create and maintain racially segregated neighborhoods in response to the Great Migration of rural Southern blacks to the urban North as well as the 1917 *Buchanan v. Warley* US Supreme Court ruling that made racial zoning ordinances unenforceable.

By 1920 it was unethical for real estate firms and land developers *not* to restrict certain ethnic groups, especially blacks, to specific areas of the city through the use of racially restrictive covenants. These stigmatizing ideas further contributed to the “racialization of urban space” by linking race and culturally specific behavior to place of residence in the city. It could be argued that the rise of the modern real estate industry was crucial in the creation of segregated neighborhoods beyond the South through the use and enforcement of racially restrictive covenants. Other significant groups who were victims of racially restrictive covenants were Asians, Jews, and Latinos. It was estimated that until 1948 racially restrictive covenants were in place in more than half the new subdivisions built in the US. As a result, these discriminatory practices influenced the shape of entire subdivisions and metropolitan areas.

Another powerful example of institutionalized racism was the Federal Housing Administration, established in 1934, which instructed in its manual that blacks were adverse influences on property values and therefore homes should not be federally insured unless there is a racially restrictive covenant. Although the agency removed the racially explicit language in the 1950s, it found expression by private insurers, as well as in codes of ethics for realtors, until the 1970s.

In 1948 the Supreme Court held that restrictive covenants were illegal, and more importantly, that government could not help enforce them (*Shelley v. Kraemer*). Shelley, an African American family, argued that racially restrictive covenants in deeds violated their constitutional rights. Specifically, the petitioner contended that the racially restrictive covenant violated the Equal Protection Clause of the Fourteenth Amendment and the court ruled in its favor. However, it is important to note that the Supreme Court did not specifically renounce racially restrictive covenants. It held that the covenants alone did not violate constitutional rights. Rather, the judicial enforcement of racially restrictive covenants violated the petitioner's rights because it was an action of the state. This decision helped other challenges as courts throughout the nation cited Shelley in racially restrictive covenant cases, so that today they are no longer legal.

retirement

Angela M. O'Rand

Retirement has traditionally been defined as an age related and permanent transition from an income status based on employment to one based on transfers and assets at the end of the work career. The relationship of retirement to age has been defined more by state and market institutions that have provided age based incentives to exit the labor force than by the physical aging process itself. These institutions developed since the late nineteenth century to replace income from earnings with pensions and to support access to health care systems through public and private insurance systems, although they vary across countries in their eligibility criteria and share of public funding support. However, all countries now confront major fiscal challenges associated with population aging, economic restructuring at a global level, and

changing family and household arrangements that are motivating the reorganization of income and health support policies. As such, the institution of retirement is changing.

RETIREMENT IN US HISTORY

The major demographic trend over the twentieth century associated with these institutions in the US was the decline in labor force participation of the elderly, and especially of elderly men (Costa 1998). Early in the twentieth century, ill health and unemployment were factors in this decline. However, the spread of pensions across the public and private sectors contributed increasingly to older men's labor force exits. The passage of the Social Security Act in 1935 established 65 as the age of eligibility for worker retirement. Thirty years later, age 65 was the most common age of retirement. This legislation also accelerated the spread of private pensions whose benefit calculations – based on age, years of service, and salary levels – became strong inducements for pension covered workers to remain with their employers until eligibility for their private pensions or for both Social Security and their pensions. However, these private pensions were available in only the most advantaged labor markets, including manufacturing, communications and transportation, and financial and professional sectors. Service and trade sectors offered far less pension coverage.

By the 1960s two contrasting patterns associated with retirement emerged. The first was the “discovery” of poverty among the elderly; one in three elderly persons fell below the poverty line. Medicare, an array of community level programs under the rubric of the Administration on Aging, and early reduced benefit retirement at age 62 were implemented over the years following this discovery to respond directly to the needs of this subgroup. The Supplementary Security Income program was also enacted in 1972 to add a final safety net for the poorest retirees without eligibility for normal worker Social Security benefits.

Since the implementation of these programs, lower income groups comprised largely of minorities and women have tended to retire earlier (at age 62). Longitudinal studies of their retirement experiences have revealed that the

disadvantages among these groups accumulate after retirement, placing them at higher risks of poverty and institutionalization in old age (Haveman et al. 2003). Moreover, a significant portion of this group moves onto Social Security retirement benefits from disability rolls and from years of under employment and unemployment (Flippen & Tienda 2000). Current trends related to escalating medical costs and out of pocket expenses among the elderly have added to the deteriorating life conditions of these elderly groups.

The other pattern that was observable by the late 1960s was the emergence of a “pension elite”: a subgroup of retirees who benefited by the spread of generous pensions, some of which were linked to retiree health insurance. After 30 years of tenure with the same employer, pension covered workers began to retire earlier than the age of Social Security eligibility. Higher pension wealth coupled with access to early Social Security spawned the trend towards “early retirement,” which persisted among men until the 1990s. Figure 1 displays the trend towards acceptance of early (and reduced) worker benefits among men and women between 1970 and 2000. In 1970 a very small portion of retired men's benefits were being distributed at aged 62 (about 19 percent). This portion more than doubled by 1985, then rose slowly and finally reversed by 2000. Women have had higher rates of early retirement than men, historically. However, their pattern somewhat parallels men's: the trend in women's early retirement rates peaked in 1985 and has fallen since.

What happened between the 1980s and 1990s to slow (and perhaps reverse) these trends? First, structural changes that altered the relationship between employers and workers steadily accumulated over this period. Long term employment relationships, once the hallmark of industrial and related sectors, were abandoned and replaced by outsourcing, offshore labor markets, and contingent arrangements as global market competition and economic restructuring increased (Levy 1998). This shift was especially evident in new forms of pensions that were offered to replace the traditional defined benefit plans. The new plans moved the responsibility for pension saving to workers, whose sheltered contributions were allocated to a mix of stock, bond, real estate, and related holdings

Figure 1 Percent Social Security distributions to early retired worker benefits by gender between 1970 and 2000.

Source: Social Security Administration (2004) *Annual Statistical Supplement to the Social Security Bulletin*, Table 6.B5.

selected and managed by workers themselves. Pensions can no longer be expected to provide predictable lifetime benefits easily calculated from pre retirement earnings, years of service, and age. Rather, the pensions that now predominate in the workplace are account balances accumulated through workers' voluntary contributions and affected by their risk preferences for investing these accounts. The stock market bubble of the 1990s influenced workers' behaviors, leading them to exit work at the peak of the boom and to delay their retirements when the bust occurred (Gustman & Steinmeier 2002). Moreover, some scholars argue that this structural change will be pivotal in extending the trend away from earlier retirement among the baby boom cohorts born between 1946 and 1964 (Hughes and O'Rand 2004).

Second, demographic changes have amplified the impact of structural change. Chief among these changes are the extension of life expectancy, women's increased labor force participation over the life span, and changing family and living arrangements across age groups. Life expectancy in the US has increased more than 60 percent over the twentieth century, from 47 years in 1900 to 77 years in 2000. A significant trend underlying these aggregate figures is the

more rapid growth of those aged 85 and older, termed the "oldest old" and comprised primarily of single women (Himes 2001). Consequently, the number of years between early and normal retirement and average life expectancy are increasing and rapidly feeding concerns about the future fiscal health of pension and health insurance systems to support growing dependency.

Accompanying these life expectancy projections are increases in the heterogeneity and inequality of the older population. Ethnic, class, and gender differences stratify the older population to be among the most unequal in advanced industrial societies. Married couples persist as the most advantaged in income and benefit receipt, while single individuals (especially divorced and widowed women) are at high risk of poverty, in part as a result of their more limited earnings histories and in part as a result of pension policies that privilege traditional marriage and penalize nontraditional living arrangements. The demographic diversity of the baby boom cohorts in these regards (i.e., higher levels of income inequality, higher rates of divorce, and greater ethnic heterogeneity than earlier cohorts) have combined with structural changes in the workplace and reforms of the

Social Security Act to alter future patterns of retirement in ways that will increase the variability in retirement timing with such diverse patterns as the delay of final labor force exits or the combination of retirement with continued labor force participation (Hughes & O'Rand 2004).

CROSS NATIONAL PATTERNS

Other advanced industrial societies have preceded the US in both population aging and early retirement. Fertility rates decreased in Europe earlier than in the US. In addition, efforts to control the age composition of the labor force to make more room for younger workers encouraged early retirement in European countries (Kohli et al. 1991). These trends in Europe are challenging their more publicly based pension and health insurance systems (Esping Andersen 1999). At the same time, less advanced countries are also facing population aging and are being forced to confront the challenges of population aging and global restructuring in the development of their policies.

Most advanced countries have been proposing and/or implementing changes in their policies in order to discourage early retirement

behaviors. Figure 2 compares the differences between average life expectancy and statutory early retirement ages for workers in six countries as of 2002. The disparities between life expectancy and the earliest pensionable age of men and women varied slightly from country to country. The gender differences in life expectancy were generally consistent, but gender specific versus gender neutral policies related to retirement timing varied. In the case of the US, age 62 is the earliest pensionable age for all workers and 65 the normal age – at least until the baby boom cohorts begin to retire; then full benefits will be extended to age 66 for the early boomer cohorts and continue to shift upward to age 67 for the later boomers and younger cohorts. In addition, the levels of early benefits at age 62 will be cut for these groups to discourage early retirement further.

Other countries are shifting their gender related policies and also changing tax and benefit schedules. The United Kingdom and Germany have adopted gender neutral policies since 2002, to be implemented over the future, that raise statutory retirement for all to age 65 with no earlier option for future cohorts. Austria and Japan have retained early retirement options, but made full retirement the same for women and men at age 65. And Sweden, which has been among the most socially democratic

Figure 2 Comparison of early retirement age to life expectancy by gender across six countries.

welfare systems, has shifted towards policies to discourage early retirement by linking benefits to individual contribution levels, while still retaining gender neutral early and late age thresholds (Social Security Administration 2002).

In short, retirement policy is on the table throughout the world (Social Security Administration 2002). Some developing countries (like Spain and China) have moved to gender neutral policies, while others (like Brazil) have not. Key concerns of these countries are centered on economic development and the inclusion of larger proportions of their populations in the formal economy. But above and beyond economic development issues, the demographic pressures of population aging and the changing roles of women in the marketplace are relevant to the development of retirement policies.

retirement communities

Gordon Streib

Retirement communities are residential areas designated by federal law requiring, for the purpose of excluding younger residents, that at least 80 percent of their occupied dwelling units must have at least one person of 55 years of age or older living there, and that the communities must publish and follow policies and procedures that demonstrate an intent to be 55 and older housing. This legal definition does not describe the wide range of communities housing older persons. There are two major kinds of retirement communities: (1) Planned Leisure Oriented Retirement Communities, and (2) Continuing Care Retirement Communities (CCRCs). A third type is called Naturally Occurring Retirement Communities. These do not need to meet the precise legal requirements, but their age dense populations qualify them as a type of retirement community. In addition, public housing projects primarily restricted to low income older persons are mostly for retirees, although some projects permit younger disabled persons to live there.

Demographic and political economic social forces have shaped the context for retirement communities. The gradual increase in life expectancy in the US and the related increase in the older population has provided the base for specialized housing of many varieties. The political economic factors are complex and provide basic economic security for many older persons. The economic fundamentals include public programs, notably Social Security and Medicare, public and private pension plans, plus savings and a high amount of home ownership. The

latter is important for those older persons who move permanently to a retirement community and also for seasonal residents ("Snow Birds") who have a second home in the Sunbelt.

The major components of the retirement housing industry involve available land and real estate developers who recognize there is a market for specialized housing for older persons. The high amount of occupational and residential mobility experienced by many Americans makes them amenable to both seasonal and permanent moves to warmer climates.

Retirement communities are labeled correctly because the overwhelming majority of residents have left the labor force. The possibility of an early retirement made possible by Social Security has undoubtedly added to the interest in retirement community living. The exploration of residing in a new setting leads many older persons to consider the services and amenities provided by developers for this new "leisure class."

The retirement community industry has grown and changed over the past half century. After World War II mobile home parks and modest homes (both for rent and for purchase) developed for the growing cohort of retirees. Over time these early communities have provided very economical housing for the lower end of the retirement community market. In recent years the kind of housing, the amenities, the services, and the ambience have become more upscale. Some older communities have now become economically stratified. In the older growing communities, like the Sun Cities, neighborhood stratification can be easily identified by the type of housing, lot size, and adjacent leisure facilities. However, it must be noted that in these larger communities there is a broad array of programs and activities that involve residents with a wide range of income. Some communities are income differentiated, but that is not always the case in large, older, class integrated communities.

CCRCs are a burgeoning aspect of the industry involving both profit and not for profit sponsorship. The CCRCs developed from the concept of life care or continuum of care that provides a full range of services to meet changing needs as older persons become functionally impaired. A CCRC usually has three levels of living: independent housing, assisted living,

and 24 hour nursing care. The leadership for CCRCs emerged primarily from the not for profit sector as some religiously affiliated homes adapted services to changing needs. Providing housing and care for members, clergy, and their widows has a long history in different religious traditions. The typical CCRC today is controlled by a complex set of federal and state regulations to protect residents who usually must pay a sizable up front fee in addition to monthly service charges.

Another growing segment of the industry is retirement communities of various kinds that are now being built in or near major metropolitan areas. These communities may be either leisure oriented or CCRCs and often serve higher income persons who choose to remain in the area where they have lived in order to continue contact with family, kin, and friends, and also to enjoy the cultural, social, and recreational opportunities that are available in metropolitan areas.

CCRCs affiliated with universities are also a growing part of the market. Signed agreements spell out the reciprocal arrangements in which schools and colleges (e.g., nursing, physical education, music) have staff and students working at or studying the living environment of the CCRC. The residents have opportunities to attend programs, lectures, musical events, galleries, or sports events at the affiliated university.

Retirement communities may be located in terms of theory and research in the fields of sociology and gerontology. The proliferation of specialties in these fields and the complexities of modern society result in a diffused agenda. There is an opportunity for integration of theoretical approaches and research methods. As one surveys sociology and gerontology, one notes different models, paradigms, and perspectives. Various qualitative and quantitative methods are adapted and employed, but most research has been descriptive.

A theoretical grounding for studying age dense communities based on Durkheim's concept of social integration, as well as the later concept of age segregation derived from the racial integration segregation arguments, was developed by social gerontologists. Although some earlier writers viewed the age segregation inherent in retirement communities in a negative light, Rosow (1967) and Osgood (1982)

provided theoretical and empirical support for their socially integrating capacities.

A useful orientation to age dense housing in general and specifically to retirement communities is the work of Charles Lindblom (1977): "In all the political systems of the world much of politics is economic, and most economics is political" (p. 8). This orientation has been adapted to studying the linkages of retirement communities to local, state, and national political and market structures. Political economic embeddedness provides the context for retirement communities with attention to the specifics of locality, and research has shown that retirement communities generally have a positive economic impact on the surrounding area.

Another theoretical orientation is socio historical or evolutionary. Although retirement communities are of recent historical vintage in the US, there are older evolutionary developments in some European countries. Great Britain and the Scandinavian countries have evolved unique retirement communities that are contextually congruent with their cultures and climates. Social democracies have been adaptable and more systematic in meeting the housing needs of older persons than the market driven US.

Suzanne Keller (2003: 215) concludes her 30 year study of a planned community reflecting on "the territorial community as an anchor of human existence." Her research is based on a nuanced adaptation of community (*Gemeinschaft*) and society (*Gesellschaft*) originated by Ferdinand Tönnies. The concepts are analytically distinct, but in real life they interact, and the boundaries must be determined empirically in retirement communities.

Much research has shown that the residents of retirement communities are overwhelmingly satisfied with their choice of this living environment. Research on conflict in retirement communities, however, indicates that a few residents view participation in community conflict as a form of "recreation." Conflict is socially constructed by a few individuals and some groups. Most of the residents stay out of community disagreements or stay on the margins. Unless their economic interests or basic style of life are threatened, or a major change is involved, the residents generally will attempt to avoid situations resulting in conflict. Residents generally are sensitive and concerned that they not

give offense. Conflict with administration is minimized if the management is perceived as benign. Democratic procedures are valued, but decision making is usually left in the hands of management.

A considerable literature on retirement communities has concentrated on the internal structure and activities that take place. There are persons who practice an active lifestyle and they are a visible minority who are highlighted for marketing goals. A less visible majority practices a more sheltered and passive lifestyle, with television and reading occupying their time. CCRCs provide some transportation services for their residents, but most retirement communities expect that residents will drive a car. When physical limitations make driving difficult, the loss of independence is felt keenly, although caring neighbors may offer help. Travel to places outside the community to shop or visit family and friends provides an occasional break for many.

Activities are an important, opportunistic way to create new acquaintances and friendships. Some relationships could be described as friendship with social distance. Participation in the life of the community is a way to avoid being marginalized. Personality and sociability skills are important factors in participating and making new friends. Widows, widowers, singles, and newcomers may live on the margin unless they exercise some initiative. The aging in place of the populations evolves slowly into a decline in community participation and the activists are challenged to find new leadership and participants for programs.

Theoretical ideas derived from sociology of consumption could provide future research directions for students of retirement communities. Older persons deciding to move are making decisions that go beyond buying a home because the structure and functions of retirement communities are different from the typical housing subdivision. The prospective residents are concerned not only with costs, quality, and location, but also with lifestyle, services, amenities, safety, and community spirit. Some of these aspects may be involved in the purchase or renting of a home by younger persons, but the potential retirement community residents are asking new questions related to community involvement from an older person's perspective.

Rational choice may enter the consumer's decision making in different ways because the final choice is not a housing move related to employment, and the time pressures are less stringent. The prospective retiree often personally visits many communities for several years before deciding on his or her choice. Family relationships, finances, legacies, and health status are involved in intricate ways. Moving to a CCRC considerably reduces dependency on children, kin, or friends. However, rational choice theory does not explain why so many older persons do not choose to move to a retirement community. Only about 5 percent finally move. Economic considerations are only part of the answer, for ageism may be more important. Some older persons are repelled by the idea of living in an age dense community. How a person defines his or her personal aging requires research in terms of consumer theory.

The future direction of retirement communities in terms of theory, research, and methodology lies in part in the adaptation of perspectives outlined above. However, the future sociology of retirement communities will also be strongly influenced by the realities of the political economic context and on how incoming cohorts (e.g., baby boomers) individually and collectively make decisions about home ownership, financial security, migration patterns, and residential preferences. The Golden Age of Retirement their parents experienced will probably be an uncertain template for their decision making.

revolutions

John Foran

Ever since the French Revolution of 1789, revolutions have helped define the modern age. Though rare events, they have been associated with the emergence of, and transitions to, democracy, capitalism, and socialism. They are significant as often inspiring, human directed attempts to refashion the world for the better; they have also typically fallen far short of the goals of their makers. Their complexity has challenged scholars and revolutionaries alike – just as consequences have been unforeseen and outcomes uncontrollable by actors, prediction has proven next to impossible for scholars, and even the more modest goal of explanation has opened up extensive debates about the causes, makers, and outcomes of revolutions.

Currently, the study of revolutions has flowed into ever more ambitious theoretical syntheses, comparative studies, and new topics, including the roles played by emotions, culture, race/ethnicity, gender, and social class. As the world enters further into the twenty first century and the era of globalization, the issue of

the continued relevance of revolutions, and the possibility that they are changing in nature, will challenge the sociological imaginations of some of the best students of social change, as well as pose crucial tasks for the practical application of strategies of radical social change among activists seeking solutions to some of the world's most acute social problems.

DEFINITIONS AND METHODS OF STUDY

Among many definitions of *social revolutions*, or the great revolutions of history, Theda Skocpol's remains the most widely cited and in many ways is still unsurpassed: "Social revolutions are rapid, basic transformations of a society's state and class structures; and they are accompanied and in part carried through by class based revolts from below" (1979: 4). This definition stresses the conjuncture of deep political and socioeconomic change with the mass participation of social forces. It has the virtue of leaving violence – a commonsense element of revolutionary change – to the side, allowing us to consider non violent paths to revolution, as in Chile 1970, Iran 1979, Eastern Europe 1989, and in Chiapas since 1994. It does not specify how much social change qualifies an event as a social revolution, nor how rapidly the process must occur, which means that scholars will argue over whether particular cases merit inclusion.

We can also use this definition to distinguish the more thorough going social revolutions of France 1789, Mexico 1910, Russia 1917, China 1949, Cuba 1958, and Iran 1979 from *political revolutions*, where the holders of state power change through mass participation but without deep social transformation, such as the "People's Power" movement that toppled Ferdinand Marcos in the Philippines in 1986, the fall of dictators like Mobutu in Zaire in 1996 and Duvalier in Haiti in 1986, the collapse of the Manchu dynasty in China in 1911, and the end of apartheid in South Africa in 1994. Mass participation by revolutionaries that fails to change either government or social structure is classified as a *failed or attempted revolution*; examples include El Salvador, Guatemala, and Peru in the 1980s, or China's Tiananmen Square uprising in 1989. When power is seized by the

army or an elite movement and then turned somewhat surprisingly in the direction of radical social transformation, we speak of a *revolution from above*, such as those of the 1868–73 Meiji Restoration in Japan, Atatürk in 1920s and 1930s Turkey, Nasser in 1952 Egypt, or the revolutionary armed forces of Peru between 1968 and 1975.

Two other sets of cases also qualify as social revolutions: one set consists of the *anti colonial* revolutionary movements that achieved relatively deep social change in Algeria in the 1950s, Angola, Mozambique, and Zimbabwe in the 1970s, and Vietnam's long struggle for independence from 1945 to 1975. The main difference of these cases when compared with the classical social revolutions is the overthrow not of an internal regime but of a colonial power – France, Portugal, England, or (indirectly in Vietnam) the United States. Many such movements of national liberation do not, however, result in the degree of social transformation that would earn them the title of social revolution, as in most of Africa after World War II, or in India in 1947. A final set of cases might be termed *reversed revolutions*, instances of social revolution where revolutionaries achieved power and embarked on a process of social transformation but could not hold onto that power more than a few years, usually falling to a combination of external intervention and its internal right wing and military allies, as with Iran from 1951 to 1953, Guatemala 1944–54, and Chile's elected socialist government from 1970 to 1973, or Nicaragua's Sandinistas who governed from 1979 to 1991 when they lost elections, and Grenada's New Jewel Movement which overthrew the dictator Eric Gairy in 1979 but self destructed in a power struggle that opened the door to US invasion in 1983.

These typologies are important for distinguishing different phenomena that can be grouped under the general rubric of revolutions. For most sociologists of revolution, the focus has been on the set of fewer than 20 instances of social revolution, whether these be classical, anti colonial, or reversed revolutions. It is noteworthy that with the exceptions of France, Russia, and Eastern Europe, all the rest have occurred in the third world regions of Latin America, Africa, Asia, and the Middle East, with the most in any one region coming from

Latin America. The reasons for this will be explored below.

The methods of studying such complex phenomena are diverse: we have many fine archival based histories, some excellent ethnographic based work, and a few notable quantitative studies (Paige 1975; Goldstone 1991), but leaving aside single case studies, the vast majority of sociological work on revolutions has been comparative historical in nature, with sets of cases ranging from two or three to several dozen, and sources ranging from archival and other primary documents to the secondary scholarship of historians and social scientists. The most common methodologies for comparing cases have been John Stuart Mill's methods of agreement and difference, brought into the study of revolutions by Skocpol (1979), and more recently Boolean or qualitative comparative analysis, as developed by Charles Ragin (1987) and first used by Timothy Wickham Crowley (1992), which is suitable for studies involving more than a half dozen cases. Some studies combine these methods with each other, and with such approaches as regional/ecological analysis, demography, content analysis, or interviewing. A younger generation of scholars is doing more intensive fieldwork, inspired by new theories of agency, culture, and race, class, and gender.

A BRIEF HISTORY OF THEORIZING ABOUT THE CAUSES OF REVOLUTIONS

Given the multiple possible determinants of these rare, large scale events, it should come as no surprise that theories about their causes have been offered by successive generations of historians and social scientists, and that there has never been general agreement among them. The French Revolution put this question on the agenda, and one of its first and most insightful interpreters was Alexis de Tocqueville, writing 70 years later, who noted the importance of the state and elites, village autonomy, and ideology in bringing about the revolution, arguing that the moment of greatest danger for an autocratic regime was when it started granting reforms, for this only encouraged people to demand more: "For it is not always when things are going from bad to worse that revolutions break out. On the

contrary, it oftener happens that when a people which has put up with an oppressive rule over a long period without protest suddenly finds the government relaxing its pressure, it takes up arms against it" (Tocqueville 1955 [1856]: 176).

Another influential theorist of the French Revolution was Karl Marx, who stressed the role played by class struggles as structured by the mode of production (the unequal social relations that arise from a particular labor process) found in societies undergoing economic transition. For Marx, the key to understanding revolution was the tensions generated by vast economic transformations, resolved only when exploited social classes organized to take possession of political power. Thus the French Revolution as well as the earlier English Civil War (1640–88) were considered products of the rise of capitalist economic forms in the midst of feudal societies, and their success spelled the end of feudalism and led to the consolidation of capitalism in the two countries.

The Marxian idea of a socialist revolution was first enacted in Russia in 1917, and that experience gave powerful impetus to one of its organizers, Leon Trotsky, to offer his own theory of its causes. Trotsky lays emphasis on what he calls the peculiarities of Russia's development to explain the paradox of why a largely peasant society was the first to have a working class revolution, making use of a concept called "combined and uneven development," that is, the uneasy mixture of older and more recent forms of social organization, such as the vestiges of feudalism and the emergence of large scale factory production, respectively. He also identifies elements which would become popular much later in the works of Skocpol and other theorists who lay great emphasis on the state: "In the historic conditions which formed Russia, her economy, her classes, her State, in the action upon her of other states, we ought to be able to find the premises [or causes] both of the February revolution and of the October revolution which replaced it" (1959 [1930]: xii). In another memorable line, he anticipates the latest wave of interest in human agency, warning: "Let us not forget that revolutions are accomplished through people, though they be nameless" (1959 [1930]: 249).

Scholarly theorizing in a formal sense took wing in the 1920s and 1930s when comparative historians such as L. P. Edwards (*The Natural*

History of Revolutions, 1927), Crane Brinton (*The Anatomy of Revolution*, 1938), and G. S. Pettee (*The Process of Revolution*, 1938) searched for common patterns among such major revolutions as the French, American, English, and Russian cases. They developed a "natural history" of revolutions to describe their course, emphasizing a sequence of events that started when intellectuals cease supporting the regime, forcing the state to undertake reforms in the face of a crisis it cannot resolve, thus opening a space for a revolutionary coalition to come to power, which in its turn fragments as first moderate reformers are overturned by radicals who often take extreme measures to implement their program, and who in their turn yield power to military leaders before more moderate pragmatic leaders once more return to power.

More descriptive than explanatory, the natural history school led subsequent social scientists in the 1960s to develop models derived from the then dominant paradigm in US sociology of Parsonian structural functionalism, and its relative, modernization theory. The aim of Ted Robert Gurr (*Why Men Rebel*, 1970) and James Davies (1962) was to develop theories of political violence based on aggregate psychological states, notably relative deprivation, a thesis that echoes Tocqueville in arguing that regimes were most vulnerable when a period of growing prosperity raises people's expectations for improvements in their lives, but leads instead to revolt when these expectations are not met. As structural functionalists, Neil Smelser (*Theory of Collective Behavior*, 1962) and Chalmers Johnson (*Revolutionary Change*, 1966) looked for imbalances in the political, economic, or cultural subsystems (arrangements) of a society which disoriented people and made them more prone to embrace radical ideologies. While critics have found these theories wanting because of the difficulty of measuring such aggregate psychological states or the pitfalls of tautological reasoning in knowing whether structural subsystems are in disequilibrium, the value of these approaches lies in their attention to human agency and culture.

This was definitely not the emphasis of a new generation of theorists in the 1970s and after led by Theda Skocpol, probably the single most influential scholar of revolutions, who insisted that "Revolutions are not made; they

come" (1979: 17). She argued that revolutions should be studied in terms of the relations between nations, between the state and the economy, and between social classes, and applied this structural perspective to the French, Russian, and Chinese revolutions, where a common pattern emerged: political crises arose when the state could not meet external military or economic challenges because of a limited agricultural base. In France, foreign wars led to fiscal crisis and efforts to tax nobles led to elite revolts; peasants then took advantage of the crisis and were able to mobilize due to communal solidarity structures. In Russia, collapse in World War I led to state crisis; in China the Japanese invasion and World War II created an opportunity.

Charles Tilly (*From Mobilization to Revolution*, 1978) took the renewed interest in the political causes of revolution in another direction by advancing a "resource mobilization" perspective that draws attention to the organizational and other resources available to contending groups (states, elites, challengers). More recently, he and collaborators Doug McAdam and Sidney Tarrow have elaborated a political process theory stressing the role of such factors as broad socioeconomic processes, expanded political opportunities, and "cognitive liberation frames," the ideas that motivate people into action (McAdam et al. 1996).

Skocpol's emphasis on the state has been extended by Jeff Goodwin (2000), who finds that repressive dictatorships and colonial regimes were most vulnerable to revolutionary challenge across the third world after World War II, a model he extends to the Eastern European revolutions of 1989. Jack Goldstone (1991) used a state centered approach, combined with a demographic analysis of blocked opportunities for marginal elites, to explain why states broke down in early modern Europe and Asia. Tim Wickham Crowley (1992) also followed in Skocpol's footsteps with a structuralist theory of Latin American revolutions looking at the repressive state type he terms "mafiaocracies," the ability of guerrillas to attract peasant support, and the absence of intervention from outside to prevent revolutions from coming to power in Cuba and Nicaragua.

As critiques of state centered structuralism's one sided approach to revolutions emerged in the 1990s, a renewed interest in culture,

agency, and ideas came to the fore, in the work of Eric Selbin (1999) and others who insisted that structural factors could not by themselves bring revolutions to power in the absence of broad coalitions of motivated actors. A new and growing group of theorists, sometimes referred to as the "fourth generation" of scholars of revolution, has attempted to integrate structure and agency, and the political, economic, and cultural dimensions of causality, in a variety of multicausal models of revolution that draw on the insights of many of the theorists who preceded them. An early exemplar is John Walton (1984), whose study of failed revolutions in the Philippines, Colombia, and Kenya takes into account uneven economic development, the role of the state, cultural nationalism, and an economic downturn. Farideh Farhi's (1990) study of Iran and Nicaragua combined Skocpol's emphasis on the state and social structure with a Gramscian analysis of ideology. In a comparative study that covers Eastern Europe, China, Vietnam, Cuba, Nicaragua, Iran, and South Africa, James DeFronzo proposes a model of five factors, including mass frustration, dissident elites, "unifying motivations," a crisis of the state, and "a permissive or tolerant world context" (1991: 10). Misagh Parsa's (2000) study of Iran, Nicaragua, and the Philippines integrates economic factors (particularly the degree of state intervention in the economy) with the ideology of state challengers and the political vulnerabilities of repressive regimes. John Foran's (2005) study of three dozen third world revolutions synthesizes the effects of dependent development, the vulnerabilities of both repressive, exclusionary states and truly open democratic polities which may permit the left to come to power through elections (as in Chile in 1970), political cultures of opposition, an economic downturn, and a world systemic opening, referring to the disruption of supportive ties between the regime and first world powers.

The consuming question, then, of what particular combination of causes is most likely to explain revolutionary success and failure has produced a number of suggestive answers, but is still not settled. What we do know is that a balance must be sought between structure and agency, internal and external factors, and the proper weight and roles of economic, political,

and cultural causes must be addressed. This seems a fitting challenge for those who wish to contribute to the theorizing sketched in above.

THE ISSUE OF ACTORS

A second set of debates revolves around the question of who, precisely, makes revolutions, and why. Until recently, the answer has usually been couched in terms of social class, with some stressing a single key class: classically, for Marx, industrial workers; more recent candidates have been peasants (Wolf 1969), or even, to some degree, elites. Others have seen this in terms of peasants or workers providing the mass base of revolutions plus dissident intellectuals, including students, playing leadership roles. Much recent work has identified the significance of broad coalitions of actors, since it requires the collaboration of many social forces to overthrow an absolutist monarchy, an entrenched dictator, or a colonial occupier, or to elect a radical government where the system is open enough to permit this (among others, see Parsa 2000). John Foran (2005 and in earlier work) has spoken of this kind of tactical alliance of lower, middle, and even upper class elements as a multiclass populist coalition, since it pits actors drawn from all social classes, representing "the people," and each contributing its own part to the making of a revolution, against the government and its dwindling set of supporters. This kind of alliance has been prominent in all the great revolutions of the twentieth century, although the degree to which a given percentage of the population has participated actively has varied across cases.

Recent work on the roles of women and diverse ethnic and racial groups in the making of revolution has forced consideration of what we might call the "race/class/gender" dimensions of such populist alliances. Karen Kampwirth (2002) and Julie Shayne (2004) have done much to sensitize us to the crucial and complex ways in which revolutions have been shaped by the contributions of women. Kampwirth's study of Latin American cases accounts for the increasing mobilization of women through an astute synthesis of personal factors such as birth order for daughters, family traditions of resistance, access to school, and age cohort with such

cultural developments as the rise of liberation theology, and structural causes including male work migration and land concentration. Shayne's work on a similar set of cases has given us the concept of women as "gendered revolutionary bridges" who use the advantages of their closeness to the population and relatively less threatening appearances for bringing "ordinary" people into the ranks of revolution in a variety of capacities crucial for success in protracted guerrilla and civil wars. Such roles can be instrumental (male revolutionaries making use of women's unique abilities for their own purposes) or strategic (women deploying their femininity consciously in the cause of revolution), and they may result in feminist outcomes where women organize around their own issues either during or after the revolution.

Race has been studied far less, yet it too is now coming into clearer focus as a significant factor in the rise and fall of revolutions. The historical record shows people of color at the forefront of some of the great revolutions, such as the Haitian Revolution around 1800, in complex, more tenuous alliances with whiter revolutionaries as in the Mexican or Cuban cases, and in mixed roles in such revolutions as Nicaragua's, where the Sandinistas possessed significant indigenous support in certain cities on the Pacific coast but alienated the English speaking Afro Nicaraguan communities of the Atlantic coast (see Foran et al. 1997 and McAuley 1997 for consideration of these cases). The growing weight of indigenous revolutionaries has been marked across Latin America since the 1980s, and in the twenty first century it has become preponderant in the various struggles in Bolivia, Ecuador, and most dramatically in the Zapatista insurgency in Chiapas, which has centered demands for indigenous rights and autonomy.

This raises the question of why people, often at great personal risk, choose to become involved in revolutions that shatter the fabric of their everyday routines. Perhaps the most common view is that "misery breeds revolt" – that poverty and oppression and exploitation lead people to participate in revolution. While this may well be true in some cases, and is possibly at the root of virtually all revolutions to some degree, it has to be pointed out that given societies produce different reactions to situations of poverty and oppression. Sometimes people do not feel that

revolt is possible, sometimes they protest in more private ways, or only in their local areas. If poverty alone caused revolutions, we would see more revolutions than we have in the third world. While the existence of exploitation may be necessary to impel many groups into revolutions, it does not seem to be sufficient by itself. This "why" question has been addressed by scholars whose interests lie in the intersection of culture and agency. Eric Selbin (1997) has laid stress upon collective memories – the stories, folk tales, songs, plays, myths, and symbols that circulate in societies about past or present resistance to oppression – as indispensable to the making of revolutions, indeed, turning Skocpol's aphorism on its head: revolutions do not come, they are made by people. Jean Pierre Reed and John Foran (2002) have developed the concept of "political cultures of opposition" to suggest the connections among people's lived and shared experiences of political and economic oppression, the collective memories identified by Selbin, revolutionary ideologies such as socialism and liberation theology, and the networks that draw these together. Sometimes a single powerful political culture is forged, as with Sandinismo in the Nicaraguan Revolution; at other times, diverse political cultures appeal to different strata in society as in the Iranian Revolution, where several strands of Islam and secular political cultures brought particular groups to the demonstrations that toppled the shah. Emotions are now being recognized as further factors that compel people to participate in revolutions. All of this work has strengthened what we know about who makes revolutions, and why, opening the way for future scholars to bring fresh energy to this question.

THE OUTCOMES OF REVOLUTIONS

With all of the attention that has been lavished on the causes of revolutions, it is surprising indeed that relatively little systematic theorizing or comparative study has been done on their outcomes. A few pointers and leads may be advanced here, with much work ahead for others.

In assessing the positive side of revolutionary outcomes, Theda Skocpol has noted that the great revolutions of France, Russia, and China

succeeded in terms of creating stronger, more centralized states capable of competing economically with their main rivals than had the pre revolutionary monarchies in each case. Many of the twentieth century's third world revolutions have delivered a degree of material improvement in people's lives, at least for a time, as in Chile and Nicaragua.

Cuba in particular, the longest lived revolutionary society on the planet, has registered some impressive gains that are remarkable and unprecedented in the history of revolutions: unemployment was virtually wiped out; income distribution became the fairest in Latin America; high quality medical care and education through the university level were afforded the population at no cost. Cubans came to consume more food on the average than citizens anywhere in Latin America except Argentina; infant mortality fell to 6.2 per thousand, compared with 126.9 in Haiti, and was lower than the 18.1 per thousand among African Americans in the US. After 1958, life expectancy rose from 57 years to over 77 years.

But considered from the viewpoint of meeting the expectations they have unleashed about human liberation, the outcomes of revolutions to date have generally been disappointing in nature. The Russian Revolution achieved heavy industrialization and the creation of a military that proved capable of contributing massively to the defeat of Nazi Germany in World War II, but devolved into the murderous excesses of Stalin and ultimately the sclerosis of the communist state, which fell to a popular reform movement in 1989–91. The 1949 Chinese Revolution raised the living standards and dignity of the peasant majority tremendously, but went through many changes of political and economic direction under Mao, leading to much persecution before the Communist Party moved away from socialism altogether in the 1980s while retaining its own unquestioned power. In Cuba, Fidel Castro held onto power unchallenged for almost 50 years, during which many basic freedoms – of the press, of expression, of religion, of sexual orientation, and of party and trade union organization – were rigorously controlled by the state. Other revolutions, more promising in terms of a potential for democratically directed change, have ended in foreign intervention: Nicaragua, Chile, and a host of others. For Val

Moghadam (1997), all modern revolutions have featured either a patriarchal outcome for women which returns them to traditional family roles, as in France and Iran, or, in the case of the socialist revolutions, fallen short of real emancipation for women. The same mixed results have been experienced by people of color and ethnic minorities across many revolutions. Looking at the overall record, one might ask whether there is some kind of inevitable tradeoff between economic gains and political rights after a revolution, with virtually no case having been able to deliver both.

What might explain these disappointing, or at best, highly mixed outcomes? Two key ideas may be suggested: the pressure put on revolutionary societies by powerful external enemies (in most cases in Latin America and the Middle East, the United States has opposed and tried, with some notable successes, to reverse revolutions), compounding and compounded by the fragmentation of the broad coalitions that are required to bring about revolutions. Such coalitions, so effective in opposing the military power of the state, have typically broken into competing factions after taking power themselves. This is logical, given the differing interests and political cultures that the diverse social groups involved may possess. This process narrows the scope for democratic participation, as one faction typically gains the upper hand, often with much bloodshed, as in Iran. When foreign intervention or wars follow the seizure of power, this further concentrates authority in the state and military and is used to justify curtailment of social and political justice. This in turn makes economic improvements harder to realize, already difficult in the poorer, dependent societies where most revolutions have occurred (these arguments are found in Foran & Goodwin 1993).

THE FUTURE OF REVOLUTIONS

All of these topics will likely be explored by the next generation of scholars, as they continue the search for a grand synthesis of economics, politics, and culture, get deeper into the race/class/gender stories of revolutionary actors, and attempt to understand outcomes with more sophistication. The study of revolutions offers

great scope for the development of ideas and theories about all of these matters, touching on some of the most fundamental and seemingly intractable problems of understanding how societies are structured and how they change.

A final dimension to this discussion must be the future of revolutions themselves. The end of the Cold War, the inexorable rise of globalization, and the crushing turning points of September 11, 2001 and the 2003 US invasion of Iraq all raise questions about where revolutions are heading. The Cold War removed the hand of the Soviet Union from the revolutionary equation, with mixed consequences: the USSR could no longer subsidize the Cuban Revolution or provide aid and cover to would be socialist revolutionaries, but its fall also freed a space for creative new political cultures drawing on more democratic and non violent means of change to emerge, and it removed one of the main explicit justifications of US intervention against revolutions in the third world.

Globalization followed quickly on the heels of the end of the Cold War, and it, too, has deeply impacted world politics in economic, political, and cultural terms. It increasingly appears that the neoliberal capitalist globalization favored by both transnational corporations and institutions like the World Trade Organization, the International Monetary Fund, and the World Bank creates new forms of dependency, inequality, and poverty that may fuel national revolutions. A new global movement for change – the global justice movement – has also arisen to bring together activists from across the globe into “a movement of movements” encompassing demands for deep economic reform, the expansion of political and human rights, gender and racial justice, and efforts to mitigate the looming perils of global climate change and the coming shortages of fossil fuels. The rise of the Internet and other communications technologies has both aided this movement and at the same time given new tools for governments’ efforts to contain them. The global justice movement’s diversity, size, and decentralization present similar opportunities and challenges, raising the possibility of global forms of revolution on the one hand, and on the other presenting daunting problems of organizing its many constituent parts into an effective vehicle for deep social change. The World Social Forum

gatherings held in Brazil and India from the year 2001 on have provided spaces for sharing experiences and working toward a common set of goals and strategies. The potential of this movement to counter the juggernaut of capitalist globalization remains unclear, and offers a vital research agenda for those interested in the future of revolutions.

A more localized revolutionary movement that has been shaped by the end of the Cold War and driven in part by the impact of neoliberal globalization is that of the Zapatistas. Since 1994, this movement has attempted to achieve indigenous rights in Chiapas and elsewhere in Mexico, to expand popular participation throughout the country, and to reject the prevailing national and global models of capitalist development in favor of new forms of community and economy that have inspired activists well beyond Mexico. These goals have been explicitly framed in terms of *not* taking state power in any direct sense, either through elections or armed struggle, but rather opening up spaces throughout society for democratic discussion of, and work toward, their goals. The end of the 70 year reign of the ironically named Party of the Institutionalized Revolution in 2000 was due in part to the Zapatistas’ principled critiques. What the movement can ultimately achieve will only become more apparent as time passes; meanwhile, there are rich lessons to be learned by scholars from the Zapatista experiment.

After the terrorist attacks on the World Trade Center in New York and the Pentagon in Washington on September 11, 2001, the attempt of the US Bush administration to create a new type of global war against Islamic terrorism also altered the picture for the future. Upsetting the smooth operation of globalization from above by its militarized approach to foreign policy in Iraq has made for a more unstable US and global economy and increased the risks of terrorist attacks on the West, with uncertain implications for the revolutions of the future, which scholars must assess.

There may well continue to be national revolutions since the conditions that fuel and enable them do not seem to be disappearing. These may take democratic routes to power through elections, especially in Latin America, where radical reformers came to power in Brazil, Venezuela, and Uruguay in the first years of

the twenty first century. Whether such peaceful strategies can bring about deep and lasting social change on a national basis given the constraints posed by globalization remains to be seen. The Zapatistas in Chiapas offer a non violent, non electoral path to deep social transformation and a less authoritarian, more inclusive approach to building coalitions to confront social powers. As in Iraq and Palestine, there will also continue to be both armed and peaceful resistance to foreign occupations. The global justice movement holds out the possibility of a new form of world revolution across borders that may bring the old revolutionary dream of social justice closer to reality. Revolutions – in whatever form – are likely to be with us to the end of human time, and present ever hopeful possibilities for humanly directed social change as well as rich opportunities for scholarly understanding of the processes of this type of change.

revolutions, sociology of

John Lie and Nicholas Hoover Wilson

What distinguishes revolution from riot or rebellion, collective action or collective violence, or *coups d'état* or just plain old regime change? Historical records are replete with instances of sudden, violent, extra constitutional, and consequential regime change. However, the modern concept of revolution is the product of the French Revolution of 1789–94. The events that came to be known as the Revolution denoted and dominated modern politics. Henceforth, revolution referred to a sudden, violent political change that leads to consequential extra political transformation. The French Revolution generated a new class of political actors – revolutionaries – and a new political ideology – the possibility and desirability of intentional, mass uprising to achieve sudden, extra constitutional political change. In the modern political imagination, revolution came to denote the possibility of a better – indeed, utopian – future through the seizure of state power and the construction of a new revolutionary order.

Before the French Revolution, the concept of revolution was used in a radically different way. Though today we may speak of the Roman Revolution or the English Revolution, contemporary observers employed other categories. Thus, the English Revolution was usually called the Great Rebellion, while what we would call restoration was called the Great – and later the Glorious – Revolution (the first such event to be called revolution by contemporaries). When the “world turned upside down” in seventeenth century England, rebelling or revolting referred to the fall of the powers that be (Hill 1972). Overturning the overthrow was then the revolution. True to the Latin etymological root of *revolutio*, revolution referred to circling back to the status quo ante. The older vocabularies of betrayal, treason, and rebellion were replaced by revolution only *after* the French Revolution.

After the late eighteenth century, however, revolution became inextricably intertwined with the events of late eighteenth century France. Concurrently, revolution became a modular keyword to describe rapid, qualitative, significant, and positive change. Thus, all manners of radical, progressive change became known as revolution. The War of Independence, for example, became the American Revolution. The industrial revolution, along with the French Revolution, was said to define the nineteenth century. Popular and scholarly discourses employed the language of revolution, whether the scientific revolution or the military revolution, the democratic revolution or the information revolution.

The “echoes of the Marseillaise” reverberated for two centuries after 1789, and defined and sometimes dominated the nature and discourse of modern politics (Hobsbawm 1990). The self conscious revolutionaries sought to replicate the Revolution in their own countries, overthrowing the old regime in favor of the new order. Almost immediately after 1789, the 1791 “revolution” in Haiti augured many later instances of anti colonial movements and revolutions. Yet by far the most consequential event was the second, “October” revolution in Russia in 1917. The Bolshevik Revolution colored radical politics in the twentieth century. The vanguard party, often identified as socialist or communist and allied with the Soviet Union, became the dominant technique and imaginary of the revolutionaries. Indeed, the French Revolution in particular and revolution *tout court* came to be seen retrospectively from a Marxist Bolshevik perspective (Furet 1986).

Given the significance of the Bolshevik Revolution, Karl Marx – or, more accurately, Marxist theory through Lenin’s lens – established the broad parameters of understanding and explaining the causes, courses, and consequences of revolution. In terms of cause, the dominant mode of explanation stressed the role of social classes. Hence, the French Revolution was said to be caused by the rise of the bourgeoisie. Moore’s (1966) classic study, for example, analyzes the class relations between the existing ruling class, the bourgeoisie, and the peasantry. While Marx expected socialist revolutions to emerge in capitalist societies, Moore’s study stressed the revolutionary outcome in

“backward” societies. Certainly, the twentieth century revolutions belied the Marxist Leninist expectation and occurred largely in agrarian societies (Wolf 1969). In terms of consequences, revolution was believed to be progressive, pointing to a socialist or a communist future. Counter revolution, in turn, referred to those defending the capitalist present that was soon to be moribund.

The geopolitics and the ideological conflicts of the Cold War inflected the scholarly and popular understanding of revolution. Modernization theory sought to counter Marxist explanation by employing functional analysis. Yet functional analysis was often tautological (e.g., revolution happens because the existing regime was not working). In retrospect, however, both Marxist and modernization theorists held highly normative and politicized understandings of revolution. The Marxist Leninist view regarded the Bolshevik Revolution as the paradigmatic revolution: a conscious vanguard party inspires mass mobilization, seizes state power, and creates a revolutionary (socialist) future. Concrete analyses would have cast doubt on the certitudes, but any sudden, qualitative political change came to be called a revolution, whether agrarian based revolts, such as Mexico in 1910, or urban, religious based upheavals, such as Iran in 1979. In fact, very few cases – if any – fitted the Marxist Leninist imaginary of the revolution (and certainly not the French Revolution). Revolution turned out to be a nominal term without much substantive content. Dunn (1989) trenchantly exposed the wide diversity of phenomena that are usually classed unproblematically as revolutions. In this regard, consider that the Nazi seizure of power was almost never regarded as an instance of revolution when in fact the regime was revolutionary in almost every way: a vanguard party, mass mobilization, the seizure of state power, and the construction of a revolutionary order.

The political palatability of actually existing revolutions faded with the recognition of the politically authoritarian and economically destructive nature of the Soviet Union and other revolutionary societies. By the very late twentieth century, scholars questioned the desirability and even the very possibility of revolution. In a sense, they echoed the first sustained analysis, Edmund Burke’s *Reflections on the Revolution in*

France (2001). That is, scholars stressed its human costs, both during and after the upheaval, and questioned whether it denoted anything more than a *coup d’état*. Skocpol’s (1979) influential study followed Tocqueville’s (2004) pioneering analysis in stressing that revolution is not “made” but “come” because of the corrosion of the state apparatus. Her attention to state power and geopolitics also pointed to the significance of military struggle, which is in fact crucial to any successful revolutionary upheaval (Chorley 1943). Revolution, after all, is a form of civil or internal war. Moreover, the survival of a revolutionary regime depends profoundly on geopolitics. US intervention, for example, accounted in large part for the failure of Latin American “revolutions” beginning with Guatemala in 1944 and Bolivia in 1952 (Grandin 2004).

In the early twenty first century the very study of revolution has become unpopular. In part the earlier consensus on the necessity or the desirability of revolution has withered away, reflecting the perceived failures of the actually existing revolutions. In part the very focus on regime transformation and the state apparatuses seems outmoded. Certainly, few political groups today are committed to a violent seizure of state power to create a revolutionary future. The “echoes of the Marseillaise” have softened to the point of silence. The very dominance and diffusion of the terminology has obfuscated the description and explanation of concrete political transformations. Not surprisingly, then, no one has yet to predict the coming of revolution because we encounter an order of distinct entities and events about which our theories remain impotent.

Riesman, David (1909–2002)

Craig D. Lair

David Riesman was not a formally trained sociologist. Nevertheless, his 1950 book *The Lonely Crowd: A Study of the Changing American Character*, written in collaboration with Nathan Glazer and Reuel Denney, has earned a unique distinction in American sociology: excluding textbooks and “classical” works, it is the only book by an American sociologist to sell over a million copies (Gans 1997). This means that the all time bestselling work in American sociology was written by someone who never earned a degree in this discipline.

Riesman was born in Philadelphia and studied biochemistry at Harvard as an undergraduate. Later, he attended Harvard Law School, where he received his law degree in 1934. After graduating from law school Riesman both taught and practiced law. For a time, he served as a clerk to Supreme Court Justice Louis Brandeis. During World War II Riesman took an executive position in the private sector, working at the Sperry Gyroscope Company. It was not until 1946 that Riesman took an academic post in the social sciences, first as a visiting lecturer, then, three years later, as a full professor, at the University of Chicago. In 1958 he

would return to Harvard as a faculty member, where he would stay until the end of his career.

However, it was during his early years at Chicago, and in collaboration with Glazer and Denney, that he wrote what was to become his most famous work: *The Lonely Crowd*. The subject of this work is a historical exploration of what Riesman et al. call “social character,” or that part of an individual’s personality that is shared in common with other members of a social group. This common element of personality is the result of individuals living in similar social and material environments and also a means by which a society generates a degree of conformity from its members. As such, Riesman et al. use the terms “social character” and “mode of conformity” interchangeably.

Riesman et al. argue that there have been three distinct social character types that have existed over time. These character types are: tradition directed, inner directed, and other directed. The shifts between these social character types were linked by Riesman et al. to demographic changes that roughly correspond to a three stage demographic transition: tradition directed societies are in a state of “high growth potential”; inner directed societies are in a state of “transitional population growth”; and other directed societies are seen to be in a state of “incipient population decline.” However, Riesman et al. note that the linking of population factors to changes in social character is “shorthand” for many other social, technological, institutional, and informational changes that took place at the same time as these demographic shifts, such as industrialization, the birth and expansion of capitalism, urbanism, rationalization, and the growth and expansion of various media.

The historically first social character type identified by Riesman et al. is the tradition directed personality. This character type is formed in “family and clan oriented” societies where much of life is socially institutionalized, stabilized, and lived in accordance with collective mandates and rules. Accordingly, levels of individuation and innovation in tradition directed societies are low, as the motivation for individual thought and action are rooted, not in individual motivations, but rather in the collective practices and norms that have been transmitted over the ages. This conception of

the tradition directed personality is similar to Durkheim's conception of mechanical solidarity and Tönnies's conception of *Gemeinschaft* as the collective that flows through and guides individuals throughout their lives.

Riesman et al. see the tradition directed monopoly upon personality being broken by the emergence of the inner directed character, who began to surface in the social, political, and economic upheavals of the seventeenth century, particularly the Industrial Revolution and the Protestant Reformation. This social character has a very different mode of orientation than that of his or her traditional counterpart. For the tradition directed person, most features of life were socially regulated. Riesman et al. argue that this personality type was not flexible enough to cope with the expanding populations and production systems of this time that led to an increase in both social and geographical mobility, and new forms of work. It was in response to an expanding social environment that the inner directed person emerged.

The inner directed person's source of direction comes from general yet forceful goals that are instilled early in the child by parents which he or she comes to internalize (e.g., goals such as to be a good person, to be successful or productive, to do God's work). While not as encompassing and detailed as the social dictates found in tradition directed societies, these internalized goals are still powerful enough to give inner directed people guidance throughout their lives, even if they are in new, different, or changing social environments. That is, once instilled, inner directed people are not directed by what is outside them, but rather, they are guided by their inner convictions. As such, Riesman et al. conceive of these early implanted goals as a kind of "psychological gyroscope" that gives individuals clear direction wherever they may be. Riesman et al. offer Weber's description of the Protestant work ethic as being emblematic of this personality type, with its emphasis on morality and industriousness despite the surrounding environment.

However, as population growth steadies, as work moves from a more entrepreneurial mode to a more bureaucratic one, and as material scarcity fades in the face of abundance, Riesman et al. see a new mode of orientation coming into

being. If the tradition directed character was anchored to the past and custom, and if the inner directed person followed the directions set in his or her internal gyroscope, then the other directed personality, which Riesman et al. see developing in the "new middle class" of bureaucratic and salaried employees, is controlled and corralled by the thoughts and evaluations of others that he or she picks up on his or her "radar." That is, the prime mode of orientation for other directed persons is to live in harmony with others. In this regard, the other directed personality is very much a socialized one, in that their overriding goal is to please those around them. However, this socialization lacks the stability found in tradition directed societies, being more akin to changes in fashion than to time honored customs. Moreover, this personality is more flexible and open than either the tradition or inner directed person, as each other directed person looks to others for cues of how they should act in certain situations. Indeed, "others" are the central problematic for other directed people.

Ironically, though, Riesman et al. see the other directed person as a lonely personality who tries to overcome loneliness by flocking into groups. However, the authors argue that "they no more assuage their loneliness in a crowd of peers than one can assuage one's thirst by drinking sea water" because what they try to escape to is exactly what they need to escape from: others. What individuals really need in order to quench their thirst is not to be surrounded by more people, but rather something which transcends others' thoughts and evaluations altogether: autonomy.

Riesman et al. see three possible modes of adaptation open to the individual in response to the prevalent mode of conformity at the time. People can either be adjusted (i.e., live in proper accordance with their social character type), anomic (i.e., be either under or overly adjusted to the prevalent mode of conformity), or they can live a life of autonomy. Autonomy for the authors is seen as the ability of an individual to decide whether or not to live in accordance with a social character without, in the process, slipping into an anomic state. The key to autonomy is self consciousness and as other directed persons are more self conscious

than the inner directed, just as the latter are more self conscious than the tradition directed, Riesman et al. see the increased self consciousness of the other directed as opening the door to the possibility of living an autonomous life. In part this self consciousness is tied to changes in the material environment: as scarcity is overcome via increased production, more attention can be devoted to developing one's self. However, Riesman et al. see the most promising space for this development not in terms of work or "species being" as classical Marxism would argue, but instead in terms of consumption and leisure. As such, it is the abundance of modern society that allows for individuals to be exposed to a greater diversity of goods and lifestyles, while also offering them more free time to enjoy these things that allow for a greater sense of self consciousness to be formed. Riesman would later modify these ideas by noting that work was a more important sphere of life than he gave it credit for in *The Lonely Crowd* and that the levels of production needed to satisfy a consumer style autonomy were formed in an "era of innocent optimism" (Riesman 1998) that could not be sustained into the future.

Nevertheless, Riesman et al.'s cry for autonomy struck a chord in the time of the "organization man" and other forms of conformism. In this regard, *The Lonely Crowd* is often lumped together with other critiques of "mass" society (e.g., the work of Fromm and Mills). While undoubtedly critical of aspects of other directedness, Riesman et al. did not see the emergence of this character type as a wholly negative development. In fact, one positive development to come out of an other directed attitude was a greater tolerance for, and sensitivity to, others and their concerns. This made the possibility of living an autonomous life even greater than in the past. However, Riesman also took great pains to point out that inner direction was not a universally good character type whose passing we should mourn and whose reemergence we should strive for (for example, the inner directed person could be intolerant of others and too single minded in nature), nor should inner direction be equated with autonomy, as some who misread this work did. In the end, it was autonomy and the ability to live a self directed life that these authors pinned their hopes on, even if this was a "utopian" thought.

The Lonely Crowd was later supplemented by *Faces in the Crowd: Individual Studies in Character and Politics* (1952), which presented transcripts of some 20 interviews that were used, in part, to make the case of *The Lonely Crowd*, and also some of the individual essays put forward in *Individualism Reconsidered* (1954). Later in his career, however, Riesman was to modify, sometimes greatly, some of the claims made in *The Lonely Crowd*, calling some of them "wrong," claiming others to be based on an "ethnocentric" perspective, and saying that others were based on notions of American "exceptionalism." In particular, he abandoned the linkage made between character types and demographic shifts (Riesman noted this was an issue of concern even before the book was originally published) and even questioned the adequacy of the tradition directed and other directed character types. Riesman was also dismayed at how the ideas he put forward were to his mind misappropriated in radical calls for social change while he himself advocated a more reformist approach.

While undoubtedly his most popular work, *The Lonely Crowd* and related works were far from his only interests. In 1953 Riesman published *Thorstein Veblen: A Critical Interpretation*, a psychological biography of this thinker, and in 1976 he published *Adam Smith's Sociological Economics*, which argues, as the name implies, for a more sociological reading of Smith's economics. In 1964 Riesman published *Abundance for What? and Other Essays*, a collection of works ranging from Veblen and de Tocqueville, to suburbanization and the Cold War, and essays which reformulate and revise some aspects of what was said in *The Lonely Crowd*. In 1967 Riesman and his wife Evelyn Thompson Riesman published a book on Japan: *Japan: Modernization, Politics, and Culture*. Riesman also founded and edited the antinuclear journal *The Correspondent*, which sought to be a forum through which intellectuals could influence government policy on this and other issues. However, much of Riesman's later career was focused on higher education, particularly how academic institutions were becoming standardized, how intellectual diversity was being squeezed out, and how some disadvantaged groups were being excluded from the meritocratic promises of the educational system. Riesman's works on

education include *Constraint and Variety in American Education* (1956), *The Academic Revolution* (1968; co authored with Christopher Jencks), *The Perpetual Dream: Reform and Experiment in the American College* (1978; co authored with Gerald Grant), and *Education and Politics at Harvard* (1975; co authored with Seymour Martin Lipset), as well as a contributed field report to Lazarsfeld and Thielens's *The Academic Mind* (1958).

There have also been two volumes of critical commentary on Riesman's work. One is Seymour Martin Lipset and Leo Lowenthal's edited book *Culture and Social Character: The Work of David Riesman Reviewed* (1961). The other is an edited volume by Herbert Gans, Nathan Glazer, Joseph Gusfield, and Christopher Jencks entitled *On the Making of Americans: Essays in Honor of David Riesman* (1979).

Though Riesman was never formally trained in sociology, his influence on the discipline is beyond question. His thoughts captured the imagination of a generation and continue to influence sociological discussions to this day (see Wolfe 2001: 72).

Riot Grrrls

Pamela Aronson

Riot Grrrls are participants in a social movement focused on a radical female youth culture. The movement was originally formed as a reaction to a male dominated punk rock music scene. With mostly male performers, girls often felt that the issues that concerned them were not reflected in their music. Before Riot Grrrl, girls who listened to this type of music were commonly perceived as connected to punk rock culture through their boyfriends rather than their own interests. The Riot Grrrl movement originated as punk rock feminism, which had two main goals: demarginalizing women in punk rock and providing a critique of patriarchy. Later in its history, the Riot Grrrl movement expanded to include participation in other cultural and political outlets. Ideas spread through the Internet and zines, which are inexpensive newsletters with individual reflection, and political and feminist commentary. Riot Grrrls themselves produced the zines and they were shared with other girls to raise awareness about feminist issues and help create a network of activists. Many women active in Riot Grrrl situate their activism within the "third wave" feminist movement.

Riot Grrrl was founded in 1991 in Olympia, Washington, when a group of girls set out to expand girls' and young women's involvement in predominantly white, male punk rock. The International Pop Underground Festival, organized by K Records in Olympia, designated the first night as Girls' Night with the goal of demarginalizing the role of women in punk rock. In 1992 a Riot Grrrl convention took place in Washington, DC. Bands such as Bikini Kill, Bratmobile, and Heavens to Betsy provided a critique of patriarchy, as well as role models for young women to get involved in the production of their own music. Zines such as *Girl Germs* and *Jigsaw* provided girls with an alternative perspective, and helped create a network of Riot Grrrls in diverse locations. Riot Grrrl chapters began across the country, and, later, in other countries like Britain. There have been a number of Riot Grrrl conventions, where girls and young women meet to perform music, exchange zines, and attend workshops on topics such as

sexual assault, abuse, self defense, and eating disorders. Eventually, the mainstream media began to report on Riot Grrrl, although engagement with the mainstream press has been controversial within the movement.

The Riot Grrrl philosophy is pro girl and separatist, as it seeks to establish a distinct female youth culture apart from boys and adults. Riot Grrrls express themselves angrily and frankly, as they reclaim the power of girlhood with “an added growl to replace the perceived passivity of ‘girl’” (Rosenberg & Garofalo 1998: 809). As a girl active in the movement put it, it is “loud, aggressive, and in your face” (p. 837). This social movement emphasizes empowerment, the “do it yourself” philosophy of punk rock, and anger at mainstream and patriarchal culture. In fact, Riot Grrrls frequently reclaim derogatory terms used to describe women to call attention to the objectification of women. As they seek a “Revolution girl style now,” they make visible through their music and zines often unspoken topics like rape and abuse. Their cultural productions also serve to create a network of girls who have felt isolated from others who share similar beliefs.

Riot Grrrl culture is also an explicitly youth culture that rejects the concerns of adult women. Reacting to the second wave feminist movement of the late 1960s and 1970s, Riot Grrrl seeks to provide a critique of patriarchy based on the concerns of girls. For example, while the second wave feminist movement was concerned with opening up workplace opportunities and equal rights, these issues are not viewed as central for many Riot Grrrls, who are too young to feel the effects of workplace discrimination. Instead, the Riot Grrrl movement works to make cultural and personal changes, such as seeing their own concerns reflected in their music and raising awareness about issues like sexual assault and incest. Riot Grrrl is often viewed as a white, middle to upper middle class movement, which may result from the largely white punk rock audience from which it emerged.

Riot Grrrl represents an important space for girls and young women to develop and voice their own experiences, as well as to articulate an alternative feminist vision. Riot Grrrl meetings and conventions are frequently compared to the consciousness raising groups of the second wave women’s movement, where women could

connect with each other and become aware of the ways that personal concerns are actually political issues. Those who are involved stress the importance of community and the development of mutual emotional support.

In 1993 Riot Grrrls began a press blackout, in which they refused to talk or be photographed by the popular media. The blackout followed what many considered to be a trivialization of their community in outlets such as the *New York Times* and *Newsweek*. The blackout was motivated by a concern that the mainstream media would continue to commodify and misrepresent Riot Grrrl culture.

Several writers pinpoint the heyday of the Riot Grrrl movement as occurring in the 1990s. Since Riot Grrrl was never a movement with membership lists, others have argued that the decline of the movement is largely an interpretation by the media.

riots

Daniel J. Myers

A riot is an unruly collective act of violence that is temporary, discontinuous from everyday routines, and results in damage to persons or

property of either the participants or targets of the collective actor. Although most social scientists have an intuitive sense of what constitutes a riot, the edges of the definition are fuzzy and it can be difficult to determine whether or not some events are actually riots. For example, it is agreed that a riot is a collective act. That is, more than one individual must be involved and at least minimally coordinate action in order for a riot to occur. Two people acting together, however, would not constitute a riot, even though it is a collective act of violence. Thus, the lower limit for participation, damage, and duration to define a riot is difficult to establish and has led many sociologists to analyze events more ambiguously referred to as civil disorders or collective violence. For most, however, unless there are at least 30–50 people involved, the events last more than a few moments, and there is action that could result in property damage or injury requiring medical attention, a riot has not occurred.

Even those events that consensus would label as riots are a diverse lot. The American sociologist's vision of rioting is heavily influenced by the race related urban riots that occurred in the 1960s, including the infamous Watts 1965, Newark 1967, Detroit 1967, and Washington, DC 1968 riots. These riots were typically ignited by a confrontation between police and African American citizens and, although injuries occurred, the activity in the riots was dominated by attacks on property and looting. Injuries most typically resulted from attempts by police and military officials to prevent damage and contain or extinguish the riot. These kinds of riots have been echoed in other urban environments over the years, including riots in Britain in the early 1980s, in Los Angeles following the Rodney King verdict, in Cincinnati, Ohio following accusations of police brutality, and most recently in the Parisian suburbs of France, as immigrants from North Africa took to the streets and burned thousands of cars in protest of perceived police brutality and poverty.

While these kinds of events are important, there are many other kinds of collective events that have been treated as riots, including food riots, machine breaking raids, murderous ethnic purges, lynching, brawls at sporting events, and even victory celebrations. Horowitz (2001), for example, documents what he calls "deadly

ethnic riots," which are collective lethal attacks of one ethnic group on another and include events ranging across the globe from Hindu attacks on Muslims in India, anti Catholic violence in Northern Ireland, and attacks on Ibo citizens in Nigeria. In practice, these different types of riots are not completely distinct. Rather, riots are complex events in which different kinds of people with different motivations participate in a variety of ways in the larger riot. For example, the celebration riots that followed the string of National Basketball Association Championships in Chicago and later in Los Angeles took on many of the characteristics of the urban street riots of the 1960s.

Concern with riots, and crowd behavior more generally, has a long history in sociology, reaching back to the founding moments of the discipline when thinkers such as Gustave Le Bon and Sigmund Freud produced a view of crowds as unanimous, crazed, criminal, anonymous masses whose constituent individuals had ceded control of themselves to the mob and/or a hypnotically suggestive leader. Although subsequently debunked in sociological scholarship, this view of the crowd and of rioters lives on in the popular mind, in journalistic accounts of riots, and even in introductory textbooks. Empirical research on crowds, however, indicates that riot participants are certainly not of unanimous mind and in fact their participation and behaviors reveal diverse motivations, actions, and experiences of the event. Furthermore, individuals in crowds are not anonymous, as they typically attend the event in small groups made up of friends and family members. These small groups remain intact throughout the event, move through the larger crowd together, and are the fundamental unit in which decisions about what to do are made. Nor do individuals in crowds become hypnotized by the situation or cede control of themselves to crazed irrationality. In fact, even when engaging in some of the most extreme and heinous atrocities (such as genocidal purges), riot participants retain an extraordinary level of rationality, going to great lengths, for example, to ensure they are killing the right kind of person (Horowitz 2001). Rioters, for example, may stop rioting to actually interrogate those suspected of being on the wrong side. Horowitz relates one such instance in which Sinhalese

rioters in Sri Lanka questioned a man once, held him as a prisoner while they proceeded to kill other Tamils, later questioned him further, and eventually (mistakenly, since he was a Tamil) released him.

Because of this unfortunate history of thinking about riots and crowds, care must be taken when using the riot label – not just because it is not always clear if an event is a riot, but also because the term has inherently pejorative connotations. For some, the riot label invokes images of mob psychology, hooliganism, opportunism, and criminality and thereby immediately marginalizes the participants. Rather than being seen as political actors with a legitimate protest agenda, rioters are viewed as dangerous criminals that must be controlled. The riot label, therefore, reflects the views of social control agents and the act of labeling is itself inherently political. Once the riot label has been applied, it leads authorities and observers to focus on controlling rioters with heavy handed repressive tactics rather than attending to the social conditions and political concerns that underlie the unrest. As a result, some scholars prefer to refer to these events as rebellion or revolt. Others disagree, believing that most incidents labeled riots fall short of the kind of politically revolutionary agenda necessary to be a rebellion.

RIOT PARTICIPANTS

Based on historical thinking about rioting and crowds, scholars also developed expectations about what kinds of persons would be more likely to participate in a riot. Criminals, socially marginalized, isolated, unemployed, and uneducated were all stereotypes portrayed in earlier writing on riots. As has been the case with mob psychology notions more generally, these ideas have been proven false by empirical research. When the characteristics of riot participants have been compared to those of non participants (particularly to those living in geographic proximity to riots), few differences have been detected (Mason & Murtagh 1985). Even though, for example, unemployment in a city predicts rioting, the unemployed are not disproportionately represented among the actual rioters: their rates of participation are virtually identical to those who are employed. Nor do

rioters tend to be more psychologically frustrated with their circumstances or feel more deprived than non participants. Thus, rioters do not fit the image of marginalized societal refuse held by early crowd theorists.

What can be said about rioters? First, as with most violence, the participants are considerably more likely to be men than women. Second, rioters tend to be younger than the average person living in the area where a riot occurs, although rioting is clearly not just an activity of the young. More important, however, is simple biographical availability, which in part accounts for the presence of the young at riots. Those who happen to be spatially close to a riot are more likely to join in. Those who are not at work, watching children, or attending classes are more likely to be able to break free from their routines and become part of the crowd. There is, for example, a clear daily pattern of riot activity that peaks after usual work hours and then dies down when people have to return to their jobs and schools (McPhail 1994). Third, rioters tend to have higher senses of personal efficacy than those who do not participate. They are more likely than those who stay at home to believe that their actions matter and will make some kind of a difference (Snow & Oliver 1995).

ECONOMIC HARDSHIP AND RIOTING

Sociological research and theorizing about riots has focused on the causes of rioting. What conditions contribute to its emergence? Many factors have been posited as important contributors to, or preconditions for, rioting. Economic factors such as unemployment and poverty have been cast as both absolute and relative deprivation conditions that produce what is essentially a violent protest about these conditions. This theoretical argument seemed more than plausible and the emergence of so much rioting in poor, urban areas disproportionately involving racial and ethnic minorities buoyed the notion. The research, however, has been less than definitive. Research attempting to explain the variation among cities in riot frequency and riot severity based on relative and absolute deprivation measures as well as other indicators of social and economic well being has been hard pressed to find any consistent relationship supporting the

basic theoretical notions (Spilerman 1970, 1976). Related concepts, such as the pressure that rapid changes in population place on the provision of social services and the notion that poor political representation prevents the opportunity to redress grievances through conventional means, have not fared any better.

More recently, competition theory has been used somewhat more successfully to predict rioting. Here, analysts propose that battles over economic (and to a lesser degree, residential) turf escalate into collective violence as one group attempts to improve its position or maintain relative advantage over another advancing group. After all this research though, economic factors, however they may have been cast, still remain a fairly weak predictor of rioting. Economic hardship is too ubiquitous and rioting is too rare for economic conditions to produce rioting directly. Thus, economic conditions may be seen as providing fertile ground for rioting and other collective violence, but are not, by themselves, a sufficient explanation for the emergence of violence.

SOCIAL CONTROL AGENTS

The role of state authorities, especially local police, in producing, escalating, and quelling riots has been a major topic of research, not only because interaction between police and citizens so often seems to ignite rioting, but also because state authorities have a responsibility to maintain order and therefore are expected to wield repressive forces to bring riots under control, to return the social environment to a state of calm, and to protect the persons and property that might be targeted by rioters.

These two dynamics have produced different hypotheses about the roles of police in riots. On one hand, if confrontations with citizens and heavy handed policing tactics provide the sparks that set off riots, then increases in police presence ought to increase rioting. Likewise, if police engage rioters with escalated engagement as they attempt to quell the riot, they may inflame rather than extinguish the riots. On the other hand, repression can actually stop or slow rioting, and although police intervention can lead to more discontent and grievances,

police presence, especially if early and formidable, can prevent or reduce rioting by raising the anticipated costs of participation.

The quantitative empirical evidence on the role of policing has been inconsistent. Some scholars have found that larger police forces are related to more and more severe riots, while others have found no relationship or just the opposite. Qualitative and historical studies, however, have demonstrated that it is not just the strength of the police in terms of number and firepower that matters, but rather, it is how they wield their power and what kinds of relationships exist between the police and the community that matter most. Those communities that have a history of antagonism between the police and some segment of the citizenry seem much more likely to erupt after a publicized instance of heavy handed police behavior.

DIFFUSION, MASS MEDIA, AND EFFECTIVENESS

The mass media are another key player in understanding the origins and trajectory of rioting, particularly as rioting spreads and becomes a wave of unrest rather than a single or a few isolated events. When the National Advisory Commission on Civil Disorders published its report on the US riots of the summer of 1967, it put substantial responsibility for the spread of riots on the mass media and how it handled reports of the riots, as had the McCone Commission's report on the Watts riot of 1965. Since then, scholars and politicians have routinely criticized mass media for their conduct during and after riots. The mass media contribute to riots in two main ways. First, they can fan the flames of a riot while it is happening by live broadcasts of the action on the streets. These reports immediately draw the attention of potential participants, who can be drawn out into the street and increase the size of the crowd, the complexity of the situation, and the chances for further inflammatory confrontations as police try to control the situation. The pressure for immediacy can also contribute to inaccurate and inflammatory reporting as reporters rely on hearsay and rumors as they quickly attempt to piece together the story. Second, media reports of

riots spread information about riots and their outcomes and seem to suggest rioting as a behavioral tactic to potential actors in other locations. Thus, in modern times, mass media distribution has become the key network structure that provides a conduit for the diffusion of collective violence.

Rather than the mindless imitation posited by early crowd theorists, however, modern takes on the diffusion of collective violence are inherently rationalist. These approaches to diffusion understand the imitation process as involving transmission of information about the actions of rioters, the reactions by social control agents, and the outcomes of the riot to other potential rioters in other locations. The potential rioters then evaluate the outcomes of the prior act and then, individually and collectively, make decisions about whether they will be likely to adopt the behavior, should the opportunity arise. When an opportunity does arise, such as when a crowd gathers around to observe an arrest, rioting is then more likely to develop.

Because media distribution areas and the cultural salience of actors are both geographically concentrated, information flows that could inform further rioting are geographically concentrated as well. In addition, the salience of past events wanes quickly as the riots become old news, and thus the chances of imitations are concentrated in brief periods, thereby inducing short lived bursts of action or mini waves of rioting reflected in the relatively jagged pattern of rioting most often observed in riot waves.

The rationalist logic requires that riots are observed and evaluated positively so that the evaluation would lead to imitation. A negative appraisal would presumably dissuade diffusion. Contrary to what might be expected by an outsider viewing the sometimes devastating effects of riots on neighborhoods and businesses, surveys conducted by social scientists after urban riots in the 1960s repeatedly demonstrated that many African Americans viewed the riots positively. Even in the very neighborhoods where the riots caused the most damage, the residents often believed that the riots were necessary to call attention to the problems of the area and would ultimately do more good than harm (Feagin & Hahn 1973). Many of those who participated in the riots and later testified

before congressional committee expressed a sense of pride and efficacy for both their own actions and of others they observed (US Senate 1967–70). Likewise, in 2005, many French Muslims often expressed supportive attitudes toward the actions of rioters, believing that these destructive protests were finally calling attention to the problems of a population that had been systematically neglected by French policymakers. These positive evaluations of rioting are consistent with and lend support to rationalist, diffusion based explanations for the spread of rioting.

Whether riots actually do produce positive outcomes is an open question. There is little doubt that riots draw attention to the community in which they occur and invite speculation about the causes of the riots and what might be done to correct them. Government commissions are formed and legislative bodies investigate and sometimes introduce policy and allocate resources to address the posited problems. Because riots seem to appear in relatively impoverished areas, for example, policy interventions have been targeted toward improving the economic conditions in these areas. The Model Cities program in the late 1960s was one key federal program that was developed at least in part as a response to the riots of the era (Gale 1996). Thus, riots can produce attention to problems in a community as rioters often seem to expect. Whether this attention and the resulting programs ultimately have any positive effect is a different question and one that has been harder to demonstrate. Often, the programs are underfunded or dismantled before any effect has been felt. Furthermore, the long term effects on the economies of riot stricken areas are difficult to overcome – some areas never seem to recover from the devastation (Collins & Margo 2004).

risk, risk society, risk behavior, and social problems

Alfons Bora

Modern society is undergoing a deep rooted structural change. This change concerns both the internal relations between all parts of society and external relations with nature. During the nineteenth century, the industrial and technological revolution shook up the structures of a society that had been shaped traditionally by crafts and agriculture. In the same dramatic way, the "second modernity" or "risk society," as Ulrich Beck (1992) calls the period at the end of the second millennium, transforms the nucleus of the industrial society. New technologies confront society with problems that are connected to the term "risk" (Perrow 1987). This is not so much because the quantitative amount of dangerous situations has increased – this amount might have been relatively higher in earlier societies. However, what has significantly changed is the fact that social actors and institutions are being made accountable for those dangers. The new quality of the risk society consists of socially generated risks – or, at least, of the increase in assigning dangers to social behavior. Socially caused dangers will regularly produce more social conflict than inevitable natural disasters. In this sense, science and technology contain risks for each individual, for social groups, for contemporary society as a whole, and for future generations. The examples for this diagnosis are numerous. One may think of nuclear energy, IT technologies, biotechnology, or nano technologies, for instance. All these technological innovations are embedded in rapid social change, entailing growing individualization, patchwork biographies, significant changes in employment structures and occupational situation, and an accelerating transformation of many established institutions of the welfare state. They make clear that the issue of "risk" is a central category in societal self observation and self description.

RISK AND INFORMATION THEORY

Generally, the risk of a certain event ($R_{(E)}$) is defined as the probability of a dangerous event ($p_{(E)}$) multiplied by the amount of the expected damage (D) connected to this event: $R_{(E)} = p_{(E)} \times D$. We can call this concept of risk an information theoretical concept. Insurance companies usually work with this approach. Law courts and administrations make use of it when deciding cases. In this conception, risk is a question of complete or incomplete knowledge. Risk management, in this perspective, has the task of dealing with an information problem, namely, the problem of acquiring as much information as possible about probability and damage. Therefore, in the information theoretical perspective, risk management is mainly information management, trying to shift an imaginary border between knowledge and non knowledge. In the best case, this shift will dissolve non knowledge.

The information theoretical approach has historical roots. The idea of risk was born in the emerging seafaring and long distance trade, where shipowners and traders tried to secure their investments by the first insurances calculating probability and estimated damage. Until today, this connection with information is constitutive for the understanding of risk. It also has coined risk research from its early stages (Knight 1921). In addition, newer risk theories are influenced by information theory (Elster 1993).

However, the information theoretical concept brings with it certain problems. One critical issue in many cases is the quantification of possible benefits and damages. What if they are qualitatively different? It is often impossible to compare both sides on the same scale. Often there is no clear indicator for the estimation of the damage. This holds true for "catastrophic" damage, as for instance in the case of a nuclear catastrophe. Therefore, many situations in technological decision making, as well as in everyday life, make it difficult to establish a uniform risk measure. The socially contested cases are often those in which, owing to a lack of empirical experience, an exact calculation of probabilities is not feasible. Last but not least, commercial calculations in many cases lie across the risk perceptions of individual actors and of the political public. In summary, the information theoretical risk concept can be said to be closely related to a

concept of knowledge that is rather static and which treats the relation between knowledge and non knowledge as a zero sum game. Complementary to this approach, it can therefore be argued from a sociological point of view that new knowledge in every case instantly creates new non knowledge. It is, for epistemological reasons, impossible to eliminate non knowledge. Risk theory can try to take profit from this insight.

RISK AND DECISION THEORY

Risk research has turned its attention toward all forms of social knowledge and non knowledge. From this sociological perspective, the distinction between specific and unspecific non knowledge (Japp 1997) is of great importance. Specific non knowledge describes the case in which an actor explicitly knows that she lacks knowledge in a certain aspect. Specific non knowledge, therefore, is a reason to start an inquiry and to try to produce new knowledge. It is the characteristic condition of scientific research: we try to expand our knowledge in an area where we still do not have (enough) knowledge. From the point of view of risk research, positively knowing about the existence of our non knowledge is decisive. This form of specific non knowledge has to be sharply distinguished from any kind of unspecific non knowledge. Unspecific non knowledge describes a case of categorical ignorance, a case in which an actor cannot know that she lacks knowledge in a certain aspect. Unspecific non knowledge transcends the barriers of our epistemic capacities in a given moment.

Social forces produce all kinds of damage, danger, and catastrophe. The causes for risk, therefore, are social, and not primarily natural. Under such a condition, the question of causation and accountability gains increasing importance. Consequently, the distinction between the social roles of decision maker and those affected by the decision come increasingly to the center of interest. Accordingly, a growing amount of social protest can be expected from those who are (even potentially) affected by decisions. Insofar as events are understood as consequences of social decisions and not as effects of natural processes, the category of

decision becomes relevant for the analysis and understanding of risk. For these reasons, decision theory becomes relevant for a sociological analysis of risk.

The central characteristic of a risk decision consists of a situation arising from the need to select between different options, which may all entail negative consequences for third parties and therefore will provoke the issue of responsibility (Luhmann 1991). The risk of decision making expresses a specific form of what Luhmann calls "temporal coupling" (*Zeitbindung*). A decision becomes risky insofar as three aspects are intertwined. These are (1) the knowledge that non decision is impossible; even inactivity contains a decision; (2) the knowledge that unspecific knowledge is unavoidable; this knowledge makes us aware that consequences will appear later that are epistemologically unknown when the decision is taken, and that they will bear negative effects for others; and (3) the knowledge that future consequences will be attributed to the decision and to the decision maker's responsibility. In the co occurrence of these three aspects, some fundamental dilemmas become apparent. Firstly, we observe the control dilemma that Collingridge (1980) mentioned. The term indicates that at a time when it is still possible to control a new technology, our technological knowledge goes far beyond the knowledge about social factors and consequences. The social effects of a given technology are not visible at the moment of the decision. However, when they are detected, the technology is often very deeply embedded in the social practice, so that it is usually almost impossible to control it. This dilemma clearly points to the temporal structure of decision making. At the same time it leads to a second dilemma, what we call the risk dilemma, which consists of the constitutive connection between the pressure to decide and the impossibility of holding the necessary knowledge. This aspect of uncertainty entails a paradoxical moment, which Clausen and Dombrowsky (1984) called the warning paradox. According to this paradox, warning against possible dangers does not help to decide risky cases. The reason is that we can learn whether the warning was reasonable only if we fail to heed it. If we follow the warning, we will never know whether it was well founded or not.

RISK AS A SOCIAL PROBLEM

The notion of risk, as formulated in the decision theory of risk, is sharply distinguished from the notion of danger. Whether an event will be perceived as risk or as danger mainly depends on the question of whether it can be attributed to the decision in the social dimension. Risk – in contrast to a natural disaster, for instance – is caused by social decisions, and is therefore related to the decision making actor or institution. Danger, on the other hand, relates to those who are affected by the consequences of the decision. This differentiation not only helps to describe the historical trend from danger to risk, it also indicates a change in social attitude toward the future. A greater number of far reaching consequences have to be taken into consideration. Very distant futures are relevant to our contemporary decisions. The effects of acting as well as of not acting are equally complex and uncertain. Modern societies are fundamentally characterized by the difference between decision makers and those affected by their decisions. Every individual may occupy either side of this distinction in various social contexts.

Looking at those affected by a decision and threatened by the danger of a negative consequence, we can see that this side of risk decisions is related to social inequalities. These inequalities can be conceived under the terms inclusion and exclusion. The distinction between inclusion and exclusion describes a very general form of social inequality (Stichweh 2000). This inequality can be realized in different gradual forms and modalities. Social regions of exclusion, which may be highly integrated internally but are characterized by strong differentiation from all central political and legal institutions, usually show a dramatic potential for social dangers. Absence of health care, low levels of education, high rates of criminal victimization, as well as a high level of environmental damage and poor nutrition, are significant indicators for social exclusion. It is in this area that social movements find cause to protest, pointing out the dangers for the excluded that stem from social decisions taken elsewhere. Social communication about risk becomes politicized under these conditions.

RISK THEORIES IN THE SOCIAL SCIENCES

Scientific concern with risk theory reaches from medical epidemiology via mathematics and economic theory to the legal and social sciences. Within the realm of the social sciences, three groups of risk theory can be distinguished.

Psychology and cognition theory. Approaches from psychology and cognition theory refer to the difficulties resulting from the dilemma of risk decision. Given that in a fundamental sense we never have sufficient information to make an *ex ante* assessment of risks, the question rises as to how decision making actors (individuals as well as organizations) empirically arrive at their decision (Jungermann & Slovic 1993). Psychological risk analysis is interested in analyzing individual and collective attitudes to risk behavior and risk management under given situational conditions. In this respect, it has produced numerous valuable insights into the mechanisms of risk behavior (see, e.g., Jungermann & Slovic 1993). It shows that risks which are undertaken voluntarily are viewed as much more acceptable than those which are not voluntarily assumed. Moreover, the acceptance of a given risk depends on the amount of perceived control over the risk and/or over the source of the risk. Risks from new technologies will usually be estimated as much higher than those from older or "well known" technologies. The fairer the possible consequences seem to be, the lower the risk of a decision will be judged. Risk acceptance in particular depends on the perceived reversibility of the decision.

Cultural theory. Whilst the cognitive approaches are mainly concerned with individual perceptions, cultural theory looks at social groups as the decisive factor. This approach understands risk as a collective social construct (in the sense of an interpretive pattern, or *Deutungsmuster*). The particular form of this construct depends on the properties of the social group in which it occurs. Cultural theory categorizes social groups along two main dimensions, namely, "group" and "grid" (Douglas & Wildavsky 1982; Thompson 1999). Group stands for the external boundaries of a social collective and describes the extent of the group's differentiation from its social environment. Grid refers to the social distinctions within the group

that regulate its internal behavior. By cross tabulation of these two dimensions, four types of social groups (cultures) can be found, each with a specific concept of risk:

- 1 Hierarchical culture has high values in both dimensions. It is characterized by high differentiation against the external world and by high internal integration. In this culture, risks are treated as manageable.
- 2 Individualistic market culture bears low grid and low group values. It attributes risks to the sphere of individual action frames and generally accepts them as calculable issues.
- 3 Egalitarian culture (sometimes also called "sectarian" culture) has low grid and high group values. Usually it is highly risk averse and very sensitive to every kind of danger.
- 4 Fatalist culture is characterized by high grid and low group values. Risks are conceived as imposed by others. They provoke passive reactions rather than active avoidance or risk management.

Based on these differentiations, cultural theory analyzes social categorizations of risk. It explains these categories from the structures of the different risk cultures (for an overview see Thompson 1999). In contrast to psychological theories, cultural theory allows an understanding of risk as a social (i.e., socially constructed) phenomenon and thus as a social problem.

Systems theory. The new (or autopoietic) sociological systems theory also looks at risk as a social phenomenon. It describes the characteristic features of risky decisions (Luhmann 1991; Japp 2000). Risk is the result of a tension between temporal and issue dimensions. In modern society, the increasing use of risk as a category of social observation and interpretation indicates a change in the relation of society and its environment:

- 1 Risk communications show that dangers increasingly are attributed to decisions. This holds true even for phenomena that until recently had been understood as inevitable natural disasters, such as flooding, for example.
- 2 The future increasingly becomes a relevant dimension with respect to the legitimation

of decisions, and is no longer seen as constitutively incalculable. The issue of risk assessment becomes pervasive for all social systems.

- 3 Social differentiation between decision makers and those affected by the consequences of decisions helps to explain why social movements mobilize protest through risk communication and why they politicize decisions with respect to risk.
- 4 At the same time, social systems tend to externalize risks and to shift responsibility for risky decisions to other functional systems. This process can be observed, for instance, in the relation between politics, law, and economy (Luhmann 1991).

These three types of social risk theory refer to decision making processes in different aspects. They are distinguished from each other by their central term of reference – individual behavior, rational calculus, group identity, social systems. Thus, they differ from each other with respect to their level of generalization. It is doubtful whether approaches related to individuals and groups can cover the general (sociological) aspects of risk decisions. Nevertheless, they offer highly developed tools for the description of particular strategies in decision making. Systems theory, in contrast, focuses on the general sociological problems of risk decisions.

RISK PERCEPTION, TRUST, AND EXPERTISE

Individual assessment of risk depends on a large number of factors, such as the opportunity for control. Besides the individual perspective, public opinion about risk and risk regulation is of great importance for the understanding of modern society. Public opinion, as numerous studies show, is far from being averse to modern technology in general. This holds true for all countries and regions (Durant et al. 1998; Hampel & Renn 1999; Gaskell & Bauer 2001). With regard to certain issues, such as different applications of biotechnology (e.g., plant biotechnology, human stem cells, to mention two prominent examples), public opinion is ambivalent. However, what is more relevant than the attitude toward the technological issue at stake is the fact

that public opinion does not depend on the level of information about a particular technology. A common hypothesis contending that more information and enlightenment would raise acceptance (the so called “deficit hypothesis”) must be considered inadequate from a sociological point of view. On the contrary, a higher level of education probably leads to a more critical attitude toward risk and technology, as other studies report (Levidow & Marris 2001). Obviously, public opinion is strongly influenced by very general patterns of interpretation and often by a generalized suspicion toward misapplications of any kind. The options for regulating risk and technology that modern society provides for are usually estimated as too low or insufficient (Durant et al. 1998; Hampel & Renn 1999). A significant number of people think that the possibility of controlling and regulating risk through the law and legal institutions is inadequate. More than 80 percent say that existing laws are not applied and that surveillance is not strong enough. As a result, political and legal instruments of regulation can be said to be one – if not *the* – factor for explaining public opinion toward risk: risk perception is a question of trust in institutions. The role of the mass media in this process is important, but not as decisive as might be supposed (Durant et al. 1998; Hampel & Renn 1999). At the European level, for instance, no significant correlation could be observed between media coverage and public perception (Durant et al. 1998).

Historically, the first answer to the perceived weakness of regulatory means has been expertise (control by knowledge, in Max Weber’s formulation). The assumption is that the relevant knowledge for the control of risks can best be produced by scientific expertise. Law and politics have made use of this model from the very beginning of regulatory activities in technology and risk. However, as debates over the last few decades have shown, the expert model is burdened with some serious difficulties. Experts are, for epistemological reasons, not able to eliminate risk. Their status is embedded in what has been called “mode 2” of knowledge production (Gibbons et al. 1994). Mode 2 means that the process of knowledge is not linear but undirected, more like a large reservoir to which many different institutions have an input. Expertise is often contested and uncertain. Society itself

becomes a large laboratory, in which "real world experiments" are conducted (Groß et al. 2003). On the other hand, on the basic level of cognition, there is no way out from expertise, because it is only scientific knowledge that aims to deal with our questions about truth and reliable information. No delegitimization of expertise could destroy its basic function for society. One may even speak of an increasing importance of expertise in politics and law (Weingart 1999, 2001).

The crisis of expertise mentioned above has led to an increase in participatory decision making. Participation is usually understood as a form of dialogical process shaping technology and managing possible risks. It can be observed in areas where research, regulation, and public opinion overlap. In most political contexts, participation is a relevant tool for decision making. It is conceptually based on a critique of expertise and on a discourse of "democratizing expertise" (Liberatore & Funtowicz 2003). Participatory procedures, according to a common hypothesis, are more likely to evoke the motivation to engage in decision making, to broaden the basis of knowledge and values involved, to initiate learning processes, to produce new possibilities for conflict resolution, to realize common interests, and to increase acceptance and legitimacy of a decision (Durant 1999; Fischer 1999; Joss & Bellucci 2002). The term "participatory procedure" describes instruments and methods aimed at the inclusion of laypersons and/or stakeholders. Scientific expertise is a relevant feature in participatory procedures, but is usually embedded in concepts of deliberation among laypersons and stakeholders. This combination results from the fact that the function of such procedures is to integrate the issue dimension (e.g., information, facts, truth) and the social dimension (e.g., acceptance, trust, legitimacy, values, preferences). With respect to risk decisions, such procedures represent an important mechanism of risk externalization. The broad inclusion of those people potentially affected by a decision may help to absorb protest. Some one who has participated in the decision making process will find it difficult to blame decision makers for any negative effects.

In addition to the possible advantages of participation, its weaknesses should be considered. Participatory procedures will not develop

sufficient commitment from all parties unless they lead to a real win win solution. Participants' loyalty to their organizational background may even force them to leave the procedure if serious conflicts arise. The functional differentiation of society may create insurmountable barriers to communication. Furthermore, these procedures often provoke questions such as their political representativity, imbalance of power, or lack of political mandate for those involved. One cause of such problems may be seen in their lack of embeddedness in the institutions of representative democracy. Participation, therefore, is a means to cope with risk decisions and their problems. At the same time, it creates new problems.

The regulation of risks challenges science and practice in modern society. The concept of decision theory sheds light on the fact that every regulatory approach entails new consequences, which can be found in the realm of unspecific non knowledge. They consequently provoke effects that cannot be known in advance and that will raise serious problems of risk and danger, thereby leading to social protest and conflict. The value of this theoretical approach for political, legal, and scientific practice could lie in its ability to reduce expectations about social capacities for eliminating risk from social life to a realistic amount.

rite of passage

Rodanthi Tzanelli

The term rite of passage was first used in anthropology to encapsulate rituals that symbolize the transition of an individual or a group from one status to another, or to denote the passage of calendrical time, but soon it was embraced in other disciplines. The concept was developed by the Durkheimian anthropologist Arnold Van Gennep in *Les Rites de passage* (1909), in which he explored the nature of ceremonies that mark personal or collective changes of identity (childbirth, puberty, marriage, motherhood, and death), as well as collective celebrations of seasonal change (Easter,

harvest). Van Gennep identified three phases in these rites: (1) separation, when the individual or the group is distanced from their former identities; (2) liminality, the phase in between two conditions (the one from which the individual/group departs and the one which they will enter); and (3) reaggregation (or incorporation), the final stage in which the individual/group is readmitted to society as bearer of new status. Because rites of passage belong to sacred time (not the profane of everyday life), their performance is formalized. The initiate(s) are placed in a symbolically subordinate position vis à vis those who have been initiated (elders, married, mothers) and have to go through elaborate "trials" (isolation, humiliation, fasting) before they are accepted back into the community.

The flexibility of Van Gennep's theory led to its implementation and use in a vast array of contexts in different human sciences (anthropology, sociology, history). Van Gennep influenced two of the most important twentieth-century symbolic anthropologists, Victor Turner and Mary Douglas. In *The Ritual Process: Structure and Anti Structure* (1966), Turner illustrated the significance of liminality as a dangerous phase for the initiate(s) and the whole community, which both challenges and sustains social order. This idea reappeared in Mary Douglas's *Purity and Danger: An Analysis of the Concepts of Pollution and Taboo* (1966) in a more structuralist fashion. Douglas regarded liminality as a point that negotiates two opposing structural situations: her analysis of "dirt" as a moral sign that enables societies to establish boundaries between social categories (e.g., clean and unclean, good and evil, dangerous and safe) echoes Van Gennep's tripartite schema of the rite of passage.

One of the problems highlighted about the concept is its inherent vagueness, because it invites social scientists to construct almost every transitional stage as a rite of passage. Van Gennep also stressed that not all rites of passage retain their tripartite structure: one phase may be ritualistically exaggerated at the expense of the other two (e.g., baptism as incorporation into society). Again, this led to confusion concerning the classification of transitional rituals as rites of separation, liminality, or incorporation (e.g., marriage can be all three). The concept of liminality, however, found extensive use in

sociology, especially in tourism and leisure studies. Unfortunately, its association with ambiguity, indeterminacy, and displacement also invited its abuse by "cultural theorists" who are often not informed of its origins.

rite/ritual

Aldo Natale Terrin

The field of ritual studies has expanded dramatically over the past 20 years. Rituals are analyzed in anthropology, sociology of religion, religious studies, and theology, and also in the study of literature, philosophy, theater, political science, and education, especially from the perspective of performance theory (Schechner 1977). Many disciplines have taken different theoretical approaches to this broad and complex topic, and thus a great variety of definitions have been proposed, no single one of which is adequate. For present purposes ritual will be defined as a formal and symbolic behavior that leads to the creation or recreation of

an emotion in order to obtain or maintain a correct balance between persons and the world.

"Formal and symbolic behavior" speaks of the particular behavior included in ritual. Certain acts, gestures, utterances, and so on seem to be of a particular kind that sets them off from acts performed in other contexts and situations. This intuitive demarcation from other behaviors is the first step in any consideration of ritual. Analyses of ritual should begin by describing what is distinctive about it, rather than what makes it similar to other forms of social interaction. Symbolic behavior is generated from the word "ritual" itself, which derives from the Indo European root *ri* – like "rhyme," "rhythm," and "river" – and signifies something like an ordered flow, governed by rules, repetitions, and conventions. As rule governed behavior, ritual is collective, repetitive, and stylized. It normally follows a pattern established on earlier occasions or by tradition and has since become "holy," having been instituted by the ancestors or ordered by a deity. Ritual is also formal in the sense that it distances participants from their spontaneous selves and their private motives. Formal gestures are fewer in number than informal ones and are more prescribed and impersonal. During the practice of ritual, participants observe rules, conforming themselves to what is prescribed for them. Bloch (1989) argues these formalized ways of behavior and communication normally have to be considered as a complex of primitive behavioral modes, like dance, song, and formulaic speech. These stylized behaviors tend also to be closely connected with traditional forms of social hierarchy and authority. In other words, using standardized forms of speech in which vocabulary, syntax, and intonation are reduced to a minimum, ritual reinforces power and the status quo. The most highly formalized of such behavior is perhaps religious ritual.

It is very difficult to discuss the sense of the symbolic in ritual. Ritual is particularly symbolic when it evokes a foundational myth. For instance, Turner's (1967) *mudiyi* tree and Rappaport's (1999) *rumbim* each bring together in ritual multiple significations, ranging from the physiological to the ideological and the cosmic. The contemplation of representations in which ideological significations are emotionally present in association with the physiological constitutes

an attempt to integrate and unify the whole of reality. This is capable of arousing great emotion.

The repetition, the invariance, and the formalization of ritual – producing rhyme, rhythm, *phoné*, and music – allow a new interpretation of ritual as having an unconscious force from which an ancient emotion can emerge. Ritual's strong link with the physiology of the body is important here. Ritual behavior is in fact a performance in which the value of the body is manifested through a multifaceted sensory experience. Like any other performance, ritual communicates on multiple sensory levels, involving imagery, dramatic sounds, and tactile, olfactory, and gustatory stimulation. All the communicative codes are involved. In this sense ritual is constructed in order to prioritize the body and to valorize knowledge through the performance of the body.

Why should ritual action accord primacy to bodily techniques in this way? We know in the first place that bodily movements can do more than words can say. It is through the ritual itself that one understands this, both phylogenetically and ontogenetically. Thinking and communicating through the body precede and to a great extent always remain beyond speech. In this sense we can understand ritual as not opposed to rationality, but as inhabiting another level of rationality, constructed not by semantic truths, but established by experiential and expressive truths and emotional constructs. Indeed, the practical understanding and deep knowledge demanded by ritual operate best without concepts (e.g., through the gestures and emotions of the body and in the body). For instance, we understand the language of facial expressions, postures, gestures, and involuntary bodily changes first and best, just as a child understands the facial expression of its mother long before it understands verbal language (Vygotsky 1962). And this type of knowledge is in any case the deepest knowledge. Another example stems from the common experience we have when our familiar environment is disrupted: we feel suddenly uprooted, we lose our footing, we collapse, we fall. This experience is not solely metaphorical. Rather, the shock and disorientation occur in the body and the mind, and refer to a basic physiological and ontological structure – to our

“being in the world” (Binswanger 1963). In the same manner, in dance and music we may obtain the best knowledge of ourselves and we may recognize ourselves, for instance, as members of a community: we become emotionally a common body.

From this perspective, we arrive at the most important expression of the proposed definition of ritual: “behavior that leads to the creation or recreation of an emotion.” Above all, ritual must be seen in its relationship with the “emotional body.” Such emotion probably derives from the hypothalamus and the amygdala, the most ancient part of the brain. Newberg and D’Aquili (2000) reviewed a number of studies that apparently established links between sustained attention associated with the practice of ritual or meditation and electroencephalography (EEG) theta waves above the prefrontal cortex. The two authors confirmed these data and enlarged them using single photon emission computed tomography (SPECT). Results demonstrated significantly increased blood flow to the inferior frontal and dorsolateral prefrontal cortical regions when subjects were engaged in intense meditation or ritual.

The definition of ritual suggested here is therefore partly dependent upon this result. The expression “correct balance between persons and the world” is the most interpretive part of the definition and provides the *sine qua non* for social life and survival. This interpretation is very broad in content and therefore not in contrast with other definitions, but it is also very narrow in the sense of a physiological and emotional experience. By stressing this fundamental data of ritual it is possible to surmount all the difficulties associated for instance with the so called “meaninglessness” of ritual (Staal 1975), which is the negative outcome of previous studies made by ritologists and anthropologists, who asked which type of functionality, communication, and expressivity were included in ritual.

In Durkheim, for instance, we find both a passive and an active notion of the relationship between religion and society: while religion is a system of ideas with which individuals represent to themselves the society of which they are members, rituals really strengthen the bonds between individuals and society. But is this reciprocity between society and religion all we

can say by means of the concept of function? And is the concept of symbolic function sufficiently clear? We have gone from social functions and instrumental/non instrumental theories of ritual, to communication theories based on the idea that ritual is a particular form of social action with its own modalities of communicative and meta communicative framing; from expressive performative theories for which ritual is symbolic drama, to those based on the simple semiotic value of rite. In this perspective ritual is regulated only by formal rules and is comparable to syntactic or musical structures. This would mean that ritual actually is not a language, but something “like” a language. In this sense the inner structure of ritual is not a structure based upon meanings, but constructed only on a complex of signs. Ritual, says Staal (1975), is like a bird song.

The most recent theories are no less important and problematic. “Cognitivist” theories of ritual that turn to the psychological aspects of the representation of action ask whether the religious meaning of ritual can be reformulated in terms of the connections established by participants between representation of the ritual sequence and other types of religious assumptions. Meanwhile, “ecological” theories, for instance, examine the new space time relationship in which ritual appears as the ground for anthropological spatial direction and bodily division. The construction of time in ritual is important because ritual provides grounds for the creation and recurrence of time as well as space. Further, such ecological theories posit an essential adaptive function of rite as a type of “sanctification” of the environment in connection with the ecosystem. Burkert (1996) suggests that “through manifold forms as functions of ritual behavior and cultural interpretations, religion can still be seen to inhabit the deep values of the landscape of life.” What should be stressed here is that religion – through ritual – not only relates to the social sciences, but also connects with the ecosystem, with naturalism, and with life and biology itself.

All these contributions can be understood in a renewed epistemological context if we suppose that in the beginning religion was not a matter of reflection and consciousness, but one of simple biological and physiological *arousal* of human nature in front of the varieties of events

and situations. If we consider the links between ritual and the autonomous nervous system, it is clear that by means of (especially) repetition and formalization the system is driven unconsciously to maintain or recreate a very particular "primitive emotion." Rite stirs up an emotion that does not really reach consciousness and self awareness, but reaches deeper, into the most ancient and original point of consciousness, leading to an emotional balance, a *habit* that is not an emotion derived from a situation or routine. This is also the way to understand the "serious" or non empirical aspect of ritual.

In other words, language and consciousness are functions that are too developed for the subcortical structure of the brain. Ritual belongs to the primitive structure of humanity, dominated not by language but by physiological emotion. In this sense Langer (1969) was right to think about the "presemantic" and "preverbal" dimension of ritual. She suggested that rite belonged to a prelinguistic world and carried out a dramatic emotional logic.

Can an emotion exorcise the fear of death? Using the definition of ritual advanced here, it is easier to see the "synthetic" value of ritual and to write a new history of ritual in which it is possible to stress without contradiction its connections with social, religious, functional, biological, adaptive, and ecosystemic dimensions. This multimodality is explained by the fact that ritual arouses a deep, primitive emotion in which all is convergent.

ritual

Philip Smith

Ritual involves conventionalized and stylized human actions. These are often organized with reference to overarching cultural codes, have a communicative intent, and generate powerful emotional responses among participants. Historically marginalized as a concern for anthropologists, since the cultural turn became institutionalized in social theory in the 1980s the concept of ritual has become more and more central to the sociological enterprise. The core debates revolve around the following themes: (1) whether priority should be given to analyzing rites (embodied actions, doing) or beliefs (cosmologies and symbols, thinking); (2) how a model conceived in functionalism can be adapted to include understandings of power and domination; (3) whether we should understand ritual in collectivistic or more microsocio logical ways.

The canonical text for the study of ritual in social science is Durkheim's *Elementary Forms of Religious Life*. Here, Durkheim drew upon ethnographic material about Aboriginal Australia to argue that societies needed periodically to renew social bonds and solidaristic ties. Tribal gatherings involving ritual activity – the corroboree – performed this function. They involved

the manipulation and invocation of symbols, totems, and supernatural forces; coordinated bodily motions and expressive actions, feasting and sexual activity, the enactment of myths and legends. The result was a heightened emotional sensibility and sense of excitement that Durkheim called *collective effervescence*. Durkheim emphasized the interplay of such socially integrative rites with underlying systems of belief and classification that marked out the sacred from the profane. He understood religion as this complex of cultural codes and ritual actions, and society as being founded upon this religious core. The history of ritual theory in sociology can be broadly understood as the story of elaborations upon, challenges to, and creative readings of *The Elementary Forms*.

Although he drew his material from what he thought of as a "primitive" society, Durkheim explicitly intended his insights on the characteristics and social functions of ritual to have universal relevance. Yet sociologists were slow on the uptake. When Marcel Mauss, Durkheim's nephew, wrote about *The Gift* in the 1920s, he gave more attention to theorizing exchange relationships and economic life than the ritual qualities of gift giving. In the 1930s France Bataille and the College de Sociologie were seemingly more interested in elaborating the qualities of the sacred and the ways this could be immanently experienced without the mediation of collective social activity. For this reason W. Lloyd Warner's application of the ritual model to "advanced" societies in his study of American small town life marks an important intervention. Although rather simplistic in retrospect, his analysis of America's Memorial Day ceremonies as a "cult of the dead" attempted to validate Durkheim's broader thesis. Likewise the attempt by Edward Shils and Michael Young to interpret the 1952 coronation of Queen Elizabeth II as a ritual of national communion stands out from this period. Subsequent work in the 1960s by Robert Bellah on civil religion, Edward Shils on center and periphery, and Mary Douglas on purity and pollution saw the leading Durkheimians focus once more on classifications and cosmologies rather than ritual activity. In Durkheim's own terms, scholars were looking at beliefs rather than rites, even if they bought into the general proposition that society had a quasi religious foundation. The most important

exception was the work of Victor Turner. Although Turner rarely cites Durkheim, his theorizing of the solidaristic, egalitarian, and creative social relations he called *communitas* owes a clear debt to the strand of *The Elementary Forms* concerned with ritual practices.

The period extending through the 1970s and 1980s saw the consensual normative functionalism of Durkheim and Talcott Parsons come under attack. New visions of ritual as an instrumental strategy fell into place. These directly or indirectly challenged what was seen as a cognitive and integrative bias in Durkheim's thinking, arguing instead for ritual as a form of political practice. In a seminal article, Steven Lukes (1975) argued that we needed to understand rituals as events with sponsors and as attempts at domination. David Kertzer agreed, suggesting that rituals were a medium of contestation and mobilization that could work even in the absence of an overarching consensus or set of shared beliefs. Pierre Bourdieu's analysis of gift exchange, unlike the work of Mauss, put strategy and reflexive calculation center stage. Scholars like Stuart Hall in the emergent area of cultural studies spoke of youth subcultures as "rituals of resistance" characterized by stylized critique of the dominant social order. Michel Foucault spoke of the "spectacle of the scaffold" and the ways this reproduced systems of power.

A second front against the Durkheimian mainstream emerged out of Erving Goffman's work on face to face interaction. This microsociological approach drew as much from Arnold van Gennep's (1960) early study of the "rite of passage" as from *The Elementary Forms*. Van Gennep had argued that ritual interventions were ways in which societies conferred legitimate and recognizable identities on subjects, especially at times of status transition. What Goffman (1967) called *interaction rituals* were everyday encounters between people in which appropriate displays of deference and demeanor were expected. These offered mutual confirmation of the value of the self, of social status, and of role expectations, thus providing a sense of ontological security and allowing interactions to be successfully accomplished by more or less reflexive social agents. The work of Randall Collins combined this line of thinking on ritual with that of conflict sociology, asserting that

collective identities and solidarities are built from the bottom up through *interaction ritual chains*. These not only generate pro social emotions, such as enthusiasm and esprit de corps, but also play a role in the formation of stratification hierarchies and exclusionary cliques.

The contemporary sociology of ritual continues to debate these themes, often through reinterpretations of *The Elementary Forms* itself (see Alexander & Smith 2004). Some focus on what Durkheim had to say about the sacred and profane, and see rituals as the enactment of deeply held beliefs. Others see this as idealism, point to the weak, incoherent, and inchoate nature of many belief systems, and suggest that rituals are really all about embodied and practical actions. Some look to the solidaristic, universalist, and egalitarian outcomes of rituals and others to their uses as a tool for domination; some focus on ritual and ritualization as an emergent property of action and others on ritual as the social fact that constrains and motivates action in the first place. Such underlying controversies are being played out currently in a number of established and emergent empirical domains where the concept seems to pay dividends: studies of political scandals, controversies and contests; investigations of play, sport, tourism, and pilgrimage; accounts of collective memory and commemoration; the literature on bodies, emotions, and everyday interactions; research on revolutions, protests, and collective mobilization; discussions of punishment, regulation, and control; and last but not least, of course, in the sociology of religion itself.

Rizal, José (1861–96)

Syed Farid Alatas

José Rizal, Filipino thinker and activist, may be considered the first systematic social thinker in Southeast Asia. While the bulk of his writings were not in the social sciences, it is possible to extract a sociological theory from his works. This would be a theory that explains the nature and conditions of Filipino colonial society, and the requirements for emancipation.

José Protasio Rizal y Alonso was born in Calamba, Laguna, the Philippines, on June 19, 1861, to a wealthy family. His father ran a sugar plantation on land leased from the Dominican Order, while his mother was a highly educated woman. Rizal was educated at home till he was 11 years of age, after which he attended the best schools in Manila. He went on to study at the Ateneo de Manila University and then the University of Santo Thomas. He was known to be a well rounded student, having studied medicine and the humanities simultaneously. In addition to being a qualified ophthalmic doctor, Rizal was also a writer, poet, ethnologist, sculptor, cartoonist, fencer, sharpshooter, and linguist (Coates 1978: 1905–6). In 1882 Rizal left for Spain where he continued his studies in medicine and the humanities at the Universidad Central in Madrid. At the same time, he became familiar with liberal movements and modern constitutions and began to draw lessons for the analysis of Spanish rule in the Philippines. Within a few years, Rizal's activities with a group of Filipino students in Madrid led to his being acknowledged as the leader of the Philippine reform movement (Coates 1978: 1906).

His first novel, *Noli Me Tangere* (*Touch Me Not*), was published in Berlin in 1887, the year that Rizal returned to the Philippines. The novel was a reflection of exploitative conditions under Spanish colonial rule and enraged the Spanish friars. Fearing for his safety, Rizal left the Philippines for Japan, the United States, and Britain in 1888. At the same time in Spain, the nationalist movement started a fortnightly newspaper, *La Solidaridad*, to which Rizal contributed. His second novel, *El Filibusterismo* (*The Revolution*), was published in 1891 in Ghent, Belgium, and thematized the

possibilities and consequences of revolution. As Rizal's political ideas became known to the authorities, he and his family suffered many hardships. His parents were dispossessed of their home and the male members deported to the island of Mondoro (Coates 1978: 1908). Rizal himself was finally exiled to Dapitan, Mindanao, from 1892 to 1896, implicated in the revolution of 1896, tried for sedition, and executed by firing squad on December 30, 1896, at the age of 35. Although he lived such a short time, his productivity remains unsurpassed by anyone in Southeast Asia, perhaps even Asia. He wrote several poems and essays, three novels, and conducted studies in early Philippine history, Tagalog grammar, and even entomology. Rizal's achievements were all the more remarkable when it is realized that great obstacles were put in the way of the educational and intellectual advancement of the Filipinos during the colonial period.

Rizal lived in colonial Filipino society and was deeply affected by the colonial exploitation of the Filipinos. The early Filipino nationalists were priests who pressed for reforms. For example, an 1826 royal decree required that parishes previously in the hands of Filipino priests be gradually returned to Spanish friars. Several Filipino priests worked for the revocation of this anti Filipino decree. Their political activities led to the execution of three Filipino priests, Mariano Gomez, José Burgos, and Jacinto Zamora in 1872. Rizal dedicated his *El Filibusterismo* to them.

Rizal also lived at a time when there was little critique of the state of knowledge on the Philippines among Spanish colonial and Filipino scholars. Rizal was well acquainted with the world of Orientalist scholarship in Europe (Mojares 2002: 54). Rizal himself took an interest in this, as can be seen in his annotated reedition of Antonio de Morga's *Sucesos de las Islas Filipinas*, which first appeared in 1609. Prior to producing this work, Morga served eight years in the Philippines as Lieutenant Governor General and Captain General as well as a justice of the Supreme Court of Manila (Audiencia Real de Manila) (Morga 1991 [1890]: xxxv). Rizal believed that Spanish colonization had virtually wiped out the precolonial past from the memory of Filipinos and presented the reedition in order to correct what he

saw as false reports and slanderous statements to be found in most Spanish works on the Philippines ("To the Filipinos," in Morga 1962 [1890]: vii). This includes the destruction of pre Spanish records such as artifacts that would have thrown light on the nature of precolonial society (Zaide 1993: 5). Rizal found Morga's work an apt choice as it was, according to Ocampo (1998: 192), the only civil history of the Philippines written during the Spanish colonial period, other works being mainly ecclesiastical histories. The problem with ecclesiastical histories, apart from the falsifications and slander, was that they "abound in stories of devils, miracles, apparitions, etc., these forming the bulk of the voluminous histories of the Philippines" (Morga 1962 [1890]: 291 n4). For Rizal, therefore, existing histories of the Philippines were false and biased as well as unscientific and irrational. Rizal's interests were thus to reform Filipino society in both sociopolitical and intellectual terms.

If we were to construct a sociological theory from Rizal's works, this would be a theory of colonial society, one that explains the nature and conditions of colonial society and the meaning and requirements for emancipation. The outline of Rizal's perspective is as follows. A corrupt Spanish colonial government and its officials oppress and exploit the Filipinos. Rizal's novels, political writings, and letters provide examples such as the confiscation of lands, appropriation of farmers' labor, high taxes, forced labor without payment, and so on (Rizal 1963a). Rizal's *Noli Me Tangere* is a diagnosis of the problems of Filipino society. This novel is a socially descriptive text in which the various characters represent the social malaise and wrongs of his time (Majul 1999: 3). Rizal was tireless in pointing out the hypocrisies of the Spaniards. He was critical of the "boasted ministers of God [the friars] and propagators of light (!) [who] have not sowed nor do they sow Christian morals, they have not taught religion, but rituals and superstitions" (Rizal 1963b: 38).

Rizal noted that the Spaniards blamed the backwardness of the Filipinos on their indolence. The Spaniards charged that the Filipinos had little love for work. Rizal, however, made a number of important points in what was the first sociological treatment of the topic (Alatas

1977: 98). First of all, Rizal noted that the “miseries of a people without freedom should not be imputed to the people but to their rulers” (Rizal 1963b: 31). Secondly, that the Filipinos are an inherently lazy people was not true. Rizal admits that there was some indolence but does not attribute it to backwardness. Rather, it was the backwardness and disorder of Filipino colonial society that caused indolence. Prior to the colonial period, Filipinos were not indolent. They controlled trade routes and were involved in agriculture, mining, manufacturing, and so on. But when their destiny was taken away from them, they became indolent. Rizal’s approach to the problem is interesting in that he made a distinction between being “indolent” as a reaction to climate, for example, and indolence in terms of the absence of love for work or the avoidance of work. The second kind of indolence was a result of the social and historical experience of the Filipinos under Spanish rule. Rizal examined historical accounts by Europeans from centuries earlier which showed Filipinos to be industrious. Therefore, indolence must have social causes and these were to be found in the nature of colonial rule (Rizal 1963c).

The backwardness of colonial society is not due to any inherent defects of the Filipino people but to the backwardness of the church. Emancipation could only come from enlightenment. Spanish colonial rule was exploitative because of the backwardness of the church in that the church was against enlightenment, the supremacy of reason. The European Enlightenment was good for Filipinos, while the church was against it because it established reason as authority, not God or the church. Thinkers such as Marx, Weber, and Durkheim were products of the Enlightenment but recognized that reason had gone wrong. Modernity, which was a creation of reason, was unreasonable because it was alienating, anomic, and ultimately irrational. It is interesting to note that Rizal, who was also writing in the nineteenth century, had a different attitude to the Enlightenment and to reason (Bonoan & Raul 1994). His writings do not show disappointment with reason and he was not dissatisfied with modernity in the way that Marx, Weber, and Durkheim were. This is probably because for Rizal the Philippines was not

modern enough and was kept backward by the anti rational church.

This results in the emergence of the *filibustero*, the “dangerous patriot who should be hanged soon,” that is, a revolutionary. Revolution, in other words breakaway from Spanish rule and church, is inevitable and the only means of emancipation. Rizal’s *El Filibusterismo* is a prescription for revolution. His *Noli Me Tangere* of 1887 gives the impression of Rizal merely being in favor of breaking the friars’ civil power. This can be seen from the characters in the novel. The villains were the Franciscan *padres*. But the civil and military power exercised by the Spanish Captain General, a colonial officer, is rational and progressive. Elias, a noble, patriotic, and selfless Filipino, dies in the novel, while the egoist Ibarra survives. The sequel, *El Filibusterismo*, implies a shift in Rizal’s thinking. The villains are the Dominican priests as well as the Captain General, who turns out to be a mercenary. The revolution fails, reflecting Rizal’s assessment of the readiness and preparedness of the Filipinos for revolution. He saw those who would lead a revolution as working out of self interest rather than on behalf of a national community (Majul 1999: 19). Rizal was reluctant to join a revolution that was doomed to failure due to lack of preparation, the egoism of the so called revolutionaries, and the lack of a cohesive front. Nevertheless, his very actions and writings were revolutionary and he was executed for treason against Spain.

While a serious assessment of Rizal’s studies of Filipino history and colonial society would reveal the extent to which his claims were true or exaggerated, it is important to note the contra Eurocentric significance of his works. This suggests a redefining of classical social theory, recognizing that another context of the rise of sociological theory is the historical fact of European political and cultural domination from the fifteenth century onwards, and colonization. Looking at colonized peoples as part of the process of the rise of modernity would lead to a consideration of the ideas of the contemporaries of Marx, Weber, and Durkheim in colonized areas as classical social theorists.

robbery

Scott H. Decker

Robbery is the use or threat of force to take another's property and ranks among the most serious crime problems in the US. Robbery is one of the four crimes of violence (murder, rape, robbery, and aggravated assault) and is the second most prevalent of the four. Robbery is also a central component of the fear of crime, magnifying its impact particularly for women, the elderly, and suburban residents. As Conklin (1972: 4) has observed: "Although the public certainly fears murder and rape, it is probably fear of robbery . . . which keeps people off the street, makes them avoid strangers, and leads them to lock their doors."

Data reported to the police indicate that victims and offenders in most robberies are strangers. Robbery is a crime committed disproportionately by drug users, is more likely than other violent offenses to involve black offenders, and seldom nets large sums of money. Robbery rates are highest in urban areas. Many inner city neighborhoods experience high rates of robbery. Robbery poses a serious risk of injury or death. One in three robbery victims sustains at least minor injuries during the offense (Reaves 1993), and more than 10 percent of all homicides occur in the context of a robbery (Cook 1991).

The findings from interviews with armed robbers underscore the versatility of offending patterns among robbers, their high levels of victimization, and the role of lifestyle pressures among this group of offenders.

Jacobs (2000) conducted research among drug robbers (offenders who robbed drug dealers) in St. Louis, Missouri, a city with high levels of violence. Jacobs notes that while robbery is the "purest" of offenses with regard to motive and intent (cash), robbers engage in a variety of other offenses. The robbers interviewed by Jacobs were involved in both legal and illegal activities that involved them in a variety of contingencies that they could not escape. These individuals also had very high rates of victimization.

Wright and Decker (1997) studied 85 active armed robbers in St. Louis, Missouri, conducting interviews and "ride alongs" with

these individuals. This group of armed robbers committed a large number of diverse offenses, including burglary, drug sales, auto theft, and assault. Wright and Decker found that offenders engaged in minor forms of offending, would be victimized, and would then retaliate by engaging in a robbery. This pattern increased their level of offending, both in terms of frequency and seriousness. Not many of these offenders reported their victimization to the police. Lacking legal recourse, many offenders take the law into their own hands, circumventing legal means, and thereby increasing the odds of engaging in additional crime.

The research with armed robbers found a strong link between their lifestyle and their patterns of lawbreaking. This research has examined the separate steps in robberies: motivation, target selection, and confrontation, documenting their key components.

Most armed robbers report in interviews that the primary goal of their offense was a pressing need for cash. However, the majority of robbers report that the proceeds of their crimes did not go to pay for necessities. Rather, most indicate that they used the cash to initiate or sustain various forms of illicit street action (e.g., drinking, drug taking, gambling). Other robbers indicated that they committed robberies to ease financial burdens that were largely of their own making, such as gambling debts or other personal obligations.

Target selection among street robbers seldom matches the rational, well planned target selection process that might be imagined. Two key factors seem to be most important: the availability of good hiding places and getaway avenues. The primary goal in selecting potential victims is to select someone who appears to be carrying a good deal of cash. Often this means someone involved in criminal activities, such as a drug dealer, a customer of prostitutes, or gamblers. As Jacobs (2000) found, drug dealers can be particularly attractive targets for robbery. Other robbers may search for potential victims in environments where there is plenty of cash, such as areas around check cashing places, entertainment or restaurant districts, or automatic teller machines.

Robbery of commercial establishments takes a somewhat different form requiring considerably more planning and expertise. Only a small

proportion of the offenders in Wright and Decker's sample targeted commercial establishments. Most of these offenders targeted small local businesses such as liquor stores, taverns, or pawn shops. They claimed that they liked robbing commercial targets because they could count on the ready availability of a reasonable amount of cash – something that could not be taken for granted with many street robberies. Few of the commercial robbers could be classified as sophisticated, high level, or “professional” criminals.

The confrontation between perpetrators and victims is the final step in the robbery process. This stage of a robbery is likely to be the briefest, often taking no more than a few seconds. While robbers generally may prefer not to inflict harm, the ability to convince potential victims that they are willing to do so is an important part of being successful as a robber. Another key element of the confrontation between robber and victim is to frighten victims into compliance. This is done most effectively when a convincing illusion of impending death can be conveyed.

Robert E. Park, Ernest W. Burgess, and urban social research

Barbara Ballis Lal

The style of social research associated with the Chicago School of American sociology owes much to the determination of Robert E. Park and his younger colleague, Ernest Burgess, to understand city life. (Park was a faculty member in the department of sociology/anthropology at the University of Chicago between 1913 and 1934. Burgess was a faculty member in the department between 1916 and 1952. In 1929 sociology and anthropology became separate departments.) Other scholars who aided them in this endeavor included W. I. Thomas, Louis Wirth, Everett Hughes, Clifford Shaw, Donald Cressey, Frederick Thrasher, St. Clair Drake, and Horace Cayton. Economic growth, industrialization, population increase, immigration, and rural-urban migration, including the large scale movement of African Americans from the South, contributed to the emergence of Chicago as a city in which diversity of occupation was complemented by differences having to do with race, ethnicity (whether or not foreign born), religion, and language. Chicago, and cities like it, differed profoundly from the rural towns that had hitherto shaped American social life and politics. What, asked Park in an essay published in 1926, is to be the basis of a "moral order" which supposes communication and obligation between individuals and groups, in an urban environment characterized by "physical propinquity" and "social isolation"? The monographs *The Crowd and the Public* (1904), *Old World Traits Transplanted*, in the most part the work of W. I. Thomas but with authorship attributed to Park and H. A. Miller (1921), and *The Immigrant Press and Its Control* (1922), along with numerous essays, reflect his concerns.

Park and Burgess enjoined faculty and graduate students to view the city of Chicago as "a social laboratory." With this in mind, investigations proliferated of the ongoing group life of hobos, gangs, the Jews of Maxwell Street,

criminals, denizens of the gold coast and the slum, taxi hall dancers, the preachers in Bronzeville, and participants and onlookers involved in the 1919 race riot in Chicago. Each of these small scale studies was a contribution to a larger "mosaic" representing the urban context of which each was a part. Both Park and Burgess edited collections of essays suggesting future lines of research in cities (Park 1967; Burgess 1926).

Urban ethnography and the analysis of "human documents" such as newspapers, life histories, letters, and court records combined theory and empirical data. These strategies of research, although preferred, especially in the period before 1927, existed alongside of quantitative procedures based upon surveys and mapping the changing distributions of demographic and occupational statistics, land use, real estate values, vice, juvenile delinquency, and other phenomena of interest to social scientists investigating city life. Urban ethnography, that is to say, social research in a "natural setting," directed sociologists to document and interpret the nature of social life in cities as lived experience in a specific locality. The "narrative, case study approach" insisted that the subjective point of view of the actor and the collective representations made possible by language and local narratives be collected in an effort to find out what gives meaning and purpose to the life of those groups that sociologists study. The examination of "culture as process" (Matthews 1989) animated studies such as *The Ghetto* (1928), *The Gang* (1927), *The Gold Coast and the Slum* (1929), and *The Jack Roller* (1930), *Taxi Dance Hall* (1932), and *Black Metropolis* (1945). Later sociological monographs continue to reflect the development of the tradition of urban ethnography originating at Chicago. Current emphasis on fieldwork as "a way of knowing" as well as "immersion" in the ongoing activities of a group (Emerson 2001) complements rather than diminishes Park's injunction that sociologists study urban life and culture in much the same spirit as anthropologists study unfamiliar people in premodern settings.

Urban sociology at Chicago also developed the perspective of human ecology as a way of approaching city life. Human ecology charts the changing spatial distribution of groups, institutions, and activities, as well as examining the

distribution of a population in an occupational order. Spatial and occupational distributions result from competition among individuals and groups for both living space and an economic niche. Competition in turn results in "symbiosis," defined by Park as "the living together of distinct and dissimilar species, especially when the relationship is mutually beneficial." Symbiosis is a condition in which there is cooperation sufficient to maintain a common economy, but lacking sufficient consensus to sustain collective action. Competition is a type of "non social" interaction because there is neither communication nor the reciprocal adjustment of activity in pursuit of a common goal.

Ecological processes such as competition, "succession, and "dominance" describe observable, aggregate properties of a group. Ecological explanations are not concerned with the actor's point of view.

Human ecology made use of maps and graphic representations based on the collection of numerical data. Burgess's influential essay "The Growth of the City: An Introduction to a Research Project" (1967) displayed the physical growth and expansion of the city as a dynamic process in which a central business district "invaded" encircling zones of transition, workingmen's homes, residential areas, and commuter suburbs. Burgess pointed out that the processes and rate of expansion of cities "may be studied not only in the physical growth and business development, but also in the consequent changes in the social organization and in personality types." He further depicted zones of the city in terms of "natural areas" which are differentiated from one another on the basis of social organization and disorganization as indicated by the occupations and mobility of residents, type of housing, land values, and the rates of crime, vice, poverty, and homelessness. Burgess's model of the growth of cities was an "ideal construction" which he thought would capture the nature of urban growth generally.

Park never confused sociology, whose objective is to study culture and communication, with human ecology. Human "society" as opposed to plant and animal "communities" exists on two levels: the "biotic" and the "cultural." These levels can be presented analytically as a "spatial pattern" and a "moral order" (Park 1952b). Human ecology deals with the "biotic" (e.g.,

the biological and the geographical) aspects of group life, while sociology investigates "culture" and the subjectively motivated activities of "persons." Human ecology is of interest because social relations are so often reflected in spatial patterns and because "social distances" are frequently expressed as physical distances. As Park's student Louis Wirth (1945) pointed out, human ecology "is not a substitute for, but a supplement to, other frames of reference and methods of social investigation." The "cultural order" is imposed upon and modifies the "ecological order."

Park, Burgess, Wirth, and other colleagues at Chicago thought that the problematic features of urban life were amenable to social reform at the local level. In this spirit these scholars participated in local political activities and joined civic organizations. They were confident that increased communication between educated urbanites informed by expert knowledge could be directed towards ameliorating social problems such as ethnic conflict, race discrimination and race riots, juvenile delinquency, vice, labor strikes, unfair employment practices, and political corruption.

role

David D. Franks

Social role is a critical analytical tool for sociology and social psychology because it provides the nexus between social structure and individual behavior. The term role is a metaphor that comes from the theater and Shakespeare's famous statement about people playing roles

with entrances and exits throughout their lives. Social structures consist of roles or performance parts that provide vehicles for the organization of selves and social relations. People have many different sides, and different roles can produce very different behaviors from the same person. In the past century, role theory has evolved from a framework wherein "causation" flows down from preexisting roles shaping individual behavior, to a theory wherein "causation" also flows upward from social interaction to establishing a constant recreation of structure.

STRUCTURAL APPROACHES

The macro level notion of role was first presented by Park and further developed by the anthropologist Ralph Linton, and adopted by the mid century functionalists. In structural formulations a person occupies a social position. A position is a person's placement on a larger organizational map. The position has a status and one plays a behavioral role attached to the position. A status is a ranking on a continuum of invidious distinctions in social regard, importance, and privilege. Linton used status as synonymous with position and role, blurring these three meanings. Linton explained role "as the dynamic aspect of status that puts the rights and duties that constitute the status into effect." Roles usually involve a number of supporting roles referred to as *role sets*.

Role strain and role conflict illustrate two fruitful elaborations of structural role analysis. Since selves play many roles, contradictions within and between role expectations can present challenges to self formation. Persons feel *role strain* when a role important to their identity demands contradictory identities. For example, some professors feel a strain between the demands of teaching and publishing. *Role conflict* occurs when pressures arise between the demands of several roles, such as those of career and family (see Hochschild's *Commercialization of Intimate Life*, 2003). Here again, the degree to which both roles are important to the individual will determine the amount of stress felt. Insofar as adolescents care equally about what their parents and peers think of them, they are vulnerable to role conflict. Balance between

determinism and agency is maintained by considering the coping abilities of the person.

INTERACTIONAL APPROACHES

A very different micro level meaning of role comes to us from the pragmatist philosopher G. H. Mead. His conception of *role taking* stems from the insight of the Scottish philosophers that humans have the reflexive capacity to see themselves as others see them. Role taking involves imagining the other's responses to one's behavior and using this anticipation to guide one's line of conduct. Here role refers not to a theatrical part but to the *perspective* people will have towards the actor's emerging talk and gestures. This is very different from "taking on" a preexistent societal role and passively enacting its prescriptions.

Mead's formulation of role taking still remains the only thoroughly social theory available of the flexible and voluntary *self control* of behavior. In this perspective self control is also social control because the anticipated response of the other shapes the way actors manage their own oncoming behavior. It is thoroughly social because a preexistent pool of *shared* meanings must exist if actors are to respond to their oncoming behavior as would the other. Thus, role taking is decidedly more tentative and flexible than Linton's script like conception of role playing (i.e., playing out role expectations). Depending on others' overt reactions, one can change one's tone or original intention in the middle of a sentence.

Structural roles can be *played* with only minimal role taking. The teacher telling a high school class that a fact is an "empirically verifiable statement about phenomena in terms of a conceptual scheme" is surely playing the role of teacher in contrast to role taking. Role taking is thus episodic, and sociologists have inquired into those social situations that trigger role taking and those that make it relatively unnecessary (Thomas et al. 1972).

Frequently, one must role take with whole groups rather than individuals. A speaker may need to decide what Republicans would be interested in hearing in contrast to Democrats, or what freshman students can be expected to

understand rather than seniors. This is referred to as taking the role of the "generalized other." As Mills (1939) originally argued, this process allows for impersonalized, objective reflection. When people attempt to write in clear logical sequences, or to carefully follow rules of due process, they are taking the role of the generalized other. Mead associated the generalized other with taking the role of one's community. However, as communities become broader and more complicated, unified responses become problematic, as does self formation.

OTHER CONTRIBUTIONS TO INTERACTIONAL APPROACHES

Znaniecki and Lopata rejected the "confused and static image" of Linton's approach, especially his assumptions about the direction of causation where "social role is somehow a consequence of its status." According to Znaniecki and Lopata, the Lintonian model confused status with position and failed to see that the meaning of a given role could only be determined by specifying its part in the larger social placement system. She also stressed what Turner (1962) had referred to as "self other" roles (i.e., roles that are only meaningful in relation to other reciprocal roles). One actor's duty is the other actor's right.

Rather than taking roles as reified "givens," Gross and Stone suggested that roles arise out of the need for actors to be poised and readied for *relevant* interactions. Relevancy and readiness is achieved by establishing identities – placing each other on the social map in regard to the situation at hand. What is relevant in one self other role is irrelevant in another. Gross and Stone "speak of role as consensual attitudes mobilized by announced and ratified identities." Following Mead, attitudes are seen as incipient acts and meaningful discourse requires incorporating each other's incipient activities into one's emerging actions. When announcements and ratifications go awry embarrassment ensues, role performances suffer, and interactions break down. This offers another important explanation of how causation flows upward from social interaction to maintain and recreate role expectations and structure.

RALPH TURNER'S RECONCILIATION BETWEEN STRUCTURAL AND INTERACTIONAL APPROACHES

R. Turner's (1962) critical contribution to role theory offers a reconciliation of the partisan structural and interactional views of social roles. Currently, leading theorists such as Ritzer (1992) and J. Turner (2002) have stressed the importance of integrating the macro and micro levels in sociology. "Role analysis" is an important part of such integration.

For many functionalists, the motivation for role behavior consisted of three elements: the actor *conforms* to the *expectations* of others in order to gain their *approval*. While this simplification may be true in many cases, it is hardly adequate to explain the whole range of role behaviors. Therefore, R. Turner replaces *conformity* with "the efficient accomplishment of an objective." For example, a person may conform to another's linguistic style, but only as a deliberate means to enhance communication. *Expectations* are broadened to "a preparedness to interpret behavior as consistent with the role." The teacher lecturing a class from underneath the table is presumed to be making some academic point to be explained later in the lecture. The president who misnames his staff in public is seen as "being preoccupied with more important matters." Finally, rather than seeking *approval* per se, we are more usually "confirming an identity," as with the delinquent who is trying to demonstrate what a "bad actor" he or she is by being as offensive as possible.

For R. Turner, a role is a loosely shared mental set or gestalt. The actor's task is to act in a way that can be plausibly interpreted as congruent with the role. The audience's contribution is a willingness to interpret behavior as congruent with the role. As the ethnomethodologists have shown, actors will go to extremes in order to explain away inconsistencies in roles, thus rendering others' behavior intelligible.

In regard to transcending the overconformist implications of the old role theory, Turner has made it possible for a normal person to act in a way contrary to social expectations and simultaneously be effective socially. The role playing scheme in functionalism placed such novel behavior outside of normality because

conformity and the approval motive formed the exclusive explanation for routine social behavior.

ROLE MAKING

R. Turner's broader and more "agentive" analysis allows him to talk about role *making* as well as role playing, wherein two people interpret each other's behavior within the loose framework of very general roles, and make their own unique relationships within that role. This allows more room for creativity, spontaneity, and authenticity in role behavior. Formal situations limit role making, but it is fostered in everyday informal situations. Role making stresses the importance of the other person's anticipated response rather than merely playing out a self sufficient script that is independent of the other persons involved in the role. In replacing *expectations* with "preparedness to interpret behavior as consistent with the role," much depends on the ability to "take each other's meanings." This puts a premium on role taking because the confirmation of one's identity is contingent on others. Role taking is thus at the heart of R. Turner's analysis of role making.

OTHER USES OF ROLE THEORY

Baker and Faulkner focus on roles as resources strategically used to gain access to other beneficial roles. Stryker (1980), McCall and Simmons (1978) and Peter Burke have emphasized the human tendency to identify more strongly with roles congruent with important self conceptions and to show "role distance" in roles contradicting these self conceptions. This "role identity" framework articulates in detail the close connection between roles and self. The self conception is comprised of the differential emotional attachments to the various roles played. Generally, performance is better when role and self concept are congruent.

CURRENT ASSESSMENT

The broader contribution of Ralph Turner's movement from oversimplified, fixed scripts to

self other processes is that he avoids the old parochial split between micro and macro level thinking. Currently, the aim of role analysis is simultaneously to handle the reality of constraints in social structure as well as the more "processual" character of the production of action by individuals engaged in self other roles. Scheff warns that macrostructural concepts are certainly necessary, but to the extent that they are not related point by point to micro processes, they become reifications hovering detached from empirical grounding in the activities of real people. The history of role theory shows consistent movement toward demonstrating how micro and macro levels are inseparably implicated in each other.

Among those most dedicated to moving role analysis towards an empirically testable theory are Stryker (1980), R. Turner (1962), and J. Turner (1989). They have consistently contributed to isolating "if/then" statements of general tendencies in role behavior into a more tightly integrated whole.

role-taking

Steven P. Dandaneau

Role taking refers to social interaction in which people adopt and act out a particular social role. If, adapting Shakespeare, society is a stage, then people may be thought of as social actors performing roles, each the other's fellow player. Rendered more clinically, and following Ralph H. Turner, role taking is a process of anticipating and viewing behavior as motivated by an imputed social role. From the child playing at being "a mother" to the adult playing at being "a police officer," role taking is a ubiquitous feature of social life. This initial definition belies, however, considerable theoretical and, even more so, empirical complexity.

The original impetus to conceive role taking as an elementary feature of social life is found in the pragmatist social psychology of George Herbert Mead. In Mead's view, society is best understood not as any sort of organic or mechanical object but as an open ended symbolic universe created and recreated through ongoing, emergent, and ultimately indeterminate symbolic interaction. This constantly (even though usually subtly) changing symbolic universe mediates all major facets of human experience, as in the title of his most famous collection of lectures, *Mind, Self, and Society* (1934).

For Mead, the process of "taking the role of the other" is, however, no simple process. From one perspective, Mead theorizes the growing complexity of role taking as roughly corresponding to stages in the development of perceived "Otherness." In the "play stage," the initial and most rudimentary, the roles that are taken, so to speak, are simple, derived typically from proximate experience, and discrete. Children who play at being "a mother," for example, at first typically model their own mother's expected and routine behavior. Whether or not this "mother" bore the child, is a woman, or contributed genetic material to the children's biological origin are equally beside the point. The child's general notion of a symbolically defined mothering role is initially derived from imitation of a specific instance of mothering, and is only later expanded, conceptually abstracted, and complicated on the basis of additional social experience.

The "game" stage follows. In game, the roles taken are multiple and related systematically by rules. Mead employs the example of "ball nine," or baseball, to illustrate this stage of role taking competence. If a batter strikes the ball to the short stop and all the short stop's fellow defenders, from the third baseman to the right fielder, join her in charging the ball, evidence would be had of a team not yet having mastered role taking at the game level of interactional skill. People who have witnessed children clumped together around a soccer ball as it makes its way up and down a pitch have observed an exactly similar phenomenon. If, however, the same batted ball leads the short stop to charge the ball and the first baseman to retreat to her own bag in anticipation of a successful catch and throw from the short stop, or if a soccer team's players space themselves across a pitch in order better to deploy a strategy to maintain possession of the ball, and only ultimately direct it toward the opponent's goal, then there is evidence of these teammates taking one another's roles as though toward themselves and, thus, of the game stage of role taking.

Implied in the above is an expansive view of role taking, which is typical of Mead and of great significance to sociology. Indeed, Mead's final stage of role taking, the so called generalized other stage, implies that humans can and must come to see their actions as more than simply behavior aligned with the rule governed actions of others as these same others present themselves through narrowly defined roles. Taking the role of the generalized other means taking the attitude of some abstract community toward oneself. The boundaries of community are conceptually indeterminate. Even though he never traveled from his hometown of Königsberg, Immanuel Kant imagined life on other planets and, not incidentally, conceived a universal humanity. Whereas in game, then, one might say to oneself, "if I were the short stop who was mindful of the rules and game situation, I would respond to the ball being struck in that direction by..." today's social actors who take the role of the generalized other would typically need to position themselves in a symbolic universe that is ever more integrated and independent on a planetary scale and therefore requiring each actor to relate her action and attitudes to those of her fellow six plus

billion earthlings. "If I were a slave on a coca plantation in Côte d'Ivoire, how would I view Tiger Woods's notable success at the annual golf tournament in Dubai?" In this view, critically discussed by Walter Coutu as a psychological rather than a sociological phenomenon, role taking is but a narrow version of attitude taking, but from attitude taking worlds are won and lost.

Mead is the first but far from the last influential social theorist to place role taking at the center of their social view. Mid century luminaries as divergent as Talcott Parsons, on the one hand, and Hans H. Gerth and C. Wright Mills, on the other, also regarded role taking as elemental to a general theory seeking to trace the linkages between social institutions and individuals. In *The Social System* (1951), Parsons construes roles as component parts of group structure, where groups are then incorporated schematically into the functionally differentiated institutional subsystems of the social system itself. Parsons conceptually divides role from "status," the latter defined as a social location or position and the former a set of actions generally prescribed for those who occupy a particular position. He also elaborates on such basic sociological concepts as role differentiation, role expectations, and role conflict. Even though Parsons's exposition is decidedly weighted in the direction of stressing the objective, constraining properties of the social role, his sociology is necessarily drawn to role taking as a means for explaining socialization in particular, and societal reproduction generally.

In *Character and Social Structure* (1953), Gerth and Mills use the concept of "role" as the chief mediating concept between character structure and social structure. As these authors stress, roles are inherently interpersonal. Role taking always occurs in relation to the expectations of others and with respect to shared understandings of given social situations. And more than does Parsons, Gerth and Mills are wont to stress the constructed nature of roles, that is, that actors possess the power not only to enact roles but also to alter them by their actions, recast them altogether, or, as Ralph H. Turner also emphasized with his notion of *role making*, create new roles out of whole cloth. This attention to agency is also reflected in Gerth and Mills's relatively historical approach

to role taking. Whereas Parsons's social system is typically understood *in abstracto* and in stasis, Gerth and Mills are interested in the relationship between an open ended role taking and an equally open ended history making.

The enigmatic "dramaturgical" sociology of Erving Goffman provides a third and, to some extent, synthetic mid century approach to role taking in sociology. In Goffman's view, people do not play roles so much as roles play people. That is, for Goffman, there is no moral substratum providing a transcendent basis for humanity lying beyond role playing itself. We are what we make ourselves to be on the stage of life and no more (and no less). To rid sociology of its humanistic metaphysics, Goffman attended scrupulously to such phenomena as that highlighted by the title of his first and perhaps most famous book, *The Presentation of Self in Everyday Life* (1956). Thus, Goffman no less than Parsons is interested in carefully mapping a detailed, complex social world of roles, stages, and scripts, but he is also, as with Gerth and Mills, keenly attentive to the creativity and critical historical significance of social actors.

One superb if perhaps also ironic contemporary application of Goffman's approach to sociology is found in Bogdan and Taylor's (1989) study of "the social construction of humanness," a process they studied with respect to people who are severely disabled. Bogdan and Taylor's focus is not disabled persons *per se* but those who interact with them, such as family members and medical personnel. When these people act toward persons who are disabled in ways that attribute thinking, highlight individuality and reciprocity, and incorporate the disabled person as a player in the life of the larger group, they are, for Bogdan and Taylor, actively creating humanness. These efforts are often necessitated because, as Goffman (1964) himself had shown, persons with disabilities are typically the victims of "stigma" or "spoiled identity," which, by definition, is dehumanizing. Bogdan and Taylor's is a critical social psychology that presents empirical evidence of ongoing efforts to challenge the prevailing yet harmful stigmatization of the disabled role, and as such demonstrates the duality of roles as both constructed and constraining.

Another important contemporary application of role taking theory is given in Arlie Russell

Hochschild's *The Managed Heart* (1983). Hochschild studies what she terms "the commercialization of human feelings" through a close up examination of flight attendants and, to a lesser extent, bill collectors. Would be flight attendants and, in a converse way, bill collectors are required to engage in workplace role playing that drains them of their emotional energy, whether in politely providing face to face service for airline passengers or in aggressively creating alarm among debtors interacted with via telephone. Hochschild's study stimulated considerable research on role taking with respect to human emotions, the construction of gender, and the distinctive characteristics of workplace alienation in post industrial economies.

As Clifford Geertz once observed, social science often "blurs genres" by using borrowed metaphors such as text, game, and drama. Role taking is a prominent example of the last. While the concept of role has been subjected to sustained criticism for over 50 years, including especially by feminist scholars (see Connell 1987, but also Komarovsky 1992), it is perhaps more the case that it has been so criticized due to its elemental standing among sociology's most basic concepts than for essential reasons deriving from inherent limitations or necessarily adverse consequences that follow from its use. It is, after all, a concept, and a heavily metaphorical one at that. As such, its value to sociology is very much dependent on its use and abuse by practicing sociologists and their readers. Criticism aside, then, the concept of role taking has the advantage of emphasizing the interactional nature of social order and, equally as well, disorder, and of linking contemporary sociology in the postmodern world to its not so distant origins in what C. Wright Mills called the classical tradition of sociology. The critical empirical question remains as to whether or not role taking is an everyday occurrence in societies the world over. Evidence seems to suggest that it is; that children are, as Mead put it, wont to "play at some thing," even if that something might involve a hand held video game that offers up a cyber stage on which fictional characters carry out fictional interactions, replicating the old fashioned world of face to face human interaction such as one still occasionally finds in a game of ball nine.

role theory

Michelle J. Hindin

Role theory is designed to explain how individuals who occupy particular social positions are expected to behave and how they expect others to behave. Role theory is based on the observation that people behave predictably and that an individual's behavior is context specific, based on their social position and situation. Role theory is often described using the metaphor of the theater.

There has been substantial debate over the meaning of the key concept in role theory: that of role. A role can be defined as a social position, behavior associated with a social position, or a typical behavior. Some theorists have suggested that roles are expectations about how an individual ought to behave, while others consider how individuals actually behave in a given social position. Others have suggested that a role is a characteristic behavior or expected behavior, a part to be played, or a script for social conduct. Although the word role (or roll) has existed in European languages for centuries, as a sociological concept the term has only been around since the 1920s and 1930s. It became more prominent in sociological discourse through the theoretical works of Mead, Moreno, and Linton.

Two of Mead's concepts – the mind and the self – are the precursors to role theory. The mind emerges through communication with others during childhood. Children develop the capacity to extrapolate from communications with others and eventually learn how and when to respond to others. Mead's concept of the self includes three stages of development. In the initial stage, infants interact or "play" with others and eventually are able to empathize with or take on the role of others. In the second stage, referred to as the "game," the child becomes sophisticated enough to play multiple roles, first consecutively then playing several roles at once.

The child must be able to understand and anticipate the behaviors of other people, and then cast herself into their roles in order to play her own role. Once the child is able to understand and internalize the roles of multiple others, the child is able to interact with groups or the society. In this third stage, Mead refers to the ability to take on the role of the “generalized other.” Individuals take on the values, norms, and beliefs of a group or society. Moreno used a dramaturgical approach of role playing to learn how taking on different roles is related to changing behaviors. Linton also contributed to the concept of a role by making the distinction between a status or position and a role. Linton considered a status as a collection of rights and duties, while a role is the dynamic aspect of a status.

In summary, theorists have used the term role to connote characteristic behaviors, social parts to be played, or social conduct, depending on the theorist’s definition. While some agreement exists that the basic concerns of role theory are with characteristic behaviors, parts to be played, and scripts for behavior, theorists differ on whether roles are norms, beliefs, or preferences. Because the term is used in everyday language, imprecision in the sociological definition has led to misinterpretations of role theory itself and some disagreement concerning key aspects of role theory (e.g., whether expectations about behaviors associated with social positions are based on norms, beliefs, or preferences).

TYPES OF ROLE THEORY

Depending on the general perspective of the theoretical tradition, there is a range of “types” of role theory. For example, there is a more functional perspective of role theory, which can be contrasted with the more micro level approach of the symbolic interactionist tradition. The type of role theory will dictate how closely related individuals’ actions are to the society, as well as how empirically testable a particular role theory perspective may be.

Functional role theory emerged out of Linton’s perspective on roles, as well as functionalism as described by Parsons. Under functional role theory, roles are considered to be prescriptive and based on a shared understanding of

expectations. These roles are learned and individuals are expected to conform to roles and sanction others who deviate from their roles. One of the key aspects of functional role theory is that the social system is considered stable. Individuals within this perspective learn roles which are normative expectations that dictate appropriate behavior. With the general decline of functionalism starting in the mid 1970s, the functional role theory perspective has faded in importance. As with functionalism in general, functional role theory is limited by the fact that social positions and roles are not necessarily clearly delineated or fixed and that most social systems are not stable.

Symbolic interactionist role theory is based on Mead’s development of the mind and self. Roles are learned through social interaction, and unlike functional role theorists, symbolic interactionist role theorists suggest that norms are developed through social interaction and are therefore less prescriptive. This perspective on role theory is the one most closely linked with the theater and the writings of Simmel and Goffman’s “looking glass self.” Theorists coming to role theory from the symbolic interactionist tradition consider how roles are played out and how this playing out of roles impacts on both the actor and others. There is often little attention to actors’ expectations for other persons or to structural constraints on expectations and roles. For this type of role theory, the research tends primarily to be ethnographic and of limited generalizability.

Structural role theory is the perspective most related to the dramaturgical tradition. Structural role theory considers roles as parts played by actors in scripts written by society. The social structure or script is relatively fixed, much like in the functionalist perspective. Society is described as a system of functional substructures and actors learn their roles through repeated interactions. Individuals generally interact in groups delineated by people with shared goals and who are therefore willing to cooperate. Despite shared goals, not everyone has the same role within a group. It is unclear from this type of role theory how social change is accomplished and what happens to actors who choose not to conform to the groups’ shared goals.

Organizational role theory is concerned with the role of formal organizations and how

individuals interact with these organizations. Roles are associated with social positions and come from normative expectations generated by the organization. An individual's roles are based both on normative expectations from a given social position as well as from informal groups within the organization. This perspective on role theory allows for role conflict and role strain. Organizational role theory has often been used for business applications, as well as among psychologists and sociologists interested in organizational theory. This perspective has been used to do empirical analyses more often than some of the other perspectives.

Cognitive role theory has most often been applied by social psychologists. This perspective focuses on the relationship between the individual, role expectations, and behaviors. It is one of the perspectives that has generated more empirical research. There are several subfields of cognitive role theory. The first looks at role playing along the lines of the work of Moreno. A second subfield considers the roles of leaders and followers within groups. A third branch considers the relationship between an individual's beliefs about behavior and the beliefs of others. A final branch emerged out of Mead's work on role taking. This perspective, with its emphasis on individual behavior and roles, minimizes the importance of social positions and social structures.

KEY CONCEPTS

Consensus is used by role theorists to denote agreement among expectations that are held by various people. Underlying consensus or "disensus" is the question of under what conditions are the individual and others likely to agree or disagree about role definitions. Consensus is most likely to occur when individuals have been socialized in a similar way or when individuals have experience in similar types of interactions. Social psychologists view negotiation as a key way to overcome disagreements about role definitions.

Role strain refers to the difficulty of meeting the normative expectations of the roles that an individual either chooses or is pressured to play.

Role strain or role pressure may arise when there is a conflict in the demands of roles, when an individual does not agree with the assessment of others concerning his or her performance in roles, or from accepting roles that are beyond an individual's capacity. An individual may have limited power to negotiate away from accepting roles that cause strain because he or she is constrained by the societal norms, or because the individual has limited social status relegating him or her to having a poorer hand for negotiation. Role strain is often described as a conflict within a role. For example, in the role of a professor, strain may be caused by the demands of teaching a course well and the demands of submitting research grants. Within role strain there are two commonly used subtypes: role overload and role conflict.

Role conflict occurs when people experience contradictory or incompatible expectations based on the roles they occupy. For example, parents may experience role conflict when an employer requires overtime hours while their young children need their attention. This is a conflict across two or more roles rather than within a role. Another type of role conflict occurs when there is a mismatch of expectations, poor communication of the demands of the role, or conflicting demands within a role. For example, the principal of a school may need to cut after school activities due to limited funding for such programs and the demands of the school board. However, cutting after school programs would be harmful for the students and parents. The concept of role conflict may bridge the experiences of individuals in particular roles with the societal or cultural expectations for those roles. The concept of role conflict is generally attributed to the functionalist perspective on role theory.

Role overload occurs when an individual is unable to perform all of his or her expected roles. For example, a woman who occupies the roles of a full time employee, mother, and daughter may feel she has too many roles and therefore does not have the time, energy, or resources to perform all of them to the satisfaction of others or the society. An area of growing empirical research considers whether the benefits of multiple roles outweigh the stress caused by them.

Rosenberg, Morris (1922–92)

Elena Fazio and Kim Nguyen

An American social psychologist, Morris (Manny) Rosenberg was a leading scholar in the study of the self concept and a significant contributor to the intellectual and scientific advancement of the broader discipline of sociological social psychology. Over the course of his long and prolific career, Manny advanced sociological inquiry theoretically, methodologically,

and substantively by critically addressing a host of social psychological issues; pioneering methodological practices with the use of large scale samples and codifying the logic of survey data analysis; and carrying out an impressive range of research efforts. While his scholarly interests spanned a wide spectrum of sociological concerns, including political ideology and behavior, occupations and values, class stratification, social distance, and mass communication, it would ultimately be his intellectual engagement with self concept research – particularly the dimension of self esteem – for which he would become best known.

Rosenberg received his masters and doctoral degrees from Columbia University where he studied under the guidance of C. Wright Mills, Paul Lazarsfeld, and Robert K. Merton – eminent sociologists whose careful attention to the theoretical and methodological issues would later influence his own work. After graduating in 1953, Rosenberg spent the early part of his career teaching at Cornell and Columbia universities before moving on to the Laboratory of Socio Environmental Studies at the National Institute of Mental Health, first as chief of the Section on Social Studies in Therapeutic Settings and subsequently as chief of the Section on Social Structure. During this period – which would span nearly two decades – Rosenberg also held visiting professorships at various universities, including Stanford University and the London School of Economics and Political Science. In 1975 he went on to become professor of sociology at the University of Maryland, where he stayed until his death in 1992.

Over his lifetime Rosenberg also authored or edited numerous books, including *The Language of Social Research* (1955) with Lazarsfeld, *Occupations and Values* (1957), *Society and the Adolescent Self Image* (1965), *The Logic of Survey Analysis* (1968), *Conceiving the Self* (1979), and *Social Psychology: Sociological Perspectives* (1981), co edited with Ralph Turner. Rosenberg's characteristic imprint is evident throughout these endeavors, with their rigorous wedding of theory and research, application of suitable methodology, and incorporation of interdisciplinary research.

Of particular importance was his research and writing on the self and self processes. Through

these efforts, Rosenberg became a leading figure in reviving scholarly interest in the self concept that had been lying fairly dormant for the larger part of a half century. Despite the fact that Cooley had laid out the conceptual groundwork for the sociological study of the self concept as early as 1902, sociological publication on the self concept did not emerge until the mid 1950s. Scholarship on the self has since flourished as an area of sociological inquiry and Rosenberg's work on the self concept remains at the forefront of social psychological research, serving to explain the importance of self esteem, and more generally, the importance of research on the self concept in the theoretical and empirical work of the discipline.

In his groundbreaking book *Society and the Adolescent Self Image*, Rosenberg undertook the first large scale systematic study of the self concept. Employing a sample of over 5,000 adolescents, he examined the influence of social structure, culture, context, and interpersonal relations on shaping self esteem and how self esteem affects social behavior. Defined as a positive or negative attitude toward oneself – an overall evaluation of one's self worth – self esteem was viewed as an important determinant of well being but one that had received little sociological attention until that time.

For the study, Rosenberg developed a 10 item global self esteem scale. Today, the Rosenberg Self Esteem Scale remains the most widely used self esteem measure in social science research. Its popularity, Rosenberg suspected, was attributed in part to the conciseness of the research instrument and, consequently, its easy adoption by interested investigators. While retaining the reliability and validity of comparable but more elaborate measures previously developed by psychologists, Rosenberg's self esteem scale was constructed with an economy and conceptual appropriateness amenable to social survey research. His accomplishment helped bridge the gap between the disciplines of sociology and psychology and renewed research on the self and self processes.

In a later classic of the self concept literature, *Conceiving the Self*, Rosenberg expanded the theoretical framework for thinking about the self concept that has remained central to the study of self within sociology as well as related

disciplines. Conceptualizing the self as “the totality of the individual's thoughts and feeling having reference to himself as object” (1979: 7), Rosenberg set forth a detailed cartography of the self concept, mapping out its motives and structure (forms, content, dimensions, boundaries) and delineating four fundamental principles underlying the process of self concept formation – reflected appraisals, social comparison, self attribution, and psychological centrality.

Drawing on three survey data sets, Rosenberg identified the conditions under which these self processes operate and analyzed how larger social forces, such as social structural position and institutional context – through their bearing on self formation processes – exercised their influence on the self and are in turn shaped by it. A central theme throughout Rosenberg's analyses is this idea that the self concept is not merely a social product but also a social force.

With respect to the larger discipline, Rosenberg co edited with Ralph Turner an authoritative reference on the field, *Social Psychology: Sociological Perspectives*. Commissioned by the Social Psychology Section of the American Sociological Association (ASA), the book was an official effort to offer a sociological perspective on an emerging discipline in need of theoretical and empirical synthesis. At the same time, the volume was notable for its attention to interdisciplinary work, especially its attempt to unite contributions from psychology. For this undertaking, Rosenberg and Turner organized a broad and diverse set of topics around five parts – theoretical orientation, socialization, social interaction, society and social behavior, and society and personality – with each capturing various styles and approaches to the subject area from outstanding authorities in the field. The handbook has since become a landmark collection in social psychology.

Beyond these contributions, Manny's scholarship touched upon other areas as well, although these interests have received relatively less attention, such as his inquiries into other aspects of the self such as mattering, his reflection on the relationship between reflexivity and emotions, and his turn toward a more symbolic interactionist position at the end of his life, apparent in his last book, *The Unread Mind* (1992).

A dedicated sociological social psychologist, Manny's enduring contributions to sociology rest with his innovative study of methodology, values, and self and self processes. These achievements – particularly his conceptualization of the self concept and his extensive work on one component of the self concept, self esteem – stand as permanent legacies to the field. His theoretical, methodological, and substantive efforts, furthermore, have left behind a remarkable body of work that has influenced generations of subsequent scholars within and outside the discipline in their intellectual pursuits. Inquiries about Rosenberg's self esteem scale regularly flow into the Foundation that bears his name. Questions and correspondence about research based on his self esteem measure come from scholars in child and adolescent health research, sociology, occupational therapy, nursing, social work, psychology, and beyond. The sheer volume of research produced outside the field of sociology, based on his work, is a true testament to Rosenberg's broad reaching ideas and his emphasis on interdisciplinary scholarship.

Rosenfeld, Rachel (1948–2002)

Stephanie Moller

Rachel Rosenfeld established herself as a leading figure in sociology through groundbreaking research on the diversity of occupational mobility patterns. Rosenfeld's interest in diversity emerged during her youth when she witnessed the effects of institutionalized school segregation in Little Rock, Arkansas. Her interests expanded during her undergraduate studies at Carleton College and graduate studies at the University of Wisconsin at Madison, where she learned more about the women's movement and gender scholarship (during the late 1960s and early 1970s).

Rosenfeld began studying sociology during a period of social change and unrest; a period when diversity and difference influenced public discourse. Yet, only a small segment of the sociological community had embraced such an orientation to diversity. Indeed, among mobility scholars, substantial research focused on intergenerational mobility among white men, with little attention to variations based on race, ethnicity, or gender. To the extent that researchers had examined women's mobility, they only examined the link between fathers' and daughters' occupations. Thus, Rosenfeld was poised to profoundly influence the discipline through her interest in difference and her exceptional understanding of quantitative methods.

In 1976, under the advisement of her esteemed mentor Aage Sørensen, Rosenfeld earned her PhD in sociology, with a concentration in economics and statistics. She began her career as an assistant professor at McGill University. During her first three years at McGill, she published research on women's career and mobility patterns in the top sociology journals, including the *American Sociological Review*, *Social Forces*, *Social Science Research*, and *Demography*. This marked the beginning of a productive and influential career. Rosenfeld's research illuminated the diversity of mobility patterns by showing that mothers' employment patterns are important determinants of women's intergenerational mobility

(Rosenfeld 1978); that occupational sex segregation impacts women's mobility and wages (Wolf & Rosenfeld 1978; Rosenfeld 1983); and that mobility patterns vary by gender and race (Rosenfeld 1980).

Early in her career, Rosenfeld left academia to work for the National Opinion Research Center (1978–81), where she conducted research on farm women (Rosenfeld 1985). After this brief divergence, Rosenfeld returned to the academy as an Assistant Professor of Sociology at the University of North Carolina at Chapel Hill, where she continued her research on careers and mobility. Later in her career, Rosenfeld broadened her influence to the cross national literature through collaborative research on comparative income inequality and job shifting patterns (Rosenfeld & Kalleberg 1990; Trappe & Rosenfeld 1998).

In addition to her outstanding research, Rosenfeld influenced the discipline through exceptional mentoring of future scholars that culminated in numerous mentoring awards. These awards included the Sociologists for Women in Society Award for Outstanding Mentoring in 1992 and the first Graduate Student Association Award for Excellence in Mentoring at the University of North Carolina's Department of Sociology in 1998. These awards acknowledged Rosenfeld's efforts to embrace the differences among her students and colleagues. In essence, Rosenfeld's mentoring style reflected the goals of her research: to uncover difference and diversity.

At the time of her death, Rachel Rosenfeld was a distinguished professor and the chair of the Sociology Department at the University of North Carolina at Chapel Hill and recent president of the Southern Sociological Society. Rosenfeld's presidential address to the society in 2002 was published in *Social Forces* (Rosenfeld 2002). This address allowed her an uncanny opportunity to discuss her life, her research, and the state of gender scholarship. Rosenfeld's legacy is lasting because she demonstrated how sociological processes work differently for different groups in society. Her research helped pioneer a burgeoning subfield in sociology, entitled *race, gender, and class*.

routine activity theory

Sharon Chamard

Routine activity theory is a theoretical approach that explains the components of a criminal incident. It breaks down a crime into three basic elements: (1) a likely offender, (2) a suitable target, and (3) the absence of a capable guardian. It is only when these three elements converge in time and space that a crime occurs. Despite this focus on the crime event, routine activities is considered a macro level theory, as it concerns how broad changes in society lead to alterations in community life that create new opportunities for crime.

Routine activities is one of a constellation of theoretical approaches generally referred to as environmental criminology. These approaches include rational choice, crime pattern theory, situational crime prevention, and explanations for victimization that focus on lifestyles. Routine activities draws upon the work of early human ecologists such as Amos Hawley and members of the Chicago School (such as Parks and Burgess) who looked at the relationship between humans and the environment.

Unlike many theories attempting to explain criminal behavior, routine activities does not spend much time trying to explain why offenders do what they do in terms of motivation or preexisting factors that predispose a person to break the law. The assumption is that there is a large group of persons who have the potential, or the likelihood, to be offenders, and crime only occurs when the likely offender comes into contact with a good target and there is no capable guardian around to prevent the interaction. Routine activities is thus a theory of crime, not a theory of criminality.

A suitable target can be a person or an item. What makes a target attractive or desirable to likely offenders depends on four things included in the VIVA acronym: value, inertia, visibility, access. More valuable items are typically more attractive to thieves because they can be converted to more cash than can less valuable objects. The idea of value applies to persons as well. Certain people may be targeted because they have a characteristic that is appealing to the offender. Rapists tend to prefer younger women. Armed robbers victimize those who would be expected to have money or other valuables. Inertia refers to how easily an item can be carried away. Small, light items are ideal theft targets, while heavy objects generally have a low risk of theft, unless they have wheels. If the target is visible, it will more easily capture the eye of a potential thief, hence the good advice to keep valuables in your trunk and close your curtains at night. Items that are accessible are more suitable as targets than those that are locked up or in an area that cannot be easily entered.

Routine activities differs from many approaches to explaining crime because it mentions the absence of something as a contributing factor to crime events. When guardians are

not present, there is nothing to protect the target from the predations of the likely offender. Crime can be the result. It is explicit in routine activities that a capable guardian is seldom a police officer. Rather, a capable guardian is most probably a property owner, friend, family member, employer, or passer by.

Like other theoretical approaches with a connection to the Chicago School and environmental criminology, routine activities emphasizes the importance of temporal and spatial factors. It recognizes that crime cannot be explained solely in terms of characteristics of offenders, but that environmental factors are as, or more, important. It is intuitively obvious that patterns of criminal behavior vary from place to place – your car is much more likely to be stolen or broken into if it is parked in a public parking lot than in your residential garage – and across different time periods. Why an area might be safe during the day but dangerous at night has a lot to do with who is using the space at particular times. During traditional business hours, a downtown park might be filled with lunching office workers, food vendors, and elderly people feeding pigeons and so on. While there may be plenty of suitable targets, there are also many capable guardians. The same park at night might be populated with drunks staggering home from the taverns, youth hanging out, and a few straggling commuters. There may be fewer targets compared to the day when the park is bustling with activity, but capable guardians are in short supply.

The routine activities approach was developed by Lawrence Cohen and Marcus Felson, and was proposed in a 1979 article in the prominent journal *American Sociological Review*. Cohen and Felson (1979) attempted to explain the paradox of dramatic increases in crime from 1960 to 1975, while during that same 15 year period the social factors that supposedly cause crime had changed for the better: in urban areas there were reductions in poverty and unemployment, and increases in income and average education level. The traditional criminological theories seemed of little use to account for the increases in violent crime or property crime.

Cohen and Felson, then, looked at how crime rates might be related to broader social and technological patterns. They observed that the *routine activities* of people had changed.

Routine activities refer to “recurrent and prevalent activities” that people do to meet their needs. These activities can occur at home or away from home, and include going to work or school, shopping, socializing, and playing. Cohen and Felson argued that during the 1960s, more women entered the workforce or post secondary education, and there were more households comprising one person. People also traveled out of town more. These changes pointed to what Cohen and Felson termed a “dispersion of activities away from households.”

As more people’s routine activities took them away from their homes, there was less guardianship of those homes, and hence more burglary. As mothers moved into the workplace, there was less supervision of children and teenagers. This did two things: it increased their risk of victimization (because no adults were around to protect them) and also increased the chances they would become involved in criminal activity.

In addition to changes in daily life on the home front, the movement of women into the workplace and college created more targets for opportunistic offenders in public life. Commuting places people and their property, especially their vehicles, at high risk for victimization, relative to staying at home. People coming together in schools and in work settings likewise create new criminal opportunities.

Beyond these demographic changes, routine activities also considers technological changes with respect to crime rates. Positing that aspects of a physical item are strongly related to its “attractiveness” to motivated offenders, Cohen and Felson (1979) found that the supply and characteristics of “durable goods” (such as television sets and cars) were strongly associated with levels of property crime. Over the years 1960 to 1970 there was a dramatic increase in the number of motor vehicles and electronic household appliances sold, and hence an increase in the number of potential targets. These targets also became more *suitable* because they became lighter and, in many cases, smaller. During this period, products with relatively high “values per pound” (e.g., home entertainment items) and those that have low inertia, meaning they are easily transportable (e.g., motor vehicles and bicycles), comprised a large and hugely disproportionate majority of stolen items.

Also during the 1960s the amount of goods sold increased, even as the number per person of business establishments selling durable goods remained fairly constant. Businesses themselves were busier, but a smaller proportion of the workforce was employed as salespeople, so there were fewer employees to keep an eye on customers. This, coupled with changes in retailing practice that made shopping a largely self service activity, contributed to an increase in shoplifting.

A significant change in the routine activities approach was the explicit addition of concepts from Travis Hirschi’s control theory. Felson (1986) summarized the four components of control theory – attachment, commitment, involvement, and belief – with one word: *handle*. Society controls people, argued Felson, by making them fear the consequences of bad behavior (their future will be jeopardized or they will damage their relationships with friends and family) and placing practical limitations on behavioral options by encouraging involvement in conventional activities and by manipulating belief systems to make people feel guilty when they are bad. The social bond we have to others is the “handle” that can be used to informally control our behavior. The “intimate handler” became a fourth element of the routine activities approach. This element is closely linked to the offender, as the handler is someone who knows the potential offender well enough to act as a curb on criminal behavior.

A more recent incorporation into routine activities is the “place manager.” First suggested by John Eck (see Felson 1995), this is someone who controls or monitors places. Examples are doormen, receptionists, janitors, security guards, and building superintendents. With this addition and that of the intimate handler, the original conception of routine activities (a likely offender and suitable target converging in time and space in the absence of a capable guardian) can be thought of in terms of two triplets. The likely offender is supervised by the intimate handler, the suitable target is protected by the capable guardian, and the time and space where the convergence occurs is monitored by the place manager (Felson 1995).

Criticism has been leveled at routine activities (and other theories of crime as well) for their apparent neglect of the “root causes” of

crime, such as poor parenting, poverty, blocked opportunities, and the like. In addition, opponents argue that these theories fail to take into account differences in disposition, as it is assumed that motivation is irrelevant. The latter point is specifically addressed by Felson (1986). He notes that while "some people are inclined to break laws . . . others are inclined to protect their own person and property [and] others are inclined to keep their children out of trouble" (p. 120). The routine activities approach is not concerned with why some people are likely to be motivated offenders while others are more prone to be capable guardians or intimate handlers. This is not to say the approach assumes that we are all equally disposed to be offenders, just that the differences in levels of motivation are not a focus.

The routine activities approach is used in studies of victimization patterns. The observation that victims and offenders often have similar characteristics has led to use of the routine activities approach and related lifestyle theories to explain violence. Richard Felson (1997), for example, found that routine activities associated with having an active "night life" were a good predictor of involvement in violence as an actor, witness, or victim. Some research on shoplifting refers to aspects of the theory that concern target suitability and attractiveness. Other researchers have used the routine activities approach to account for differences in burglary rates, particularly repeat victimization. Routine activities only partially explains the difference, perhaps because it only addresses initial target selection (because of target attractiveness and guardianship factors) and does not account for why offenders chose the same target repeatedly (Tseloni et al. 2004).

ruling relations

Marjorie L. DeVault

The term ruling relations is associated with the feminist thought of Dorothy E. Smith, who came to prominence in the academic movement that arose from women's activism in the 1960s and 1970s. Her work takes up the project of locating lived experiences of oppression within the social contexts that produce those experiences. Ruling relations identifies the institutional complexes (emerging from the development and elaboration of capitalist economies) that coordinate the everyday work of administration and the lives of those subject to administrative regimes.

Smith wrote in the early days of feminist scholarship and explains that she drew insights from her location as a single mother and the awareness that she and her children were seen, institutionally, as a "defective" family (Smith 1987; Griffith & Smith 2005). She began to write about women's "bifurcated consciousness" in the mid 1970s (Smith 1974) and produced an extended account of her approach in *The Everyday World as Problematic* (1987). Drawing from Marx a materialist mode of analysis and the analytic of "social relations," she noted that developments since Marx's time have produced an expansive "ruling apparatus" encompassing not only state and economy, but also academic, professional, and bureaucratic

knowledge and associated practices. The categories and concepts of these institutional complexes textualize lived experience, so that people's circumstances can be "worked up" to fit administrative and managerial schemata (that is, they come to be seen and treated as "mentally ill," for example, or as "defective" in relation to the "ideological code" of a "Standard North American Family") (Smith 1999).

Smith sketches an experience and knowledge associated with single motherhood in her early writing: the experience of sole responsibility for children and the capacity to shift from an embodied consciousness tied to caring work to an abstracted professional outlook tied to the conceptual frames of administration. She indicates, however, that her aim is not to identify a determinate womanly "experience" with specific content, but rather to direct thought to actual sites of everyday living as "points of entry" for empirical inquiry, with the experiences of single mothers providing one example. Smith's formulation of ruling relations is also meant to direct attention to actual practices; it is not only a heuristic device, but is also meant to refer to the complex web of discourse and practice that constitutes an expansive, historically specific formation of power that arose with the development of corporate capitalism in developed nations and which supports its operation. In later writings, Smith discussed the historical emergence and trajectory of "the ruling relations" (Smith 1999) and those who have adopted her "institutional ethnography" approach pursue inquiries that locate embodied and particular experiences within the institutional complexes identified with those relations (Campbell & Gregor 2002; Smith 2005).

rural aging

B. Jan McCulloch

Rural aging is an area of scholarship focusing on issues affecting quality of life for older persons living in areas of low population density. Rural versus urban (or metropolitan versus non metropolitan) conceptualizations are rooted in characteristics of folk or traditional societies versus contemporary or urban societies. Elders living in rural areas are portrayed as valuing independence and self sufficiency, having strong family and religious ties, mistrusting "outsiders," and giving and receiving help through informal networks of families and neighbors (Shenk 1998; Lawrence & McCulloch 2001).

Rural areas have significant proportions of elders (14.4 percent compared with 11.5 percent in urban areas). In addition, three trends suggest that this proportion will increase in the future: (1) the overall US population is aging; (2) young adults are migrating from rural areas in search of better economic opportunities; and (3) some rural areas, especially those with recreational amenities and planned retirement communities, are relocation destinations for retirees (Longino & Haas 1993).

Rural aging envelops the study of aging within a contextual focus. Increasingly, the diversity found within rural areas is recognized. The experience of aging is also quite different in

the more populated rural areas of the East – rural Appalachia or the Mississippi Delta, for example – as compared to that in the West where specific areas remain quite isolated, with some having as few as six persons per square mile (Coward & Krout 1998).

Inherent in the majority of research addressing rural aging has been the comparison of rural elders with their urban counterparts. Topics consistently of interest include health, informal social support, formal support services and issues focusing on barriers to health and service delivery, and persistent poverty. When social structural measures are assessed, rural elders are portrayed as being disadvantaged – they have poorer health, more chronic health conditions, fewer formal social services, greater difficulty assessing existing health and social services, higher rates of poverty, and more limited lifelong opportunities to accrue financial resources for later life. They also live in small communities that have limited economic bases and suffer from the political and economic biases toward urban areas.

Perhaps the most disconcerting result of over five decades of research focusing on rural aging is that researchers have continued to investigate the same topics for a long period of time. Early comparisons with urban older adults outlined the poorer income, health status, and social life of rural elders, and the disadvantage they faced in having access to public transportation and health care (Youmans 1967, 1977). Later Youmans (1977) addressed the “triple jeopardy” of rural elders who “have extremely small incomes, inadequate transportation, a restricted social life, and poor physical and mental health.” More recently, Coward and Krout (1998) introduced their edited volume on this topic with similar comments including individual as well as community level disadvantages. It is encouraging that recently researchers have recognized the complexity of identifying rural issues; the variation in the experiences of rural older adults must be acknowledged if progress is to be made concerning the historic and persistent identification of disadvantages for persons aging in these areas.

The most longstanding and dominant methodological issue relating to “rural aging” is the definition of this concept (Friedland 2002). Historically, residence has been operationalized

as a dichotomy (i.e., rural versus urban). Several scholars have noted that this approach is too simple. The need to address the complexity of rural aging, however, has led to a number of different proposed conceptualizations – a result that, while improving operationalization, makes comparisons across studies difficult. For example, at least three definitions of “rural” are provided by the federal government (Dibartolo & McCrone 2003). In addition, Halfacree (1993) promotes a three part rural definition including an overall assessment of “rural” across descriptive, sociocultural, and locality characteristics. Continued attention is needed to bring consistency to the ways in which rural is operationalized.

Also needed is the application of theoretical approaches that link the micro processes related to individual aging with the macro structures that affect the probability of “a good old age” within the context of residence, including aging in rural areas. Success will require a consistent definition of residence that will capture the diversity of what a rural context is. This work is particularly relevant if policies are to be developed that adequately address the persistent disadvantages that examinations of rural aging confirm – disadvantages in personal health status and income as well as more limited access to health care and formal social services.

rural sociology

William W. Falk and Thomas A. Lyson

Like nearly all major concepts in sociology, *rural sociology* has come to mean a variety of things and like all things social, there is a historical context for understanding what rural sociology is. Intellectually, rural sociology grew out of the same historical era and ferment as sociology more broadly, but whereas the discipline from whence it sprang was rooted heavily in liberal arts colleges, rural sociology – in America – was heavily indebted institutionally to the rise of the land grant university. This was a uniquely American initiative, deeding land to states specifically for establishing universities that consciously sought to link teaching, research, and service – in this latter case, in the form of another institution, the Cooperative Extension Service. The federal legislation which began this was the Morrill Act of 1862. This was a time when racial segregation still ruled the land. Ironically, in the South, all of the original land grant universities were black, but white universities quickly became the dominant ones in all states, including the Southern ones. The Morrill Act of 1890 provided the enabling

legislation for a system of historically black colleges and universities, virtually all of which were Southern (for a wonderful source on rural sociology's history, see this web page: www.ag.ohiostate.edu).

In the late 1800s and on into the early 1900s, it was also true that America was still a decidedly "rural" place, with most Americans living in the countryside and working directly or indirectly in production agriculture. Many land grant universities recognized this with "A&M" (Agricultural and Mechanical) as part of their name and legacy. While some states established an "Ag" school as the comprehensive university, others established a companion university more oriented toward traditional liberal arts; examples abound – the University of Texas and Texas A&M; the University of Virginia and Virginia Polytechnic Institute and State University; the University of Oklahoma and Oklahoma State University; the University of Idaho and Idaho State University; the University of Washington and Washington State University; the University of Mississippi and Mississippi State University, and so on. Interestingly, some historic "ag" schools can hardly be identified by their names (e.g., Rutgers, Clemson, Auburn, and Purdue). In time, all states had land grant universities and many (but not all) had departments of rural sociology.

Rural sociology's foci historically and contemporarily have followed closely what is generally meant by "rural." This is a term written and debated about by rural sociologists (Bealer 1966; Falk & Pinhey 1978; Miller & Luloff 1981). In general, the term was thought to have three meanings. First, "rural" often was a short hand for areas with relatively low population density; this placed it in sharp contrast with "urban" areas notable for their high population density. The population emphasis was also true in US census categories, where people were sorted by such residential distinctions as farming, open land; small town, less than 2,500 total population; population 2,500–25,000 (or sometimes 50,000); and so on up to and including large cities. In time, this kind of categorization changed to be called non metropolitan and metropolitan (among other schemes). Regardless, the overriding issues were (1) the population density and (2) where people lived. A second way of characterizing rural areas was

by occupation. This usually meant giving great emphasis to farming both as activity and as industry. Rural areas not only had more of this activity, but as one consequence they had comparatively less of many other occupations and industries which were more likely to be found in urban areas. This was especially true at the turn of the twentieth century, when millions of Americans migrated from rural areas to urban ones to work in the emerging "industrial" America. A third way of thinking about rural areas was one based on values; in this case, "tradition" was paramount, often thought of in sharp contrast to urban areas. Where urban areas were heterogeneous (in all ways), sophisticated, hip, progressive, and modern, rural areas were homogeneous, unsophisticated, unhip, unprogressive, and traditional. Early sociologists, including Redfield and Tönnies, among others, captured this difference with terms such as "folk" and "urban" or *Gemeinschaft* and *Gesellschaft*. While this is primarily a stereo type, there is no question that in many people's minds (according to public opinion data) this sense of contrast still holds. Indeed, in American politics, "red" states and "blue" states follow somewhat this same distinction.

The first department of rural sociology was established in 1915 at Cornell (Larson & Zimmerman 2003: 13). Subsequently, many state universities developed similar programs, often merged with other programs, usually agricultural economics. Rural sociology, because it was so much smaller than the larger discipline, has always had a more limited intellectual vision as well as a much greater emphasis on application. This is easily understood when considering its place in the "mission" oriented land grant university and, again, given its size. For example, while the American Sociological Association had about 14,000 members in 2005, the Rural Sociological Society had about 1,000.

Despite its size, rural sociology has had considerable impact. This is partly because its work has been more narrowly focused – on issues such as population, community, family, stratification, development, and more recently the environment. For much of its history, rural sociology research often responded to a sense of local need and as a result had considerable application; this was facilitated by many rural

sociologists having appointments funded in part by the Cooperative Extension Service. Many early rural sociologists were former or currently practicing ministers, something that helps to explain rural sociology's historical penchant for being relevant to any given era's social issues and problems. As with all sociologists, their "sociological imaginations" were grounded in the eras in which they were living.

Again because of its size, the full range of sociological "theories" has never been found in rural sociology. For much of the twentieth century, rural sociology was nearly mono theoretical with its use of structural functionalism (Falk & Zhao 1989). It flirted some with more Marxist ideas but, in part, because so much of its institutional base was in state funded land grant universities (again, with mission driven principles and usually supported by federally funded research dollars), Marx – no matter his prominence in the sociological pantheon – was cited and employed rarely by rural sociologists (for a notable exception, see the "political economy" approach of Friedland et al. 1991). More broadly adopted were the apolitical principles of social psychology, often coupled methodologically with social surveys.

Rural sociology has always been heavily empirical and data driven. Indeed, to say that it was often atheoretical would be accurate (thus making it much like demography, a prominent style of scholarship in rural sociology throughout its history). In the early years, rural sociologists did considerable fieldwork and helped to pioneer social surveys (for a good overview, see Bertrand 1958). And some of the early rural sociologists (e.g., Dwight Sanderson, Charles Loomis, and William Sewell) were elected as president of both the Rural Sociological Society and the American Sociological Association. Rural sociologists also did a series of "community" studies and while the study of community faded from much of mainstream sociology for nearly a generation (essentially the 1970s and 1980s), it was always a staple of rural sociology (see especially Luloff & Kranich 2002). Indeed, one of rural sociology's best departments – Penn State's – was famous in part for training community scholars.

Coming out of World War II, rural sociology entered a period of both institutional and

organizational growth. States and federal funding for rural sociological research, along with funding for the social sciences in general, grew throughout the 1950s and 1960s. Substantively, rural sociologists continued to study rural institutions such as the family, religion, education, and governance. The units of analysis were generally communities, regions, and states. These studies were undertaken as the US farm sector saw the number of producers fall from nearly 6 million at the end of the war to just over 2 million by 1980. Rural to urban migration and non agricultural economic development strategies attracted the attention of the rural sociological community in the post war years.

During this same period the federal government began to pour resources into area studies and international development programs. The imperatives of the Cold War meant that the US needed to know as much as possible about the lives of the people living in the third world to combat the spread of communism and ensure that western models of economic development prevailed. Universities like Cornell, Wisconsin, and Michigan State became centers of international rural sociology scholarship. Many rural sociologists changed their research foci from domestic to international topics and cadres of rural sociology graduate students, often fresh out of the Peace Corps, were recruited to expand scholarship and build intellectual capacity on the international front. At the same time, rural sociology programs saw an influx of graduate students from the developing world.

Organizationally, after World War II, virtually all states had either a department of rural sociology ensconced in their land grant universities or a strong rural sociology unit nested in their departments of sociology. Many universities awarded PhDs in rural sociology and jobs were plentiful in the land grant system, in government, and in an expanding network of non governmental organizations.

During the 1970s the organizational fabric of rural sociology came under scrutiny as states began to withdraw support from higher education in general and agricultural programs in particular. Funds for international development work stagnated. To be sure, the changes affecting rural sociology varied from state to state, often depending on the economic viability of agriculture in the state. States with strong

constituents of family farmers and/or large rural populations maintained economically viable colleges of agriculture and usually strong rural sociology programs. States in which agriculture diminished in economic importance and in which rural interests waned experienced a downsizing of programs and staff. Rural sociology programs that developed expertise in international development in the previous decades were more likely to be maintained. At the same time, paralleling work in the larger discipline, some scholars engaged in sociology of rural sociology inquiries, spurred on, in part, by a famous Rural Sociological Society presidential address in which James Copp (1972) asked about the discipline's "relevance." Not long after, studies had been done on rural sociology theory (Gilbert 1982), methods (Stokes & Miller 1985), paradigms (Picou et al. 1978), and future (Friedland 1982).

In the 1980s the field of rural sociology experienced a resurgence of sorts, in part to accommodate scholarship in the area of the environment. Many of the key debates in what has become the subfield of environmental sociology were inspired by work undertaken by rural sociologists (Field & Burch 1988; Buttel 1996). And while environmental sociology has entered the mainstream of sociology, rural sociology still maintains both organizational capacity and scholarly depth in this area. Also during the 1980s, rural sociology rediscovered rural poverty; in fact a task force was formed to pursue this topic which led to both academic and policy related work and activity (Summers et al. 1993).

As the twentieth century ended and the twenty first began, the sociology of agriculture and food systems emerged as a burgeoning area of scholarship and outreach in many rural sociology programs around the country (Lyson 2004). Partly in response to the globalization of the food system and partly in response to the economic decline of rural areas, rural sociologists have begun looking at local agricultural and food systems as engines of economic and community development. The agriculture and food foci has also developed an ancillary health component, which links agriculture, food, nutrition, and health.

Unlike conventional or mainstream sociology, rural sociology has always been more

driven by the needs and concerns of a client base. In the early years of the discipline the client base was the farm sector and rural communities. Today, rural sociologists are responding to broader constituencies, ones concerned about environmental problems, food safety, and health. However, rural sociology's longstanding focus on rural people and communities has remained a staple, and it is easy to find rural sociologists working on topics related to these things, especially population, family, social capital, and various forms of inequality, including some of the dominant variables found in many sociological analyses – race, class, and gender (for a notable essay on gender and rural sociology, see Tickamyer 1996).

In the contemporary era, rural sociology has struggled to keep its competitive advantage – both broadly (in sociology) and narrowly (in ag schools). Much of the funding for ag school rural sociology projects has been based on what are called formula funds. These are federal funds based on a state's rural population, provided from the US Department of Agriculture to the Agricultural Experiment Station (always housed with colleges of agriculture on land grant university campuses). Since the rural population has become smaller and smaller over the years, so, too, have these funds. Rural sociologists, almost always the smallest cadre of scholars in colleges of agriculture (where they have usually been housed), have seen their proportion of the research pie shrink along with other recipients of these funds. But since rural sociology programs were small to begin with, many have been merged with other departments or been eliminated altogether. It is notable and increasingly normative for rural sociologists to seek outside funding to support their work, a kind of entrepreneurial activity which may help to secure their longevity in the years ahead.

While much of what has been said thus far applies primarily to the American experience, some of the general intellectual emphases of the discipline are also found overseas. There, agriculture and all things related to it – farming as both activity and industry, farm families, social change in all its manifestations related to the changing importance of agriculture, and the impact on natural resources and the environment – have been dominant. This has been

especially true among scholars examining less developed societies, where modernity (and all things related to it) has received considerable attention. Indeed, this is one part of rural sociology – in and out of the US – where more Marxian informed theoretical views are likely to be found. It is also true, however, that while an emphasis on agriculture, food systems, and related issues has received considerable attention, nearly anything related to population studies and demography has long been a staple of rural sociology as done overseas.

As rural sociology enters the twenty first century, especially in the US, its research funds and, importantly, undergraduate students have continued to decline. Consequently, it is likely to see its autonomy diminished along with its sense of itself as a coherent organizational and institutional discipline. Some programs may remain essentially intact as traditional rural sociology departments (e.g., Wisconsin, Penn State) and award PhDs in rural sociology. Other programs will reorganize themselves into speciality niches that emphasize some key aspect of rural sociology (e.g., development sociology at Cornell; community and leadership development at the University of Kentucky). In some cases, rural sociology will be folded into “hybrid” departments (e.g., human and community resource development at Ohio State) or either remain with or become part of the usually much larger departments of agricultural economics (e.g., Auburn, Louisiana State University, Texas A&M University). In most cases, it is likely that rural sociology programs will maintain their status as subunits or cognate areas in larger programs (e.g., Michigan State University, Iowa State University). This parallels what one usually finds overseas, where rural “sociologists” are often trained in fields other than sociology; what unites them is not the name of their academic departments but their substantive focus on rural issues which in some cases, especially in Great Britain, may be called more inclusively “rural studies.”

When considering the discipline's future, we are certain about one thing: by whatever name, there will be scholars whose work will focus on rural people and places, and this will remain true both in the US (where nearly one quarter of the population lives in rural areas) and abroad.

Rustbelt

John M. Hagedorn

The Rustbelt historically refers to the Great Lakes and Northeastern regions of the US that had been hardest hit in the 1970s by the decline in manufacturing. The term uses as metaphor the "rusting" of the physical plants of factories to represent the economic and social decay of the older industrial cities and their attendant social problems.

A Rustbelt city is one that experiences population loss, rising crime rates, loss of union jobs (particularly in manufacturing), white flight to the suburbs, and a generally declining urban environment. Cities like Gary, Indiana, Detroit, Michigan, and Milwaukee, Wisconsin saw a steady stream of manufacturing jobs leave to lower wage regions of the country, Mexico, and overseas. Massive but abandoned factories rusted away and scarred the landscape of once vibrant cities.

The Rustbelt was contrasted in the 1970s to the rise of the "Sunbelt," or cities in the South and Southwest characterized by high rates of immigration, low wages, retirement communities, and new defense, oil, and high tech industries. The Sunbelt also corresponded with the rise to power of the Republican Party in the 1980s, as electoral votes shifted to the South and Southwest states, adding political to economic advantage.

Theoretically, the term Rustbelt is associated with some of the major trends of thought in urban sociology. While popular thinking saw the rusting of the industrial centers and the rapid growth of the Southwest as a natural process, some social scientists disagreed. Perry

and Watkins (1977) posited the Rustbelt–Sunbelt dyad as one outcome of uneven capitalist development. Rejecting “convergence” theories that saw such processes as an inevitable consequence of the “invisible hand,” these urban political economists attributed the decline of the Rustbelt to conscious decisions by political and economic actors.

The crisis of the Rustbelt was seen as a crisis of the state, and particularly its redistributive policies. Sunbelt cities were dominated by private capital while the Rustbelt poor were dependent on public works or welfare. As the political spectrum swung to the right during the Reagan years, budget cuts further undermined the income and well being of workers, the unemployed, and the “underclass” in Rustbelt cities. Investment in aerospace and other defense industries and later the information economy enriched the Sunbelt as the Rustbelt declined.

Wilson (1987) looked more closely at the social consequences of the deindustrialization for the “truly disadvantaged” or black urban poor. In the 1970s and 1980s, Chicago was a prime example of a Rustbelt city with a corresponding growth in African American concentrated poverty. Chicago also saw sharp population losses, increases in rates of single parent families, high unemployment, a persistent violent gang problem, and an overall decay in African American social institutions.

While Wilson (1978) had earlier pointed to the “declining significance of race,” the Rustbelt led to work disappearing precisely in those cities, like Chicago, that African Americans had concentrated on in order to get high wage manufacturing jobs. Thus the “spatial mismatch” of jobs and workers made Rustbelt cities’ African American population the “truly disadvantaged.” No other ethnic group, Wilson and Sampson (1995), Massey (1990), and others pointed out, suffered from such high rates of concentrated poverty.

In recent years, the Rustbelt concept has diffused internationally. For example, China describes its northeastern provinces of Heilongjiang, Jilin, and Liaoning as its Rustbelt. Saskia Sassen, Manuel Castells, and other urban sociologists have subsumed the Rustbelt concept into explanations of various processes of globalization and the new economy. In Sassen’s terms, some cities and regions are “valorized” in the

global era, while others are marginalized. The strength of former industrial cities like Manchester, Mumbai, or Detroit turns into a disadvantage as cities seek to become major players in the information economy.

Some US cities appear to have rebounded from Rustbelt to information city status. Pittsburgh, for example, has shed its dependence on steel to become a center of software and finance. Boston’s maze of universities and electronics industries provided it with an entrée into the new economy as it shed its textile and other light industry past.

Other cities failed to find a niche in the information era, and have stagnated. Detroit saw its auto industry relocate and has continued to experience major population loss, including nearly all of its white residents. Gary’s steel mills lie darkened in a row on the banks of Lake Michigan, interrupted only by the bright lights of Harrah’s gambling casino. Rustbelt cities have looked to gambling, tourism, and entertainment venues to try to provide jobs and keep their more affluent population from leaving. When old factories are not torn down, some are refurbished as shopping malls. Rustbelt cities today continue to lose population and have high rates of urban violence.

The term Rustbelt is used less in the twenty-first century, as cities look to define themselves more in terms of the new economy than to be held captive to nineteenth and twentieth century labels. Research, like the reputation of cities, has moved from looking at the nature of urban transitions from the industrial era, to the challenges of confronting the inequalities of the new global order.

S

Sacks, Harvey (1935–75)

Martin M. Jacobsen

Harvey Sacks was a sociologist who developed the methodological subdiscipline called conversation analysis. It conceptualized conversation as a means of social action rather than as an indicator of cognitive or psychological intent. Conversation analysis examines the surface structure and sequencing of linguistic exchanges as social acts rather than as indications of a speaker's intent, as is the case with speech act theory, pragmatics, or sociolinguistics. Sacks's focus on the surface structure of language use as an end in itself places him alongside such modern thinkers as Harold Garfinkel and Noam Chomsky.

Sacks's interest in conversation grew from his experience in legal studies. After earning an LLB (Yale Law School) in 1955, Sacks turned his attention to developing analytical approaches toward the analysis of conversation as a behavior that accomplishes social ends. Most of this early work emerged while a graduate student at MIT and the University of California system, where he earned a PhD in sociology (UC Berkley, 1966) and rose through the ranks to full professor at UC Irvine in 1974, one year before his death in an automobile accident.

Sacks occupies an important position in the interdisciplinary field of discourse analysis. He is contemporary with the generation of scholars who, after adapting sociological, anthropological, and philosophical methods to analyze linguistic behavior as a social phenomenon, became interested in language itself. Sacks's publications (whether submitted by him before his death or by his intellectual heirs after it) focus primarily on methodology, and both his

publications and his collected lectures privilege real world data as opposed to the created or literary examples of many of his contemporaries. By concentrating on the act of conversation as a thing in itself, Sacks took a radical step away from the mainstream view of sociology as mass psychology. His preference for examining the work done with language rather than using language as a way to examine the mentality of the speaker placed him as firmly in the discipline of linguistics as it did in the discipline of sociology.

sacred

Stephen Hunt

The Latin word *sacer*, from which the term sacred is derived, denotes a distinction between what is and what is not pertaining to the gods. In not a dissimilar fashion, the Hebrew root of *k d sh*, which is usually translated as “Holy,” is based on the idea of separation of the consecrated and desecrated in relation to the divine. Whatever the specific expression of the sacred, however, there is a fairly universal cultural division where the sacred constitutes phenomena which are set apart, revered, and distinguished from all other phenomena that constitute the profane or the mundane. However, in Hinduism there has long existed the belief that the sacred and the unclean both belong to a single linguistic category. Thus, the Hindu notion of pollution suggests that the sacred and the non sacred need not be absolute opposites; they can be relative categories; what is clean in relation to one thing may be unclean in relation to another, and vice versa.

The interest of sociologists in the social significance of the sacred is largely derived from the concerns of the subdiscipline of the sociology of religion. However, considerable disagreement exists as to the precise social origins of that which is designated sacred. Hence, an understanding of the sacred is frequently intimately bound up with broad definitions of religion itself, the categorization of certain social activities as religious, and particular sociological approaches to the subject. Such concerns have subsequently ensured that sociological perceptions of what constitutes the sacred as a social manifestation are subject to constant change and have led to a divergence of thought as to its nature.

The exploration of the cultural perception of the sacred is by no means limited to the discipline of sociology. Psychoanalytical theory and anthropology have also brought their own unique reductions and these have not infrequently informed past sociological speculations. In terms of psychoanalytical accounts, the sacred is discussed in Freud’s theory of totemism and is central to his famous analysis of religion in *Totem and Taboo* (1938). For Freud, the link between totemism and the sacred is

evident in certain aspects of the development of religion which have left their traces in historical myth and legend. In Freud’s account the Oedipus myth symbolizes a son’s desire to possess his mother and murder his father. Freud interpreted sacred animal sacrifices in “savage” tribes as partly a reenactment of the original parricide and partly an expiation of it and where the totemic animal is the symbolic substitute for the father or the dominate male. However, in more civilized communities where in the totemic feast the totem animal is slaughtered and eaten, Freud believed that sacrifice loses its sacredness and becomes an offering to the gods rather than a representation of the gods.

In anthropological terms, Robertson Smith (1889) identified the principal difference between primitive taboo and rules of the sacred as the difference between friendly and unfriendly deities. The separation of sacred and consecrated things and persons from profane ones, which is an integral part of the religious cult, is basically the same as the separation which is inspired by fear of malevolent spirits. Separation is the essential idea in both contexts, only the motive is different, since friendly gods are also to be feared on occasion. Robertson Smith maintained that distinguishing between the holy and the unclean marks a real advance above savagery. In this way he produces a criterion for classifying religions as “advanced” or “primitive.” If primitive, then rules of sacredness and rules of uncleanliness are indistinguishable; if advanced, then rules of uncleanliness disappear from religion.

While early anthropological accounts of the nature of the sacred have informed sociological theorizing, it was in turn heavily influenced by the work of Durkheim. In the opening chapter to *The Elementary Forms of the Religious Life* (1915) Durkheim summarized and rejected earlier definitions of religion. He dismissed Tylor’s (1903) “substantive” definition of religion, namely “belief in spiritual beings.” This definition was bound up with Tylor’s account of the origins of religion in a system of thought which he referred to as “animism” – the belief that all things, organic and inorganic, contain a soul or a spirit which infuses them with their particular sacred nature and characteristics. Durkheim insisted that this emphasis was erroneous since it ignored practices, the real essence of religion,

which are more important than beliefs. Durkheim likewise dismissed Marett's (1914) conjecture that the essence of religion is the experience of a mysterious, sacred occult power or force that was associated with deep and ambivalent emotions of awe, fear, and respect of natural phenomena which predated conceptualizations of spirits, deities, and the like.

Durkheim then proceeded to adopt two criteria which he assumed would be found to coincide: the communal organization for the community cult and the separation of the sacred from the profane. For Durkheim, the sacred was the object of worship. The rules of separation between religion and the secular are the distinguishing marks of the sacred, the polar opposite to the profane. The sacred, according to Durkheim, is frequently projected as abstract religious entities, but these are merely collective ideas and expressions of collective morality. Moreover, the sacred needs to be continually enforced by prohibitions. The sacred must always be treated as contagious because relations with it are bound to be expressed by rituals of separation and demarcation and by beliefs in the danger of crossing forbidden boundaries.

Durkheim's advanced his own "functional" definition of religion which amounted to a distinction between the sacred and profane, so that religion was "a unified system of beliefs and practices relative to sacred things, that is to say, things set apart and forbidden – beliefs and practices which unite them into one single moral community called a church of all those who adhere to them" (Durkheim 1915: 47). Thus, beliefs and practices in relation to the sacred are the defining factors of all religions.

Durkheim's deductionist approach gave way to an examination of what he perceived as the most simple and primitive religion, that of the Australian aborigine, which he believed would provide insights into the origins of religion that are predominantly social in cause. Durkheim described the clan organization of aboriginal society and the association between each clan and a sacred totem animal or plant species. These totems are represented by stylistic images drawn on stones or wooden objects called *churingas* which, since they bear the representation of the sacred totem, are also sacred. In aboriginal collectives *churingas* are surrounded by taboo and treated with the utmost respect. These

totemic symbols, Durkheim insisted, are emblems of the clan in much the same way as a flag of a country. The *churingas* are the most sacred objects in aborigine ritual – the outward and visible form of the totemic principle or god.

Durkheim argued that by sacred things we should not understand simply those things which are called gods or spirits – a rock a tree, a river, a pebble, a building – which are frequently held as sacred, as displaying inherent sacred qualities. The totem is the emblem of the clan, but more than what the *churingas* represents. The *churingas* are at once the symbol of the sacred and society, for the sacred and society are one. Thus, through worship of god or the totem, human beings worship society – the real object of religious veneration. It is a relationship of inferiority and dependency. Durkheim argued that it is easier for human beings to visualize and direct feelings of awe towards a symbol than such a complex thing as a clan. This is what gives the totem, hence society, its sacred quality.

Durkheim also explored how human beings partake of the sacred. At one level social members express their faith in common values and beliefs. In the highly charged atmosphere of collective worship, the integration of society is strengthened. Members of society express, communicate, and acknowledge the moral bonds between them. At the same time, as members of clans with sacred totems and who believe themselves to be descended from such totems, they too are sacred. Through totemic representation to which they belong, they are in some sense of the same essence as the totemic species and consequently, sacred. In the same way, in the totemic system of ideas, since all things are related with one or another clan totem, natural phenomena such as rain, thunder, and clouds become sacred. As totemic clans partake of a universal principle they are part of an anonymous impersonal force which constitutes society as a whole greater than its parts and which has a sacred quality. This impersonal force has a particular mysterious quality related to the totem and the social consciousness and unity which it represents. This force may be understood by the Polynesian term *mana*, which has parallels among some North American Indian tribes with the notion of *orenda* and in ancient Persian, *maga*.

There are a number of problems frequently identified with Durkheim's definition of the sacred. Firstly, such a definition is derived from a western context that is not readily appropriate to the worldviews of a number of non western societies, since it carries various culture bound connotations. Thus, Durkheim's assertion that religion is related to the sacred and that this is a universal conception in human society has been disputed by anthropologists: Evans Prichard (1937), for example, found that the distinction was not meaningful among the Azunde tribe he studied. The idea of the sacred, therefore, is one which exists in the mind of the observer and not necessarily of the believer or social agent. It might nonetheless be argued that the distinction remains a useful analytical conception by which sociologists can operationalize the study of religion. However, there remain difficulties with such a methodology even as an analytical distinction that focuses on the criteria by which the sacred is distinguished from the profane. Anthropologists point out that this is not useful in distinguishing a sacred from a profane sphere in at least some societies. While many cultures do have a category of things set apart and for bidden, these things are not always those that feature in religious belief and ritual and, on the other hand, things which do figure in religious belief and ritual may not be set apart and forbidden.

Durkheim also speaks of the sacred as commanding an attitude of respect. This does not, however, provide a consistent criterion because, in many religious systems, religious objects and entities do not necessarily receive reverence. Idols, and the gods and spirits they symbolize, may be punished if they do not produce the benefits they are called upon to bring. Such difficulties have led Goody to abandon the attempt to define religion in terms of the sacred. Goody (1961) maintains that it is far from legitimate for the observer to establish a definition of religious activity on a universal perception of the sacred world – no more than is the actor's division of the universe into a natural or supernatural sphere.

Despite such critiques of Durkheim's distinction between the sacred and profane, his work inspired important schools of anthropological thought. Radcliffe Brown, for instance, saw the nature of the sacred as a communal cult. In his

classic study *The Andaman Islanders* (1933) Radcliffe Brown was heavily influenced by Durkheim in asserting that ritual provided a socially integrative force which compensated for a lack of unitary political structure. Ritual is a symbolic action regarding the sacred and essentially expressed social sentiments, although Radcliffe Brown recognized that not all rituals are sacred rituals. Taboo rituals related to the sacred express, for example, the value of child birth taboos among Andaman Islanders – emphasizing the value of marriage and maternity, alongside the danger to life in the birthing process.

There are aspects of Mary Douglas's work which also developed some of the themes of Durkheim's thesis, although she also departed significantly from a number of his basic tenets (Douglas 1966). Like Durkheim, Douglas identified the sacred and the impure as opposite poles, but noted that in some primitive cultures the sacred is a very general idea meaning little more than prohibition. In that sense the universe is divided between things and actions which are subject to restrictions and others which are not. Among such restrictions some are intended to protect the divine from profanations, and others to protect the profane from the dangerous intrusion of the divine. Sacred rules are thus merely rules hedging divinity off, and uncleanness is the two way danger of contact with the divine.

Douglas established the sacred as the polar opposite of uncleanness, although what constitutes either she understood as socially defined and thus varied between cultures. For Douglas, religion often sacralized boundaries related to food, sexuality, dress, etc., as integral to caste systems, gender relations, or distinguishing communities. This is exemplified by a number of the rules of pollution in the "abominations" as outlined in the Judaic scriptures of the book of Leviticus, which are associated with ambiguities such as animals which part the hoof but are not cloven footed and the stipulation that those who touch them are likewise polluted (Leviticus 11).

A rarely observed perspective on Durkheim's work is that it also constituted a study in the sociology of knowledge. For Durkheim, the basic social concepts and categories of thought, time, space, and causation, in addition to the

distinction between the sacred and the profane, are born in religion as a community enterprise. Through the shared beliefs and moral values which form the collective conscience, social order is made possible and the social and natural world understood and given meaning by those who comprise the "sacred" community. Durkheim proceeded to show how the totemic system was also a cosmological system and how such basic categories had origins within totemism and the clan structure.

A more stringent phenomenological approach to the sacred was offered by Peter Berger in a series of influential works written since the late 1960s (e.g., Berger 1967). In Berger's account religion is essentially derived from a subjective interpretation of reality from which meaning is given to the world (including the social world) and, indeed, the entire cosmos. Religion is thus one of the most important means by which human beings categorize and make sense of their existence. Such an enterprise is a collective one and, in constructing a universe of meaning, human beings perceive a "plausibility structure" of understanding which, in turn, feeds back to inform and sustain the social order. According to Berger, this plausibility structure constructs a "sacred canopy" which includes not just religious belief systems but also philosophical notions about how the world is and enforces everyday taken for granted knowledge. In doing so, the sacred canopy upholds the precariousness of human existence. Therefore, in most historical societies religion helped build, maintain, and legitimate a universe of meaning and provided ultimate answers to ultimate questions. This was achieved through beliefs in supernatural powers that created all things and further functioned to legitimate social institutions through a sacred and cosmic frame of reference. Since the sacred canopy is derived from a social base, that which is regarded as "true" and legitimate is only so in the minds of the human actors who have conceived it. Hence, through notions of the sacred, as an ultimate frame of reference, any given social order comes to see itself as the center of the world and the cosmos.

In a more recent account, in which he makes a contribution to the secularization debate, Demerath (1999) differentiates the concept of religion from that of the sacred. Demerath

argues that the sociological study of religion has long labored under the constraint and misleading premise of concepts of religion, and has not sufficiently dwelt on the sacred. He thus argues that religion should be defined "substantively" and the sacred "functionally," thus resolving the longstanding tension in earlier definitions of both. Religion, according to Demerath, is a category of activity, and the sacred a statement of function. Demerath observes that religious activities do not always have sacred consequences. This is very often because religion frequently displays organized expressions and bureaucratic encumbrances. Nonetheless, the substantive definition of religion does suggest an orientation towards the supernatural world and "externally" imposed moral systems. By contrast, "the sacred" is a category of social phenomena which is not religious in conventional terms even though sacred phenomena may display some aspects of religion. Demerath therefore sees "folk," "implicit," "quasi," and "para" religions as part of the "sociology of the sacred," conceptions which hitherto had the disadvantage of using a conventional image of religion with unfortunate consequences, one of which has been to narrow the search for the sacred to include those things which are religious in character. There are sacred entities and symbols which have a compelling power without necessarily being religious. Since any social activity has potentially sacred functions there may be a large inventory of any society's cultural stock which constitutes the sacred.

sacred, eclipse of the

Sabino Acquaviva

The thesis of the eclipse of the sacred, which is built on psychological experience of the sacred and measures of its decline, moves in a different space than many other theories of secularization that – according to the scholars who defend the eclipse – give less importance to the problem of the level of experience and therefore to the presence of the sacred and instead concentrate on cultural and structural analysis. The theory of the eclipse proceeds from the definition of the sacred as experience (which nearly all individuals have). Sacred experience exists when an aspect of the real is recognized as “radically other” compared to natural reality. In different cultures and societies there are different hierarchies of sacred experience. This experience, lived as individual psychological reality and as the central nucleus of religiousness and religion, is considered to be the center around which religiously significant social acts and facts orbit.

The sacred, which is present (a quantifiable presence) in various ways ranging from individual psychology to social life, is in decline if there is a progressive retreat from the forms of the sacred in individual and social experience.

This approach has been challenged by the claim that an invisible religion exists that transcends the practical data on religious practice and the religious value of social events and so the eclipse of the sacred then is merely an apparent phenomenon. This approach attempts to refute the most widely accepted theories of secularization by claiming that we cannot ignore (or must adequately take into consideration) individual experience of the sacred as an expression of the biological and psychological characteristics of men and women.

The basic theoretical hypothesis of the theory rests on the fact there is a strict relation between religious experience (or the sacred) and human needs. Analysis of the system of needs and the ways in which they are sublimated when they are unsatisfied is thus fundamental to the theory: the genetically based need of immortality, the need to love and to be loved (by considering God or the gods as both objects and subjects of love it is possible to satisfy the genetic and psychological need to love and to be loved), the need to know (the so called exploratory instinct), and the need to give meaning. The lack of satisfaction of these and other biological needs stimulates the mechanisms of sublimation, including religious sublimation.

For those who espouse the theory of the eclipse of the sacred, conventional theories concerning the crisis of religion move predominantly within the analytical space of religious and cultural systems that lie behind the sublimations, which are then translated in a series of interpretations of the phenomenon that often contradict each other. For this reason a methodological turn is necessary.

In its first phase, the theory of the eclipse accounted for psychological components, but perhaps not adequately because of a lack of experimental data. Its initial formulation, developed in 1960–1, was exposed to criticism. After several years of debate in response to some of these critiques, a distinction between experience of the sacred and magical use of the sacred was introduced. However, further analysis (carried out within the psychology of religion) seems to validate the fundamental thesis of the theory of the eclipse of the sacred. This is especially true for Europe, but it is less so for other continents to the extent that they were shielded from the changes that are the expression of the consumer

and technical scientific revolution. The situation changed during the 1970s and 1980s as great improvements in the experimental psychology of religion made it possible to verify the hypothesis. Experimental findings allowed it to be established that a vast area of religious experience exists outside the church, but also that – data in hand – the presence of religious experience is quite high among practitioners, is lower among non practicing members of a religion, and is even lower among agnostics and atheists. In society today – especially in Europe and China – practitioners have decreased dramatically, and non practitioners and agnostics have increased, and thus, generally, the presence of experience of the sacred has seriously declined. In conclusion, the supporters of the thesis of the eclipse of the sacred claim that it can be demonstrated that the crisis discussed in the early 1960s continues along the same trajectory.

The experimental methodology of the psychology of religion has made possible the measurement of the presence of religious experience and has led to a logical and methodological transformation in the formulation and the analysis of the problem. This methodology, according to many, is a sound analytical tool capable of verifying theories, data, and tendencies that otherwise would be difficult to understand and define, and it is able to confirm the (growing) size of the eclipse of the sacred. It is a pity the experimental application of the theory to Islamic religiousness is inadequate at present, even if some minor findings seem to make plausible the emergence of similar phenomena to that which has been found in Europe and other developed countries.

sacred/profane

William H. Swatos, Jr.

The significance of the sacred/profane distinction in sociology is to be most directly credited to Durkheim's *The Elementary Forms of the Religious Life* (1915), first published in France as *Les Formes élémentaires de la vie religieuse* in 1912. The distinction had an enormous direct effect in the sociology of religion, but also powerfully influenced the broader sociological theoretical paradigm of functionalism, since in the *Forms*, which was published at the culmination of a distinguished career, Durkheim saw religion as the bearer of the sacred and the sacred as maintaining social order or equilibrium. As *Forms* was the capstone work of Durkheim's career, "sacred" became the capstone of social structure. Hence, although the sacred/profane distinction is the device that Durkheim used to make his point, in fact *sacred* is the crucial concept within the distinction; that is, it is the concept of the sacred that makes the sacred/profane distinction theoretically powerful within functionalist sociology. Crucial to the widespread influence of Durkheim's specific paradigm was its integration into Talcott Parsons's *The Structure of Social Action* (1938), which became the foundational theory text for a generation of sociologists from the end of World War II until the mid 1960s – although when Parsons came to reformulate Durkheim in his own writings he substituted "supernatural"

for sacred, something Durkheim consistently avoided because of its theological bias.

THE SACRED AND SOCIETY

The sacred/profane distinction lies at the heart of Durkheim's definition of religion in *Forms* (which was actually his second attempt at a definition, his first being generally unwieldy, and quickly discarded): "A religion is a unified system of beliefs and practices relative to sacred things, that is to say, things set apart and for bidden – beliefs and practices which unite into one single moral community called a Church, all who adhere to them" (Durkheim 1915: 47). The sacred thus involves *things set apart and forbidden*. Everything else is profane. As a result, "profane" is always easy to define: it is anything within a society (or social system/institution) that is not sacred. To come to this conclusion about the sacred and its role in establishing a "single moral community," Durkheim read anthropological works, specifically on the Australian aborigines and particularly the role of totems among clans or tribes of what were considered "primitive" peoples. This is the significance of the word *elementary* in the title of his book. He wanted to study what was generally considered in his day the simplest (or least complex) societies in existence anywhere in the world. Durkheim, like many other early sociologists, believed that by studying the maintenance of social organization among these peoples significant insights could be obtained about core processes that enabled societies to develop and maintain themselves – and, as a corollary, what changes in the transition to modernity might explain the emerging social problems of his day. Durkheim thus saw the sacred object as a symbol of society: in this totemic sense, "God" was really society. Religion was simultaneously a human social product, hence essentially false, and the producer of social order, hence powerfully true. "Education" was the process by which the symbolic realities contained within this "truth" were passed from generation to generation so that social structure could be maintained, hence function.

In the Parsonian synthesis that popularized and standardized Durkheim's definition for an

especially formative generation of sociologists, the notion of "church" in the original Durkheimian formulation of the definition of religion was gradually secularized into "society" – that is, whereas Durkheim spoke quite specifically of a moral community "called a Church," later generations came to identify the moral community with society or in other cases with virtually any other ongoing social group. Rather tautologically, in fact, social scientists began to look for "the sacred" in all groupings and structures that one would not normally associate with religion – ranging as widely, for example, from the flag and related patriotic paraphernalia in the US, the tombs of Lenin and Stalin in the Soviet Union (where there were no formal state churches), to Babe Ruth's bat as sacred to baseball. This also led to some groups trying to create rituals and symbolic centers, as evidenced by various halls of fame or signs of identification – the flags of the Confederacy and Nazi Germany having particular significance at this writing. Regardless of the specific items or ceremonies of veneration, the underlying logic is the same: there must be some set apart and forbidden object or objectifiable process both to create and maintain the structure and function of any social group.

This understanding of sacrality had a twofold effect on the study of both society and religion. On the one hand, it made religion an essential social institution: no religion, no society. On the other hand, it also said that while religion was good (functional), it was not true. That is, it reduced the end point of religion (the divine, in whatever name or form) to a social construction. One might almost say that at the level of society Durkheim served as religion's funeral director: embalming the corpse or providing an urn of ashes that sustained family unity as if the loved one were really there.

OUTCOMES AND CRITICISMS

The Janus faced character of Durkheim's sacrality proposition led in at least two directions in the study of religion. The positive outcome was a significant corpus of work on political religion that flowed freely and broadly from an initial seminal essay by Parsons's former student Robert Bellah, "Civil Religion in America"

(1963). In this use, the concept refers to a “transcendent religion of the nation” and resonates well with the functionalism of both Durkheim and Parsons. Bellah’s definition of American civil religion is that it is “an institutionalized collection of sacred beliefs about the American nation,” which he sees symbolically expressed in America’s founding documents and presidential inaugural addresses. It includes a belief in the existence of a transcendent being called “God,” an idea that the American nation is subject to God’s laws, and an assurance that God will guide and protect the US. Bellah sees these beliefs in the values of liberty, justice, charity, and personal virtue and concretized in, for example, the words *In God We Trust* on both national emblems and on the currency used in daily economic transactions. Although American civil religion shares much with the religion of Judeo Christian denominations, Bellah claims that it is distinct from denominational religion. Crucial to Bellah’s Durkheimian emphasis is the claim that civil religion is definitionally an “objective social fact.”

Hence, although the civil religion thesis claims that civil religion exists *symbolically* in American culture, such symbols must be perceived and believed by people within the society if the symbols are to be said to have meaning. Several studies by Ronald Wimberley and others (1976) developed statements on civil religious beliefs and obtained responses on them from various public samples. Their findings show that people do affirm civil religious beliefs, although most would not know what the term “civil religion” means. These large surveys and factor analytic studies give credence to Bellah’s conceptual argument that civil religion is a distinct cultural component within American society that is not captured either by American politics or by denominational religiosity. The result of both Bellah’s initial conceptual foray and these empirical studies has not only established the validity and usefulness of the civil religion concept in understanding important cultural and social dynamics within American society, but also spawned comparative studies around the world – Crystal Lane’s studies of the former Soviet Union being particularly significant.

Ironically, a move away from functionalism generally in sociology beginning in the late 1960s brought in its wake first secularization

theory, and then a reaction against the Durkheimian (or Parsonian Durkheimian) formulation as an adequate understanding of religion. The term *secularization* was coined quite apart from Durkheim by Max Weber, who used it as a way of conceptualizing the process by which the world was “robbed of gods.” In many respects Weber would have seen Durkheim as part of that process, since Durkheim himself was influenced by an ongoing French tradition that looked toward a “religion of Humanity.” Parsons, however, attempted an integration of Durkheim and Weber in the *Structure of Social Action*, hence secularization became integrated into a neo Durkheimian framework. C. Wright Mills (1959: 32–3), one of Parsons’s most trenchant early critics, critically summarizes Parsons’s religious historiography: “Once the world was filled with the sacred – in thought, practice, and institutional form. After the Reformation and the Renaissance, the forces of modernization swept across the globe and secularization, a corollary historical process, loosened the dominance of the sacred. In due course, the sacred shall disappear altogether except, possibly, in the private realm.” Although many social scientists had come to accept this analysis, which implies his torical description, it is in fact based on almost no historical evidence. Rather than systematic studies of the past, it draws from commonsense generalizations about history related to systematic studies of the present. Put differently, the aborigines of 1900 were just as “contemporary” as the French of 1900.

Secularization theory hence led to anti secularization theory, which amounted to a rethinking of both religion and sacrality in the Durkheimian context. Runciman (1970: 98) has raised three specific issues regarding the Durkheimian approach, the most telling of which is that Durkheim’s “explanation” of religious beliefs in a this worldly terminus (society) does not actually “explain” them at all (except to explain them away): “Why, after all,” Runciman asks, “is the worship of society any more readily explicable than the worship of gods?” Intimately connected with this “explanation,” however, is Durkheim’s search for the source of social solidarity, and behind this is his *presumption* of solidarity. The integrating power in society of religion is *not*, in fact, what Durkheim would call a “social fact,” but a largely unsubstantiated

social anthropological *belief* stemming from Durkheimian sources. This belief underlies the “religion” of secularization; that is, contemporary secularization theory is based on the view that religion is defined by religion’s “function” of social integration or the maintenance of social solidarity. Not only is the notion of solidarity as definitive of society now suspect (Beyer 1989), but even if we do accept some concept of solidarity into our sociological arsenal, there is no reason to presume an integrated wholeness that certainly is now difficult to see, and may well have never existed. On the one hand, this may be evidenced by the observation that many so called primitive societies do not, strictly speaking, have a linguistic equivalent for the word “religion” (our “way” or “culture” being both better translations), while people in advanced industrial societies increasingly express a preference for describing themselves as “spiritual” rather than religious. What is especially missing in this shift is the relative absence of Durkheim’s hope that the “sacred” would become a “religion of humanity” (viz., morality), which is an increasingly rationalized and bureaucratized civilizational element associated with formal boards of ethical review, hence more a matter of the sociology of law and industrial/work relations than of religion and culture.

sacrifice

Simone Ghiaroni

Sacrifice is a ritual practice that includes the removal of goods (objects, vegetables, animals, human beings) from profane use or their destruction in relation to a supernatural sphere, but not necessarily with an offer or dedication. Sacrifices that involve the killing of a victim and the shedding of blood are called blood sacrifices.

The issue of the definition of sacrifice, a focal point in contemporary debate, went so far as to deny the empirical existence of a ritual identifiable as a sacrifice. Marcel Detienne (Detienne & Vernant 1986) criticized the concept, claiming that it was an arbitrary category built on elements drawn from the Christian tradition and adopted in order to lump different phenomena together. The study of sacrifice should therefore be based on a historical analysis of the rituals within their own contexts. Thus, for instance, Grecian sacrifice turns out to be nothing but a culinary practice; there does not exist any ritual designated as a sacrifice, but simply a meat eating mode of a historically determined human group. In Detienne’s view, the concept of sacrifice should be dropped because it is a “category of yesterday’s thought” that has no interpretive or descriptive value. Detienne hit the mark when he recognized the Christian inheritance underlying many theories of sacrifice, but many scholars felt that the dissolution of the concept of sacrifice was an interpretive impoverishment. Seeking refuge in historical particularism is not the solution to the problem of definition: the concept of sacrifice still has a heuristic value and is an excellent instrument for interpreting some social facts. The solution consists rather in replacing a rigid, clear cut definition with a more flexible, inclusive family of notions. The concept of sacrifice turns out to be a modern

theoretical construction that is useful for analysis but has been devised artificially in order to interpret a category of phenomena interconnected by family resemblances (Valeri 1994). The noun "sacrifice" does not correspond, in the real world, to any unequivocally defined substance: it denotes a group of social facts among which it is possible to trace analogies based on some common criteria. As Ivan Strenski (2003) pointed out, the modern study of sacrifice cannot be founded on theological bases, identifying an ideal central concept that is essential in all types of sacrifice, for instance offer or abnegation: it is necessary to analyze the formal characteristics of the rites that can be interpreted as sacrifices. In this sense, Strenski recognizes the study of sacrifice by Durkheim's followers Hubert and Mauss (1964 [1899]) as a scientific attempt to achieve emancipation from an ethnocentric and Christian outlook.

Among the phenomena that are subsumed into the category "sacrifice," three main types can be distinguished: *firstfruit offer*, *gift sacrifice*, and *communion*. Firstfruit offer consists in leaving to the supernatural sphere a part of the goods obtained from hunting or collecting, concentrating sacrality on that part and thus desacralizing the remaining part so it can be eaten by men and women without any danger. Gift sacrifice consecrates and offers to the supernatural world a part of the goods produced by human labor. Communion sacrifice, finally, is the sacrifice rite that stresses the communal consumption of the sacrificial victim. From a formal point of view, a sacrifice rite comprises four main stages: the obtaining and preparation of the sacrificial object, its destruction or removal from the human sphere, renunciation, and consumption. Within the ritual, it is possible to isolate and analyze three types of relationships: between human beings and the superhuman world, between human beings and the victim, and among human beings. The combination and emphasizing of different stages and relationships, and of the kind of object that is sacrificed, determine the type of sacrifice.

Various theories of sacrifice have been produced within the analysis of religious practices. On the whole, they are aligned with distinct theoretical lines: some are based on utilitarian ideas; some emphasize emotional and religious aspects; some highlight the symbolic

and communicative nature of the rite; some neglect the social and cultural aspects and stress the importance of attention to pure violence; and others underscore the ecological function of rituals. Moreover, in the history of theories there is a constant intertwining of themes such as the idea of reciprocity between the human world and the supernatural one; offer and gift; debt and credit between humankind and deity; self sacrifice and abnegation; and, finally, the themes of the scapegoat, the symbolic replacement of the sacrificer with the victim, violence, consecration, and desacralization.

One of the first theories of sacrifice was proposed in 1871 by the evolutionist anthropologist Edward B. Tylor in his work *Primitive Culture*. Tylor interpreted sacrifice on the basis of the utilitarian principle of *do ut des* ("I give that you may give"): "primitives," in his view, offer gifts to the extrahuman powers in order to gain their benevolence, in the same way as gifts are offered to high ranking people. This practice was included in the general evolutionary scale: a *self interested gift* aiming at a reward was followed, at a more "civilized" evolutionary stage, by a *free gift* that did not hope for a reward, and, finally, by *abnegation*, self sacrifice, the highest expression of the moral evolution of human kind. Tylor did not seek an explanation of the mechanism of sacrifice, and failed to recognize the symbolic aspects of the offer, regarding it only as "material goods." Moreover, since he concentrated entirely on the ideal content of the rite, he did not account for the widespread custom of partly or totally eating the sacrificial victim. This was attempted by the Scottish scholar William Robertson Smith by supplying, in his *Lectures on the Religion of Semites* (1894), an early "sociological" explanation of sacrifice, based on the theory of totemism. In Smith's opinion, the function of the sacrificial rite was to reinforce the bonds within the totemic community through the sharing of a sacrificial meal. The latter was the only occasion in which it was possible to kill and eat the totemic animal, symbol of the community, regarded as the common ancestor. The commensals, by eating this animal, strengthened the social bonds among themselves and the ideal ones between them and the deity. Within the evolutionist area, another contribution was contained in James G. Frazer's monumental work *The Golden Bough* (editio

maior published in the period 1911–15). In sacrifice, Frazer picked out the intertwining of two themes: that of the scapegoat and that of the ritual killing of the “divine king.” Sacrifice is based on the analogy between the health of the king and that of his community: when the king’s health begins to decline, he must be killed, in order to ensure the stability of the kingdom. All the evil, guilt, and sins of the subjects are conveyed into the sovereign’s body and atoned for by the king’s sacrifice. Moreover, Frazer, focusing on the sphere of agrarian sacrifices and beginning from the idea of the totemic relationship with the victim and of its sacred character, analyzed the “killing of the Corn spirit.” According to him, the gods are killed because they take on the role of scapegoat, sweeping away disease, death, and sin from the community, and are eaten in order to be assimilated. Frazer’s theory does not add much to Smith’s contribution, except for a Christian sense of atonement and purification of the human world through the sacrifice of the god.

Dissatisfied with these idealistic theories, in 1899, Durkheim’s followers Henri Hubert and Marcel Mauss published their fundamental contribution to the study of sacrifice, entitled *Essai sur la nature et la fonction du sacrifice* (*Sacrifice: Its Nature and Function*), which decisively broke away from the evolutionist approach of the previous theories. They defined sacrifice as a religious act that – through the consecration of the victim – changes the state of the person who performs it and the sacrality state of certain objects involved in the ritual. This definition immediately reveals the difference between this theory and the previous ones: here sacrifice is no longer a mere oblation performed in the hope of a reward or with the purpose of reinforcing social relationships, but a process of consecration and transformation of the people who take part in the rite. Moreover, the victim takes on the role of a mediator between the sacred sphere and the profane one, and the entire sacrificial process is therefore interpreted as a process of communication between the sacred and the profane through an intermediary that is destroyed during the ceremony. The mediation and subsequent destruction of the mediator are made necessary by the dangerous, “untouchable” character of the sacred sphere in Durkheim’s

view: no human being can come into contact with any sacred entity without undergoing harmful consequences. As Valeri (1985: 64–5) remarks, the mediation does not logically make it necessary for the sacrificed commodity to be interpreted as an offering: the concept of sacrifice as communication is broader than that of sacrifice as a gift to the supernatural world. In addition, referring to Mauss’s celebrated *Essai sur le don* (*The Gift*) (1990 [1923–4]), there is a much more complex vision of the meaning of an offer of goods. The gift must be interpreted in its social and symbolic dimension in “primitive” societies, that is, as a social fact consisting in the obligation to *give*, *receive*, and *requite*, and as if each gift metonymically implied a self offering of the sacrificer. Within this theory, there appears a new conception of the sacrificial offer: in relation to this idea of gift and as a result of the fact that the victim becomes a mediator between the sacred and the profane, the sacrificial offer becomes a symbolic substitute of the sacrificer. Moreover, Hubert’s and Mauss’s study is the first one that undertakes a formal analysis of the “pattern of sacrifice,” implements used, and ritual procedures. This attention to the technical and formal procedures leads the two sociologists to include the ritual stages of the sacrificial process in a parabola of sacrality. At the top of this parabola is the killing of the victim, preceded by a period of increasing consecration and followed by relative desacralization, important for enabling the human utilization of the victim’s flesh and the reintroduction of the participants into the profane world. In a similar way, this interest in the material aspects leads to an analysis of the ritual space, outlining a pattern of concentric circles that correspond to different levels of sacrality, with the altar or sacrificial pole at the center. This study, finally, has the merit of stabilizing the terms that define the participants in the rite. According to this classification, the person who benefits from the sacrifice and undergoes its effects, and who usually supplies the victim, is called the *sacrificer*, while the officiant (some times a priest) who guides or materially carries out the sacrifice is called the *sacrificer*.

Besides Hubert’s and Mauss’s sociological reaction, there were other theories of sacrifice that aimed at removing from this concept the

utilitarian ideas introduced by Tylor. Among them, the most significant were those of the philosopher Georges Gusdorf, the Protestant theologian Jan van Baal, and the scholar in the nomenclature of religions Gerardus van der Leeuw. Gusdorf, in his book *L'Expérience humaine du sacrifice* (*The Human Experience of Sacrifice*), published in 1948, reversed the traditional perspective of *do ut des*, contending that the sacrificial offer was the recognition of an unrepayable preexisting debt toward the divine sphere: human beings, perpetually indebted to the gods who sustained their existence, were forced to give, without ever completely discharging their life debt. Van Baal, on the contrary, argued that the sacrificial gift was a disinterested expression of submission to the divine sphere, without any expectation of a reward: thus he included all sacrifices in the third stage outlined by Tylor, that of abnegation. The development of the Tylorian theme of *do ut des* by van der Leeuw, in his book of 1933 entitled *Phänomenologie der Religion* (*Religion in Essence and Manifestations*), advanced the idea that in sacrifice the gift always consisted in the offer of oneself, thus bringing something of the sacrificer in the sphere of the sacred. This took place in relation to the law of participation – detected in pre-logic thought by Lucien Lévy Bruhl – whereby a person's possessions were an integral part of his or her personality, so any sacrificial offer was always an offer of oneself.

Referring to Hubert's and Mauss's idea of sacrifice as a rite that is significant in all its parts and not only in a special aspect such as the offer, gift, or communion, Alfred Loisy, in his *Essai historique sur le sacrifice* (*Historical Essay on Sacrifice*) of 1920, regarded sacrifice as an efficacious representation, a symbolic action that produced some effects on social reality. The rite is allegedly a representation of the result that the sacrificer wishes to achieve, performed by means of the manipulation of icons and symbols. The meaning of the sacrificial victim, therefore, does not consist in its value as a commodity for exchange or communion, but in the symbolic semantics it exhibits. In other words, it is not so much a gift as an icon that represents the extrahuman powers, the human beings, the sacrificer, and their interrelationships. This theoretical line was followed also by the British

anthropologist Godfrey Lienhardt (1961), who argued that sacrifice controls and solves situations of conflict or uncertainty by manipulating the symbols involved in the ritual. In his opinion, these symbols, like the gods, are representations or reified images that reflect the experience of social life.

The social anthropologist Edward E. Evans Pritchard (1956) proposed a criticism of the social and communal visions of sacrifice like those of Smith and of Hubert and Mauss, starting from a perspective of communication between the individual and the superhuman powers. Evans Pritchard focused on personal and expiatory sacrifices. The need for expiation, in his view, depends on the danger resulting from the intervention of the spirits in the human world: this is a criticism of the totemic origin theories that regard sacrifice as a union between the supernatural world and the human one. The function of the gift is to separate these two worlds through the symbolic replacement of the sacrificer with the victim, which is accepted by the extrahuman powers in the sacrificer's stead. In Evans Pritchard's view, sacrifice always has an apotropaic (that wards off evil) and prophylactic function (that defends and protects), expressed through the polysemanticity of the sacrificial victim, which acts as a substitute of the sacrificer, a scapegoat and a mediator between the gods and humankind. Thus the sacrificial rite is celebrated in case of diseases or other negative events caused by an intervention of the gods due to a misdeed. Evans Pritchard's vision, which emphasizes the concepts of guilt, sin, remorse, and purification, seems to be strongly influenced by Christian theology.

In the opinion of the Belgian anthropologist Luc de Heusch (1986), on the contrary, even the sacrifice of the Nuer, to which Evans Pritchard refers, should not be understood in terms of individual guilt or expiation, but in terms of the restoration of cosmological order. De Heusch, as a matter of fact, maintains that a structured thought (similar to that outlined by Claude Lévi Strauss about myths) underlies the various sacrificial systems. For this reason, any sacrifice must be deciphered on the basis of the symbolic and mythological structure it postulates, produces, and reproduces. As regards the African

sacrificial systems, de Heusch attempts a structural reunification of them by making use of the notion of sacrificial debt and of reproduction of the cosmogonical myths from which humankind's life debt began.

The anthropologist Valerio Valeri (1985) advanced a theory of sacrifice that referred directly to the tradition that interpreted sacrifice as an efficacious symbolic action. In Valeri's view, sacrifice is a cognitive and communicative instrument that makes it possible – within the framework provided by the ritual context – for the sacrificer and the overall society to obtain information about their position in the social world. This position is defined by the contact with the supernatural sphere, regarded as a paradigmatic model of the ideal social order. Sacrifice, therefore, is allegedly a symbolic process having a dialectic nature: the subjective *self* of the sacrificer, through the sacrificial substitution, takes on the value of its antithesis, that is, of the extrahuman powers; thus, at the end of the rite, a synthesis is achieved that amounts to a *process of objectification of the subject in the social world*. Sacrifice as *dialectics of the subject* makes it possible to “tune in” the social properties of the subject to the ideal properties of the transcendent subject. The result of the sacrifice is thus the recovery of the sacrificer's awareness of his/her position in the social world. Moreover, Valeri (1994) maintains that in the sacrificial exchange, what must be highlighted is not the renunciation but the benefits and the symbolic or material enjoyment that issue from it.

Other theories regard the violence of the sacrificial killing as the central element of sacrifice. According to René Girard (1977), every sacrifice is a mechanism of expulsion of the violence inherent in social life. Mutual, widespread violence, introduced by a primeval “society founding lynching” committed on an innocent victim, is allegedly concentrated on a single object, the victim of the sacrifice, which always appears as a scapegoat. In Girard's theory, the sacrificial violence does not mean anything more than itself: he inverts the theory of consecration by arguing that the victim is not killed because it is sacred, but is sacred precisely because it must be killed. The violence of the sacrifice must be kept distant from the level of consciousness, and, for this reason, the expelled violence is, at the same time, an unacknowledged violence. This

theory assumes that the psychological datum can be attained transcending any cultural form; the latter is thus treated like a false motivation or hypocritical rationalization. The Hellenist Walter Burkert (1987), too, places violence at the center of his interpretation of sacrifice. He maintains that humankind's phylogenetic heritage, formed during the Paleolithic hunting and collecting period, involved the development of a violence between individuals that was expelled and transcended through hunting. When sedentary agriculture set in, the inherited violence was transferred to the killing of farmed animals in specific ritual settings that ensured the peaceable perpetuation of human society: this was the origin of sacrifices.

Besides these theories, there are others that emphasize the material aspect and ecological function of sacrifice. According to Marvin Harris (1977), the sacrifice of human beings or animals followed by the sharing of the victim's flesh is correlated with the availability of noble protein in the diet and with the examined population's technical and environmental possibility of breeding animals. In Roy Rappaport's (2000 [1968]) view, on the contrary, the sacrifice of a great number of pigs by a population of New Guinea took on a homeostatic function in the ecological balance between the population and the resources. Rappaport endeavored to evaluate the capability of that particular ecosystem to sustain the human population and a growing pig population, with reference to a periodic sacrificial feast during which the number of pigs was drastically cut down, bringing the ecological system back to a state of equilibrium.

Besides the interpretation of sacrifice as a ritual, it is possible to regard sacrifice as a special case within a broader system of practices pertaining to symbolic classification, manipulation, and consumption of living creatures (Douglas 1966; Lévi Strauss 1968). In sacrifice, the symbolic correlations by which the natural and social world is regulated become evident: for instance, the relation between dietary prohibitions, the animal offered in the sacrifice, and the division of the victim's flesh, understood also as a practice that reproduces the social hierarchy. It is important, moreover, to highlight the relation between sacrifice and divination, not only as an examination of the body of the victim or of some of its parts, but also as a divinatory practice

based on the observation of the progress of the rite (interpreting, for instance, the victim's movements). Finally, it is useful to draw attention to the question of the discontinuation or survival of the sacrificial themes. Blood sacrifice does not survive only in "exotic" religions, and the sacrificial themes – though subjected to transformation and abstraction – are still present in the great monotheistic religions, for instance in the Catholic sacrament of the Eucharist, which reintroduces the salvific death of a divine victim with an expiatory function.

sadomasochism

Gert Hekma

The word sadomasochism refers to sexual pleasure in physical or psychic pain or humiliation. The psychiatrist Richard von Krafft Ebing coined the word in 1891. It stems from the names of the philosopher Marquis Donatien Alphonse François de Sade (1740–1814) and the novelist Leopold von Sacher Masoch (1836–95). Both men were primarily masochists. Sociological research on sadomasochism, its practitioners and their subcultures, is rare. In the arts, the subject is abundantly available and both literary historians and philosophers have discussed it more than have social scientists. The life and work of the men who lent their names to this sexual variation have been the subject of many studies, especially the Marquis de Sade.

Although there can be little doubt that earlier generations erotically enjoyed violence, for example in the Roman arenas, at scaffolds, for martyrs depicted in Christian art, and with religious and medical flagellations, the specific articulation of feelings of sexual pleasure in pain goes back to the eighteenth century, when Jean Jacques Rousseau and the Marquis de Sade expressed such emotions. In the *Psychopathia Sexualis* (1886) of Krafft Ebing, the desire for giving and receiving real or imaginary pain is put on a scale. This psychiatrist found it normal

when such pleasures were an addition to sexual play, but they became an abnormality when they were its central element. The prevention and therapy of "perverted" sexual identities was the work of psychiatrists. The Greek neologism "algolagnia" (pleasure in pain) was an alternative word, while later psychiatrists created new terms for the many specific forms of sadomasochism (whipping, bondage, hanging, slavery, military or police uniforms, use of excrement). Objects of this psychiatric interest welcomed the handbooks of sexology that offered the rare possibility of identification and excitement (Oosterhuis 2000). Nineteenth century England had bordellos for the spanking of men who learned to enjoy this pleasure as boys at boarding school.

Oosterhuis (2000) explains the invention of the various perversions as a result of growing self reflection and individualism and of the anonymity in the quickly expanding metropolises. Noyes (1998) has argued that s/m became visible in this liberal era at the end of the nineteenth century also because this sexual practice so completely contradicted liberal ideals of free will and self determination. The issue of consent of the masochist partner remains an essential point of discussion in s/m circles, as his or her dependent position flatly contradicts modern ideas of erotic equality and free choice. The answer of the aficionados has been that the submissive partner consents beforehand with the choreography of the erotic scene and can stop its continuation with code words or signs. While many abhor the real or imaginary violence of s/m, few practitioners have dared to take pride in its transgressiveness, certainly not when it gets beyond liberal issues of consent. Notwithstanding restrictive sexual ideologies, modern sexual citizens continue to believe in a liberal ideology of free choice and erotic equality that feeds their unrealistic, romantic ideas of love and pleasure.

Specialized s/m subcultures developed first in Germany from 1900 and later in other places after World War II. Bordellos took a central place in this world. The sexual revolution saw a further rise in organizations and in representations of s/m in novels, movies, and porn. The subcultural imagery of leather and sex toys made a breakthrough in the 1980s in the punk scene and in the 1990s in fashion and music.

Notwithstanding its cultural popularity, psychiatric handbooks such as the latest editions of the *Diagnostic and Statistical Manual of Mental Disorders* (DSM) continue to consider sadism and masochism to be psychic disturbances. Nowadays its best known expression is the gay and straight leather scene, while the Internet has many sites and chat rooms for the manifold variations of s/m desire. Its followers see no reason why psychiatrists and psychologists declare them insane. Their fantasies are obvious examples of the social construction of sexual pleasure, as their contents always refer to concrete external stimuli such as soldiers, bikers, slavery, rape, child beating, and medical care, while unpleasant, cruel, and humiliating scenes are transformed into excitement. Sociologists have rarely taken up this fascinating topic of how the social has become so deeply embedded in the individual psyche.

The contemporary literature on sadomasochism takes most often a psychological stance, discussing its individual manifestations and issues of consent (Phillips 1998). Most surveys of its practitioners were made some time ago (Spengler 1979). The work of Gosselin and Wilson (1980) relates the great variety of sadomasochistic desires. These authors were sympathetic to this world while others took a negative stance. General surveys asked few questions on sadomasochism, but the data indicate that some 10 percent of the respondents admit having kinky fantasies. Historical studies focus on the nineteenth century history of perversion and discuss the invention of sadomasochism or specialized kinky tastes (Noyes 1998; Oosterhuis 2000). Vandermeersch (2002) researched the path of flagellation from religious practice and medical therapy to sexual specialty. More sociological works studied kinky scenes and desires in relation to spaces (Rubin 1991). Most literature includes both personal and emancipatory perspectives or discussions on politics (Thompson 1991; Thompson 1994; Califia 1994).

Methodological issues are similar to those regarding other sexual variations. Additional problems concern the sometimes criminal and often pathological status of sadomasochism. Research may endanger the safety and privacy of respondents, while many practitioners feel ashamed, guilty, or insecure on their

preferences. Most literature still stems from psychiatry and psychology and follows the dated ideas from the DSM. It means that researchers of kinky sex have to be particularly sensitive to the social discrimination that their subjects are facing.

As few studies have been done on sadomasochism, the terrain is open. Main issues will be the roots of these sexual preferences in their social context and their subcultural, historical, and spatial development. Sadomasochism is interesting for sociology because it mixes sexuality and violence and eroticizes social inequality, going against a trend that promotes non violent and equal sexual relations. It shows as well through its many variations the specificity of sexual pleasures that sociologists in general neglect. The research on sexual scripts, stories, or narratives should take kinky variations as its topic because they are a concrete example of the connection between individual desires and social worlds. The social and historical backgrounds of s/m preferences and organizing are still hidden in the dark and offer interesting themes for further research in their connections to liberal politics, the rise of individualism and self reflection, the belief in consent and equality, and the denial of violence in sexual relations.

safer sex

Benjamin Shepard

Safer sex emerged as a strategy to prevent the spread of disease with the advent of the AIDS epidemic in the early 1980s. Richard Berkowitz and Michael Callen, two gay New Yorkers, first outlined the theory and application of safer sex in their 1983 tract, "How to Have Sex in an Epidemic." As an alternative to the confusing, all or nothing early approaches to HIV prevention, safer sex offered a practical strategy. People were going to have sex. As such, it was best to do it in a safe, mutually satisfying, caring manner. Berkowitz and Callen presented a harm reduction approach now recognized around the world as a model that allows for both intimacy and protection.

The third key inventor of safer sex was Dr. Joseph Sonnabend, a gay friendly doctor working in a Greenwich Village health clinic who treated Berkowitz, who was working as a hustler at the time. In the course of frequent appointments for antibiotics to battle VD, Berkowitz and Sonnabend developed a frank relationship. When Berkowitz developed a case of hepatitis, swollen lymph nodes, and a bump behind his ear that got in the way of his cruising, Sonnabend counseled him to stop "screwing around." It was not a welcome piece of advice for someone whose livelihood depended on sexual commerce. In 1982, as the health crisis mounted, Sonnabend engaged Berkowitz and

another patient, the late Michael Callen, to write a call for gay men to protect themselves. "You must celebrate gay sex in your writing and give men support," Sonnabend counseled (Berkowitz 2003: 121). At first, Berkowitz and Callen borrowed from the "just say no" rhetoric of the early 1980s, but the response was negative.

One day Berkowitz received a knock on his door from one of his former clients, begging for services. Berkowitz pulled out two gloves to create a safe seal between himself and his client. This led to a eureka like recognition. It dawned on Berkowitz that prohibition is more dangerous than acknowledgment, careful expression, and prevention. Before this, it had never occurred to Berkowitz, Callen, or Sonnabend that latex offered the necessary life saving compromise. Berkowitz and Callen drew on the lessons of gay liberation to draft "How to Have Sex in an Epidemic." The result was a revolution allowing for personal and political protection, both for sex and for the movement that liberated it. With time, safer sex practices spread around the globe as a theoretical and practical approach to preventing the spread of HIV. Safer sex became the model for sex positive discourses that rejected the politics of sexual shame, temperance, and prohibition.

For more than 20 years, safer sex has been a key element in debates about effective HIV prevention. Queer theorist and activist Douglas Crimp (1988) argues that gay people invented safe sex based on an implicit understanding that sexuality comes in many forms. Sex, after all, is not limited to penetration. For Crimp, the lessons of queer "promiscuity" can be understood in terms of multiple understandings of the possibility and multiplicity of pleasures. Thus, the gay public sexual cultures of previous decades resulted in a sort of "psychic preparation" and appetite for experimentation, which cultivated a culture which was capable of absorbing wide ranging changes in sexual norms and practices.

Crimp's words suggest that safer sex can be understood as a cornerstone of a harm reduction approach to sexuality. Harm reduction sets out to "meet people where they're at" instead of where others want them to be. Advocates of safer sex argued that messages that promote prohibition without offering alternatives push people into unnecessarily high risk behavior.

HIV prevention could be most effective through community based approaches that built on personal connections.

The safer sex message is that practices – not places – cause HIV transmission. While prohibitionists sought to close down spaces where gay men congregate to have sex, safer sex advocates promoted these spaces as sites for education. Prevention activists and peer outreach workers could reach people where they were having sex and establish healthy community norms and grassroots models of peer based HIV prevention and mutual protection. In 1997 Allan Bérubé argued: "These activities, sex outside the home, I call it – they need to be preserved and used to eroticize safer sex, and to take advantage of the fact that men are already congregating." As such, HIV prevention work should take place in tearooms, parks, bath houses, theaters, bookstores, and other places where people meet for sex.

A decade after the invention of safer sex, reports suggested that many men who "knew better" continued to have unsafe sex. Walt Odets, a clinical psychologist who has a private practice working with gay men in Berkeley, California, reported that many men he saw reported that practicing safer sex for a lifetime was not sustainable. Odets contended that the standard "100 Percent Safe All the Time" AIDS prevention message was ill conceived and needed to be reconsidered. For Odets, unsafe sex had to be viewed as a response to ambiguous feelings in an environment saturated with death, crisis, guilt, and depression. Unlike advertising campaigns, Odets sought to embrace the complexities of queer sexuality. Prevention activists and therapists across the country called for new approaches to HIV prevention (Patton 1996). "HIV prevention requires taking into account the diversity of people's sex lives, that prevention should be grounded in people's desires and pleasures," Michael Warner argued (Smith 1998). The result was a wave of discussions in the late 1990s referred to as the Sex Panic debate or the Gay Men's Sex Wars.

Future research will need to contend with the problems of safer sex and explore alternative technologies, such as microbicides, which can serve as substitutes for latex. In the two decades since the birth of safer sex, new practices of safer

sexual activity have emerged. These include community based approaches such as “jack off” clubs, where men meet to have the safest type of safe sex – mutual masturbation – and more distant approaches such as telephone sex and cybersex. As Waskul (2003) elaborates: “In outercourse, images and/or words fully replace the corporal body as they are crafted among participants to represent the whole of sexual and erotic interactions between them.” Thus, while corporal sexual pleasure takes place between bodies, Waskul concludes, “the pleasures of outercourse are encapsulated in dislocated and disembodied erotic communication where participants latently rearrange taken for granted relationships between bodies, selves, and situated social interactions” (p. 73).

Said, Edward W. (1935–2003)

Syed Farid Alatas

Edward W. Said was born to an Arab Christian family in Talbiyeh, Jerusalem when it was under British control, but spent most of his teenage years with his family in Egypt and Lebanon. The creation of the State of Israel in 1948 resulted in Said living in exile from Palestine for most of his life. He attended high school and college in the US, obtaining degrees at Princeton and Harvard and then beginning his career in English and Comparative Literature at Columbia University, where he became University Professor in 1992.

Said is best known as a literary critic as well as a political activist. His political activism for the Palestinian cause was provoked by Golda Meir's infamous statement in 1969 to the effect that Palestinians did not exist. This motivated Said to undertake “the slightly preposterous challenge of disproving her, of beginning to articulate a history of loss and dispossession that had to be extricated, minute by minute, word by word, inch by inch.” Said's political interests are not to be distinguished from his literary concerns, which also dealt with the critique of received knowledge and the generation of alternative discourses. This is where Said's work is most relevant to sociology; that is, where it concerns the study of Orientalism as an ideology conditioned by colonial and imperial interests. Said's works most relevant in this regard are *Orientalism* (1978), *Covering Islam* (1981), *Culture and Imperialism* (1993), and *Representations of the Intellectuals* (1994). Said died in 2003 after battling leukemia for 12 years.

An important aspect of Said's background that greatly influenced his intellectual concerns and political activism was the formation of the State of Israel, the resulting displacement of masses of Palestinians, and the emergence of a discourse that distorted these realities. To a great extent this was simply a specific case of the more general phenomenon of colonization, decolonization, and the accompanying European and American discourses that

attempted their respective constructions of the Arab and Muslim worlds. In any case, there was the problem of loss and dispossession and the need, as felt by Said, to resist such discourse.

Although Said's main field was literary criticism, he brought to it a sociological dimension by bringing in the context of colonialism and empire. In *Orientalism* Said argued that there was a lack of correspondence between what was said in *Orientalism* and the Orient itself and that *Orientalism* was a discourse that functioned to systematically manage and produce the Orient politically, sociologically, militarily, ideologically, scientifically, and imaginatively during the post Enlightenment era. *Orientalism* seeks to expose this function. Herein lies the sociology of knowledge in Said's work. He studied *Orientalism* as a reflection of a "whole series of 'interests' which, by such means as scholarly discovery, philological reconstruction, psychological analysis, landscape and sociological description, ... not only creates but also maintains" (Said 1978: 12). In sociological terms, therefore, Said was interested in the critical study of the ideology of *Orientalism* and its connections with colonialism and imperialism. The problem of the objectivity of knowledge was raised in Said's critique of *Orientalism*, a theme not unknown in the sociology of knowledge. What Said did, however, was to give this theme its Islamic and Middle Eastern content. His analysis of media representations of Islam in the Middle East in *Covering Islam* was also along these lines, but of a more polemical nature. These interests also led Said to be interested in the role of intellectuals, another issue of sociological relevance. Thus, in *Culture and Imperialism*, the focus shifts to discourses that attempt to resist Orientalist ones. Said noted the presence of resistance discourse among Europeans as well; that is, those who wrote in sympathetic alliance with non Europeans (Said 1993: 259). On the latter, Said discusses the work of intellectuals from the colonies or ex colonies who used the ideas and techniques of western scholarship to critique western discourses. He discusses four texts as examples of such resistance discourse: C. L. R. James's *The Black Jacobins*, George Antonius's *The Arab Awakening*, Ranajit Guha's *A Rule of Property for Bengal*, and Syed Hussein Alatas's *The Myth of the Lazy Native*.

A project that Said did not have time to engage in but which he regarded as important was the undertaking of studies of contemporary alternatives to *Orientalism*, studying societies and cultures from non repressive and non manipulative perspectives (Said 1978: 24). In sociology, this has yet to be recognized as an important task as far as the future development of the discipline is concerned.

Sainsaulieu, Renaud (1935–2002)

Norbert Alter and Dominique Martin

Renaud Sainsaulieu was born in Paris on November 4, 1935 and died there on July 26, 2002. After secondary studies in a Jesuit school, he went on to obtain advanced degrees in law and psychology from the Sorbonne. It was

there that he committed himself to sociological studies and wrote his doctoral dissertation, with Michel Crozier as his adviser. Named Professor of Sociology at the Institut d'Études Politiques de Paris in 1975, he managed the Laboratory for the Sociology of Institutional Creation (LSCI). Renaud Sainsaulieu was also one of the main European promoters of sociology outside academia. He created a specific master's program for that purpose, as well as the Association Professionnelle des Sociologues d'Entreprise (APSE), a professional association for in house sociologists. He also served as an active member and president of the Association Internationale des Sociologues de Langue Française (AISLF).

With *L'Identité au travail (Identity at Work)* (1977), Renaud Sainsaulieu revived the French school of the sociology of organizations by integrating into it an analysis of the cultural dimension of work; power does not directly define the rationality of actors, who act according to the representations, norms, and values that they carry with them. Furthermore, power is not divided equally in a company. Based on these two premises, social experiences are sufficiently differentiated that one can distinguish specific "actor logics." For the mass actor, in a large group of unskilled workers, relations are marked by fusion: power is inaccessible and the collective is valorized as a refuge and as a form of protection. On the other hand, if access to power is made possible through a professional or hierarchical status, negotiation of interpersonal relations is characterized by a rich affective and cognitive dimension, with the possibility, for the strategic actor, of coping with differences. The self promoting actor, who privileges social advancement, carefully cultivates selected affinities with a few colleagues, to the detriment of groups, which are perceived as threatening. Finally, retreat is the stance of the actor for whom work is above all an economic necessity and the means to achieve other goals.

This cultural approach is also original because of the importance it gives to the idea of social change: "cultural apprenticeship" occurs and can subsequently recur in relation to changes in the division of labor. This apprenticeship is not, however, systematic: in certain cases the actors withdraw and resist because they do not have the resources to project themselves into a new frame of action.

The approach that Renaud Sainsaulieu developed under the term *sociologie de l'entreprise* (sociology of the company) extends these observations and opens new fields of investigation. This theoretical approach defines the company as an object of analysis and puts the concept of culture at the center. It does not limit its space of observation to the workshop or to specific professional groups or to relations of power, and thus privileges analysis of the relationship between the company and the global society, understood as the cultural, economic, and political environment of the firm's activity. The analysis of contingencies that is centered on the relationship of the company to these environments is complemented by two other types of analysis: strategic analysis, which studies informal relationships of power, and cultural analysis, which is concerned with what "cements" the identities by which the subjects cope with the trials of their daily working lives.

While the company is usually criticized in the sociology of labor as a place of domination, it is here understood as an "institution," as a place of integration and collective dynamics. The major management issue for companies is, according to Sainsaulieu, to put the "social at the heart of the economic," in order to provide them with an efficiency and meaning that conventional methods have failed to generate. This research approach is also "interventionist" in that sociology is conceived not only as a tool for analysis but also as a means of action. The goal of researchers is thus to participate in the functioning and transformation of companies by making their expertise available to the actors, and also by defining programs of action based on empirically and theoretically grounded diagnoses. The boundary defying idea, formulated in terms of the "social development of the company," is that companies can move from a defensive and bureaucratic logic to a creative and democratic functioning through change and innovation, and that this evolution requires the mobilization of all the actors, whatever their importance, whether they are institutionalized or not.

salary men

Tomoko Kurihara

In contemporary Japanese society the term salary men refers mainly to white collar elites in multinational corporations (who represent approximately 20 percent of the total working population). As described in Beck and Beck's *A Change of a Lifetime* (1994) salary men constitute a managerial class that occupies the top stratum of the business community and is accorded high status in society. Its members have almost exclusively obtained degrees from Japan's most prestigious universities. However, in practice, a wider use of and flexible self identification with the term is common. The term can therefore refer to both non elite white collar and occasionally blue collar workers. Such flexible usage is made possible by Japan's industrial structure – the *keiretsu* system – which links large corporations to medium sized and small subcontracting firms. The combination of English terms is used to signify, literally, a worker whose firm guarantees him a salaried income.

The reference to salary men as a category of workers in society arose in parallel with the concept of the nation state, and industrialization and urbanization, which can be traced to the Meiji period in the late nineteenth century. In the twentieth century, salary men are most strongly associated with the post war economic boom. This period in Japanese history is also associated with the emergence of the nuclear family (often headed by the salary man), a large new middle class (of which the salary man was a member) associated with a consumerist life style, and the rise of corporatism or corporate centered society. In this context, they came to signify the economic and social development of Japan.

Western sociological and anthropological writing on salaried workers developed in parallel to the growth and strength of the Japanese economy, which in the post war period became a powerful player in the international market. Writers have explored notions of development (Dore 1987), the structure of the economy, the Japanese management system (such as the life time employment and seniority based wage and promotion system, *nenkojyoretsu seido*), and the harmonious characteristic of interpersonal relationships within firms (Nakane 1970; Rohlen 1974; Clark 1979; Cole 1979). Contemporary scholars are critical of contributions made before the late 1970s (the early period) for applying a culturalist approach (i.e., the discredited *nihon jinron* perspective) to understanding Japanese working culture. Nonetheless, the detailed studies by early scholars of the meaning and significance of emic terms continue to serve as essential referents in much of contemporary literature, for any level of analysis – interactional, organizational, theoretical – on changes in contemporaneity and the critical development of theoretical perspective is impossible without reference to these native concepts. Mouer and Kawanishi (2005) provide a comprehensive guide to the history and future orientation of research into working life in Japan.

In the best known study (albeit grounded in the *nihonjinron*) of Japanese society based on white collar organizations, Nakane (1970) examines the internal structure of firms while suggesting a correlation to the functioning of society. The most significant relationships that constitute the core of the organization's structure are vertical relations, which are experienced between senior (*senpai*) and junior (*kohai*) workers, and, horizontal relations, which are experienced between individuals of the same rank or horizontal stratum (*doryo*). These relations bring a sense of cohesion and stability to the organization: this is important to a consensus based society which values the ethos of collectivism. Ties between individuals within an organization are strong by nature of the fact that individuals belong to a particular group (or "frame"); because membership to a group is the essential basis of Japanese social structure; and also because contact between individuals lays stress on the emotions and morals of belonging to the group which breeds loyalty,

dependency, and affection between individuals within vertical ties. It is in this sense that the operation of a strong consciousness of ranking order effectively exerts control over individual behavior and thought.

Salary men are known as corporate warriors (*kigyō senshi*), as their lifestyles (daily commutes, transfers to subsidiaries, and the ability to support non working wives) is said to resemble the lifestyle of samurai warriors of the pre Meiji (1868) class system (Vogel 1963; Ueno 1987). However, whereas the samurai ideology upholds qualities of courage, boldness, and capacity for individual action, the salary man is bound to the organization, unable to make independent choices (Plath 1964). For example, the culture of large corporations requires salary men to work long hours, at times doing overtime without pay, and reporting to work or being available for consultation on work related emergencies during holiday time. However, salary men experienced benefits from the lifetime employment and seniority based wage and promotion system, such as financial stability and security, which was a return for the loyalty shown to the company. This in turn enabled the salary man to provide an identity for his family. Salary men, in essence, reflect a certain cultural ideal of masculinity, both at the level of corporate discourse and by individuals who uphold these moral values and work very hard (Morinaga 1995; Ueno 1995; Dasgupta 2000). These values are also expressed via specific physical and personal attributes typically exemplified by a sombre and conservative dress code, politeness and deference to senior workers, and sensitivity to social codes. Moreover, work for salary men does not end when they leave the office. Work continues, only it shifts to a different venue – bars, restaurants, or clubs – where socializing with co workers and clients is obligatory for the salary man who wants to keep ahead of his game. An exchange of vital information about projects and people takes place in an informal atmosphere and deals might be sealed with clients (Allison 1994).

Furthermore, during the bubble economy, salary men became the vehicle by means of which economic and political tensions in international relations were articulated. This is due to the association between salary men and the ideals which foster notions of nationalism, as

salary men come to embody the economic strategies and goals of the Japanese government and corporations for which they work. While the ideology behind salary men can be seen to support part of the national discourse that perpetuates the myth of Japanese uniqueness, conversely, the opposite holds true whereby militaristic and gendered connotations are often used to extend the general discourse of Orientalism about Japan. Particularly, in western media in the 1980s, parallels were drawn between an image of Japan's ruthless and savage wartime activities and the corporate infiltration of western markets to near saturation while pursuing isolationist economic strategies, despite British and Dutch corporations having a similar high degree of foreign investment in the US. This parallels the general discourse of Orientalism directed against the non West.

In the period of decelerating economic growth, an internal critique of Japan's characteristically hierarchical and male dominated corporate culture became prominent. During the 1980s and 1990s Japanese companies faced two notable problems: a downturn in the economy which forced a strict reassessment of labor costs, and the aging of their personnel, corresponding to aging of the Japanese population as a whole. Personnel policy has been the main point of focus for revision in companies, whereby the lifetime employment system, and seniority wage and promotion systems, are being abolished or altered. Furthermore, the greater acceptability of transfers and job changes even among the managerial elite of large corporations has followed on from economic necessity and has been greeted with greater cultural acceptability.

Overall, however, the social and structural effects of restructuring have been negative as well as positive (Kurihara 2007). In the late 1990s and early 2000s the unemployment rate was high, as was the rate of unemployment accounted for by redundancies, which is a direct result of companies engaging in restructuring through job cuts. Under the lifetime employment system companies are bound by non contractual agreement to provide jobs for life to their employees; therefore, companies have responded by creating redundancies either by encouraging older employees to retire early, or by asking volunteers to take early retirement or

temporary leave. The greatest number of job losses are among middle aged male workers, and also suicide rates and divorce rates are increasing. To aid this growing body of retrenched salary men, the government proposed to extend financial support to new small and medium sized ventures because of the likelihood that these will soak up these individuals.

The changing economy also has had implications for new graduates. As a result of companies cutting back on recruitment in the late 1990s, a smaller proportion of new university graduates was able to find employment within the same year, as opposed to the early 1990s, during the tail end of the economic bubble. As a flexible and relatively lower cost response to the drop in levels of intake of new recruits, the larger and traditional companies have set up internship programs. Internship schemes provide university students summer work experience and help to develop creativity and inspiration among them, while creating a smoother flow in the transition between university and the work place. The future trend points to small companies incorporating internship schemes into existing recruitment methods.

Alongside the structural changes in the economy, labor markets, and management practices which took place in the post bubble period, cultural changes to the lifestyles of salary men have also been subject to much debate. The critique of corporate centered society by Osawa (1994) best exemplifies the cultural side of the debate. One recognition in this has been the need for freedom among corporate men that will enable them to have a richer private life free from the constant demands of the corporation. The ethic guiding the conduct of the salary man – enforcing a strict division between private and public roles and insisting on sacrificing life at home – is generally seen to be outdated. The salary man, called a *kaisha ningen* (company person) who would be proud to be seen acting out his appropriate role, was a positive and desirable image for men during the rapid growth period. But in the late 1990s and early 2000s the self identification that is common among salary men is of a man of principle, committed to hard work, but equally to his family, which is called *mai homu shugi*. The term salary man has (in a loose sense) lost its former hard image of workaholics.

same-sex marriage/civil unions

Brian Heaphy

Same sex marriage refers to a union by two people of the same sex that is legally sanctioned by the state, where identical rights and responsibilities are afforded same sex and heterosexual married couples. The term "gay marriage" is popularly used to refer to same sex partnerships or cohabiting relationships that are formally registered in some way as a "civil union" (variously known as civil partnerships, registered partnerships, and registered cohabitation), although the latter are in fact legally distinct from marriage. The term is also sometimes employed to talk about unregistered same sex couple cohabitation or partnerships acknowledged through commitment ceremonies. Few states currently afford same sex couples the opportunity to participate in marriage (those that do include Belgium, Spain, the Netherlands, and Canada, but see the following web sites for detailed information on changing status in different countries: www.marriageequality.org; www.samesexmarriage.ca; www.stonewall.org.uk). Civil unions, civil partnerships, and registered cohabitation, which include some exemptions from the automatic rights and responsibilities afforded heterosexual married couples, are the most common forms of legal recognition. They offer some of the symbolic and material advantages associated with marriage, but with more limited legal status. At a global level, most same sex partners must currently rely on "do it yourself" affirmation and commitment ceremonies, or seek religious blessings where available.

Same sex marriage and civil unions have become high profile political issues in many countries since the early 1990s. In Europe the number of states that have extended, or are planning to extend, legal recognition to lesbian and gay relationships through civil unions has increased steadily since the first civil partnership legislation was passed in Denmark in 1989. Elsewhere, Australia, Argentina, Brazil, New Zealand, South Africa, and other countries have either nationwide or regional legal facilities for

the recognition of same sex partnerships or cohabiting relationships. In the United States, the issue of same sex marriage has been an especially contentious one. While some states have introduced legislation to recognize same sex marriage or civil unions (e.g., Massachusetts, Connecticut, Vermont), other states have enacted constitutional amendments that explicitly forbid same sex marriage, or have passed legislation that bars civil union type recognition. This points to the strength of support and opposition that the issue of same sex marriage can generate in the US and most other countries where the issue is debated. On the one hand, some constituencies see same sex marriage and civil unions as an ultimate marker of social and political tolerance. On the other hand, some groups view the issue as indicative of the decline in religious and moral values in an increasingly secular world. Amongst conservative religious and social groups especially, same sex marriage is often interpreted as an attack on the primacy and "naturalness" of the heterosexual married bond that is assumed to underpin a stable society.

Same sex marriage and civil unions therefore touch on important sociological themes to do with sexuality, family life, and social change, and raise questions about social "rights" and responsibilities, sexual politics, and citizenship. The topic features highly in debates on the demise of the "traditional" family, the legitimacy of new family forms, and the blurring of the "public" and "private" in contemporary social contexts. Existing theory and research has focused on the social, cultural, and political forces that have brought the issue to the fore; the extent to which same sex marriage represents full "sexual citizenship"; the meanings afforded partnership recognition by lesbians and gay men; and the implications of recognition for couples and their "blood" or "chosen" families (Weston 1991).

A number of social developments have influenced the current focus of lesbian and gay politics on same sex marriage. AIDS, some theorists argue, was a catalyst in mobilizing a new lesbian and gay relational politics in the 1980s. This was initially focused on the recognition of same sex partners' caring commitments, and protecting "rights" in relation to property and next of kin issues. Community responses to

AIDS facilitated the institution building and political confidence that made same sex marriage seem like a realizable political objective. Since the 1980s new possibilities have opened up for lesbian and gay parenting (through self and assisted insemination, surrogacy, fostering, adoption, and so on) and a growing number of same sex couples are choosing to parent. Same sex marriage is seen as a crucial strategy for recognizing and protecting co parenting commitments.

Another social development is the changing nature of heterosexual marriage itself. The separation of marriage from the needs of reproduction and women's increasing economic independence from men are transforming the meanings of heterosexual marriage. Some theorists cite statistics on divorce, cohabitation, single parenting, and solo living as an indication of the fragility of the institution of marriage. For others, these statistics are indicative of how processes of detraditionalization and individualization make marriage a "zombie" institution (Beck 2000). The recognition of same sex marriage can therefore be interpreted as an attempt to reinvigorate or reinvent an ailing institution. A different perspective suggests that the changing role of welfare states can explain the political support that same sex marriage has received from unexpected quarters. Some argue that as welfare states seek to shift social and care responsibilities back onto individuals and their families and communities, the recognition of same sex marriage makes sense as it formalizes the responsibilities of lesbians and gay men for their partners and families.

The tendency is for sociological analyses of same sex marriage to reflect broader political and social debate, and to be framed around dichotomies of accommodation and resistance. The core debate is the extent to which same sex marriage represents a radical challenge to heteronormativity or a triumph of heterosexual norms. This is sometimes referred to as the "Sullivan versus Warner" debate. On the one hand, marriage is viewed as the legitimate aim of lesbian and gay politics, and as the most appropriate strategy for non heterosexual citizenship (Sullivan). This position understands the marriage contract as symbolizing an emotional, financial, and psychological bond and highlights the economic and social advantages of marriage.

Some analyses suggest that the legalizing of same sex unions can reshape and modernize the institution of marriage in keeping with gender and sexual equality.

On the other hand, feminist, liberationist, and queer critics have argued that same sex marriage represents the dominance of heterosexual values and undermines the distinctiveness of lesbian and gay cultures. This views the extension of marriage to same sex couples as a form of social regulation, with profound normalizing implications for same sex relationships and queer identities (Warner). The political desire for marriage, it is argued, is based on outmoded notions of commitment. Ultimately it may lead to normative constructions of socially responsible and irresponsible homosexuals, and to the imposition of rules which may stifle the creativity of same sex partnerships. Feminist critics have further argued that the valorization of marriage as "full citizenship" for lesbians and gay men is a naïve political strategy. They point to the historical role of the institution of marriage in the reproduction of patriarchal structures and its grounding in gendered inequalities.

Some researchers have explored the dilemmas that marriage poses for lesbians and gay men. Opinions about the value of same sex marriage range from enthusiasm to outright rejection, and many individuals and couples are ambivalent about the issue. Lesbian and gay research participants generally endorse the principle of equality with heterosexual relationships. They desire social validation, and feel that same sex couples should be entitled to the legal benefits, rights, and responsibilities that are traditionally associated with marriage (such as medical decision making, child support, inheritance, and so on). However, individuals' ambivalence is underscored where research suggests that while most lesbians and gay men feel that they *should* have the right to marry, only a small minority *would* marry given the opportunity. While lesbians and gay men appear keen to take up some of the entitlements and responsibilities traditionally associated with marriage, in comparing heterosexual marriage to their own relationships they often perceive the latter to offer greater opportunities for creativity and equality.

Some researchers suggest that lesbian and gay ambivalence about same sex marriage is indicative of the legal and cultural privileging

of the institution. This leaves individuals with “no choice” but to see it as a crucial marker of social inclusion and citizenship – irrespective of their personal or political reservations. Others have argued that this ambivalence is rooted in the tensions between the desire for validation and participation in the existing traditions that marriage represents, and the desire to retain choice and creativity in “doing” and affirming relationships. A number of studies suggest that the lack of institutional supports and cultural guidelines for same sex relationships enables the development of distinctly creative partnerships and family practices. Studies also indicate that same sex relationships tend to be underpinned by a friendship ethic that generally promotes a commitment to equality. Monogamy as the basis of commitment, and the primary significance of the couple, tend to be open to negotiation and are rarely assumed. This has led some theorists and researchers to argue that same sex relationships are creative “life experiments.” Such creativity is also noted in the research on commitment affirmation, where the playfulness of “do it yourself” traditions and rituals is highlighted. While elements of conformity are evident in how same sex relationships are celebrated and ritualized, couples often challenge or go beyond traditional ways of doing things. Research has further illustrated how commitment ceremonies simultaneously indicate conformity to wider values and introduce “queering” messages at crucial points.

Same sex marriage and civil unions are distinctly contemporary phenomena, and they offer fertile ground for theorizing and new research. Several dimensions and questions could be explored. Established themes that warrant further exploration in different national and local contexts include: the ways in which same sex marriage challenges heterosexual norms or otherwise; the motivations for accepting or rejecting same sex marriage at state, political, couple, and personal levels; and alternative strategies for recognizing and validating same sex relationships and identities, such as the individualization of “rights” and responsibilities. Other areas for research open up as the availability and take up of marriage and civil unions increase. These include the implications for supporting same sex couple commitments; for a sense of connectedness to family and

community traditions; and for a sense of couple and familial security. Research might also explore the implications (normalizing or otherwise) of legal and symbolic recognition for how couples structure and “do” their relationships. What, for example, are the implications for sexual exclusiveness and longevity? Studies could also examine the implications for non heterosexual identities. Does recognition enhance a sense of individual security or otherwise? Are individuals judged (by themselves and others) on their capacities or willingness to marry? Finally, there is limited research on the breakup of same sex relationships. What are the implications of legal recognition for this? What are the implications of “divorce” and deregistration?

These topics and questions require creative research strategies and methodologies, an area where sexualities research has particular strengths and weaknesses. One obstacle is the “hidden” nature of lesbian and gay populations. This often means that particular experiences (white, middle class, and urban) are taken to represent *the* lesbian and gay experience. As the possibilities offered by same sex marriage and civil partnerships are likely to have profound implications for lesbians and gay men, future research should attempt to capture a fuller range of voices, experience, and opinions than has previously been the case.

sampling, qualitative (purposive)

Michael Quinn Patton

Perhaps nothing better captures the difference between quantitative and qualitative methods than the different logics that undergird sampling approaches. Qualitative inquiry typically focuses in depth on relatively small samples, even single cases ($n = 1$), selected *purposefully*. Quantitative methods typically depend on larger samples selected randomly. Not only are the techniques for sampling different, but also the very logic of each approach is unique because the purpose of each strategy is different.

The logic and power of random sampling derives from statistical probability theory. In contrast, the logic and power of *purposive sampling* lies in selecting *information rich cases* for study in depth. Information rich cases are those from which one can learn a great deal about issues of central importance to the purpose of the inquiry, thus the term *purposive* sampling (or alternatively, purposeful sampling). What

would be “bias” in statistical sampling, and therefore a weakness, becomes intended focus in qualitative sampling, and therefore a strength. Studying information rich cases yields insights and in depth understanding rather than empirical generalizations. For example, if the purpose of a program evaluation is to increase the effectiveness of a program in reaching lower socioeconomic groups, one may learn a great deal more by studying in depth a small number of carefully selected poor families than by gathering standardized information from a large, statistically representative sample of the whole program. Purposive sampling focuses on selecting information rich cases whose study will illuminate the questions under study. There are several different strategies for purposefully selecting information rich cases. The logic of each strategy serves a particular purpose.

Extreme or deviant case sampling involves selecting cases that are information rich because they are unusual or special in some way, such as outstanding successes or notable failures. The highly influential study of high performing American companies published as *In Search of Excellence* (Peters & Waterman 1982) exemplifies the logic of purposeful, extreme group sampling. The sample of 62 companies was never intended to be representative of US industry as a whole, but rather was purposefully selected to focus on innovation and excellence. In the early days of AIDS research when HIV infections almost always resulted in death, a small number of cases of people infected with HIV who did not develop AIDS became crucial outlier cases that provided important insights into directions researchers should take in combating AIDS.

In program evaluation, the logic of extreme case sampling is that lessons may be learned about unusual conditions or extreme outcomes that are relevant to improving more typical programs. Suppose that we are interested in studying a national program with hundreds of local sites. We know that many programs are operating reasonably well, that other programs verge on being disasters, and that most programs are doing “okay.” We know this from knowledgeable sources who have made site visits to enough programs to have a basic idea about what the variation is. If one wanted to document precisely the natural variation among programs, a random

sample would be appropriate, one of sufficient size to be representative and permit generalizations to the total population of programs. However, with limited resources and time, and with the priority being how to improve programs, an evaluator might learn more by intensively studying one or more examples of really poor programs and one or more examples of really excellent programs. The evaluation focus then becomes a question of understanding under what conditions programs get into trouble and under what conditions programs exemplify excellence. It is not even necessary to randomly sample poor programs or excellent programs. The researchers and intended users involved in the study think through *what cases they could learn the most from* and those are the cases that are selected for study.

Examples of other purposeful sampling strategies are briefly described below.

Maximum variation sampling involves purposefully picking a wide range of cases to get variation on dimensions of interest. Such a sample can document variations that have emerged in adapting to different conditions as well as identify important common patterns that cut across variations (cut through the noise of variation).

Homogenous sampling is used to bring focus to a sample, reduce variation, simplify analysis, and facilitate group interviewing (focus groups).

Typical case sampling is used to illustrate or highlight what is typical, normal, average, and give greater depth of understanding to the qualitative meaning of a statistical mean.

Critical case sampling refers to certain cases that can make a point quite dramatically or are, for some reason, particularly important in the scheme of things. A clue to the existence of a critical case is a statement to the effect that "if it happens there, it will happen anywhere," or, vice versa, "if it doesn't happen there, it won't happen anywhere." Another clue to the existence of a critical case is a key informant observation to the effect that "if that group is having problems, then we can be sure all the groups are having problems." Looking for the critical case is particularly important where resources may limit the inquiry to the study of only a single site. Under such conditions it makes strategic sense to pick the site that would yield

the most information and have the greatest impact on the development of knowledge. While studying one or a few critical cases does not technically permit broad generalizations to all possible cases, *logical generalizations* can often be made from the weight of evidence produced in studying a single, critical case.

Physics provides a good example of such a critical case. In Galileo's study of gravity he wanted to find out if the weight of an object affected the rate of speed at which it would fall. Rather than randomly sampling objects of different weights in order to generalize to all objects in the world, he selected a critical case: the feather. If in a vacuum, as he demonstrated, a feather fell at the same rate as some heavier object (a coin), then he could logically generalize from this one critical comparison to all objects. His finding was both useful *and* credible because the feather was a convincing critical case.

Critical cases can be found in social science and evaluation research if one is creative in looking for them. Identification of critical cases depends on recognition of the key dimensions that make for a critical case.

For a full discussion of these and other purposive sampling strategies and the full range of qualitative methods and analytical approaches, see Denzin and Lincoln (2000) and Patton (2002).

Sanskritization

Vineeta Sinha

It is crucial to make a distinction between the word Sanskritization and its conceptualization as a tool of sociological analysis. The word itself, having been derived from the root "Sanskrit," labeled the sacred language of Hindus and Hinduism, together with related terminology such as "Sanskritic," "Sanskritized," and "Sanskritizing," is already present in nineteenth and twentieth century European Indological literature. These terms are used variously, but predominantly describe either elite based, Brahmanic, "Hindu" culture or note its influence on the diverse, non Brahmanic, non Hindu elements of Indian society. As a point of historical interest, it is notable that although the conceptualization of the term is rightly attributed to the late eminent Indian social anthropologist M. N. Srinivas, it (and associated descriptions) was already in use by sociologist, historian, and economist Benoy Kumar Sarkar in the 1930s and by linguist Suniti Kumar Chatterjee in 1950.

As formulated by Srinivas, the word Sanskritization sometimes connotes a perspective, a theory, a concept or a cluster of concepts, all relevant for theorizing social change in India and firmly embedded in an anthropological model of Indian society. The concept has had a checkered history, but is probably the single most important contribution to social science scholarship from India, and a good candidate for the title of a culturally specific and "indigenous" category of analysis. It is first named and appears in Srinivas's *Religion and Society Amongst the Coorgs of South India* (1952), but the germ of the idea was present in his earlier work on *Marriage and Family in Mysore* (1942). Already at this time, the concept was criticized by such Indian social science luminaries as Datta Majumdar, Karve, and Raghavan (Bopegamage & Kulahalli 1971). Despite this early challenge, the term was welcomed by a section of Indian and western sociologists and anthropologists (Bailey 1957; Singer 1959; Gould 1961; Sahay 1962), and viewed as a concept that addressed the uniqueness and peculiarity of the Indian social structural situation. Yet, in the mid 1950s, Srinivas himself agreed that the term

was "ugly," although it was nonetheless valuable in analyses of social change in India.

In his first book published in 1942, Srinivas had already observed a process that he would subsequently name and define in his 1952 book on the Coorgs. According to Srinivas's first definition, the process of Sanskritization referred to a low caste, over a few generations, rising in the community "to a higher position in the hierarchy by adopting vegetarianism and teetotalism, and by Sanskritizing its ritual and pantheon," by taking over not only the customs and rites, but also the beliefs of the Brahmin. Srinivas acknowledges here that the adoption of the Brahmanic way of life by a low caste, although forbidden theoretically, occurred regularly in practice.

In *Caste in Modern India* (1965), his argument is expanded to include the realm of values and ideas as well as ritual practices, "which have found frequent expression in the vast body of Sanskrit literature, sacred as well as secular" (p. 48). Finally, in *Social Change in Modern India* (1967), Srinivas provided an integrated definition of the term. Sanskritization "is a process by which a 'low' Hindu caste, or tribal or other group, changes its customs, ritual, ideology and way of life in the direction of a high caste" (p. 6). The term also carried notions of upward social mobility and prestige, a central feature of the process.

Srinivas acknowledged that this process is not to be viewed as a singular, monolithic whole but that empirically many models of Sanskritization could be identified, noting that regional variation is a crucial, determining factor. For example, he listed the Brahmanic, Kshatriya, Vaishya, and Sudra variants, the nature of caste hierarchy being determined by the dominant caste groups in question. He further acknowledged that the process may be occurring amongst tribal, non Hindu groups as well, thus placing Sanskritization well outside the "Hindu" framework. In fact, he even holds open the possibility of "de Sanskritization" amongst all these groups as a reverse process.

Srinivas's career as a social anthropologist and analyst committed to theorizing Indian social structure, through the impact of modernizing and westernizing forces, can be viewed as resting on his sustained intellectual engagement with the process of Sanskritization, which

continued well into the 1990s. Thus, one observes an evolution in Srinivas's thinking about the concept, as he strived to refine, justify, and modify it in an effort to demonstrate its relevance as a meaningful instrument of investigation for Indian society. This makes it impossible to "define" the term Sanskritization briefly. It is more valuable to undertake a historical perspective to see its shifting nuances and constitutive elements within the context of Srinivas's own thinking.

Scholars have applied the concept of Sanskritization to a variety of diverse sociocultural, religious phenomena, in both Indian and diasporic settings, some with greater success than others. Despite objections, the concept has been embraced and applied by Indian and western social scientists alike, while remaining controversial. One prominent example of such application is the association of village deities with Sanskritic deities and the requisite elevation of folk ritual practices to a higher, Sanskritic, and more legitimate status. The term continues to be popular and is subject to a variety of usages and interpretations. The downside is that it is often somewhat loosely applied to a variety of substantive domains (Staal 1963), to the extent that it seems to have little conceptual rigor and coherence, for which Srinivas cannot be held responsible. But the point remains that one continues to see rather awkward applications of the term, in ways that Srinivas himself would have found problematic. One line of critique notes problems in expanding the term beyond a highly specific and localized analytical frame to a theory of grand, all encompassing proportions, presented as relevant for making sense of social change and mobility in all of India. This claim to universal reference as an "all India" category has been contested for failing to acknowledge regional variation across the Indian landscape. Another noted shortcoming is that the concept tends to gloss over, erase, or veil the many complexities, contradictions, and nuances of castes and their relations at the level of practice. In a self-critical stance Srinivas himself admitted, in later reflections on the concept he devised and popularized, that it was too broad and too loose conceptually in its original formulation, suggesting that it should be discarded if necessary.

Through these moments of reflection, which have culminated in a reworked concept, Srinivas

avoids defining it substantively, that is, it is not delimited by content. Rather, it signifies a generic process by which lower caste groups (or other subordinate groups) attempt to raise their status (ritual or otherwise) by imitating, emulating, or adopting the behavior and thinking of groups with higher status. The concept is inevitably rooted in Brahmanic tradition, the Sanskrit language, and Brahmins as guardians of the former, and carries an implicit statement about the superiority of Sanskritic tradition. Despite varied challenges to the concept, Srinivas continues to reaffirm its value, albeit in altered modes and suited to contemporary problems, reiterating the cohesive, integrating, and unifying role of Sanskritization in the plural context of sovereign, secular India. He writes in *The Cohesive Role of Sanskritization and Other Essays* (1989) that independent India's heterogeneous population can be unified, even while adhering to "what is valuable in Sanskrit thought and culture," and that to ensure this it would be "necessary for Hindus to accept the entire Indian tradition to which all sections of the population have contributed, and for the latter (i.e., non Hindus) to regard the Sanskrit heritage as their own."

Such grounding brings into sharp focus several interrelated categories and dichotomies upon which the logic of Sanskritization rests, and which have structured social science analyses of Indian society well into the 1990s. Examples include the "Great" and "Little" traditions, the "folk-urban" divide, and "non Sanskritic Hinduism" and "Sanskritic Hinduism." Several other observations in Srinivas's explication of Sanskritization are pertinent. To begin, the term carries explicitly religious overtones. Next, it selects Hinduism and caste as the twin structural pillars of Indian society. This rendering connects the term "Sanskritization" explicitly (perhaps unintentionally) to both Indological and Orientalist discourses which read India as defined by caste and Hinduism, and a classical, textual, Brahmanic and Sanskritic variety of Hindu religiosity. In this, one can see the role of Sanskritization and its inventor as perpetuating the image of India as distinct from the West, in being defined exclusively by caste principles and by Hindu religiosity – central in Orientalist imaginings of India – critiqued by postcolonial and postorientalist scholarship. In this context, the concept of Sanskritization

has neither been historicized sufficiently nor received rigorous, intellectual attention, but instead continues to be accepted rather uncritically by its proponents. At least some of this has to do less with assessment of ideas and more with reservations against contesting and refuting one of the most eminent researchers India has produced, a man who is justifiably still considered an intellectual giant and an icon amongst Indian social scientists.

In recent years, a section of Indian social scientists has wondered about the continued relevance of the notion of Sanskritization. Despite being regularly contested since its formulation in the 1950s, it persists in analyses of Indian and Hindu domains, including amongst diasporic communities. It is a tribute to its potency, prestige, popularity, and malleability that in a 1996 volume on caste in India, edited by Srinivas, there are several pieces that return to the idea of Sanskritization, but now with a different meaning and intent. For instance, here one encounters the idea of Sanskritization as an "ideology," a word that Srinivas had used in his 1989 publication to refer to the spiritual ideas carried in Brahmanic ritual practices, but importantly without the tone of control, domination, hegemony, and oppression current in later renditions. This transformation occurs in the aftermath of decades of challenges to Brahmanical orthodoxy in India and the initiation of policy, legislative, and institutional measures that acknowledge, and thus attempt to ameliorate, the socioeconomic status of non Brahmin castes therein. The practice, motivation, and consequences of "Sanskritization" are now confronted, particularly by the Dalit and non Brahmin social movements launched and active in both northern and southern parts of India. Consequently, one has to ask if the concept of "Sanskritization" has been attentive to possible deleterious effects of the transformative process, or does it assume its effects to be desired, desirable, and beneficial, or is there silence on the subject?

The concept is further important in contemporary discussions amongst proponents of alternative discourses, especially in the realm of concept and theory construction. One strong critique of mainstream social science wisdom is the overwhelming reliance on "western" and "European" cultural experiences and traditions

as the exclusive source and origin of concepts and categories of analysis, which are then presented as being of universal relevance. A suggested corrective is the search for "indigenous" concepts, from non western traditions. Sanskritization has been popularly cited as an example of such a category, which is independently derived and thus autonomous. This is ironic, for as we have seen, as originally constructed the appeal of the concept was precisely its cultural boundedness and specificity as well as its capacity to explain a uniquely Indian situation, thus viewed as a particular, indigenous concept tied to Indian realities. The present quest for indigenous categories in alternative discourses is precisely the reverse, in seeking categories that may have a broader, generic, universal relevance beyond their context of origin. However, distance from the substantive dimensions (and Indian/Hindu grounding) of the concept allows one to consider the general viability of the notion, given that it refers to a process which potentially has universal implications. For instance, it might be possible to use the concept to understand the process of gentrification occurring amongst rural peasant communities in Eastern Europe, or the rise of the *nouveaux riches* in many parts of the world. It is a pity that, to date, there has been little attempt to abstract from this concept any universal validity or see it as relevant for comparative, cross cultural analysis.

Saraswati, Pandita Ramabai (1858–1922)

Vineeta Sinha

Pandita Ramabai Saraswati was born in the forest of Gungamal in the Indian state of Maharashtra. Her father, Ananda Shastri Dongre, was a learned Brahmin and a social reformer, who at the age of 44 had taken a second wife, Lakshmi bai, of 9 years, in keeping with the custom of child marriage at the time. Shastri educated his wife in Sanskrit, a highly unorthodox move for the times, as girls were denied formal education and learning of sacred Hindu texts, the exclusive right and privilege of males. His unorthodox beliefs and practices led to his ostracization from the community. Consequently, he led a rather nomadic and secluded life, delivering religious lectures and sermons to support his young family. It was in such a context that Ramabai was born, the youngest of six children, but of which only three ultimately survived. Her formative years were spent in this rather drifting and atypical setting. She received early education in the Hindu scriptures from her mother, learnt Sanskrit, and could recite the Puranas proficiently from a young age. She was not married off as a child, but remained unmarried beyond age 10 and continued her learning. After the death of her parents between 1874 and 1877, she sustained their lifestyle and traveled across India with her brother, giving lectures in Sanskrit and engaging religious experts on a variety of social and spiritual matters. At the end of her travels, she arrived in Calcutta and spent a significant part of her adult creative life

in this city. It was here that she was honored by Brahmins of Calcutta with the title “Pandita,” which translates as “eminent scholar and teacher,” on the basis of her command and knowledge of sacred Hindu texts. She was also seen as a modern day incarnation of Saraswati, the Hindu goddess of learning. The inclusion of these two titles produced the name by which she was to be subsequently remembered. In 1880, at the age of 22, Ramabai broke all conventions in marrying by choice a friend of her brother’s, a man of a low caste and a non Brahmin of Shudra background. She had a daughter, Manorama, in 1881, but lost her husband to cholera the following year. She led a full life, intellectually and spiritually, and died in 1922, but has left a legacy of works that warrant closer academic attention than has so far been forthcoming.

In 1883, she left for England with her 2 year old daughter and enrolled at the Cheltenham Women’s College to study the natural sciences, mathematics, and English. She had also decided to join the Episcopalian Church. She had raised part of the travel fare to England through the sale of her book, *Stri Dharma Neeti* (*Morals for Women*, 1882), in which she urged women to become self reliant and take charge of their own lives. To support herself in a foreign land, she taught Sanskrit and Marathi to women missionaries who were planning to work in Maharashtra, India. In 1886 she sailed to the United States to attend the graduation of her cousin, Dr. Anandibai Joshi, who is considered the first Indian woman medical doctor. She wrote another book, *The High Caste Hindu Woman* (1886), to pay for her travel expenses to the US. This was primarily to secure support for funding a school for child widows in India. Back from her travels in February 1889, Ramabai was at the forefront of educational reform for women and strived to provide institutional alternatives for abandoned women and widowed women/girls. In April 1889, “Sharada Sadan,” the first home for widows in Maharashtra, was established in Bombay. But Ramabai’s conversion to Christianity created much controversy, and unfortunately her social reform initiatives were received with suspicion, given her connection with missionaries and her own religious conversion, which was viewed as a rejection of her Hindu identity.

Ramabai was a woman ahead of her times, living in an age that was not ready to accept her radicalism and critique of society. She overtly confronted both patriarchy and British imperialism. She was a staunch nationalist and her opposition to British colonial presence was publicly articulated. She was distinctive amongst her contemporaries for her direct critique of patriarchy, its ideologies and institutions. She challenged long held discriminatory social and cultural practices and their debilitating effect on girls, i.e., the institution of child marriage for girls, enforced widowhood, and restrictions on education of girls. Her rallying call encouraged women to be self-reliant, urging them to lead autonomous, self-reliant, and independent lives. In terms of concrete contributions, Ramabai was instrumental in establishing schools for girls, an act that was opposed by male and female reformers of her time. She also founded institutions that provided food and shelter to homeless widows and other needy women, to reduce their dependence on often hostile and non-supportive families. Being an exemplar, she encouraged women to participate in public life and take an interest in political issues, taking the lead herself in running large organizations and addressing public gatherings on issues of social and political relevance. Apart from her activism, Ramabai was a prolific writer, producing numerous books, pamphlets, brochures, and newspaper articles. Some prominent examples include the following: *Stri Dharma Neeti* (1882), *The High Caste Hindu Woman* (1886), *The Peoples of the United States* (1889), and *My Testimony* (1907).

This profile reveals Ramabai as a complex and multidimensional personality. She has most often been described in the literature as a social reformer, educationalist, feminist, and activist. In making a case for viewing her as an independent social thinker, it is crucial to abstract her intellectual thought from her activism, which in her case sharply intersect. Ramabai's life shows an explicit and engaged social reformist tone and in particular a strong concern with the status of high caste Hindu women of India, a cause to which she remained committed till the end of her life. Her primary concern was the status of women, in particular the status of high caste Hindu women, whose lives she demonstrated and argued were most constrained by a highly

rigid and patriarchal social arrangement. She was not thus speaking of the condition of all Hindu women in Indian society. Of all her publications, *The High Caste Hindu Woman* (henceforth *hchm*) is probably the most successful and has made the most impact, even during her lifetime. It sold 10,000 copies and did much to promote and raise public consciousness about her mission and agenda, particularly outside India. Sociologically too, this book is salient. Scholars have argued that on the basis of this text, Ramabai should be considered the first sociologist of kinship and family in India (Shah 1977; Kosambi 1988). The book takes the reader through the various crucial moments in the life of high caste Hindu women, from childhood to married life and widowhood, with a view to outlining their place and status in society. Using simple, direct language, Ramabai communicates the everyday life of a Hindu girl/woman and reflects on the consequences this carries for men, women, and society in general. Interestingly, the final chapter is entitled "How the Condition of Women Tells Upon Society," a theme that carries huge sociological significance. What is particularly striking here is Ramabai's insight that women's status and their societal treatment are an index of the broader structural ethos. She argues that a society cannot progress until it acknowledges the unjust and inhumane treatment doled out to the most vulnerable and oppressed members of society, including women. She also makes a powerful statement in the text about how the "degradation of women" affects not just women but also men, since their existence is mutually interdependent and shapes the future of that society. According to Kosambi (1988: 43), there is in her work a "causal connection between the condition of women and the state of the nation." A strong case has also been made to view her as a pioneering figure who directed scrutiny to the domain of kinship, family, and women's status in Hindu society, a call that has not been seriously pursued. For instance, in *hchm*, she questioned the ascription of women's roles exclusively through marriage and the institution of the family, and their confinement to the domestic domain. She encouraged women's move into the public domain, applauded their greater political participation, and worked to raise women's self-awareness about these issues. Scholars have

identified a strongly feminist stance in such thinking, which challenged patriarchy and discrimination against women, calling for their emancipation and equal treatment.

Ramabai was quite a prominent public and international figure in her lifetime. Her intellectual output was focused and committed to particular social and political agendas. Her activism was daring and effective, and grounded in a body of social and political thought. She was not just an armchair critic, but strived to translate into concrete terms her condemnation of outdated and non progressive practices vis à vis the treatment of Indian women, by initiating relevant structural changes. Additionally, as a result of her overseas travels, we also have access to Ramabai's reflections about the places she visited and the cultures and peoples she encountered, including her important critique of religion and Christianity. One such document is *The Peoples of the United States*, a text Kosambi describes as an "ethnography of American society," which carries Ramabai's account of its religious and political domains. Ramabai openly admires the anti colonial ideology, liberal democratic principles, and feminist thinking she finds here. This is in stark contrast to her anti British sentiments, negative appraisal of the style of governance, the rigid hierarchical ordering of society, and the ideology of colonialism in England (Kosambi 2003). This is an important text for a number of reasons. Substantively, it is comparative in looking at societal forms in England, the US, and India; it also carries her critique of, and resistance to, colonial subjugation and oppression. Historically, it stands out as a rare commentary by a colonized subject – a woman – on a "western" society in the nineteenth century. But it has also been noted that her positive assessment of American society is somewhat idealistic and polemical, and that she only reluctantly mentions its inherent problems, such as slavery, racism, and the non political participation of women (Kosambi 2003).

According to the prominent historian A. B. Shah (1977), Ramabai was "the greatest woman produced by modern India and one of the greatest Indians in all history . . . the one to lay the foundations for a movement for women's liberation in India." Despite this high acclaim, others have noted that Ramabai has "a surprisingly

hazy presence in contemporary consciousness – if she is indeed a presence at all" (Tharu & Lalitha 1995: 243). Consulting numerous historical social science dictionaries and encyclopedias does not produce too many entries about her. Those that do include her merely notice that she worked for women's education and widow remarriage, but seldom mention her in an independent capacity as a social thinker or reformer. This neglect continues despite the fact that there is no dearth of contemporary knowledge and evidence of Ramabai's intellectual and activist contributions. Neither Ramabai nor her "work" (broadly defined to include her writings and activism) have to date received serious scholarly attention, either in the history of Indian social reformist discourse or as a social thinker, theorist, or sociologist in her own right. A variety of reasons for such neglect can be cited, ranging from androcentric social science scholarship to plain ignorance and apathy. We do have some good biographical accounts of her life, and a few stalwarts who plod on, producing the raw material (translations of Ramabai's writings) so necessary for other practitioners (educationalists and researchers alike) in the field to begin to direct intellectual and academic attention to this marginalized and forgotten figure for future generations.

Sarkar, Benoy Kumar (1887–1949)

Vineeta Sinha

Benoy Kumar Sarkar was born in the district of Malda in the then Indian part of Bengal. At the young age of 13, he distinguished himself by coming top of the entrance exam for Calcutta University. He was educated at the Presidency College in Calcutta, where in 1905 he topped the undergraduate cohort with a double honors degree in history and English, and completed a master's degree in 1906. Apart from his solid academic credentials, he was a prominent public figure and well regarded in Bengali academic and intellectual circles. Sarkar was committed to nationalist, socialist, and social service agendas, embedded in the patriotic stance of securing for India political freedom from British colonial rule. To this end, Sarkar was active in both the Swadeshi (self rule) and the National Education movements in Bengal.

The years 1914 to 1925 saw Sarkar spending a considerable period of time outside India. He visited Egypt, England, Scotland, Ireland, the United States, Japan, China, Korea, Germany, Austria, and Italy. In these countries he was based in universities and research institutes and lectured to academics and other communities of intellectuals. He spent a significant period of time in Germany and Italy and was able to acquire linguistic competence in several European languages, such as French, German, and Italian, in addition to already having mastered English, Bengali, and Hindi, a truly impressive linguistic feat. He delivered lectures in German and Italian, and also published in these languages. He doubled up as an ambassador for India (and, more broadly speaking, Asia) and tried to facilitate greater understanding on

both sides of the East–West divide. He returned to India in 1925 and was appointed lecturer at the Department of Economics at Calcutta University, where in 1947 he was promoted to professor and head of department. In 1949 he traveled to the US, a trip arranged by the Institute of International Education, New York and the Watanull Foundation, Los Angeles. During this trip, he lectured in various American universities (including Harvard) and research institutes and addressed business organizations and political centers on the subject of East–West relations, amongst other issues. This hectic tour took its toll on his health. In October 1949 he suffered chest pains, and died a month later at the Freedman's Hospital in Washington, DC (Mukhopadhyay 1979).

Sarkar was not an armchair intellectual, and his thinking was very much grounded in concrete issues facing Bengali society, India, and "Asia." He was an institution builder. His early interest in pedagogical issues saw him establishing schools and at least nine research institutes in Calcutta, including: the Bengali Institute of Sociology, Bengali Asia Academy, Bengali Dante Society, and Bengali Institute of American Culture. He trained and supervised the research of innumerable postgraduate students, emphasizing the importance of mastering knowledge from a "world perspective" in addition to the value of learning at least one European language other than English and the mother tongue. Sarkar was fully aware that institutional and infrastructural changes were necessary before any intellectual shifts could occur in the various social science disciplines. He was at the forefront of instituting curriculum and disciplinary reform in tertiary institutions, introducing changes with the intention of producing a generation of Indian social scientists with a global and cosmopolitan outlook, but also with a firm awareness of Indian problematics.

Sarkar's published writings are vast and his scholarship can only be described as encyclopedic. He was a prolific writer, with tremendous intellectual output, straddling a range of social science perspectives from economics to political philosophy, history, sociology, literature, demography, political science, and anthropology (Mukherjee 1953), which would make his work "interdisciplinary" in contemporary language. Sarkar published predominantly in English and

Bengali. He wrote 53 books in English (many of which were published in Europe and the US) and countless articles in leading Indian, American, and European journals and periodicals. Some examples of the latter include: the *Calcutta Review*, *Modern Review* (Calcutta), *Political Science Quarterly* (New York), *American Political Science Review*, *International Journal of Ethics*, *Indian Historical Quarterly*, and *Insurance and Finance Review*. It is impossible to name all his writings here, and only a selection of books in English is offered (see Bandyopadhyay 1984 for a comprehensive list): *The Positive Background of Hindu Sociology* (Books 1 and 2, 1914/1921), *Chinese Religion Through Hindu Eyes* (1916), *The Futurism of Young Asia* (1922), *The Sociology of Population* (1936), *Villages and Towns as Social Patterns* (1941), *Political Philosophies Since 1905* (Vols. 1 and 2, 1942), and *Domination in World Perspectives* (1949). He also translated several social science books by European authors into Bengali. It is notable that Sarkar's intellectual interests were not confined to an "Indian" problematic. His substantive focus was often on issues concerning "Asia" in addition to providing critique and analysis of social, economic, cultural, and political issues in European settings. In no sense did he see himself narrowly as an "Indian social scientist," qualified to speak exclusively to "local" concerns. He did not shy away from engaging ideas of prominent American and European social scientists of his time, critiquing and challenging their theorizing. Some examples include his critique of Oswald Spengler's "urban–rural" and "culture–civilization" dichotomies and Pitirim Sorokin's progress theories.

He was unorthodox and revolutionary in his thinking and challenged conventional mainstream wisdom about everything, often providing his own original theorizing on the subject. The term "Sarkarism" was coined by his peers to refer to his unique intellectual stance, but is invoked as a metaphor, a perspective, or an orientation. Here is a sampling from his vast intellectual contribution to social science thinking. While Sarkar's works are infused with a strong historical perspective, he was not a historical determinist. The concept of "creative disequilibrium" is an original contribution to ongoing debates about the source of historical change and societal human progress. While he

acknowledged the role of history (and the past) in shaping the future, he also held open the possibility of forces independent of past events and processes, thereby highlighting the role of chance, accidents, unpredictable events, and uncertainties, and thus assumed a different position from Bankimchandra, Sorokin, Spengler, Marx, and Hegel. He avoided a stage theory of change and saw the "disequilibrium" (between the forces of "good" and "evil") as creative, in constructively moving humanity toward an improved, more perfect state, and as the basis for change. Unlike Bankimchandra's view, he held that "history less groups and classes have often by sheer energism and self determination succeeded in changing the face of the world" (Sarkar 1942: 112).

In *The Positive Background of Hindu Sociology*, Sarkar argues for the basic universalism of the human species, despite a recognition of "pluralities" at individual and national levels. This work is an early critique of Indological and Orientalist thinking, predating by decades Said's *Orientalism* (1979). As a theorist of modernity, he addressed the problematics of the Industrial Revolution, both for "Eur America" and the "East" (including India and China) in the encounter with forces of industrialization and modernization, but for the latter within the context of colonialist and imperialist experiences. Sarkar refuted the assumption of fundamental and irreconcilable differences between Asia and Europe, a view that was pervasive in popular thinking, political and international relations discourses, and in much of social science scholarship of the time, both Indian and European. Through historical research, he demonstrated overwhelming similarities between India and Europe vis à vis scientific, material, and technological developments. In so doing, he challenged the definition of India as a predominantly mystical and spiritual society (and superior), in contrast to the "West," which was defined as material, scientific, and industrial. He thus provided an alternative and contrary reading of India, one that was at odds with current opinion, fortified through the works of Max Muller, Rudyard Kipling, Max Weber, Vivekananda, and Sri Aurobindo, to name a few. These premises were debunked as myths and rejected by Sarkar as offering an analytical frame for explaining India's "backwardness" and Europe's

“progress.” Sarkar located the reasons for India’s underdevelopment elsewhere – in the domination, control, and hegemony of colonial experience(s) and their debilitating effects on material advancement.

While it is possible to abstract evidence of sociological and political thought from the huge corpus of Sarkar’s writings, this task has yet to be undertaken systematically. In particular, Sarkar’s political thought needs to be fleshed out, given that he was a pioneer in calling for an objective analysis of political institutions, values, and ideologies (Bandyopadhyay 1984), and highlighting the secular nature of politics. He was a nationalist, a liberal, and a firm believer in social democracy with a strong place for the individual and the state, in a culturally and politically plural social context. He was a staunch supporter of socialist and communist thought and was a firm advocate for the rights of the less privileged groups in society, such as the lower classes and lower castes of Hindus, Muslims, and tribals. In this context, Sarkar made an important contribution to the debates about such concepts as “culture,” “intelligence,” and “civilization.” He argued that literacy and formal education were recent, modern phenomena, and that illiteracy could not be correlated with lack of intellect, morality, or culture. His socialism viewed the natural intelligence and practical experience of illiterate members of the community as “valuable intellectual assets” (Mukherjee 1995: 55). In a related vein, he challenged the patterns of social differentiation in Spengler’s urban–rural dichotomy. He also rejected in this discourse the romanticized (non political and soulful) image of the village community, and the more negative portrayal of the average city dweller. He writes: “The milk of human kindness does not flow more frequently in the inter actions of the village ‘community’ than those in the town ‘society’” (Sarkar 1941).

Despite such credentials and achievements, Sarkar’s students and supporters note that he is a nonentity amongst contemporary social science students, even in India. In the historiography of the social sciences, knowledge about this talented social thinker is indeed dismal. What little information – biographical and intellectual – that does exist has been documented by a few of his colleagues, friends, and students (Dutt 1932, 1939; Dass 1939; Ghosal

1939; Chaudhury 1940; Mukherjee 1953, 1995; Mukhopadhyay 1979; Bandyopadhyay 1984). The most recent of this material can be dated to the 1980s, with little new secondary work on Sarkar coming in the following two decades. In his lifetime, Sarkar enjoyed tremendous public visibility (perhaps more outside India) and popularity, but his genius was probably unrecognized by his peers.

As a social scientist, Sarkar operated with a cosmopolitan, trans Asian frame of reference and recognized unifying forces in the space labeled “Asia” despite the diversity and complexity within, more so than in the present, where a fragmented view of Asia prevails. Sarkar’s pioneering status as a social thinker and a theorist of modernity, speaking at the turn of the twentieth century from a non western locale but deeply and critically engaged with social science concepts, theories, issues, and problematics current in the “West” (where social science disciplines were institutionalized), marks his distinction. He is a perfect candidate (in alternative, counter Eurocentric and counter Orientalist discourses) for the title of a social thinker whose ideas and activities transgressed given boundaries, making his ideas modern, universal, and relevant.

Sartre, Jean-Paul (1905–80)

Eric Margolis

The introduction to Sartre's monumental *Critique of Dialectical Reason* (1960) was published in English as *Search for a Method* (1963). Sartre saw the social sciences as in deep crisis arising from a basic contradiction: "We are not only knowers, in the triumph of intellectual self-consciousness, we appear as the known" (Sartre 1963: 9). Sociologists also remarked upon the discipline's state of arrested development. For instance, at the time Sartre was writing, C. Wright Mills (1959) had characterized sociology as a split between an "abstracted empiricism" and "grand theory." This is a similar notion to the Sartrian criticism of sociology and Marxism as an unprincipled empiricism on one side and pure fixed knowledge on the other. *Search for a Method* is a critical comparison of Marxism and sociology by the existential philosopher who defined his goal as "revisionism," the ongoing process in any living philosophy which takes place in thought but is also part of the "movement of society" (Sartre 1963: 7). Sartre is critical of sociology for being "an idealistic static knowing, the sole function of which is to conceal history," and a "practical empiricism in the hands of the capitalists which supports human engineering" (pp. 67–8); and critical of Marxism for no longer knowing anything: "Its concepts are dictates; its goal is no longer

to increase what it knows but to be itself constituted a priori as an absolute knowledge" (p. 28). Sartre castigated "lazy" Marxists who, "stand(ing) in their own light," transformed Marxism into determinism through the a priori application of Marx's theory (pp. 38–3), and the mechanical materialism of sociology that reduced persons in the world to a system of objects linked by universal relations (see Sartre 1955: 200).

In keeping with existentialism's philosophy of free will, Sartre rejected all determinisms. In *Being and Nothingness* he had remarked: "The historian is himself historical . . . he historicizes himself by illuminating 'history' in the light of his projects and of those of his society" (Sartre 1971: 643). Destroying the possibility of an objective "social physics," the statement opens the possibility for a social science based on praxis. Unifying theory and practice, asserting with Marx that people not prior conditions make history, Sartre sought to revise Marxism, which he saw as salvageable if it approached the social heuristically: "its principles and its prior knowledge appear as regulative in relation to its concrete research" (Sartre 1963: 26).

The praxis of "historical structural anthropology" Sartre termed the progressive regressive method. He borrowed LeFebvre's (1953) approach, which had three moments. First is the way Sartre conceived of sociology, a horizontal enterprise aimed at uncovering social structure in all its relations and functions (demographic, family, religion, etc.). Noting that at different times there have been other structures, the second, vertical, moment describes the history and genesis of social structures. The third moment calls for dialectical totalization – seeking to understand the "principle of the series." Sartre added the reservation that method itself must be subject to "modifications which its objects may impose on it – in all the domains of anthropology" (Sartre 1963: 52). This is because "the foundation of anthropology is man himself, not as the object of practical knowledge, but as a practical organism producing knowledge as a moment of praxis" (p. 179). Research is a "living relationship" in which "the sociologist and his 'object' form a couple, each of which is to be interpreted by the other; the relationship between them must be itself interpreted as a moment of history" (p. 72). Sartre argued

that a structural historical anthropology must “devise its concepts from the new experiences which it seeks to interpret”: “the particular man in his social field, in his class, in an environment of collective objects, and of other particular men. It is the individual, alienated, reified, mystified, as he has been made to be by the division of labor and by exploitation, but struggling against alienation with the help of distorting instruments. And, despite everything, patiently gaining ground” (p. 133).

Satanism

Massimo Introvigne

While organized Satanism includes quite small groups, social scientists have studied Satanism mostly as the subject matter of juvenile deviance and social panics. Satanism may be defined as the adoration of the figure known in the Bible as the Devil or Satan. Its first incarnation was in the circle operating at the Versailles court of Louis XIV (1638–1715) around Catherine La Voisin (ca. 1640–80) and the defrocked Catholic

priest Father Guibourg (1603–83), who invented the so called “Black Mass,” a parody of the Roman Catholic Mass. La Voisin was burned at the stake in 1680 and Guibourg died in jail in 1683. Small rings imitating what they had read of the group were subsequently discovered in France, Italy, and Russia in the eighteenth and nineteenth centuries.

In the 1880s, reporter Jules Bois (1868–1943) and novelist Joris Karl Huysmans (1848–1907) explored the French occult underworld, and in 1891 Huysmans published his bestselling novel on Satanism, *La bas* (Down There), which included one of the most famous literary descriptions of a Black Mass. Public opinion overreacted and sensational revelations of a worldwide Satanic conspiracy were offered to the French public by journalist Léo Taxil (1854–1907). Taxil, claiming to be an ex Freemason converted to Catholicism, revealed that a Satanist organization called Palladism was behind Freemasonry and anti clericalism. Eventually, in 1897, Taxil confessed that both his revelations and conversion to Catholicism had been a hoax conceived in order to convince the world just how gullible the anti Masonic Catholics of his time actually were.

Although a body of literature inspired by the Taxil fraud continued to be published well into the twentieth century, anti Satanism was largely discredited until British magus Aleister Crowley (1875–1947) shocked his contemporaries by styling himself “the Beast 666” and “the wickedest man in the world.” Crowley made use of Satanic imagery and is still regarded by many as the founding father of contemporary Satanism. The British occultist, however, was a “magical atheist” who did not believe in the actual existence of Satan; and, although he has been influential on later Satanic movements, he cannot be regarded as a Satanist in the most technical sense of the term. On the other hand, it is true that Crowley enthusiasts, including movie director Kenneth Anger, were instrumental in creating the Church of Satan.

The latter’s founder, Anton Szander LaVey (1930–97), joined a Crowleyn group in 1951, and through this milieu he came into contact with Anger. In 1961 they founded an organization known as the Magic Circle, which gradually evolved into the Church of Satan, founded on April 30, 1966. The Church of Satan did not

literally believe in the existence of the Devil. It was more an idiosyncratic and militantly anti-Christian human potential movement, devoted to the exaltation of human beings who, having been freed from religious superstitions and the false Christian notion of sin, would eventually become able to enjoy life and flourish.

In 1968 LaVey met Michael Aquino, an officer and intelligence specialist in the US Army with an academic education, who gradually became the main organizer of the Church of Satan. During the early 1970s, however, a contrast developed between LaVey and Aquino, since the latter believed in the real, physical existence of a character known as Set or Satan, and became increasingly disillusioned with LaVey's "rationalist" Satanism. In 1975 Aquino left LaVey and went his separate way into the newly established Temple of Set, probably the largest international Satanist organization still active today.

Currently, after LaVey's death in 1997, the Church of Satan is largely a mail organization, and has generated several splinter groups, including the First Satanic Church led by LaVey's own daughter, Karla. The current combined active membership of all organized Satanism does not reach a thousand.

LaVey's notoriety certainly played a role in the early stages of the anti Satanist campaign of the 1970s and 1980s. The McMartin case began in 1983, when the principals and a number of teachers of a respected California preschool were accused of operating an underground Satanic cult, which ritually abused and tortured children. Mental health professionals involved in the case were later accused of having "planted" the stories in the children's minds, based on their own theories about Satanism. The McMartin trial ended in 1990 with no convictions. It had an enormous media impact, however, and undoubtedly had something to do with the hundreds of subsequent similar accusations of Satanic ritual abuses in both day care centers and in family settings. Although complete statistical data are lacking, it is possible that as many as 2,000 cases of Satanic ritual abuse of children were investigated in the decade 1983–92, with only a handful of convictions. Sociologists and other academics emerged as the most vocal critics of the theory of a secret Satanic network. In 1994 two official reports, one by the US National Center for the Prevention of Child Abuse and Neglect, and one

by sociologist Jean S. La Fontaine on behalf of the UK government, concluded that stories of Satanic ritual abuse were largely figments of the accusers' imaginations. In subsequent years, the number of court cases involving allegations of Satanic ritual abuse sharply decreased.

The debate on the alleged Satanic ritual abuse of children should not be confused with discussions of adolescent Satanism. There is little doubt that there are gangs of teenagers performing some sort of homemade Satanic ritual (copied from comics, books, or movies), often also involving drugs. These teenagers are often guilty of minor crimes such as vandalism or animal sacrifice. In fewer than a dozen cases over the last two decades, more serious crimes appear to have been committed, including a handful of murders, some of them uncovered in northern Italy in 2004. In these cases, it is difficult to determine whether drugs, gang related violence, or Satan worship are mostly responsible for crimes which do not appear to be related to organized Satanism.

Saussure, Ferdinand de (1857–1913)

J. I. (Hans) Bakker

Ferdinand de Saussure is an important linguist and, along with C. S. Peirce, one of the two main contributors to semiotics (Sebeok 2001; Sanders

2004). His distinction between the signifier and the signified is central. The theory of signification, the idea that a sign is an entirely arbitrary verbal or written phonemic and phonetic device, is attributed to him. The word “cat” and the word “chat” are different only linguistically; the signified “object” remains the same (Koerner 1973). The standard view of Saussure is based on posthumous publication of his lecture notes (Saussure 1967, 1968, 1989 [1916]). Like work by Weber and Mead, the *Course in General Linguistics* (1916) is the product of other hands. Between 1906 and 1911, Saussure taught three courses on general linguistics. Student notes have now been published separately (Saussure 1993 [1910–11], 1996 [1907], 1997 [1908–9]). Bouissac (2005) argues that the standard view of Saussure is incorrect; he did not reach any definitive conclusions concerning general linguistics or semiology. Indeed, Saussure (2002) found many ideas in linguistics problematic epistemologically. He linked “signology” (*signologie*) to psychology. He poses epistemological questions, but there is debate concerning his answers. His emphasis on evolutionary change can be thought of as sophisticated neo-Darwinian theory (e.g., cognitive neuroscience). This makes it possible to think of an “algorhythmic” version of semiotics (Bouissac 2005). Saussurean scholarship (*Cahiers Ferdinand de Saussure*) has questioned some of the poststructuralist critiques (e.g., Roland Barthes, Jacques Derrida) of Saussure’s structuralist linguistics.

scapegoating

Evans Mandes

Scapegoating is the process of unjustly accusing or blaming an individual or a group for the actions of others not of their own doing. It is derived from the tendency to displace aggression toward a minority group. Typically, innocent individuals or groups receive the displaced aggression when others feel threatened by them. These targets of aggression are often perceived as “safe” targets because they are victimized and often powerless to fight back. They are frequently vilified, criticized, and rejected. In a non-pathological sense, scapegoating may also be perceived as the natural outgrowth of stereotypes associated with race, religion, sex, gender, and ethnicity. This point of view, sometimes referred to as the exaggeration hypothesis, is based upon perceptual contrasts or cognitive processing limitations. The group conflict model, however, sees scapegoating in

more motivational terms, where exaggeration grows out of individual or group conflict. Scapegoating can also be seen as the outgrowth of prejudice, which develops either in the personal sense where some group is perceived as a threat to one's own interests, economically, socially, or as a group endeavor where conformity becomes an issue. In order to conform, one's group expects you to express and support the view of the collective group.

"Scapegoat" originates from the Hebrew practice of transferring ritualistically and symbolically the sins of individuals to goats. The chosen goat was driven into the desert by the Hebrew priests to atone for guilt, thus absolving individuals and groups from their individual or collective sins. The most horrific example of scapegoating in modern times was that of the Jews by the Nazis in World War II. Prior to the war, Germany had undergone a period of economic and political upheaval. The economic failures of the Weimar Republic after Germany's defeat in World War I produced a period of economic depression, unprecedented inflation, and social unrest. These conditions set the stage for Adolf Hitler and his followers to blame Germany's social and economic problems on the Jews, thus heightening to new levels the anti-Semitism already present in the country. One Nazi leader, explaining the need for the convenient scapegoating of the Jews, noted: "If the Jews did not exist, we would have invented them" (quoted by Koltz 1983).

Other researchers have used scapegoating as a descriptive term to explain racial tensions during periods of social and economic unrest. The negative correlation between the number of lynchings of blacks by Southerners and economic conditions in the South is often cited in the popular literature on race relations. These studies have led to the promulgation of the frustration aggression hypothesis in social psychology. In this hypothesis, tensions associated with frustrated needs often are associated with violence and aggression.

Current research using scapegoating as an explanatory tool is varied and interdisciplinary. Psychoanalysis, for instance, views scapegoating in group therapy as an example of projective identification. The scapegoat is the source of hostility because she or he demonstrates traits that group members care to reject or wish

to repress, deny, or otherwise remove from their conscious experiences. Bullying or victimization is seen in this context; the bullies tend to think others are attacking them. They tend to interpret relatively neutral interpersonal relations as attempts to dominate others aggressively. Their worldview is commonly seen in terms of polar opposites – winning or losing, domination or subservience, triumph or shame. Studies examining family values show similar results. Men who display aggression toward their families often misinterpret the behavior of family members. Neutral acts or words by family members are seen as deliberate attacks, again an amplification or exaggeration of events due to underlying pathology.

Risk behavior is another contemporary area of research by sociologists interested in drug behavior and risk denial. By studying the cannabis use of French adolescents, researchers have found that the cannabis users often scapegoat other "hard drug" users. They deny their own addictions, thereby challenging the "risky" label for them and convincing themselves of their ability to control their own addictions (Peretti Watel 2003).

In social psychology, studies performed on the scapegoating mechanism tend to take a similar form. Using students as subjects, the paradigm introduces some element of failure. Failure is ensured either by employing extremely difficult tasks or by setting up unrealistic competitions among rival peer groups. Attitudes toward individual racial groups falsely associated with these failures or competitions were taken before or after the induced exposure to failure/competition. The data showed predictably lowered attitude scores after the subjects were frustrated by induced failure or competition. The researchers consider these results as evidence of scapegoating.

Most recently, research on scapegoating has examined attitudes toward family values and political attacks against the Muslim world. Both use scapegoating as descriptive mechanisms for understanding the human process. During recent campaigns, studies of the political rhetoric surrounding the issue of family values tend to identify the family as the absolute site for social change (Cloud 2001). In these studies minorities and economically disadvantaged Americans are scapegoated for social problems.

In a similar vein, attacks on the Muslim world are seen as attempts to heal the humiliation suffered by the United States due to the destruction of the World Trade Center and the Pentagon. The Muslim world is regarded in this analysis as the collective scapegoat of US frustration, which can be assuaged only through direct military action.

A history of the use of the term scapegoat can be found in Victor (2003).

school choice

Scott Davies

School choice refers to the use of public funds that give parents more discretion in their children's education. It usually entails making available to parents a wider variety of educational options beyond a standard, local public school. Examples of choice initiatives include charter schools, home schooling, voucher programs, tax credits for private schools, and the formation of magnet schools. While many parents exercise a "hidden" form of school choice via their selection of residential location, choice programs stir most controversy when they

entail privatization, that is, the redirecting of governing authority from a public body to parents and/or school staff.

In North America the impetus for choice needs to be understood in the context of the mass expansion of public education. The achievement of universal enrolments at elementary and then secondary levels over the twentieth century gave rise to large, bureaucratic schools. Known somewhat derisively as the "one best system" approach to education, large urban schools grew to be characterized by standardized offerings and a bureaucratic governing structure (Tyack 1974). While perhaps administratively efficient, such schools disenchanted many educators, students, and parents in the 1960s and 1970s. A variety of actors, including minority advocates and experimental pedagogues, portrayed mass public schools as dehumanizing, inequitable, and unresponsive to children's needs. In response, they initiated a flurry of educational alternatives, including "Free" and "Open" schools, often mandated to serve collective goals and notions of minority rights. Though most of these innovations were short lived, they brought to the public system a more "progressive" curriculum, and a greater concern with educational equity.

A very different type of choice movement emerged in the early 1980s, marked by rationales of providing avenues for individual status striving and for the benefits of school competition. Declaring public schools to be substandard, many policymakers began to seek initiatives to boost the quality of education. Some reasoned that if public schools faced competition for clients from new schools of choice, the quality of both would necessarily rise. Simultaneously, many middle class parents acquired preferences for more intensive education, looking to prep their children for prized slots in higher education, or to provide them an experience tailored to their needs. Choice was seen as a solution to both of these concerns.

This type of choice resonates with policymakers who embrace a "market" approach to schooling. A resounding theme among these proponents is that markets can be an antidote to the "one best system." They see public bureaucracies as too slow to adapt to a world in which parent, student, and teacher preferences for pedagogy are increasingly specialized and

varied. According to Chubb and Moe (1990), the most renowned market theorists, markets can free schools from the grip of central administration. Regular public funding arrangements, they argue, encourage schools to conform to legal conventions rather than provide effective service, and thus make public schools unresponsive to their clients. In contrast, many choice arrangements force schools to attract fee paying parents in order to survive. This is said to make their educational decision making more entrepreneurial and attuned to boosting student achievement. Markets are thus hailed by their advocates as the optimal medium for linking the preferences of parents to educators, and delivering a more personalized, customized education.

This theory of market based choice has spawned one of the most polarized debates in contemporary education. The intensity of this controversy is rooted in enduring philosophical issues. Many defenders of public schools see choice initiatives as threatening the common school tradition, in which schools draw students from the immediate area and bind them into a vibrant local citizenry, creating the grounds for grassroots democracy (see Fuller 2000). Choice, some warn, can only further decay the populace's common experience and their participation in collective endeavors. Further, many fault the choice movement for equating the value of school with individualistic status striving rather than collective goals, thereby further diluting the public spirit of education.

Beyond these philosophical disputes, sociologists commonly address empirical dimensions of choice, and in so doing have made some advances. Much of the choice literature in the early 1990s was highly polemical, due partly to the absence of adequate data and the novelty of most choice initiatives. The past decade, however, has produced a sprawling interdisciplinary literature, with an extensive stockpile of studies conducted by educationalists, sociologists, political scientists, and, increasingly, economists. This corpus of research has four major themes.

One theme examines how choice affects the sorting of students among schools. Advocates claim that choice can effectively reduce race and class segregation by allowing poor and minority families to escape substandard institutions. In contrast, critics claim that such policies will only "cream off" the best students from mediocre

schools, resulting in a renewed form of segregation. Interestingly, research to date suggests that choice neither lessens nor worsens existing levels of segregation. While relatively few minority parents take advantage of choice initiatives, charter schools appear roughly to reflect the composition of their neighborhoods, since they are often bound to regulations that ensure minimal levels of diversity (Goldhaber 1999).

The second theme has received the greatest attention in the US: the impact of choice on performance outcomes, particularly standardized test scores. While students in private schools have higher aggregate scores than their public counterparts, private schools can select more affluent and motivated students. The core issue is therefore whether or not choice mechanisms boost student performance net of the composition of students. A body of research has emerged that attempts to sort out those effects. While there is little consensus, and while disputes usually entail statistical intricacies, there is not any clear data that choice indeed provides a net increase in test scores. Evidence suggests that parents of students in such schools report high levels of satisfaction, and that choice can allow schools to be responsive to the vagaries of parental demand. But such evidence has led some to conclude that public schools would perform similarly given the same resources and ability to select students (Witte 2000).

A third issue deals with organizational characteristics. A central claim by choice advocates is that market forces spark innovations in school pedagogy, curricula, and personnel. Yet research to date on this issue is mixed. American studies suggest that innovation among charter schools is limited (Lubienski 2003). Canadian research similarly suggests that new private schools are rarely innovative in their instruction and structure, though many form niches and specialized identities (Davies & Quirke 2005). One provisional conclusion is that market style choice can trigger more specialized schools, but that such schools rarely deviate from the "fundamental grammar" of schooling that has been institutionalized over the past century.

A fourth issue involves whether the presence of market competition motivates local public schools to improve, presumably by threatening those schools with the risk of losing students to rivals. For instance, after making a series of bold

statistical assumptions, Hoxby (2003) claims that public school test scores indeed climb when they face greater competition. Others acknowledge this broad finding, but attribute it to the greater resources available to public schools in areas with large private enrolments (Arum 1996).

Much of this research is embroiled in methodological disputes. A core issue among quantitative researchers is how to isolate differences in school performance that are attributable to student versus school characteristics. To better sort out these effects, many researchers use measures of achievement growth instead of cross sectional data, but these longitudinal data are sometimes beset by attrition effects and by limited measures that fail to fully capture differences in motivation and academic preparedness among students. Qualitative researchers face the challenge of exploring emerging types of choice, such as home schooling, private tutoring, and the variety of charter schools. Such studies can potentially contribute to the choice literature by addressing holistic issues such as how parents and educators understand and experience choice, as well as its impact on less quantifiable outcomes like citizenship and community cohesion.

Choice movements will likely continue to thrive as long as competition for prized slots in post secondary education continues, and as families continue to embrace "intensive parenting," a practice that values intimate educational experiences tailored to children's unique needs (Davies & Quirke 2005). It will probably thrive best where public education is not strong, creating niches for schools with small classes and/or special curricular themes, or in cities with atrophied public offerings. While public schools will continue to cater to the vast bulk of students, choice will be sought by those who are most advantaged, and sometimes by those who are most disadvantaged.

school climate

Robert Crosnoe

School climate refers to the general tone of social relations in and around schools: how people in the school relate to each other, the culture that emerges among these people, the norms that they construct. Quite simply, it represents the general "feel" of the school. This aspect of school context taps the informal processes that occur within schools. Like the more formal processes (e.g., instruction, delivery of curricula), these informal processes affect a wide variety of student outcomes and are important ingredients in the general functioning of schools themselves.

More than other aspects of education, the theoretical and empirical research on school climate bridges multiple disciplines – sociology, psychology, education – and integrates qualitative and quantitative methods. The late James Coleman played a major role in this development. His pioneering study *The Adolescent Society* (1961) vividly captured the intense

dynamics of peer cultures in a group of Midwestern high schools, depicting how the social climate of a school can undermine its formal educational mission. More recently, his formulation of the social capital framework drew explicitly on the positive aspects of school climate, such as supportive intergenerational networks between young and old that form in and around schools (Coleman 1990). These social aspects of schooling, he argued, could actually facilitate the educational mission of schools. This basic argument was also a major theme in the effective schools movement of the 1970s (Lightfoot 1982), which emphasized that the social psychological, interpersonal, and political aspects of school cultures and surrounding communities were the building blocks of successful teaching and learning.

The concept of school climate in general and Coleman's discussion of social capital in schools in particular have served as both foundation and foil to sociologists. Some have pursued a more thorough understanding of the linkage between the formal and informal processes of school or the role of the school as a context of human development, while others have objected to the lack of precision in social capital concepts, the apparent lack of amenability of the cultures that arise in schools to policy intervention, and the overgeneralizations of schools and students that arose from early studies in this field. Still, this back and forth has ultimately resulted in a rich body of empirical research on school climate, which can be broken down into three general areas: peer culture in the school, intergenerational relations in the school, and the school community.

First, schools, especially middle schools and high schools, serve as the most concrete, identifiable, bounded site of peer culture in the early life course. They group together – in a specific physical location under a common institutional identity – large numbers of young people for extended periods of most days in the majority of weeks in the year. At the same time, class enrollment patterns and curricular assignments further differentiate these larger groups of young people into smaller subsets characterized by sustained interaction. The work of Maureen Hallinan and her colleagues has demonstrated how, on both of these levels, schools affect the formation of friendships and the construction of

peer networks (Kubitschek & Hallinan 1998). In effect, schools organize systems of social relations, which have their own distinct norms, values, and behavioral patterns. These diverse peer cultures, in aggregate, affect the general climate of the school. This peer dimension of school climate can range from positive (e.g., prosocial, academically focused) to negative (e.g., oppositional). The type of school based peer climate to which students are exposed, in turn, influences their academic progress and general development. On a more macro level, this aspect of school climate can effect larger patterns of inequality.

Numerous ethnographies, such as *School Talk* (Eder et al. 1995), have illustrated how these cultural patterns constructed among young people in a school can make that school an incredibly difficult – or alternatively, supportive – place to be. The ability of schools to teach and transmit knowledge is intricately related to what goes on among students. Indeed, quantitative analyses have revealed that students' social psychological functioning is highly reactive to the general norms of the student body and its subgroups and that this social psychological functioning is a major factor in their academic functioning. Also related to these in school cultures is the integration of diverse student populations and the magnitude of race and class inequality. Research has consistently shown that the ease with which school integration proceeds is, in part, a function of the cross pollination of the peer networks of different racial populations (Moody 2001).

Second, schools are a primary point of contact between young and old, in that schools serve children and adolescents but are operated by adults. The degree to which teachers and other school personnel connect to students is a crucial element in school climate. Whether conflict or cordiality reigns is important to students' trajectories through their years in that school. The nature of the intergenerational climate in the school can be thought of according to different dimensions, including support, warmth, and mutual respect. Students tend to do better academically in schools with climates that encompass all three, but, importantly, they are also happier in these schools. In other words, positive intergenerational climates foster better mental health as well as better academic

performance. Indeed, as seen in the research of Bryk et al. (1993), as well as others interested in school size and sector, the relative costs and benefits of attending a large or small school, a Catholic or public school, are often predicated on the type of intergenerational climates that characterize each. At the same time, Alexander and Entwisle's (1988) seminal research on the early school years has demonstrated the central role of student-teacher relations in race and class differences in academic achievement and learning, patterns that have been replicated on the high school level. Teachers and students are the two primary populations in schools, and so the distance between them helps to determine if a school climate is good, bad, or essentially inequitable.

Third, the climate of schools is a function of factors nominally outside the school as well as those that occur on school grounds. In short, the school is part of a larger community. On one level, this community refers to the actual neighborhoods surrounding the school. In its simplest form, the school is a building that rests in a certain area. That area is an ecology in which the school "lives and grows." Certainly, a wealth of evidence has demonstrated that the characteristics of the community in which the school is situated can affect what occurs in the school. Criminal activity and poverty in the surrounding area, for example, complicate the educational mission of schools – students have more trouble learning, and teachers teaching, when they are distracted, distressed, and frightened. The climate of education suffers in these areas, despite the best efforts of schools. The case for the significance of this aspect of school climate has emerged from both detailed ethnography, such as *Ain't No Making It* (McLeod 1995), and demographic analysis of neighborhood effects. On another level, the school community refers to the collection of families whose children attend the school; how closely connected students' parents are to the school and to the other families in the school matters. Parents are better able to manage and monitor their children's education – and stay involved in their children's lives in general – when they feel welcomed at school, when they feel support from other parents, when they have teachers or other parents to whom they can turn. Likewise, strong bonds between the adults who have ties

to the school provide a dense protective cover around children as they grow and develop. Coleman was a leader in stressing the value of this aspect of school climate, but the field of inquiry around it has, in effect, taken on a life of its own. Certainly, the idea of the school community is one of the driving forces in contemporary school reform and educational policy. Children go to school, but, in schools with a positive climate, they do not leave their families behind when they do.

The centrality of school climate to both education and developmental research has increased considerably in recent decades. It is a true growth field in sociology and related disciplines. Interest in the climates of school and their significance continues to be spurred on by new theoretical perspectives, such as human ecology; by new educational philosophies, such as the ethos of caring advocated by educational researchers like Nel Noddings; improvements in data collection, such as Add Health's large in school samples, which allow the creation of summary measures of the behaviors, beliefs, and adjustment of the student body; and, unfortunately, by public events, such as Columbine, that drive home the importance of making schools good places to be as well as centers of learning.

school discipline

Sandra Way

School discipline refers to a system of rules, monitoring, sanctions, and rewards implemented by school personnel with the intent of shaping student behavior. Commonly associated with teachers and principals imposing order in classrooms and corridors by exerting control and maintaining student compliance through supervision and punishment, school discipline also plays a role in educational and moral development. There is general agreement that discipline in school is necessary. The extent and nature of that discipline, however, is variable and, at times, controversial.

School discipline has two main goals: maintenance of order and socialization. First, discipline is associated with the need to maintain a safe environment conducive to learning. Misbehavior can distract from the educational function of the school, and particularly disruptive behavior, such as violence, harassment, and theft, victimizes teachers and students. Discipline is also a mechanism of socialization. In addition to teaching academic subjects, schools help inculcate the values that turn children into productive citizens. Discipline is a tool for teaching students socially appropriate behaviors and attitudes.

The most influential theoretical writings related to school discipline come from the sociologist Émile Durkheim, the progressive education scholar John Dewey, and the postmodern

philosopher Michel Foucault. Durkheim and Dewey were particularly interested in how discipline, defined as restraint placed on human behavior, is related to how individuals internalize the principles that guide attitudes and behaviors. Both theorists viewed the school as an important location for childhood socialization. In contrast, Foucault's discussions on discipline focused primarily on prisons with only a cursory look at schools. His work is more important for how it has informed recent critical analyses of school discipline than for any concrete theory of schooling.

Durkheim and Dewey claimed that discipline, or behavioral restraint, is beneficial for both the individual and society. In *Moral Education* (1961 [1925]), Durkheim argued that discipline is an essential element of morality, while Dewey argued in *Democracy and Education* (1966 [1916]) that discipline is important for the development of individual character and social democracy. In both cases, the goal is the development of internal, or self, discipline. The two scholars diverge, however, on their views of school discipline, which instead of being *internally motivated* tends to be *externally imposed* upon children.

Durkheim recognized external discipline as an instrument of socialization and a means for inculcating moral authority; a respect for social rules. He believed that respect for school rules helps children develop self control. He also approved of punishment as a mechanism for preserving disciplinary authority, although he questioned its usefulness as a deterrent. The role of the teacher is to inculcate the belief in the moral authority of social rules and to provide the external sanctioning needed to maintain it.

In contrast, Dewey was critical of teacher directed discipline and acknowledged external discipline only as an instrument of control. He claimed that traditional authoritarian disciplinary practices worked against the socializing goal of the school by alienating students. Self discipline develops from students' active engagement with the curriculum and task completion; teacher imposed discipline subverts this process by serving to dull initiative. According to Dewey, the teacher should not impose ideas or habits on children but rather assist them in selecting and interacting with their environment.

On further analysis, the difference between the two positions narrows. Dewey acknowledged that some external discipline may be necessary to control chaotic environments and Durkheim suggested that excessive regulation can lead to resistance or extinguish initiative. From both perspectives, as internal discipline develops there should be less need for external discipline. For Durkheim, as individuals rely on an internalized respect for the authority of rules, or moral authority, they need less external pressure to behave in a moral manner. For Dewey, when students are engaged, active learners there is less disorder to control.

Foucault approached discipline through the lens of power. In *Discipline and Punish* (1977), he argued that discipline imposes a diffuse will on individuals with the aim of controlling individuals to efficient and productive ends. Disciplinary power relies on ubiquitous monitoring and the process of normalization, where individuals are controlled through constant comparisons with those who are "normal." In schools, examinations, grades, and rules serve normalizing functions. Foucault's approach also stimulates critical discussions about student resistance and how enactments of school discipline may help produce "troublemaker" identities. While Durkheim viewed the power of the social over the individual as moral, Foucault's aim was to uncover these power relations so that they could be recognized and questioned.

Regardless of whether the focus of discipline is order or socialization, student behavior is usually the measure of effectiveness. Disciplinary systems that lead to less misbehavior and more orderly environments are viewed as effective. In some cases, however, sociologists have gauged discipline by examining academic achievement, such as grades, test scores, or graduation rates.

Social scientists have found that discipline is generally most effective when schools establish and communicate clear expectations, consistently enforce rules, and provide rewards for compliance and punishments for violations. Children appear to respond better to fair disciplinary guidelines that are not overly strict or lenient and are enforced by authority figures perceived as legitimate. Parental reactions to school discipline can also influence its effectiveness. When parents are involved and supportive

of the school, legitimacy is reinforced. When parents and communities are in disagreement with schools, however, policies and practices tend to be less effective.

Various political, cultural, and institutional forces have helped shape school discipline. Changing perceptions of children, challenges to institutional authority, and fear of violence and crime are three of the most important influences.

Historically, society has vested school personnel with in loco parentis authority. Teachers were expected to assume the parental duties and responsibilities, including discipline, on the absent parents' behalf. As society and in turn schooling bureaucratized, schools were transformed. The school became a custodial institution responsible for managing large numbers of children. As such, the control of student behavior became important for the smooth functioning of the organization. Instead of substitute parents, school personnel began acquiring more of their disciplinary authority from their professional position. Although more bureaucratized, school authority remained strong until the 1960s. At this time, a general climate of discontent with the established social order was developing and would give birth to student, civil rights, and feminist movements. These movements, along with changing public attitudes, expanded individual rights and social equality. Within this context, traditional school discipline came under scrutiny.

In the United States, the clearest blow to school based authority came from a series of court decisions that limited discipline practices. One of the most important and best known cases was the 1969 Supreme Court decision in *Tinker v. Des Moines Independent Community School District* in which Justice Fortas, writing for the majority opinion, states that students are persons under the US Constitution and do not "shed their constitutional rights to freedom of speech or expression at the schoolhouse gate." While this case was about freedom of speech, other rulings limited activities such as the ability to dictate student appearance and conduct locker searches. School guidelines and sanctions were only legitimate to the degree they could be shown to be directly relevant to the functioning of the school. Another influential US Supreme Court decision, *Goss v. Lopez*, established

students' right to due process. The court concluded that because long suspensions and expulsions denied students access to public education, it was necessary to implement procedural safeguards. Consequently, students currently have the right to a disciplinary hearing before being expelled or suspended for longer than 10 days. The discretionary prerogative of the school to control student misbehavior had been curtailed.

Schools also faced challenges from outside the legal arena. Similar to other institutions, schools were accused of maintaining discriminatory policies and practices. Discipline systems in racial and ethnically integrated schools in particular became strained under racial and ethnic conflict. Critics pointed out that disciplinary actions were differentially applied to minority and lower socioeconomic students and argued that race and class based discrimination in education was reproducing social inequalities in the larger society. For example, neo Marxist sociologists argued that working class children were subject to more authoritarian discipline with the goal of producing a submissive, obedient, and disciplined workforce. Today, some children are still more likely to be disciplined than others; boys, children from lower socioeconomic families, racial or ethnic minorities, and low achievers are all more likely to be subject to authoritarian control and punishment.

Instead of directly challenging authoritarian discipline, some parents and educators established alternative models. Based on Dewey's educational theories, "free" schools were developed in the United States and Great Britain that minimized teacher direction and control. These schools purposefully deemphasized or attempted to eliminate hierarchical relations between students and teachers. Although a few of these schools have survived, in general the free school movement did not provide a widespread alternative to traditional school organization. More modest attempts at restructuring classroom discipline appear to have been more successful. Today, there are a variety of "classroom management" approaches available to educational practitioners.

In the United States, increasing crime rates and a shift to political conservatism in the 1980s corresponded with changing views on school discipline. In contrast to the anti authoritarianism of the 1960s and 1970s, public

sentiment began to favor stricter school discipline as "get tough" approaches gained popularity not only in the United States but also in countries such as Britain, Canada, and Australia. Even in the late 1960s there was some indication of concern. Respondents in the US annual Gallup Poll of attitudes toward public schools have ranked lack of school discipline as a top problem since 1969. There is evidence of similar concern in many western countries where formal government inquiries have been made into the matter. In addition, discipline is increasingly being defined as a problem in Asian countries such as Japan.

Images of violence and disorder in chaotic urban schools and later school shootings in several US suburban schools reinforced this trend by spurring concern for teacher and student safety. Policy began to reflect these changes as governments passed tighter controls and schools implemented zero tolerance policies. Under zero tolerance policies, certain punishments are mandatory for designated offenses, leaving little flexibility for circumstance. Proponents of zero tolerance claim that these policies hold students accountable for inappropriate behaviors and serve to deter other students from similar behavior. Opponents of zero tolerance argue that these policies disproportionately affect poor and minority students, are overly harsh and unfair, and alienate students without any clear evidence that they effectively reduce misbehavior. While strict controls are generally targeted at serious misconduct, more mundane behaviors are also increasingly being restricted. Drawing on arguments that general "disorder" is at the root of more serious disorder and violence, some schools have implemented stricter codes of conduct and dress.

Stricter discipline and policies providing teachers with the explicit authority to remove students from their classrooms have not reinstated the teacher as the primary school disciplinarian. Teachers continue to have the most interactions with students in the classroom but much of the responsibility for formal sanctioning resides elsewhere. Teachers often send misbehaving students to the principal and larger or more disorderly schools designate an administrator to handle disciplinary issues. Mandatory punishments in zero tolerance policies take authority away from educators. In some schools, the

punitive control of the justice system has replaced the authority of teacher and administrators as schools increasingly employ police officers, fences, security cameras, and metal detectors.

Although the meaning and purpose of school discipline are variable, in popular and political contexts “discipline” often refers to the sanctioning of children who disobey school rules. What is defined as misbehavior may be different from school to school and classroom to classroom and can range from chewing gum and talking in class to more serious criminal behaviors. Some regulations are codified into school or classroom rules but others may be unwritten and subject to interpretation. Similarly, while most schools have formal sanctions for rule violations, sanctions also occur informally and can be idiosyncratic. Because schooling in the United States is decentralized, disciplinary policy can vary significantly between states and school districts. Where schooling is more centralized, such as Europe, policies tend to be more consistent.

At the most mundane level, teachers and administrators frequently correct behavior by asking or demanding that students alter their behavior. Punishments for misbehavior may take many forms, including verbal reprimand, humiliation, the removal of privileges, lower grades, corporal punishment, and permanent or temporary discharge. At the primary school level, sanctions often include such actions as scolding, placement in “time out,” or withholding play time. Some schools also apply corporal punishment in which school personnel strike misbehaving children with a hand or object such as a paddle or cane. At the secondary school level, school discipline tends to take a different form. Detention and suspension are common disciplinary measures for adolescents. Students in detention are required to spend additional time at school, usually before or after the official school day or on the weekend, studying or performing a task assigned by the teacher. In some schools, administrators may impose formal removal from the classroom by placing offenders on suspension for a designated amount of time. For in school suspension, students spend time in a segregated room within the school. Out of school suspension requires that students stay home from school. Schools also sanction

students by barring participation in extra curricular activities such as athletic events, clubs, or field trips. For serious infractions, schools are increasingly referring the situation to law enforcement. Students may be expelled or transferred to an alternative educational institution.

Corporal punishment is the most controversial type of sanction. Reflective of discipline in the home, prior to the nineteenth century corporal punishment was common. Supported by the Christian ideology that to “spare the rod” was to “spoil the child,” teachers were free, and often encouraged, to physically punish students. While there were limitations to the amount of force that could be used, physical force was common and severe according to today’s standards. In the early 1800s, the United States witnessed successful efforts to limit corporal punishment and by the end of the nineteenth century some urban districts had banned its use. In the third quarter of the twentieth century, a concentrated challenge to corporal punishment resurfaced. Since then a little over half of all US states and several school districts have banned its use. Today, all industrialized countries, except Australia and the United States, as well as many developing countries have eliminated the official use of corporal punishment in schools. The current trend is toward restricting corporal punishment, with countries such as Canada, India, and South Africa only recently banning its use. Consistent with the “get tough” approach, some areas in the United States, however, have actually seen an increase in the use of corporal punishment.

Corporal punishment remains controversial. Opponents argue that corporal punishment should be eliminated on the grounds that it is inhumane and teaches children that the use of violence is acceptable. Proponents argue that corporal punishment is an effective tool for controlling misbehavior and teaching authority and self control. While the empirical evidence is mixed, the majority of research suggests that physical punishment is ineffective. Some studies even suggest that corporal punishment may possibly lead in the long term to alienation and increases in antisocial behavior.

school segregation, desegregation

Roslyn Arlin Mickelson

The United States has a long history of providing racially segregated and unequal public education to its children. Racially separate and unequal public education was not an accident; it was created by public laws and policies enacted and enforced by state governments and local school systems. After a series of Supreme Court decisions eliminated the formal legal foundation for segregation, it was recreated through racially discriminatory practices in federal housing policies, lending for home purchases, employment, wages, and school assignment practices.

Desegregation is the process that removes the formal and informal barriers preventing students from diverse racial and ethnic backgrounds from learning in the same classrooms and schools. Since the middle of the twentieth century, various desegregation policies have been widely used to remedy *de jure* (by law) and *de facto* (by practice) segregation. Among the policies employed were mandatory and voluntary busing, pairing of white and minority schools, using magnet programs to attract diverse students to segregated schools, redrawing of school attendance boundaries, and siting new schools in areas between minority and white neighborhoods. Desegregation also involved creating racially diverse faculty and staff, employing multicultural curricula, and nurturing diversity in extra and cocurricular activities. These processes ensure that, once in desegregated schools, all children have equitable opportunities to learn.

The still unfinished process of school desegregation commenced with the landmark 1954 *Brown v. Board of Education* decision, in which the Supreme Court declared that "separate educational facilities are inherently unequal" and "a denial of the equal protection of the laws." The 50th anniversary of the Supreme Court's *Brown* decision offered the opportunity to reflect upon the meaning of the decision and to assess what has and has not been accomplished in its name.

The *Brown* decision was a sea change, over turning the essence of the infamous *Plessy v.*

Ferguson case, which had legitimized racially “separate but equal” public spheres. However, *Brown* only addressed public actions, not private behaviors. This tension between legal mandates for racial justice in education and private actions to preserve white educational privileges slowed effective school desegregation for decades. Arguably, the most enduring legacy of the *Brown* decision is not desegregated public schools – especially in light of nationwide trends toward resegregation and the continuing struggle for educational equity. Rather, *Brown* enshrined in US law the concept that all people are citizens of this nation and that state enforced racial segregation is unconstitutional.

Southern schools remained segregated well into the 1960s and northern schools until the 1970s. Nevertheless, since the *Brown* decision, some regions of the United States were more successful in desegregating their schools than others. Southern and border states eventually experienced the greatest degree of desegregation. In some southern school systems the percentage of blacks attending extremely segregated minority schools dropped from 78 percent in the late 1960s to 25 percent at its lowest in the mid 1980s. Other regions of the country, where *de facto* segregation was the norm, also desegregated to a large degree. In the middle of the 1980s the national trend toward greater interracial contact in public schools stalled and began a slow reversal by the decade’s end (Clotfelter 2004; Orfield & Eaton 1996).

There are a number of reasons that the significant strides toward desegregated public education began to reverse in the late 1980s. The convergence of white interests in economic growth through interracial tranquility with black interests in educational and occupational mobility that permitted desegregation in the first three quarters of the last century (Bell 1980) did not survive through the 1990s. Other reasons for resegregation trends include the lifting of federal court orders mandating desegregation, demographic shifts in the US population – especially the explosive growth in ethnic minority populations – and the suburbanization of US communities. As a result, school systems that were once relatively desegregated are now becoming resegregated. Much of current segregation is between districts – especially central cities and their metropolitan area

suburbs – rather than among schools within a single district, as was historically the case. Some observers estimate that the levels of interracial contact in public schools will soon return to pre *Brown* levels of racial isolation.

WITHIN SCHOOL SEGREGATION

A nuanced discussion of desegregation must begin with the acknowledgment that segregation exists both between and within schools, a distinction often discussed in terms of first and second generation segregation (Wells & Crain 1994). First generation segregation generally involves the racial composition of schools within a single district or between adjacent districts and has been the focus of national desegregation efforts since *Brown*. Second generation segregation involves the racially correlated placement of students within schools typically brought about by ability grouping (in primary grades) and tracking (in secondary grades).

Some form of tracking or ability grouping is an organizational feature of most US public education (Oakes 2005), even though most school systems no longer have rigid tracks for vocational, college preparatory, or commercial courses of study (Lucas 1999). Black, Latino, and Native American students are disproportionately assigned to lower level classes, or tracks, compared to their comparably able white and Asian peers. Blacks, Latinos, and Native Americans are relatively absent from the accelerated tracks (Mickelson 2001; Oakes 2005). Racially stratified tracks create a discriminatory cycle of restricted educational opportunities for disadvantaged minorities. This cycle leads to diminished school achievement and, in turn, contributes to race and social class differences in school outcomes. Ability grouping and tracking often resegregate students even in school districts operating under court mandated desegregation plans. In these ways, first and second generation segregations intersect in ways that often subvert the goals of desegregation.

DESEGREGATION EFFECTS

Effects of desegregation typically fall into two categories: long term effects, which refer to adults’ educational and occupational attainment

trajectories that are influenced by their intergroup experiences during elementary and secondary school; and short term effects, which refer to what happens to students' academic achievement and racial attitudes as a result of intergroup contact (Braddock & Eitle 2003; Wells & Crain 1994). The evidence showing that desegregation has a positive effect on minority students' long term outcomes is well documented and rarely controversial: minorities who attended desegregated schools have greater educational and occupational attainment and are more likely to work and live in integrated environments than those who went to segregated schools. Both majority and minority adults who attended desegregated schools have lower levels of racial fears and antagonisms than those who attended racially isolated schools.

Most of the scholarly and policy debates concern the short term effects of desegregation on achievement. Earlier research on short term effects on achievement was equivocal. Some social scientists found that desegregated education modestly benefited minority students' academic outcomes (especially in language) without harming whites' achievement; other studies found no systematic effects. But most early empirical studies of desegregation suffered from limitations in their design and samples (Cook 1984). Another reason for the mixed results of earlier research on short term desegregation effects was the high correlation between social class and race. Some researchers contended that desegregation could not address racial inequality in educational outcomes caused by social class differences among students (Rossell, Armor, & Walberg 2002). Other social scientists concluded that desegregation policies were essentially ineffective in raising minority achievement because the larger societal problems at the root of racially correlated school outcomes are left untouched by school desegregation (Bankston & Caldas 2002).

A growing body of newer research demonstrates desegregation's significant positive effects on the achievement of minority and majority students, even after controlling for social class differences among the groups. Recent analyses of large, representative samples permit researchers to control for family background and prior achievement when they examine the effects of desegregation on achievement. US military

schools, for instance, are thoroughly desegregated, highly effective for all students, and have very small racial gaps in achievement compared to civilian schools. Black students' National Assessment of Educational Progress test scores in reading, science, and math rose during the years between the 1970s and the 1980s when desegregation was at its peak. Scores have not increased since the trend toward resegregation began in the 1990s (NCES 2001). Many social scientists attribute these gains in achievement to desegregation.

Whites and Asians benefit from desegregation as well. NAEP scores rapidly rose for whites and Asians between the 1970s and the 1980s, but the rise leveled off since desegregation peaked in the 1980s (NCES 2001). Using the 1990 National Educational Longitudinal Study, Brown (2004) found that high schools with enrollments that are almost entirely white do not necessarily produce the best academic outcomes for all students. Schools with a racial mix of 44–75 percent white and/or Asian American, and 25–54 percent black and/or Hispanic show the highest average academic achievement for all racial groups and the smallest gap between the races in test scores. Mickelson (2001) found whites as well as blacks in Charlotte, North Carolina benefited from attending racially integrated schools and classrooms. Borman and Dorn's (2004) analysis of Florida achievement data indicates students from all ethnic groups in integrated (compared to racially segregated) schools performed better on Florida's standardized tests. Muller and her colleagues (2004) used the Adolescent Health data set to examine opportunities to learn across ethnic groups in schools with varying levels of desegregation. They found greater opportunities to learn in integrated schools and that minorities performed better in them than in segregated schools.

The likely explanations for the positive effects of desegregated learning environments on student achievement point to greater human and material resources and more rigorous school climates. Desegregated schools are more likely than racially isolated minority schools to have highly qualified teachers instructing in their field of expertise, stable teacher and student populations, smaller class sizes, and modern equipment. In addition, students in

desegregated schools are more likely to have peers who are motivated, and who value achievement, and encourage it among their classmates. Parental involvement is higher in desegregated schools. In desegregated schools, students have greater interracial contact in classrooms, in extracurricular activities, and in peer groups. Such diversity stimulates higher order thinking among all students (Gurin et al. 2002). Taken together, these factors create an academic climate with higher expectations and greater opportunities to learn for all students (Hallinan 1998).

Braddock and Eitle (2003) propose a logical and empirical connection between short term and long term effects of desegregation. Their conceptual framework links desegregation's short term effects of enhanced achievement, socialization, and positive intergroup relationships and attitudes to its long term effects of greater social inclusion and social mobility. Attending desegregated schools has a positive effect on minority students' interracial attitudes, aspirations, self esteem, locus of control, standardized tests, grades, and class rank. These academic credentials and socialization experiences, in conjunction with broadened social networks, directly influence post secondary educational and occupational attainment that, in turn, enhance minority adults' income, job status, and the diversity of the institutions in which they participate. These adults are then better able to facilitate their own children's educational success and social mobility.

THE FUTURE OF DESEGREGATION

Since the withdrawal of vigorous federal efforts in pursuit of desegregation and the disappearance of the political consensus supporting it, a number of school districts are pursuing student diversity using strategic school siting in integrated neighborhoods, or socioeconomic status and/or test performance diversity as criteria for pupil assignment. Their goal is to avoid creating schools with concentrations of low income and poor performing students. Because socioeconomic status and race are highly correlated, SES diversity generally results in racially desegregated schools as well. Socioeconomic status diversity is not merely a back door to racial

desegregation; concentrating poor, low performing students in the same schools makes improving educational outcomes extremely difficult and very expensive.

The use of racial criteria to diversify public schools has not been eliminated by court rulings, just restricted. The 2003 University of Michigan Law School's affirmative action case, *Grutter v. Bollinger*, may provide an impetus for desegregating public K 12 schools. In *Grutter*, the majority of the Court held that because diversity in higher education is a compelling state interest, the law school may use race, among other criteria, in a narrowly tailored admission policy. In 2004, two post *Grutter* appeals court decisions addressed voluntary public school desegregation plans with explicit race conscious assignment strategies. A decision by the First Circuit Court of Appeals explicitly agreed that public schools have an educational rationale – that is, a compelling state interest – in promoting diversity. However, the Ninth Circuit Court of Appeals rejected a high school assignment plan that relied on this argument (Johnston 2004).

CONCLUSION

School desegregation was launched 50 years ago by a judicial decision of extraordinary simplicity and moral clarity (Clotfelter 2004). Yet once school systems actually began the process of dismantling racially segregated school systems, white parents seized opportunities to circumvent integration through practices such as tracking and school choice (then called freedom of choice plans). The willingness of school officials and other state actors to accommodate white parents seeking ways to retain their race privileges within public schools, and the weakening resolve among federal officials to carry out court mandates to desegregate, made it increasingly difficult to fully implement the policy during the last twenty years of the twentieth century.

During the second half of the twentieth century, *de jure* segregation was dismantled and for a period between the 1970s and the late 1980s *de facto* segregation was markedly reduced. The regions of the country that were once the most segregated became the most highly desegregated. At the time that the nation's public

schools were the most racially balanced, achievement levels improved for all students and the racial gaps in academic achievement narrowed considerably. By the end of the 1980s, the nation's will to continue school desegregation faltered and public schools began a slow retreat from the policy of equality of educational opportunity through desegregation. As schools became resegregated, the earlier national trends toward greater minority achievement and smaller racial gaps in school outcomes began to plateau.

In light of the dismantling of much of the legal framework for desegregation and the recent trends toward resegregation, the future of desegregated public education is uncertain. Even some minority citizens who once supported desegregation have expressed doubts about the policy. They have grown weary of continuing political struggles and are disappointed by the results of the policy's implementation for their children's academic outcomes. Moreover, they have been wounded by the costs of desegregation to their communities' cohesion, cultural identity, and by the loss of minority educators' jobs.

Over time, these social forces have eroded the nation's capacity to fully realize the potential social and academic benefits from diverse public education, and ultimately have resulted in a retreat from desegregation as the keystone to equality of educational opportunity. Ironically, this erosion is occurring at a time that research increasingly indicates diverse learning environments are essential for preparing students to be citizens of a multi ethnic, democratic society and successful workers in the globalizing economy.

school transitions

Michelle L. Frisco

School transitions signify students' entries into new schools. They are important milestones that lead to both positive and negative events that affect young people's lives. There are two broad categories of school transitions: (1) normative school transitions (e.g., the transition into elementary school, from elementary to junior high school, from junior high to high school); (2) non normative school transitions or school transfers.

This entry discusses the causes and consequences of school transitions. Schools are one of the primary social institutions in which young people spend time. Therefore, changes in school life can be particularly disrupting, both academically and socially.

NORMATIVE SCHOOL TRANSITIONS

The types, number, and levels of schools in a district vary markedly and are primarily determined by a district's physical size and the number of students that it serves. In rare instances in the US, a student remains in the same school from kindergarten through grade twelve, and some students only make one school transition. Most students today, though, experience two transitions – from elementary to junior high school and from junior high into high school.

Normative school transitions lead to many physical, social, and academic changes. Students begin attending school in a new location and building, which is usually much larger than their original school. In addition, peer relationships become more complicated, students become the youngest rather than the oldest students within the school's hierarchy, and the racial and ethnic composition of a school's students may change (French et al. 2000). Young people's interactions with school officials also change and often become more anonymous. Finally, the level and difficulty of coursework increases. Therefore, normative school transitions can be high risk periods when students are vulnerable to negative academic and social consequences.

The educational consequences include declining academic achievement (Seidman et al. 1996; Reyes et al. 2000), lower school attendance (Seidman et al. 1996), and lower school engagement and attachment (Barber & Olsen 2004). In addition, the likelihood of school dropout and stop out rises during the transition from junior high to high school (Roderick 1993).

Negative social consequences include lower levels of overall student functioning (Barber & Olsen 2004), decreased self esteem (Reyes et al. 2000), and less rewarding and more impersonal interactions with school personnel (Barber & Olsen 2004).

There is some evidence that school transitions can be positive (or at least neutral). For instance, students who were "nerds," unpopular, or isolated can reinvent themselves (Kinney 1993).

A host of factors can influence how easy or difficult normative school transitions are for students. Gender, race and ethnicity, academic ability, school location, and students' ages all influence how well students make normative school transitions. In addition, teachers, peers, and parents can all provide valuable support to students as they make school transitions. This helps to minimize the negative consequences of normal school mobility.

SCHOOL TRANSFERS

School transfers are not a common event when compared to normative school transitions. This is one reason why researchers posit that transfers are more disruptive to students' academic and social lives than normative school transitions. Students usually experience this transition without peers and often also undergo other changes – such as a residential move or change in family structure – simultaneously. Transfers also result from school choice programs, which may or may not decrease the amount of isolation adolescents experience as they change school environments.

There is less sociological research on school transfers than on normative school transitions, most likely because transfers are often viewed as an unavoidable consequence of residential mobility or family structure change. Nonetheless, transferring has been associated with negative

academic and social consequences, including behavioral problems, decreased mathematics test score gains, and an increased risk of school dropping out and stop out (Astone & McLanahan 1994; Swanson & Schneider 1999). Transferring also changes the composition of students' friendship networks and may lead them to lower status positions within these networks (South & Haynie 2004).

In recent decades, one specific type of school transfer has become its own area of study: school choice. It is a relatively new type of school mobility and there is great variability in school choice policies from school district to school district. There is also no clear answer as to whether school choice programs lead to positive or negative social and academic consequences for American students.

CONCLUSION

Sociologists who study education are beginning to understand school mobility. Nonetheless, we know far more about school transitions earlier as opposed to later in students' educational careers. Researchers must continue to investigate the causes and consequences (both negative and positive) of school mobility, the support systems that help students make these transitions, and the best ways to meet the educational needs of students who undergo abrupt changes in schooling experiences.

Greater investigation of school transfers is particularly needed. For instance, sociologists still only have limited knowledge about complex relationships and interactions between school mobility, residential mobility, and changing family structure. The effects of transfers that result from different forces (e.g., school choice versus a residential move) are also not well understood. Findings from these areas of inquiry will help policymakers develop programs that help students cope with changing school environments that disrupt their lives academically and socially.

schooling and economic success

David B. Bills and James E. Rosenbaum

The empirical association between schooling and economic success is one of the most secure findings in the social sciences. With rare exceptions, across societies and historical periods those with more schooling or particular types of schooling have held significant material advantages over those with less schooling. While not perfect, the empirical associations

between schooling and economic success are high, persistent, and according to many accounts, increasing. Schooling in many societies is now generally regarded as the key to both individual and collective social mobility.

Educational attainment is consistently associated with virtually every standard measure of socioeconomic success. For example, in the United States only a little more than three out of five individuals who have not completed high school are in the labor force. This number rises steadily as educational attainment rises, with nearly nine out of ten college graduates participating in the labor force. Similarly, as educational attainment goes up, unemployment rates unambiguously go down. This does not mean that providing high school dropouts with diplomas will suddenly provide adequate opportunities for them, but it does mean that when jobs are scarce, the least educated have the least access to them.

The relationship between education and socioeconomic success goes beyond whether or not people are working, to the types of work they do and the rewards associated with that work. Level of schooling is consistently and strongly related to occupational status, worker autonomy, earnings, employment stability, access to learning opportunities at work, and job benefits.

The good life afforded by schooling is not equally accessible to everyone. For example, at all levels of education, African Americans and Hispanics are more likely to be unemployed than are whites. The difference is especially great for African Americans. Further, women earn less than men at all levels of schooling.

Precisely why schooling is such a consistent predictor of economic success is less certain. Human capital theory (Becker 1964; Mincer 1989) maintains that schooling provides marketable skills and abilities relevant to job performance. This makes the more schooled more valuable to employers, thus raising their incomes and their opportunities for securing jobs. In this view, employers act rationally by selecting on educational credentials (although this need not be the only hiring criterion) because schooling has prepared the more educated to be better workers. Similarly, job seekers (in their prior role as students) act rationally by investing in their own human capital.

Credentialism offers a different vision of the association between education and work (Berg 1971; Collins 1979). This view holds that educational credentials are little more than arbitrary and exclusionary means of preserving socioeconomic advantage across generations and socioeconomic groups. Rather than indicating job skills, credentials are the ways in which gatekeepers restrict access to privileged positions. By using such putatively objective indicators of merit as educational credentials, elite classes can reproduce themselves in what appears to be a fair and equitable manner (Bourdieu & Passeron 1974).

Credentialism can refer to two very different processes that may or may not be directly related. For some, credentialism describes *credential inflation*. This position describes a system of job assignment in which employers demand more and more education for the same work. As evidence, analysts point to a rate of expansion in educational enrollments that is much more rapid than technologically induced growth in the demand for skills. Of course, economies can and do experience skill shortages and skill surpluses at the same time. Credential inflation may well operate in some sectors and not in others.

A second way to think about credentialism is as “sheepskin effects.” These are usually defined as disproportionate increases in returns to schooling after the completion of a year that usually is associated with a degree (Park 1999: 238). In other words, people are economically rewarded simply for holding a given degree. (One could as easily say that they are economically penalized for not completing a degree.) The difference in earnings between, for example, someone with four years of postsecondary education but no degree and someone with the degree (the sheepskin) is in effect the “rent” one collects for being credentialed.

Other theories of the relationship between schooling and economic success lie closer to the human capital theory, while incorporating aspects of the skepticism of credentialist theory. These include theories of screening, signaling, and filtering (Bills 2003). While there are important differences between these theories, they are unified by the claim that the importance of schooling is not so much that it enhances ability but rather that it reveals it. Because

employers cannot know which potential hires are most likely to be productive, they need to identify and gather trustworthy labor market information (Rosenbaum 2001). Educational credentials provide this information. More able job seekers can thus signal their market value by acquiring educational credentials, which in most societies have attained the status of legitimate indicators of the kinds of ability valued by employers.

Both analysts and policymakers show recurrent concern for *overeducation* (variously referred to as overqualification, surplus education, or educational mismatch, but rarely, strangely enough, overskilled). The idea behind overeducation is that some workers, usually considered to be a growing number, have more education than is "needed" for the jobs they hold (Halaby 1994). Determining the criteria for how much education is "needed" is far from self evident, and there is no uniform definition about what counts as overeducation. Some see overeducation subjectively, as workers' own assessments of the adequacy of their educational backgrounds for the demands of the jobs they hold. Those who see their own credentials as significantly higher than those needed to either secure or perform a job are held to be overeducated. Others measure overeducation more in terms of the objective characteristics of jobs. One might, for example, compare the educational level of a given worker to the educational level of the typical worker in that occupation or to some "job level requirements" of the occupation. In objective conceptualizations, workers who are significantly more highly educated than other workers in the same occupational category (regardless of their self assessments) are considered to be overeducated.

The evidence on overeducation and its social, political, and economic consequences is less than definitive. Empirical findings differ quite substantially across societies, and different conceptualizations of overeducation often produce different results. Most analysts believe that overeducation is both fairly common (some times held to be nearly a third of the workforce) and increasing (Green et al. 1999). Others believe there may have been some decline in the incidence of overeducation (Groot & van den Brink 2000). Some data suggest that women are more likely to be overeducated, and men

more likely to be undereducated. In general, the returns to overeducation (typically taken as "years of surplus schooling") are lower than the returns to "matched" schooling, but are positive nonetheless.

Theory and research on the relationships between schooling and economic success should continue to develop. The emergence of several integrated efforts to conduct cross societal comparative studies of social stratification, the development of high quality nationally representative data sets for an increasing number of countries, and solid methodological and conceptual apparatuses provide a solid foundation for further progress.

schooling, home

Mitchell L. Stevens

Home schooling, the practice of educating one's own children, has seen dramatic growth in the last three decades, and has transformed from a peculiarly American innovation to a truly global movement. An estimated 15,000 US children were home schooled in the late 1970s; by 2003 the number was over a million, and the practice had won adherents throughout the industrialized world (National Center for Education Statistics 2004; Stevens 2003). Parent directed education was almost entirely eclipsed with the accomplishment of universal compulsory schooling in the early twentieth century. But as part of the "anti Establishment" cultural ferment of the 1960s and 1970s home schooling reemerged as a social movement, championed by advocates across a wide ideological spectrum.

Even while all racial groups and socioeconomic levels are represented among them, home school families are disproportionately middle class, well educated, and white. The vast majority of home schooling work is conducted by mothers; most home school households are headed by married couples and supported by a sole, male breadwinner (National Center for Education Statistics 2001). Home schooling enables women with traditionalist conceptions of motherhood to incorporate some of the status of professional teaching into their full time domesticity. This is part of why the practice is particularly appealing to conservative religious women (Stevens 2001).

What may at first appear as an individual, quixotic educational choice has from its beginnings been a collective one. Home school families have long cooperated with one another in order to lobby for the legality of the practice

and to build often elaborate home school communities. Home schooling is best understood as a social movement, one with a distinctive dual history. One branch began in the left liberal alternative school movement of the 1960s, a cause which sought to radically democratize teacher–student relationships and give students greater discretion over their own educations. John Holt, long a prominent advocate of alternative schooling, began to promote home education (which he called "unschooling") in the 1970s. Before his death in 1985, Holt had successfully nurtured a national grassroots network of home school converts. Another branch comes out of the conservative Protestant day school tradition, specifically through the work of Raymond and Dorothy Moore, whose several books and national speaking tours advocating home education reached an audience of religious families already skeptical of public schools.

Despite these cultural differences the early home school advocates shared a conviction that each child has an essential, inviolable self, and that standardized methods of instruction are harmful to children's self development. Both Holt and the Moores, for example, frequently invoked factory metaphors to derogate conventional schools and to contrast them with the educational customization home education makes possible. But to this shared conviction about children's essential individualism these leaders added rather different ideas: Holt conceived of children as essentially virtuous beings with innate abilities to educate themselves; the Moores tended to view children as essentially good but also sinful, and thus in need of discipline and direction from wiser adults. This mix of commonality and difference in early home school philosophy presaged subsequent organizational conflict between the two branches of the cause.

One of the first tasks of the fledgling movement was to secure the legality of home education nationwide. Spurred by a remarkably well organized home school lobby, judicial and legislative activity throughout the 1980s rendered home education legal throughout the US by the end of the decade (Henderson 1993). The process of legalization was facilitated by the distinctive jurisdictional structure of American education. Because authority over schooling is

largely in the hands of state and local governments in the US, activists were able to wage localized battles and win victories in piecemeal fashion.

While the two branches of the home school movement cooperated amicably through the 1980s, the differences in their organizational sensibilities split the cause in the subsequent decade. From their different cultural traditions home school advocates had inherited contradictory organizational ideas: some of them favored highly democratic, consensual organizational forms and were wary of excluding families from their associations on the basis of religion or educational philosophy; by contrast, conservative Protestants preferred hierarchical organizational forms and often were eager to define their associations as distinctively "Christian" in character and membership. Home schoolers' different ways of thinking about collective action ultimately divided the movement into two organizational worlds: one officially "diverse" and non sectarian, the other officially "Christian."

This turbulent political history was largely hidden from public view by the movement's very success. By the mid 1990s home schooling had shed much of its countercultural stigma and had become an acceptable educational choice for families with a wide range of lifestyles. Interested parents could choose from an array of support and advocacy groups at the local and national levels, and shop in a vital sector of small businesses supplying varied curriculum materials to the growing home school market.

Because quantitative research on home schooled children's academic outcomes has been piecemeal, at present researchers lack the kind of systematic data that would enable them to say definitively if the practice confers a net advantage or disadvantage relative to conventional schooling. Nevertheless, the preponderance of available evidence indicates that the average home schooled child performs at least as well as her conventionally schooled peers on nationally normed standardized tests. While not all home schooled students are academic stars, research to date has yielded no cause for alarm regarding home schoolers' basic academic aptitudes and rates of school completion (Stevens 2001).

In both its history and its character, home schooling is an American invention. The

jurisdictional boundary between parents and the state has always been especially blurry in the US, a cultural reality which made the basic logic of home schooling initially more palatable in this country than it might have been elsewhere.

Nevertheless, home education has diffused globally over the last two decades. The national homes of the movement's earliest adherents are telling: England, with its long tradition of private schooling; and Japan, where an extremely competitive, exam driven education system has fostered novel means of educational advancement and exit. Home education is now practiced throughout the industrialized world, even in nations such as Germany, where it is technically illegal (Spiegler 2003), and we might predict that it will further flourish internationally as a neoliberal logic of citizens as discretionary consumers of state services continues its ascendancy (Stevens 2003).

The home school movement teaches three general sociological lessons. First, it reminds us of the inherent tensions at the boundary between family and school. Few would dispute that schools and families have very different functions, timetables, and emotional valences; often overlooked, however, are the problems that arise from the simple fact that these two institutions share the same children. Even while the personnel requirements for the two spheres are radically different, we tend to presume that people can easily transit from one to the other on a regular – indeed daily – basis. But at this formidable institutional intersection things are bound sometimes to go awry: parents will dispute the extent to which schools adequately honor the specialness of particular children; schools will be skeptical or dismissive of parent opinions; school and family priorities will conflict. Home education represents one, particularly radical response to the chronic contradictions between these very different spheres of social life. Evidence for this is the frequency with which parents explain their decision to home school their children by referencing obstacles and problems they experienced in public schools.

Second, the popularity of home education highlights the importance of individualism as a contemporary pedagogical ideal. Home schooling shares with other currently fashionable
