## PREFACE TO THE FOURTH EDITION

How Languages Are Learned (HLAL) started out as a series of professional development workshops for teachers in Quebec, Canada, where we both worked for many years. Three editions of the book have now travelled far from those origins. When we were working on the first edition in the 1980s and 1990s we were still in the early days of remarkable growth of research in second language acquisition. In updating the research for each new edition, the decisions about what to include have grown more diflicult. Keeping the book to a reasonable length has often meant choosing between classics in the field and important new studies, of which there are now so many. In this edition, we have annotated sorne 'Suggestions for further reading' at the end of each chapter. We encourage readers to follow these readings and the refer ence list to deepen their understanding of topics that we can only introduce here.

In this fourth edition of HLAL, we have added 'Questions for reflection' at the end of each chapter, and we have included sorne new 'Activities' that give readers opportunities to explore sorne of the topics. Another new feature of this edition is a companion website which contains additional activi ties, readings, and other web-based material and resources to enhance your reading and understanding of the contents of the book. It will also provide opportunities for readers to interact with others and to share their ideas for teaching and learning languages.

The website for How Languages are Learned can be accessed at www.oup.com/elt/teacher/hlal.

We are currendy working on a new series of books for teachers, the Oxford Key Conceptsfar the Language Classroom. Each volume, written by a different author, will focus on a specific topic (such as assessment, content-based lan guage teaching, literacy, and oral interaction), reviewing the relevant research and linking the findings to classroom practice. We hope that the books in this series will encourage teachers to continue learning about sorne of the topics that are introduced in HLAL.

We hope that both new readers and those who have read the previous edi tions of HLAL will find ideas and information that will challenge and inspire them to make their own contributions to second language learning, teach ing, and research.

Patsy M. Lightbown, Harwich, MA, USA
Nina Spada, Toronto, ON, Canada

## INTRODUCTION

When new methods and textbooks for second and foreign language teach ing are introduced, they are often said to be based on the latest research in psychology, linguistics, or pedagogy. Teachers are told that they will be more effective than those that have gane befare. In many cases, the new approaches are prescribed for immediate implementation in a school or region. Sometimes, the new materials come with opportunities for extensive training in their implementation. Sometimes, they are simply ordered and distributed to teachers who have to do their best to use them effectively.

Many approaches to language teaching have been proposed and imple mented. One approach requires students to learn rules of grammar and lists of vocabulary to use in translating literary texts. Another emphasizes the value of having students imitate and practise a set of correct sentences and memorize entire dialogues. Yet another encourages 'natural' communication between students as they engage cooperatively in tasks or projects while using the new language. In sorne classrooms, the second language is used as the medium to teach subject matter, with the assumption that the language itself will be learned incidentally as students focus on the academic content.

How are teachers to evaluate the potential effectiveness of different instruc tional practices? To be sure, the most important influence on teachers' decisions is their own experience with previous successes or disappointments, as well as their understanding of the needs and abilities of their students. We believe that ideas drawn from research and theory in second language acquisition are also valuable in helping teachers to evaluate claims made by proponents of various language teaching methods. The goal of this book is to introduce teachers-both novice and experienced-to sorne of the language acquisition research that may help them not only to evaluate existing text books and materials but also to adapt them in ways that are more consistent with our understanding of how languages are learned.

The book begins with a chapter on language learning in early childhood. This background is important because both second language research and second language teaching have been influenced by our understanding of how children acquire their first language. Several theories about first language (LI) learning are presented in this chapter and they are revisited later in the book in relation to second language (L2) learning.

In Chapter 2 we look at second language learners' developing knowledge, their ability to use that knowledge, and how this compares with L1 learning. InChapter 3, we turn our attention to how individual learner characteristics may affect success. In Chapter 4, several theories that have been advanced to explain second language learning are presented and discussed. Chapter 5 begins with a comparison of natural and instructional environments for second language learning. We then examine sorne different ways in which researchers have observed and described teaching and learning practices in second language classrooms.

In Chapter 6, we examine six proposals that have been made for second language teaching. Examples of research related to each of the proposals are presented, leading to a discussion of the evidence available for assessing their effectiveness. The chapter ends with a discussion of what research findings suggest about the most effective ways to teach and learn a second language in the classroom.

In Chapter 7, we will provide a general summary of the book by looking at how research can inform our response to sorne 'popular opinions' about lan guage learning and teaching that are introduced below.

A Glossary provides a quick reference for a number of terms that may be new or have specific technical meanings in the context of language acquisition research. Glossary words are shown in bold letters where they first appear in the text. For readers who would like to find out more, an annotated list of suggestions for further reading is included at the end of each chapter. The Bibliography provides full reference information for the suggested readings and all the works that are referred to in the text.

We have tried to present the information in a way that does not assume that readers are already familiar with research methods or theoretical issues in second language learning. Examples and case studies are included through out the book to illustrate the research ideas. Many of the examples are taken from second language classrooms. We have also included a number of activi ties for readers to practise sorne of the techniques of observation and analysis used in the research that we review in this book. At the end of each chapter are 'Questions for reflection' to help readers consolidare and expand their understanding of the material.

## Before we begin ...

It is probably true, as sorne have claimed, that most of us teach as we were taught or in away that matches our ideas and preferences about howwe learn. Take a moment to reflect on your views about how languages are learned and what you think this means about how they should be taught. The statements in the activity below summarize sorne popular opinions about language
learning and teaching. Think about whether you agree or disagree with each opinion. Keep these statements and your reactions to them in mind as you read about current research and theory in second language learning.

## ACTIVIT Give your opinion on these statements

Indicare the extent to which you agree with each statement by marki ng an $X$ in the box associated with your opinion:
SA-strongly agree
A-agree somewhat
D-disagree somewhat
SD-strongly disagree

| Languages are learned mainly through imitation. |  |  |  |  |
| 2 Parents usually correct young child ren when they make grammatical errors. |  |  |  |  |
| 3 Highly intelligent people are good language learners. |  |  |  |  |
| 4 The most important predictor of success in second language acquisition is motivation. |  |  |  |  |
| 5 The earlier a second language is introduced in school programmes, the greater the likelihood of success in learni ng. |  |  |  |  |
| 6 Most of the mistakes that second language learners make are due to interference from their first language. |  |  |  |  |
| 7 The best way to learn new vocabulary is th rough reading. |  |  |  |  |
| $\mathbf{8}$ lt is essential for learners to be able to pronou nce all the individual sounds inthe second language. |  |  |  |  |
| 9 Once learners know 1,000 words and the basic structu re of a language, they can easily participate in conversations with native speakers. |  |  |  |  |
| 10 Teachers should present grammatical rules one at a time, and learners should practise examples of each one befare going on to another. |  |  |  |  |
| 11Teachers should teach simple language structu res befare complex ones. |  |  |  |  |

12 Learners' errors should be corrected as soon as they are made in order to prevent the formation of bad habits.

13 Teachers should use materials that expose students only to language structures they have already been taught.

14When learners are allowed to interact freely (for example, ingroup or pair activities), they copy each other's mistakes.

15 Students learn what they are taught.
16 Teachers should respond to students' errors by correctly reph rasing what they have said rather than by explicitly pointi ng out the error.

17 Students can learn both language and academic content (for example, science and history) simultaneously inclasses where the subject matter is taught in their second language.

18Classrooms are good places to learn about language but not for learning how to use language.

## - LAN GUAGE LEARNING IN EARLY CHI LDHOOD

## Preview

In this chapter, we will look briefly at the language development of young children. We will then consider several theories that have been offered as explanations for how language is learned. There is an immense amount of research on child language. Although much of this research has been done in middle-class North American and European families, there is a rich body of cross-linguistic and cross-cultural research as well. Our purpose in this chapter is to touch on a few main points in this research, primarily as a prepa ration for the discussion of second language acquisition (SLA), which is the focus of thisbook.

## First language acquisition

Language acquisition is one of the most impressive and fascinating aspects of human development. We listen with pleasure to the sounds made by a three-month-old baby. We laugh and 'answer' the conversational 'ba-ba-ba' babbling of older babies, and we share in the pride and joy of parents whose one-year-old has uttered the first 'bye-bye'. Indeed, learning a language is an amazing feat-one that has attracted the attention oflinguists and psycholo gists for generations. How do children accomplish this? What enables a child not only to learn words, but to put them together in meaningful sentences? What pushes children to go on developing complex grammatical language even though their early simple communication is successful for most pur poses? Does child language develop similarly around the world? How do bilingual children acquire more than one language?

## The.first threeyears: Milestones and <br> developmentalsequences

One remarkable thing about first language acquisition is the high degree of similarity in the early language of children all over the world. Researchers have described developmental sequences far many aspects of first language acquisition. The earliest vocalizations are simply the involuntary crying that babies do when they are hungry or uncomfartable. Soon, however, we hear the cooing and gurgling sounds of contented babies, lying in their beds looking at fascinating shapes and movement around them. Even though they have little control over the sounds they make in these early weeks of life, infants are able to hear subde differences between the sounds of human languages. Not only do they distinguish the voice of their mothers from those of other speakers, they also seem to recognize the language that was spoken around their mother befare they were born. Furthermore, in cleverly designed experiments, researchers have demonstrated that tiny babies are capable of very fine auditory discrimination. For example, they can hear the difference between sounds as similar as 'pa' and 'ha'.

Janet Werker, Patricia Kuhl, and others have used new technologies that allow us to see how sensitive infants are to speech sounds. What may seem even more remarkable is that infants stop making distinctions between sounds that are not phonemic in the language that is spoken around them. Far example, by the time they are a year old, babies who will become speakers of Arabic stop reacting to the difference between 'pa' and 'ha' which is not pho nemic in Arabic. Babies who regularly hear more than one language in their environment continue to respond to these differences far a longer period (Werker, Weikum, and Yoshida 2006). One important finding is that it is not enough far babies to hear language sounds from electronic devices. In arder to learn-or retain-the ability to distinguish between sounds, they need to interact with a human speaker (Conboy and Kuhl 2011). The Internet abounds with remarkable videos of infants reacting to language sounds.

Whether they are becoming monolingual or bilingual children, however, it will be many months befare their own vocalizations begin to reflect the characteristics of the language or languages they hear and longer still befare they connect language sounds with specific meaning. However, by the end of their first year, most babies understand quite a few frequently repeated words in the language or languages spoken around them. They wave when someone says 'bye-bye'; they clap when someone says 'pat-a-cake'; they eagerly hurry to the kitchen when 'juice and cookies' are mentioned.

At 12 months, most babies will have begun to produce a word or two that everyone recognizes. By the age of two, most children reliably produce at least 50 different words and sorne produce many more. About this time, they begin to combine words into simple sentences such as 'Mommy juice' and
'baby fall down'. These sentences are sometimes called 'telegraphic' because they leave out such things as anides, prepositions, and auxiliary verbs. We recognize them as sentences because, even though function words and gram matical morphemes are missing, the word order reflects the word order of the language they are hearing and the combined words have a meaningful relationship that makes them more than just a list of words. Thus, for an English-speaking child, 'kiss baby' does not mean the same thing as 'baby kiss'. Remarkably, we also see evidence, even in these early sentences that children are doing more than imperfectly imitating what they have heard. Their two- and three-word sentences show signs that they can creatively combine words. For example, 'more outside' may mean 'I want to go outside again.' Depending on the situation, 'Daddy uh-oh' might mean 'Daddy fell down' or 'Daddy dropped something' or even 'Daddy, please do that funny thing where you pretend to drop me off your lap.'

As children progress through the discovery of language in their first three years, there are predictable patterns in the emergence and development of many features of the language they are learning. For sorne language features, these patterns have been described in terms of developmental sequences or 'stages'. To sorne extent, these stages in language acquisition are related to children's cognitive development. For example, children do not use temporal adverbs such as 'tomorrow' or 'last week' until they develop sorne under standing of time. In other cases, the developmental sequences seem to reflect the gradual acquisition of the linguistic elements for expressing ideas that have been present in children's cognitive understanding for a long time. For example, children can distinguish between singular and plural long before they reliably add plural endings to nouns. Correct use of irregular plurals (such as 'feet') takes even more time and may not be completely under control until the school years.

## Grammatical morphemes

In the 1960s, severa! researchers focused on how children acquire grammati cal morphemes in English. One of the best-known studies was carried out by Roger Brown and his colleagues and students. In a longitudinal study of the language development of three children (called Adam, Eve, and Sarah) they found that 14 grammatical morphemes were acquired in a similar sequence. The list below (adapted from Brown's 1973 book) shows sorne of the mor phemes they studied.
present progressive -ing (Mommy running)
plural -s (two books)
irregular past forms (Baby went)
possessive -s (Daddy's hat)
copula (Mommy is happy)
anides the and $a$
regular past -ed (she walked)
third person singular simple present $-s$ (she runs)
auxiliary be (he is coming)
Brown and his colleagues faund that a child who had mastered the gram matical morphemes at the bottom of the list had also mastered those at the top, but the reverse was not true. Thus, there was evidence far a 'developmen tal sequence' or arder of acquisition. However, the children did not acquire the morphemes at the same age or rate. Eve had mastered nearly all the mor phemes befare she was two-and-a-half years old, while Sarah and Adam were still working on them when they were three-and-a-half or faur.

Brown's longitudinal work was confirmed in a cross-sectional study of 21 children. Jill and Peter de Villiers (1973) faund that children who correctly used the morphemes that Adam, Eve, and Sarah had acquired late were also able to use the ones that Adam, Eve, and Sarah had acquired earlier. The chil dren mastered the morphemes at different ages, just as Adam, Eve, and Sarah had done, but the arder of their acquisition was very similar.

Many hypotheses have been advanced to explain why these grammatical morphemes are acquired in the observed arder. Researchers have studied the frequency with which the morphemes occur in parents' speech, the cognitive complexity of the meanings represented by each morpheme, and the difficulty of perceiving or pronouncing them. In the end, there has been no simple satis factory explanation far the sequence, and most researchers agree that the arder is determined by an interaction among a number of different factors.

To supplement the evidence we have from simply observing children, sorne carefully designed procedures have been developed to further explore chil dren'sknowledge ofgrammatical morphemes. Oneof the first and best known is the so-called 'wug test' developed by Jean Berko Gleason (1958). In this 'test', children are shown drawings of imaginary creatures with novel names or people perfarming mysterious actions. Far example, they are told, 'Here is a wug. Now there are two of them. There are two ' or 'Here is a man who knows how to bod. Yesterday he did the same thing. Yesterday, he '. By completing these sentences with 'wugs' and 'bodded', children demonstrate that they know the patterns far plural and simple past in English. By gener alizing these patterns to words they have never heard befare, they show that their language is more than just a list of memorized word pairs such as 'book/ books' and 'nod/nodded'.

## ACtivity Tryout the 'wug'test

A web search for 'wug test' will turn up many examples of the pictu res and the text created for this land mark research. If you know sorne English-speaking child ren under the age of five years, try usi ng the test with them.

What similarities and differences do you notice among the child ren at different ages?

2 Which grammatical morphemes do they find easy and which enes are more difficult?

The acquisition of other language features also shows how children's language develops systematically, and how they go beyond what they have heard to create new forms and structures.

## Negation

Children learn the functions of negation very early. That is, they learn to comment on the disappearance of objects, to refuse a suggestion, or to reject an assertion, even at the single word stage. However, as Lois Bloom's (1991) longitudinal studies show, even though children understand these func tions and express them with single words and gestures, it takes sorne time before they can express them in sentences, using the appropriate words and word order. The following stages in the development of negation have been observed in the acquisition of English. Similar stages have been observed in other languages as well (Wode 1981).

## Stage 1

Negation is usually expressed by the word 'no', either all alone or as the first word in the utterance.

No. No cookie. No comb hair.

## Stage 2

Utterances grow longer and the sentence subject may be included. The neg ative word appears just before the verb. Sentences expressing rejection or prohibition often use 'don't'.

Daddy no comb hair. Don't touch that!

## Stage 3

The negative element is inserted into a more complex sentence. Children may add forms of the negative other than 'no', including words like 'can't' and 'don't'. These sentences appear to follow the correct English pattern of attaching the negative to the auxiliary or modal verb. However, children do not yet vary these forms for different persons or tenses.

I can't do it. He don't want it.

## Stage 4

Children begin to attach the negative element to the correct form of auxiliary verbs such as 'do' and 'be'.

You didn't have supper. She doesn't want it.
Even though their language system is by now quite complex, they may still have difficulty with sorne other features related to negatives.

I don't have no more candies.

## Questions

The challenge oflearning complex language systems is also illustrated in the developmental stages through which children learn to ask questions.

There is a remarkable consistency in the way children learn to form ques tions in English. For one thing, there is a predictable order in which the 'whwords' emerge (Bloom 1991). 'What' is generally the first wh- question word to be used. It is often learned as part of a chunk. ('Whassat?') and it is sorne time before the child learns that there are variations of the form, such as 'What is that?' and 'What are these?'.
'Where' and 'who' emerge very soon. Identifying and locating people and objects are within the child's understanding of the world. Furthermore, adults tend to ask children just these types of questions in the early days of language learning, for example, 'Where's Mommy?' or 'Who's that?'
'Why' emerges around the end of the second year and becomes a favourite for the next year or two. Children seem to ask an endless number of questions beginning with 'why', having discovered how effectively this little word gets adults to engage in conversation, for example, 'Why that lady has blue hair?'

Finally, when the child has a better understanding of manner and time, 'how' and 'when' emerge. In contrast to 'what', 'where', and 'who' questions, chil dren sometimes ask the more cognitively difficult 'why', 'when', and 'how' questions without understanding the answers they get, as the following con versation with a four-year-old clearly shows.

CHILD When can we go outside?
PARENT In about five minutes.
CHILD 1-2-3-4-5! Can we go now?
The ability to use these question words is at least partly tied to children's cog nitive development. It is also predicted in part by the questions children are asked and the linguistic complexity of questions with different wh-words. Thus it does not seem surprising that there is consistency in the sequence of their acquisition. Perhaps more surprising is the consistency in the acquisi tion of word order in questions. This development is not based on learning new meanings, but rather on learning different linguistic patterns to express meanings that are already understood.

## Stage 1

Children's earliest questions are single words or simple two- or three-word sentences with rising intonation:

Cookie? Mommy book?
At the same time, they may produce sorne correct questions-correct because they have been learned as chunks:

Where's Daddy? What's that?

## Stage 2

As they begin to ask more new questions, children use the word arder of the declarative sentence, with rising intonation.

You like this? I have sorne?
They continue to produce the correct chunk-learned forms such as 'What's that?' alongside their own created questions.

## Stage 3

Gradually, children notice that the structure of questions is different and begin to produce questions such as:

## Can I go?

Are you happy?
Although sorne questions at this stage match the adult pattern, they may be right for the wrong reason. To describe this, we need to see the pattern from the child's perspective rather than from the perspective of the adult grammar. We call this stage 'fronting' because the child's rule seems to be that questions are formed by putting something (a verb or question word) at the 'front' of a sentence, leaving the rest of the sentence in its statement form.

Is the teddy is tired? Do I can have a cookie?
Why you don't have one? Why you catched it?

## Stage 4

At Stage 4, sorne questions are formed by subject-auxiliary inversion. The questions resemble those of Stage 3, but there is more variety in the auxilia ries that appear befare the subject.

Are you going to play with me?
At this stage, children can even add 'do' in questions in which there would be no auxiliary in the declarative version of the sentence.

Do dogs like icecream?
Even at this stage, however, children seem able to use either inversion or a wh word, but not both (for example, 'Is he crying?' but not 'Why is he crying?'

Therefore, we may find inversion in yes/no questions but not in wh- ques tions, unless they are formulaic units such as 'What's that?'

## Stage 5

At Stage 5, both wh- and yes/no questions are formed correctly.
Are these your boots?
Why did you do that?
Does Daddy have a box?
Negative questions may still be a bit too difficult.
Why the teddy bear can't go outside?
And even though performance on most questions is correct, there is still one more hurdle. When $w h$ - words appear in subordinate clauses or embedded questions, children overgeneralize the inverted form that would be correct for simple questions and produce sentences such as:

Ask him why can't he go out.

## Stage 6

At this stage, children are able to correctly form all question types, including negative and complex embedded questions.

Passage through developmental sequences does not always follow a steady uninterrupted path. Children appear to learn new things and then fall back on old patterns when there is added stress in a new situation or when they are using other new elements in their language. But the overall path takes them toward a closer and closer approximation of the language that is spoken around them.

## Thepre-school years

By the age of four, most children can ask questions, give commands, repon real events, and create stories about imaginary ones, using correct word order and grammatical markers most of the time. In fact, it is generally accepted that by age four, children have acquired the basic structures of the language or languages spoken to them in these early years. Three- and four-year-olds continue to learn vocabulary at the rate of several words a day. They begin to acquire less frequent and more complex linguistic structures such as passives and relative clauses.

Much of children's language acquisition effort in the late pre-school years is spent in developing their ability to use language in a widening social environ ment. They use language in a greater variety of situations. They interact more often with unfamiliar adults. They begin to talk sensibly on the telephone to invisible grandparents (younger children do not understand that their telephone partner cannot see what they see). They acquire the aggressive or
cajoling language that is needed to defend their toys in the playground. They show that they have learned the difference between how adults talk to babies and how they talk to each other, and they use this knowledge in elaborare pretend play in which they practise using these different 'voices'. In this way, they explore and begin to understand how and why language varies.
In the pre-school years, children also begin to develop metalinguistic aware ness, the ability to treat language as an object separare from the meaning it conveys. Three-year-old children can tell you that it's 'silly' to say 'drink the chair', because it doesn't make sense. However, although they would never say 'cake the eat', they are less sure that there's anything wrong with it. They may show that they know it's a bit odd, but they will focus mainly on the fact that they can understand what it means. Five-year-olds, on the other hand, know that 'drink the chair' is wrong in a different way from 'cake the eat'. They can tell you that one is 'silly' but the other is 'the wrong way around'.

Language acquisition in the pre-school years is impressive. It is also note worthy that children have spent thousands of hours interacting with language-participating in conversations, eavesdropping on others' con versations, being read to, watching television, etc. A quick mathematical exercise will show you just how many hours children spend in language-rich environments. Ifchildren are awake for ten or twelve hours a day, we may estimate that they are in contact with the language of their environment for 20,000 hours or more by the time they go to school.

Although pre-school children acquire complex knowledge and skills for language and language use, the school setting requires new ways of using language and brings new opportunities for language development.

## Theschoolyears

Children develop the ability to use language to understand others and to express their own meanings in the pre-school years, and in the school years, this ability expands and grows. Learning to read gives a major boost to meta linguistic awareness. Seeing words represented by letters and other symbols on a page leads children to a new understanding that language has form as well as meaning. Reading reinforces the understanding that a 'word' is sepa rare from the thing it represents. Unlike three-year-olds, children who can read understand that 'the' is a word, just as 'house' is. They understand that 'caterpillar' is a longer word than 'train', even though the object it represents is substantially shorter! Metalinguistic awareness also includes the discovery of such things as ambiguity. Knowing that words and sentences can have multiple meaning gives children access to word jokes, trick questions, and riddles, which they love to share with their friends and family.

One of the most impressive aspects of language development in the school years is the astonishing growth of vocabulary. Children enter school with the ability to understand and produce several thousand words, and thousands more will be learned at school. In both the spoken and written language at school, words such as 'homework' or 'ruler' appear frequently in situations where their meaning is either immediately or gradually revealed. Words like 'population' or 'latitude' occur less frequently, but they are made important by their significance in academic subject matter.

Vocabulary grows at a rate of between several hundred and more than a thousand words a year, depending mainly on how much and how widely children read (Nagy, Herman, and Anderson 1985). The kind of vocabulary growth required for school success is likely to come from both reading for assignments and reading for pleasure, whether narrative or non-fiction. Dee Gardner (2004) suggests that reading a variety of text types is an essential part of vocabulary growth. His research has shown how the range of vocabulary in narrative texts is different from that in non-fiction. There are words in non-fiction texts that are unlikely to occur in stories or novels. In addition, non-fiction tends to include more opportunities to see a word in its different forms (for example, 'mummy', 'mummies', 'mummified'). The importance of reading for vocabulary growth is seen when observant parents report a child using a new word but mispronouncing it in a way that reveals it has been encountered only in written form.

Another important development in the school years is the acquisition of dif ferent language registers. Children learn how written language differs from spoken language, how the language used to speak to the principal is different from the language of the playground, how the language of a science report is different from the language of a narrative. As Terry Piper (2006) and others have documented, sorne children will have even more to learn if they come to school speaking an ethnic or regional variety of the school language that is quite different from the one used by the teacher. They will have to learn that another variety, often referred to as the standard variety, is required for suc cessful academic work. Other children arrive at school speaking a different language altogether. For these children, the work oflanguage learning in the early school years presents additional opportunities and challenges. We will return to this topic when we discuss bilingualism in early childhood.

## Explaining first language acquisition

These descriptions oflanguage development from infancy through the early school years show that we have considerable knowledge of what children learn in their early language development. More controversia!, however, are questions about how this development takes place. What abilities does the child bring to the task and what are the contributions of the environment?

Since the middle of the 20th century, three main theoretical positions have been advanced to explain language development: behaviourist, innatist, and interactional/ developmental perspectives.

## 1he behaviouristperspective

Behaviourism is a theory of learning that was influential in the 1940s and 1950s, especially in the United States. With regard to language learning, the best-known proponent of this psychological theory was B. F. Skinner (1957). Traditional behaviourists hypothesized that when children imitated the language produced by those around them, their attempts to reproduce what they heard received 'positive reinforcement'. This could take the form of praise or just successful communication. Thus encouraged by their envi ronment, children would continue to imitate and practise these sounds and patterns until they formed 'habits' of correct language use. According to this view, the quality and quantity of the language the child hears, as well as the consistency of the reinforcement offered by others in the environment, would shape the child's language behaviour. This theory gives great impor tance to the environment as the source of everything the child needs to learn.

## Analysing children'sspeech: Definitions and examples

The behaviourists viewed imitation and practice as the primary processes in language development. To clarify what is meant by these two terms, consider the following definitions and examples.

Imitation: word-for-word repetition of all or part of someone else's utterance.
mother Shall we play with the dolls?
LuCy Play with dolls
Practice: repetitive manipulation of form.
cIndy He eat carrots. The other one eat carrots. They both eat carrots.

Now examine the transcripts from Peter, Cindy, and Kathryn. They were all about 24 months old when they were recorded as they played with a visiting adult. Using the definitions above, notice how Peter imitates the adult in the following dialogue.

Peter (24 months) is playing with a dump truck while two adults, Patsy and Lois, look on.

| PETER | Get more. |
| :--- | :--- |
| LOIS | You're gonna put more wheels in the dump truck? |
| PETER | Dump truck. Wheels. Dump truck. |

(later)
Patsy What happened to it (the truck)?

```
PETER (looking under chair for it) Lose it. Dump truck! Dump
    truck! Fall! Fall!
lois Yes, the dump truck fell clown.
peter Dump truck fell clown. Dump truck.
```

(Unpublished data from P.M. Lightbown)
Ifwe analysed a larger sample of Peter's speech, we would see that 30-40 per cent of his sentences were imitations of what someone else had just said. We would also see that his imitations were not random. That is, he did not simply imitare 30-40 per cent of everything he heard. Detailed analyses of large samples of Peter's speech over about a year showed that he imitated words and sentence structures that were just beginning to appear in his spontaneous speech. Once these new elements became solidly grounded in his language system, he stopped imitating them and went on to imitare others.

Unlike a parrot who imitares the familiar and continues to repeat the same things again and again, children appear to imitare selectively. The choice of what to imitare seems to be based on something new that they have just begun to understand and use, not simply on what is available in the environ ment. For example, consider how Cindy imitares and practises language in the following conversations.

Cindy (24 months, 16 days) is looking at a picture of a carrot in a book and trying to get Patsy's attention.

```
CINDY Kawo? kawo? kawo? kawo? kawo?
PATSY What are the rabbits eating?
CIN DY They eating ... kando?
PATSY No, that's a carrot.
CINDY Carrot. (pointing to each carrot on the page) The other ...
        carrot. The other carrot. The other carrot.
```

(A few minutes later, Cindy brings Patsy a stuffed toy rabbit.)
patsy What does this rabbit like to eat?
CINDY (incomprehensible) eat the carrots.
(Cindy gets another stuffed rabbit.)
CIN DY He (incomprehensible) eat carrots. The other one eat carrots. They both eat carrots.
(One week later, Cindy opens the book to the same page.)

> CINDY Here's the carrots. (pointing) Is that a carrot? PATSY $\quad$ Yes.
(Unpublished data from P. M. Lightbown)

Cindy appears to be working hard on her language acquisition. She prac tises new words and structures in a way that sounds like a student in sorne foreign language classes! Perhaps most interesting is that she remembers the 'language lesson' a week later and turns straight to the page in the book she had not seen since Patsy's last visit. What is most striking is that, like Peter, her imitation and practice appear to be focused on what she is currendy 'working on'.

The samples of speech from Peter and Cindy seem to lend sorne support to the behaviourist explanation of language acquisition. Even so, as we saw, the choice of what to imitare and practise seemed determined by something inside the child rather than by the environment.

Not all children imitate and practise as much as Peter and Cindy did. The amount of imitation in the speech of other children, whose development proceeded at a rate comparable to that of Cindy and Peter, has been cal culated at less than 10 per cent. Consider the examples of imitation and practice in the following conversation between Kathryn and Lois.

Kathryn (24 months)
Lois Did you see the toys I brought?
KATH RYN I bring toys? Choo choo? Lois brought the choo choo train?
Lois Yes, Lois brought the choo choo train.
KATHRYN (reaching for bag) I want play with choo choo train. I want play with choo choo train. (taking out slide) Want play. What's this?
Lois Oh you know what that is.
kath ryn Put clown on floor. This. I do this.
(Kathryn puts the slide on the floor.)
KATH RYN (taking out two cars of train) Do this. I want do this. (trying to put train together) I do this. I do this.
lois OK. You can do it. You can do it. Look I'll show you how.
U.ois puts it together.)

KATH RYN (searching in box) I get more. Get a more. No more choo choo train. Get truck. (taking out truck) Kathryn truck. Where? Where a more choo choo train?
lois Inside. It's in the box.
Kathryn A choo choo? (taking out part of train) This is a choo choo train.
tfrom Bloom and Lahey 1978: 135)
like Cindy, Kathryn sometimes repeats herself or produces a series of related practice sentences, but she rarely imitares the other speaker. Instead, she asks md answers questions and elaborates on the other speaker's questions or statements.

Thus, children vary in the amount of imitation they do. In addition, many of the things they say show that they are using language creatively, not just repeating what they have heard. This is evident in the following examples.

## Patterns inlanguage

The first example shows a child in the process of learning patterns in lan guage, in this case the rules of word formation, and overgeneralizing them to new contexts.

Randall ( 36 months) had a sore on his hand.
mother Maybe we need to take you to the doctor. ran dall Why? So he can doc my little bump?

Randall forms the verb 'doc' from the noun 'doctor', by analogy with farmers who farm, swimmers who swim, and actors who act.

## Focus on meaning

Even older children have to work out sorne puzzles, for example, when famil iar language is used in unfamiliar ways, as in the example below. When David ( 5 years, 1 month) was at his older sister's birthday party, toasts were pro posed with grape juice in stemmed glasses:

FATHER I'd like to propose a toast.
Severa! minutes later, David raised his glass:
DAVID I'd like to propase a piece of bread.
Only when laughter sent David slinking from the table did the group realize that he wasn't intentionally making a play on words! He was concentrating
so hard on perfarming the fascinating new gesture and the farmulaic expres sion Td like to propase ...' that he failed to realize that the word he thought he knew-'toast'-was not the same toast and could not be replaced with its apparent near-synonym, 'a piece of bread'.

## Questionformation

Randall (2 years, 9 months) asked the fallowing questions in various situa tions over the course of a day.

Are dogs can wiggle their tails?
Are those are my boots?
Are this is hot?
Randall had concluded that the trick of asking questions was to put 'are' at the beginning of the sentence. His questions are good examples of Stage 3 in question development.

## Order of events

Randall (3 years, 5 months) was looking far a towel.
You took all the towels away because I can't dry my hands.
He meant 'I can't dry my hands because you took all the towels away', but he made a mistake about which clause comes first. Children at this stage of language development tend to mention events in the order of their occur rence. In this case, the towels disappeared befare Randall attempted to dry his hands, so that's what he said first. He did not yet understand how a word like 'befare' or 'because' changes the order of cause and effect.

These examples of children's speech provide us with a window on the process of language learning. Imitation and practice alone cannot explain sorne of the farms created by children. They are not merely repetitions of sentences that they have heard from adults. Rather, children appear to pick out patterns and generalize them to new contexts. They create new farms or new uses of words. Their new sentences are usually comprehensible and often correct.

Behaviourism seems to offer a reasonable way of understanding how children learn sorne of the regular and routine aspects oflanguage, especially at the ear liest stages. However, children who do little overt imitation acquire language as fully and rapidly as those who imitate a lot. And although behaviourism goes sorne way to explaining the sorts of overgeneralization that children make, classical behaviourism is not a satisfactory explanation far the acquisi rion of the more complex grammar that children acquire. These limitations led researchers to look far different explanations far language acquisition.

## lhe innatistperspective

Noam Chomsky is one of the most influential figures in linguistics, and his ideas about how language is acquired and how it is stored in the mind sparked a revolution in many aspects of linguistics and psychology, includ ing the study of language acquisition. The innatist perspective is related to Chomsky's hypothesis that all human languages are based on sorne innate universal principles.

In his 1959 review of B. F. Skinner's book Verbal Behavior, Chomsky chal lenged the behaviourist explanation far language acquisition. He argued that children are biologically programmed far language and that language devel ops in the child in just the same way that other biological functions develop. Far example, every child will learn to walk as long as adequate nourishment and reasonable freedom of movement are provided. The child does not have to be taught. Most children learn to walk at about the same age, and walking is essentially the same in all normal human beings. Far Chomsky, language acquisition is very similar. The environment makes only a basic contribu tion-in this case, the availability of people who speak to the child. The child, or rather, the child's biological endowment, will do the rest.

Chomsky argued that the behaviourist theory failed to account far 'the logical problem oflanguage acquisition'-the fact that children come to know more about the structure of their language than they could reasonably be expected to learn on the basis of the samples of language they hear. The language children are exposed to includes false starts, incomplete sentences, and slips of the tangue, and yet they learn to distinguish between grammatical and ungrammatical sentences. He concluded that children's minds are not blank slates to be filled by imitating language they hear in the environment. Instead, he hypothesized, children are born with a specific innate ability to discover far themselves the underlying rules of a language system on the basis of the samples of a natural language they are exposed to. This innate endowment was seen as a sort of templare, containing the principles that are universal to all human languages. This universal grammar (UG) would prevent the child from pursuing all sorts of wrong hypotheses about how language systems might work. Ifchildren are pre-equipped with UG, then what they have to learn is the ways in which the language they are acquiring makes use of these principles.

Consider the fallowing sentences, from a book by Lydia White (1989). These English sentences contain the reflexive pronoun 'himself'. Both the pronoun and the noun it refers to (the antecedent) are printed in italics. (An asterisk at the beginning of a sentence indicares that the sentence is ungrammatical.)

[^0]In (a) and (b), it looks as if the reflexive pronoun must follow the noun it refers to. But (e) disproves this:
e Looking after himself boresjohn.
If we consider sentences such as:
d John said that Fredliked himse/f.
e *John said that Fred liked himself.
f John told Bill to wash himself.
$\mathbf{g}$ *John told Bill to wash himself.
we might conclude that the noun closest to the reflexive pronoun is the ante cedent. However, (h) shows that this rule won't work either:
$\mathbf{h}$ john promised Bill to wash himself.
And it's even more complicated than that. Usually the reflexive must be in the same clause as the antecedent as in (a) and (d), but not always, as in (h). Furthermore, the reflexive can be in the subject position in (i) but not in (j).
i. John believes himself to be intelligent (non-finite clause).
j. *John believes that himself is intelligent (finite clause).

In sorne cases, more than one antecedent is possible, as in (k) where the reflexive could refer to either John or Bill:
$\mathbf{k}$ lohn? showed BilP. a picture of himself.
When we look at this kind of complexity, it seems it would be very hard to learn, and children do make errors along the way. Yet, most school-age children would be able to correctly interpret the grammatical sentences and recognize the ungrammaticality of the others. Researchers who study language acquisition from the innatist perspective argue that such complex grammar could never be learned purely on the basis of imitating and practis ing sentences available in the input. They hypothesize that since all children acquire the language of their environment, they must have sorne innate mechanism or knowledge that allows them to discover such complex syntax in spite of limitations of the input. They hypothesize furthermore that the innate mechanism is used exclusively for language acquisition.

The innatist perspective emphasizes the fact that almost all children success fully acquire their native language-or more than one language if they live in a multilingual community. Children who are profoundly deaf will learn sign language if they are exposed to it in infancy, and their progress in the acquisition of that language system is similar to hearing children's acquisition of spoken language. Even children with very limited cognitive ability develop quite complex language systems if they are brought up in environments in which people interact with them.

Children acquire the basic syntax and morphology of the language spoken to them in a variety of conditions, sorne of which would be expected to enhance language development (for example, caring, attentive parents who focus on the child's language), and sorne which might be expected to inhibir it (for example, abusive or rejecting parents). Children achieve different levels of vocabulary, creativity, social grace, and so on, but virtually all achieve the ability to use the patterns of the language or languages spoken to them. This is seen as support for the hypothesis that language is somehow separare from other aspects of cognitive development and may depend on a specific module of the brain.

## The Critica!Period Hypothesis

The innatist perspective is often linked to the Critica! Period Hypothesis $(\mathrm{CPH})$-the hypothesis that animals, including humans, are genetically programmed to acquire certain kinds of knowledge and skill at specific times in life. Beyond those 'critica! periods', it is either difficult or impossible to acquire those abilities. With regard to language, the CPH suggests that chil dren who are not given access to language in infancy and early childhood (because of deafness or extreme isolation) will never acquire language if these deprivations go on for too long.
It is difficult to find evidence for or against the CPH, since nearly all children are exposed to language at an early age. However, history has documented a few 'natural experiments' where children have been deprived of contact with language. Two of the most famous cases are those of 'Victor' and 'Genie'.

In 1799, a hoy who became known as Victor was found wandering naked in the woods in France. His story was dramatized in a 1970 film by Frarn;:ois Truffaut called L'enfantsauvage ( The Wild Child). When Victor was captured, he was about 12 years old and completely wild, apparently having had no contact with humans. Jean-Marc-Gaspard ltard, a young doctor accustomed to working with deaf children, devoted five years to socializing Victor and trying to teach him language. Although he succeeded to sorne extent in devel oping Victor's sociability, memory, and judgement, there was little progress in his language ability.

Neirly 200 years later, Genie, a 13-year-old girl who had been isolated, neglected, and abused, was discovered in California. Because of the irrational demands of a disturbed father and the submission and fear of an abused mother, Genie had spent more than 11 years tied to a chair or a crib in a small, darkened room. Her father had forbidden his wife and son to speak to Genie and had himself only growled and barked at her. She was beaten when she made any kind of noise, and she had long since resorted to complete silence. Genie was undeveloped physically, emotionally, and intellectually. She had no language.

After she was discovered, Genie was cared for and educated with the par ticipation of many teachers and therapists, including Susan Curtiss ( 1977). After a brief period in a rehabilitation centre, she lived in a foster home and attended special schools. Genie made remarkable progress in becoming socialized and cognitively aware. She developed deep personal relationships and strong individual tastes and traits. Nevertheless, after five years of expo sure to language, Genie's language was not like that of a typical five-year old. There was a larger than normal gap between comprehension and produc tion. She used grammatical forms inconsistently and overused formulaic and routine speech.

Although Victor and Genie appear to provide evidence in support of the CPH , it is difficult to argue that the hypothesis is confirmed on the basis of evidence from such unusual cases. We cannot know what other factors besides biological maturity might have contributed to their inability to learn language. It is not possible to determine whether either of them suffered from brain damage, developmental delays, or a specific language impair ment, even befare they were separated from normal human interaction.

A more appropriate test of the CPH is the case of children who come from homes where they receive love and care from their parents, yet do not have access to language at the usual time. This is the case for sorne profoundly deaf children who have hearing parents. Only 5-10 per cent of the pro foundly deaf are born to deaf parents, and only these children are likely to be exposed to ASL from birth. Hearing parents may not realize that their child cannot hear because the child uses other senses to interact in an apparently normal way. Thus, the early childhood period may be normal in most ways but devoid of language that is accessible to the child. These children's later experience in learning sign language has been the subject of sorne important research related to the CPH .

Like oral and written languages, American Sign Language (ASL) makes use of grammatical markers to indicate such things as time (for example, past tense) and number. These markers are expressed through specific hand or body movements.

Elissa Newport (1990) and her colleagues studied the ability of deaf users of ASL to produce and comprehend grammatical markers. They compared Native signers (who were exposed to ASL from birth), Early signers (who began using ASL between four and six years of age), and Late signers (who began learning ASL after age 12). They found no difference between the groups in sorne aspects of their use of ASL, for example in vocabulary knowl edge. However, on tests focusing on grammatical markers, the Native group used the markers more consistently than the Early group who, in turn, used them more consistently than the Late group. The researchers concluded that
their study supports the hypothesis that there is a critical period for first lan guage acquisition, whether that language is oral or gestural.

Another line of research that has given new insight into the importance of early language experience comes from studies of 'international adoptees.' These are children who were adopted at an early age by families who did not speak the language the child had heard during infancy. In their review of studies of international adoptees, Johanne Paradis, Fred Genesee, and Martha Crago (2011) concluded that cognitive and linguistic outcomes were generally very positive. Sorne comparisons of their language with that of children the same age who had always heard the same language showed that subtle differences persist even after several years, but these are not the kinds of differences that most people would notice. Here again, of course, one cannot know whether something other than a late exposure to the language spoken in the adoptive environment also contributed to differences between these children and others who did not experience an abrupt change in their language environment. Nevertheless, with continuing research on children's linguistic behaviours and intuitions, as well as the neurological studies of infants' speech perception that we saw above, it is becoming clearer that language acquisition begins at birth, and possibly even befare, as the child's brain is shaped by exposure to the language(s) in the environment.

The innatist perspective is thus partly based on evidence that there is a criti cal period for language acquisition. It is also seen as an explanation for 'the logical problem of language acquisition', that is, the question of how adult speakers come to know the complex structure of their first language on the basis of the limited samples oflanguage to which they are exposed.

## Interactionistldevelopmental perspectives

Developmental and cognitive psychologists have focused on the interplay between the innate learning ability of children and the environment in which they develop. They argue that the innatists place too much emphasis on the 'final state' (the competence of adult native speakers) and not enough on the developmental aspects oflanguage acquisition. In their view, language acquisi tion is but one example of the human child's ability to learn from experience, and they see no need to assume that there are specific brain structures devoted to language acquisition. They hypothesize that what children need to know is essentially available in the language they are exposed to as they hear it used in thousands of hours of interactions with the people and objects around them.

Psychologists attribute considerably more importance to the environment than the innatists do even though they also recognize a powerful learning mechanism in the human brain. They see language acquisition as similar to and infl.uenced by the acquisition of other kinds of skill and knowledge, rather than as something that is different from and largely independent of
the child's experience and cognitive development. Indeed, researchers such as Dan Slobin (1973) have long emphasized the close relationship between children's cognitive development and their acquisition oflanguage.

## Piaget and Vygotsky

One of the earliest proponents of the view that children's language is built on their cognitive development was the Swiss psychologist/epistemologist, Jean Piaget (1951). In the early decades of the 20th century, Piaget observed infants and children in their play and in their interaction with objects and people. He was able to trace the development of their cognitive understand ing of such things as object permanence (knowing that things hidden from sight are still there), the stability of quantities regardless of changes in their appearance (knowing that 10 pennies spread out to form a long line are not more numerous than 10 pennies in a tightly squeezed line), and logical inferencing (figuring out which properties of a set of rods (their size, weight, material, etc.) cause sorne rods to sink and others to float on water).
lt is easy to see how children's cognitive development would partly deter mine how they acquire language. For example, the use of certain terms such as 'bigger' or 'more' depends on the children's understanding of the con cepts they represent. The developing cognitive understanding is built on the interaction between the child and the things that can be observed or manipu lated. For Piaget, language was one of a number of symbol systems that are developed in childhood. Language can be used to represent knowledge that children have acquired through physical interaction with the environment.

Another influential student of child development was the psychologist Lev Vygotsky (1978). He observed interactions among children and also between children and adults in schools in the Soviet Union in the 1920s and 1930s. He concluded that language develops primarily from social interaction. He argued that in a supportive interactive environment, children are able to advance to higher levels of knowledge and performance. Vygotsky referred to a metaphorical place in which children could do more than they would be capable of doing independently as the zone of proximal development (ZPD).

Vygotsky observed the importance of conversations that children have with adults and with other children and saw in these conversations the origins of both language and thought. The conversations provide the child with scaf folding, that is, a kind of supportive structure that helps them make the most of the knowledge they have and also to acquire new knowledge.

Vygotsky's view differs from Piaget's. Piaget saw language as a symbol system that could be used to express knowledge acquired through interaction with the physical world. For Vygotsky, thought was essentially internalized speech, and speech emerged in social interaction. Vygotsky's views have become increasingly central in research on second language development, as we will see in Chapter 4.

## Cross-cultural research

Since the 1970s, researchers have studied children's language learning envi ronments in a great many different cultural communities. The research has focused not only on the development oflanguage itself, but also on the ways in which the environment provides what children need for language acquisi tion. Between 1985 and 1997, Dan Slobin edited five volumes devoted to research on the acquisition of 28 languages, providing examples and analyses of child language and the language-learning environment from communities around the world. One of the most remarkable resources for child language researchers is the Child Language Data Exchange System (CHILDES), where researchers have contributed child language data in dozens of lan guages in recorded and transcribed forms that are available as electronic files from the CHILDES website (MacWhinney 2000).

One feature of cross-cultural research is the description of child-rearing pat terns. Catherine Snow (1995) and others have studied the apparent effects on language acquisition of the ways in which adults talk to and interact with young children. In middle-class North American homes, researchers observed that adults often modify the way they speak when talking to little children. This child-directed speech may be characterized by a slower rate of delivery, higher pitch, more varied intonation, shorter, simpler sentence pat terns, stress on key words, frequent repetition, and paraphrase. Furthermore, tapies of conversation emphasize the child's immediate environment, picture books, or experiences that the adult knows the child has had. Adults often repeat the content of a child's utterance, but they expand or recast it into a grammatically correct sentence. For example, when Peter says, 'Dump truck! Dump truck! Fall! Fall!', Lois responds, 'Yes, the dump truck fell down.'

Researchers working in a 'language socialization' framework have found that the kind of child-directed speech observed in middle-class American homes is by no means universal. In sorne societies, adults do not engage in conversation or verbal play with very young children. For example, Bambi Schieffelin (1990) found that Kaluli mothers in Papua New Guinea did not consider their children to be appropriate conversational partners. Martha Crago (1992) observed that in traditional lnuit society, children are expected to watch and listen to adults. They are not expected or encouraged to par ticipate in conversations with adults until they are older and have more developed language skills.

Other researchers have observed that in sorne societies, young children inter act primarily with older siblings who serve as their caregivers. Even within the United States, Shirley Brice Heath (1983) and others have documented substantial differences in the ways parents in different socioeconomic and ethnic groups interact with their children. Nevertheless, in every society, children are in situations in which they hear language that is meaningful to them in their environment. And they acquire the community language. Thus, it is difficult to judge the long-term effect of the modifications that sorne adults make in speech addressed to children.

## Tu.e importance of interaction

The role of interaction between a language-learning child and an interlocu tor who responds to the child is illuminated by cases where such interaction is missing. Jacqueline Sachs and her colleagues (1981) studied the language development of a child they called Jim. Hewas a hearing child of deaf parents, and his only contact with oral language was through television, which he watched frequently. The family was unusual in that the parents did not use sign language with Jim. Thus, although in other respects he was well cared for, Jim did not begin his linguistic development in a normal environment in which a parent communicated with him in either oral or sign language. A language assessment at three years and nine months indicated that he was well below age level in all aspects of language. Although he attempted to express ideas appropriate to his age, he used unusual, ungrammatical word order.

When Jim began conversational sessions with an adult, his expressive abili ties began to improve. By the age of four years and two months most of the unusual speech patterns had disappeared, replaced by language more typical of his age. Jim's younger brother Glenn did not display the same type of language delay. Glenn's linguistic environment was different from Jim's: he had his older brother-not only as a model, but, more importantly as a con versational partner whose interaction allowed Glenn to develop language in a more typical way.

Jim showed very rapid acquisition of English once he began to interact with an adult on a one-to-one basis. The fact that he had failed to acquire language nor mally prior to this experience suggests that impersonal sources oflanguage such as television or radio alone are not sufficient. One-to-one interaction gives chil dren access to language that is adjusted to their level of comprehension. When a child does not understand, the adult may repeat or paraphrase. The response of the adult may also allow children to find out when their own utterances are understood. Television, for obvious reasons, does not provide such interaction. Even in children's programmes, where simpler language is used and topics are relevant to younger viewers, no immediate adjustment is made for the needs of an individual child. Once children have acquired sorne language, however, television can be a source oflanguage and cultural information.

## Usage-based learning

fu more and more research has documented the ways in which children interact with the environment, developmental and cognitive psychologists find further evidence that language acquisition is 'usage-based'. Inthis view, language acquisition is possible because of children's general cognitive capac ities and the vast number of opportunities they have to make connections between the language they hear and what they experience in their environ ment. Sophisticated electronic recording devices have been used to track and count words and phrases children hear in their daily lives. Deb Roy documented his son's acquisition of words, showing the frequency and the contexts for the occurrence of language. Most remarkable, perhaps, is the demonstration of the power of interaction between the child and the adults and how adults focus on the language the child has begun to use (Roy 2009).

The usage-based perspective on language acquisition differs from the behav iourist view in that the emphasis is more on the child's ability to create networks of associations rather than on processes of imitation and habit for mation. Referred to by various names, including cognitive linguistics, this view also differs sharply from the innatists' because language acquisition is not seen as requiring a separate 'module of the mind' but rather depends on the child's general leaming abilities and the contributions of the environ ment. As Elena Lieven and Michael Tomasello (2008) put it, 'Children leam language from their language experiences-there is no other way' (p.168). According to this view, what children need to know is essentially available to them in the language they are exposed to.

Sorne of the early research in this framework was done in the context of con nectionism and involved computer simulations in which language samples were provided as input to a fairly simple program. The goal was to show that the computer could 'leam' certain things if exposed to enough examples. The program was found to be able to sort out the pattems from the input and even generalize beyond what it was actually exposed to. Iteven made the
same kinds of creative 'mistakes' that children make, such as putting a regular -ed ending on an irregular verb, for example, eated.

In a usage-based model, language acquisition involves not only associating words with elements of externa! reality. Itis also a process of associating words and phrases with the other words and phrases that occur with them, or words with grammatical morphemes that occur with them. For example, children learning languages in which nouns have grammatical gender learn to associ ate the appropriate article and adjective forms with nouns. So if children are learning French, they learn that la and une go with chaise (chair) and le and un go with livre (book). Similarly, they learn to associate pronouns with the verb forms that mark person and number-ilaime (he likes) and nous aimons (we like). They also learn which temporal adverbs go with which verb tenses.

Of particular importance to this hypothesis is the fact that children are exposed to many thousands of opportunities to learn words and phrases. Lea.rning takes place gradually, as the number oflinks between language and meaning and among language forms are built up. For usage-based theorists, acquisition of language, while impressive, is not the only remarkable feat accomplished by the child. They compare it to other cognitive and percep rual learning, including learning to 'see'. That is, the visual abilities that we cake for granted, for example, focusing on and interpreting objects in our ,risual field, are actually learned through experience.

## Language disorders and delays

Although most children progress through the stages of language develop ment without significant difficulty or delay, there are sorne children for whom this is not the case. A discussion of the various types of disabilities (including deafness, articulatory problems, autism, dyslexia, and so on) that sometimes affect language development is outside the scope of this book. Itis essential that parents and teachers be encouraged to seek professional advice ifthey feel that a child is not developing language normally, keeping in mind that the range for 'normal' is wide indeed.
'While most children produce recognizable first words by 12 months, sorne may not speak before the age of three years. In very young children, one way to determine whether delayed language reflects a problem or simply an individual difference within the normal range is to determine whether the child responds 'ID language and appears to understand even if he or she is not speaking.

For older children, delays in learning to read that seem out of keeping with a child's overall cognitive functioning may suggest that there is a specific problem in that domain. Sorne children seem to begin reading almost by magic, discovering the mysteries of print with little direct instruction. For most children, instruction that includes sorne systematic attention to
sound-letter correspondences allows them to unlock the treasure chest of reading. Both groups fall within a normal range. For sorne children, however, reading presents such great challenges that they need expert help beyond what is available in a typical classroom.

## Childhood bilingualism

The language development of children who learn multiple languages during childhood is of enormous importance throughout the world. Indeed, the majority of the world's children are exposed to more than one language. Sorne children learn multiple languages from earliest childhood; others acquire additional languages when they go to school. The acquisition and maintenance of more than one language can open doors to many personal, social, and economic opportunities.

Unfortunately, as Jim Cummins (2000) and others have pointed out, chil dren who already know one or more languages and who arrive at their first day of school without an age-appropriate knowledge of the language of the school have often been misdiagnosed as having language delays or disorders. This includes immigrant and minority language children who do not speak the school language at home and children who speak a different variety of the school language. These children's knowledge of a different language or language variety is often incorrectly interpreted as a lack of normal language development and a lack of background knowledge for school subjects. They may be placed in remedia! or special education classes because schools are not equipped to provide an adequate assessment of children's ability to use their home language or of their general cognitive abilities or their knowledge of school subjects, learned through another language. Researchers have recently made important progress in providing guidelines that can help educators distinguish between disability and diversity (Paradis, Genesee, and Crago 2011), but much practica! work remains to be done so that children can make the most of their cognitive and linguistic abilities.

Children who learn more than one language from earliest childhood are referred to as 'simultaneous bilinguals', whereas those who learn another lan guage later may be called 'sequential bilinguals'. We sometimes hear people express the opinion that it is too difficult for children to cope with two lan guages. They fear that the children will be confused or will not learn either language well. However, there is little support for the myth that learning more than one language in early childhood is a problem for children who have adequate opportunities to use each one. There is a considerable body of research on children's ability to learn more than one language in their earliest years. Although sorne studies show minor early delays in one or both languages for simultaneous bilinguals, there is no evidence that learning two
languages substantially slows down their linguistic development or interferes with cognitive development.

Indeed, many children attain high levels of proficiency in both languages. Ellen Bialystok (2001) and other cognitive and developmental psychologists have found convincing evidence that achieving bilingual proficiency can have positive effects on abilities that are related to academic success, such as metalinguistic awareness. Limitations that may be observed in the language of bilingual individuals are more likely to be related to the circumstances in which each language is learned than to any limitation in the human capacity to learn more than one language. For example, if one language is heard much more often than the other or is more highly valued in the community, that language may eventually be used better than, or in preference to, the other.

One aspect of bilingual language use is referred to as code switching-the use of words or phrases from more than one language within a conversation. For example, a child who speaks both French and English might say, 'I'm playing with le chateau'. Such switching between languages may sometimes reflect the absence of a particular vocabulary word or expression, but it can just as often be the intentional use of a word from the other language for a variety of interactional purposes. Highly proficient adult bilinguals also code switch when they speak to others who also know both languages. The use of both languages within a bilingual context is not evidence of a lack of proficiency.It may have many different motivations, from expressing solidarity to making a joke. Psychologists have shown that speakers of more than one language are constantly making choices about how to express themselves and that code switching is patterned and often predictable. Indeed, this experience inmaking choices has been identified as contributing to cognitive flexibility throughout life (Bialystok 2009).

As children learn a second language at school, they need to learn both the variety oflanguage that children use among themselves (and in informal set tings with familiar adults) and the variety that is used in academic settings. In his early research on childhood bilingualism, Jim Cummins called these two varieties BICS (basic interpersonal communication skills) and CALP (cognitive academic language proficiency). Characteristics of the two varie ties overlap to a certain extent, but there are important differences, not just inthe range of vocabulary that each requires but also in the way information is expressed. Mary Schleppegrell (2004) and others have sought to discover what exactly it is that characterizes these varieties oflanguage and the interac tion patterns that tend to go with them, and sorne aspects of the distinction remain controversia!. It is widely agreed, however, that the language needed for academic discourse is more difficult for children to acquire than the infor mal language of day-to-day interaction (Cummins 2000).

Children entering school with little or no knowledge of the language spoken there may acquire BICS within a relatively short time-as little as a year or two. They learn from watching and imitating interactions among their peers and between teachers and students. They make connections between fre quently heard words and phrases and the routines and recurring events of the dassroom, cafeteria, and playground. For this reason, students are sometimes perceived as 'fluent' in their second language. This can lead teachers to assume that any difficulties in academic tasks are not due to limited language skills but to other causes-from lack of motivation to learning disabilities. More careful observation shows that the students, while fluent in social settings, do not have the CALP skills needed for academic tasks such as understanding a problem in mathematics, defining a word, or writing a science report.

Virginia Collier (1989) found that, for most students, acquiring age-appro priate CALP takes several years. As the second language learner tries to catch up, the children who carne to school already speaking the school language are continuing to learn hundreds of new words every year and to learn the concepts that these words represent. Ifsecond language learners have limited knowledge of the school language and do not have opportunities to continue learning academic content in a language they already know, it is not surpris ing that they fall behind in learning the academic subject matter that their peers have continued to develop.
Children need time to develop their second language skills. Many people assume that this means that the best approach is to start learning as early as possible and to avoid the use of the child's previously learned languages. Certainly, it is important for children to begin learning and using the school language as early as possible, but considerable research suggests that contin ued development of the child's home language actually contributes in the long term to more successful acquisition of the school language. Researchers and educators have expressed concern about situations where children are cut off from their family language when they are very young, spending long hours away from their families in settings where the home language is absent or even forbidden. Lily Wong Fillmore (2000) observed that when children are 'submerged' in a different language for long periods in pre-school or day care, their development of the family language may be slowed clown or stalled before they have developed an age-appropriate proficiency in the new language. Eventually they may stop speaking the family language altogether, and this loss of a common language can lead to significant social and psycho logical problems.
Wallace Lambert (1987) called the loss of one language on the way to learn ing another subtractive bilingualism. It can have negative consequences for children's self-esteem, and their relationships with family members are also likely to be affected by such early loss of the family language. In these cases, children seem to continue to be caught between two languages: they have not
yet mastered the school language, and they have not continued to develop the family language. During the transition period, they may fall behind in their academic learning. Unfortunately, the 'solution' educators sometimes propase to parents is that they should stop speaking the family language at home and concentrate instead on speaking the school language with their children.

The research evidence suggests that a better approach is to strive for addi tive bilingualism- the maintenance of the home language while the second language is being learned. This is especially true if the parents are also learn ers of the second language. Ifparents continue to use the language that they know best with their children, they are able to express their knowledge and ideas in ways that are richer and more elaborate than they can manage in a language they do not know as well. Using their own language in family set tings is also a way for parents to maintain their own self-esteem, especially as they may have their own struggles with the new language outside the home, at work, or in the community. Maintaining the family language also allows children to retain family connections with grandparents or relatives who do not speak the new language. They benefit from the opportunity to continue both cognitive and affective development using a language they understand easily while they are still learning the second language.

Other positive effects of bilingual or multilingual development go beyond those that accrue to the children and their families. Knowledge of more than one language can also increase opportunities for cross-cultural communica tion and economic cooperation among people. As we have seen, developing a second language takes years. But teachers, parents, and students need to know that the many benefits of additive bilingualism will reward their patience and effort.

## Summary

Inthis chapter we have focused on sorne of the research on children's early language development that has influenced research on second language acqui sition. We have described three broad theoretical perspectives for explaining first language acquisition. In Chapter 2 we will look at sorne of the findings of research examining the developing language of second language learners.

## Questions for reflection

1Sorne research has found that the best predictor of children's vocabulary growth is the amou nt of language addressed to them by thei $r$ parents and other caregivers. What have you seen in this chapter that is compatible with that findi ng?
2 Go to the child ren's section of a library or bookstore and look at the vocabulary used in books that are published for child ren between three
and six years old. Compare these to books for you ng readers, aged six to eight. What does this suggest about the importance of continui ng to read to child ren after they have begu nto learn to read at school? Finally, look at the language used intextbooks for child ren at age IOor II.What can you conclude about the challenge faced by English language learners entering school at this age?

3 lfyou are or may be teachi ng a second language to a group of school aged learners with different first language backgrou nds, can you think of pedagogical tasks/activities in which child ren can display and use their L1 knowledge to hel p them learn the second language?

## Suggestions for further reading

Berko Gleason,J. and N. Bernstein-Ratner (eds.). 2009. The Development of Language7th edn. New York: Allyn and Bacon.
Many of the chapters by leading experts in child language introduce readers to the best-known findings of the past 50 years of research on chil dren's language development. In addition, there are chapters based on new research, using the kinds of technology that have only recently become available. Thus, the rich database created by researchers with notepads, tape recorders, and tools such as the 'wug test' is complemented by studies of the neurological bases oflanguage learning and language use.

Paradis, J., F. Genesee, and M. B. Crago. 2011. Dual Language
Development and Disorders: A Handbook on Bilingualism and Second Language Learning 2nd edn. Baltimore: Paul H. Brookes.
The authors describe language acquisition by children who learn more than one language simultaneously or sequentially, drawing on research from edu cation, psychology, and linguistics. They make the research accessible by their writing style, the inclusion of a glossary of terms, and above all by relat ing the research to profiles of children who are acquiring their languages in a variety of home, school, and community situations. The authors provide insights into both normal and atypical multilingual development.

## Pearson, B. Z. 2008. Raising a Bilingual Child:A Step-by-Step Guidefar

 Parents. New York: Living Language (Random House).Addressing herself mainly to parents, Barbara Zurer Pearson (2008) reviews research from many studies and shows how children become bilin gual in many different environments. She also emphasizes the advantages of growing up with a knowledge of more than one language-from the evidence for cognitive flexibility to the benefits of cultural knowledge. Written in an approachable and humorous style, the text is supported by Zurer Pearson's thorough knowledge of the research literature that is included in the bibliography.

## 2 <br> SECOND LANGUAGE LEARNING

## Preview

In this chapter we focus on second language learners' developing knowledge and use of their new language. We begin by looking at the different contexts far first and second language learning as well as the different characteristics of learners in these contexts. We examine sorne of the errors that learners make and discuss what errors can tell us about their knowledge of the language and their ability to use that knowledge. We look at stages and sequences in the acquisition of sorne syntactic and morphological features in the second lan guage. We also review sorne aspects of learners' development of vocabulary, pragmatics, and phonology.

## ACTIVITY Explore contexts for second language learning

A second language learner is different in many ways from a young child acquiring a first language or an older child learning a second language.This is true in terms of both the learners' characteristics and the environments in which the language acquisition typically occurs. Think about how the characteristics and learning conditions of the following learners may differ:

- a young child learning a first language
- a child learning a second language in day care or on the playground
- an adolescent studying a foreign language in their own country
- an adult immigrant with limited or disrupted education working in asecond language environment and having no opportunity to go to language classes.

Now ask you rself the following questions about these different learners.
1 Do they al ready know at least one language?
2 Are they cognitively matu re? Are they able to engage inproblem solving, deduction, and complex memory tasks?
3 How well developed is their metalinguistic awareness? Can they define a word, say what sounds make up that word, or state a rule such as 'add an -s to form the plural'?
4 How extensive is thei $r$ general knowledge of the world? Does this knowledge enable them to make good guesses about what a second language interlocutor is probably saying?
5 Are they likely to be anxious about maki ng mistakes and concerned about soundi ng'silly' when speaking the language?
6 Does the learning environment allow them to be silent inthe early stages of learning, or are they expected to speak from the begi nning?
7 Do they have plenty of time available for language learni ng and plenty of contact with proficient speakers of the language?
8 Do they frequently receive corrective feedback when they make errors in grammar or pronu nciation, or do listeners usually overlook these errors and pay attention to the meani ng?
9 Do they receive corrective feedback when their meani ng is not clear, when they use the wrong word, or when they say something that seems inappropriate or impolite?
10s modified input available?That is, do interlocutors adapt their speech so that learners can understand (for example, interms of speed of delivery, complexity of grammatical structure, or vocabulary)?
Then compare you r views with the discussion of learner characteristics and learning conditions below.

## Learner characteristics

By definition, all second language learners, regardless of age, have already acquired at least one language. This prior knowledge may be an advantage in the sense that they have an idea of how languages work. On the other hand, knowledge of other languages can lead learners to make incorrect guesses about how the second language works, and this may result in errors that first language learners would not make.

Very young language learners begin the task of first language acquisition without the cognitive maturity or metalinguistic awareness that older second language learners have. Although young second language learners have begun to develop these characteristics, they will still have far to go in these areas, as well as in the area of world knowledge, before they reach the levels already attained by adults and adolescents.

Usi ng the chart in Table 2.1 , give you r opinion about the presence or absence of learner characteristics and learning conditions for the four different learners mentioned above. Use the following notation:

+ =usually present $\quad-=$ usually absent
? = sometimes present, sometimes absent, or you're not sure

|  | First <br> language | Second <br> language |  |  |
| :--- | :--- | :--- | :--- | :--- |
|  | Young child <br> (at home) | You ng child <br> (playground) | Adolescent <br> (classroom) | Adult <br> (on the job) |

Learner characteristics

| Another <br> languag <br> e |  |  |  |  |  |  |  |  |

Table 2. I Contexts for language learning

On the one hand, cognitive maturity and metalinguistic awareness allow older learners to salve problems and engage in discussions about language. This is particularly important for those who are learning language in a class room, with limited time in contact with the language. On the other hand, sorne theorists have suggested that the use of these cognitive skills-so valua ble for many kinds of tasks-can actually interfere with language acquisition. They argue that successful language acquisition draws on different mental abilities, abilities that are specific to language learning. Ithas been suggested that older learners draw on their problem-solving and metalinguistic abilities precisely because they can no longer access the innate language acquisition ability they had as young children. We will have more to say about this in Chapter 3, when we discuss the role of age in second language acquisition.
In addition to possible cognitive differences, there are also attitudinal and cul tural differences between children and adults. Most child learners are willing to try to use the language-even when their proficiency is quite limited. Many adults and adolescents find it stressful when they are unable to express themselves clearly and correctly. Nevertheless, even very young (pre-school) children differ in their willingness to speak a language they do not know well. Sorne children happily chatter away in their new language; others prefer to listen and participate silently in social interaction with their peers.

## Learning conditions

Young second language learners are often allowed to be silent until they are ready to speak. They may also practise their second language in songs and games that allow them to blend their voices with those of other children. Older second language learners are often forced to speak from the earli est days of their learning, whether to meet the requirements of classroom instruction or to carry out everyday tasks such as shopping, medical visits, or job interviews.

Another way in which younger and older learners may differ is in the amount of time they can actually spend learning a second language. We know that first language learners spend thousands of hours in contact with the language or languages spoken around them. Young second language learners may also be exposed to their second language for many hours every day-in the classroom, on the playground, or in front of the television. Older learners, especially students in foreign language classrooms, receive far less ex posure perhaps only a few hours a week. Indeed, a typical foreign language student will have no more than a few hundred hours of exposure, spread out over a number of years. Adult learners who are immigrants or minority language speakers often continue to use the language they already know as they fulfil their daily responsibilities for work and family, and they may use the second language only in limited situations.

Classroom learners not only spend less time in contact with the new lan guage, they also tend to be exposed to a far smaller range of discourse types. For example, classroom learners are often taught language that is somewhat formal in comparison to the language as it is used in most social settings. In manyforeign language classes, teachers may even switch to their students' first language for discipline or classroom management, thus depriving learners of opportunities to experience uses of the language in real communication.

As we saw in Chapter 1, parents tend to respond to the meaning rather than to the grammatical accuracy of their children's language. Similarly, in second language learning outside classrooms, errors that do not interfere with meaning are usually overlooked. Most people would feel they were being impolite if they interrupted and corrected someone who was trying to have a conversation with them. Nevertheless, interlocutors may react to an error if they cannot understand what the speaker is trying to say. Thus, errors of grammar and pronunciation may not be remarked on, but the wrong word choice may receive comment from a puzzled interlocutor. In a situation where a second language speaker appears to use inappropriate language, interlocu tors may feel uncomfortable, not knowing whether the speaker intends to be rude or simply does not know the polite way to say what is intended. Inthis case too, especially between adults, it is unlikely that the second language speaker would be told that something had gone wrong. The only place where feedback on error is typically present with high frequency is the language classroom. Even there, it is not always provided consistently. In Chapters 5 and 6 , research on the role of feedback in the classroom will be reviewed.

One condition that appears to be common to learners of all ages-though not inequal quality or quantity-is exposure to modified or adapted input. This adjusted speech style, called child-directed speech in first language acquisi tion, has sometimes been called foreigner talk or teacher talk depending on the contexts of second language acquisition. Sorne people who interact regularly with language learners seem to have an intuitive sense of what adjustments they need to make to help learners understand. Of course, not everyone knows what adjustments will be most helpful. We have all witnessed ch.ose painful conversations in which people seem to think that they can make learners understand better if they simply talk louder! Sorne Canadian friends told us of an experience they had in China. They were visiting sorne historie temples and wanted to get more information about them than they muld glean from a guidebook, so they asked their guide sorne questions. Unfortunately, their limited Chinese and his non-existent English made it difficult for them to exchange information. The guide kept speaking louder and louder, but our friends understood very little. Finally, in frustration, the pude concluded that it would help if they could see the information, so he $\mathbb{l}>$ Oka stick and began writing in the sand-in Chinese characters!

This brief discussion places the emphasis on how both the characteristics of learners and the contexts in which they acquire a second language may be different. Inthe following pages, we will focus more on similarities in how their knowledge of the new language develops over time.

## Studying the language of second language learners

We have seen that children's knowledge of the grammatical system of their first language is built up in predictable sequences. Por example, grammati cal morphemes such as the -ing of the present progressive or the -ed of the simple past are not acquired at the same time, but in a sequence. Are there developmental sequences for second language acquisition? How does the prior knowledge of the first language affect the acquisition of the second (or third) language? How does instruction affect second language acquisition? Are there differences in the development oflearners whose only contact with the new language is in a dassroom and those who use the language in daily life? These are sorne of the questions researchers have sought to answer, and we will address them in this chapter as well as in Chapters 5 and 6.

Knowing more about the development oflearner language helps teachers to assess teaching procedures in the light of what they can reasonably expect to accomplish in the dassroom. As we will see, sorne characteristics of learner
language can be quite perplexing if one does not have an overall picture of the steps learners go through in acquiring the second language.

In presenting sorne of the findings of second language research, we have induded a number of examples oflearner language as well as sorne additional samples to give you an opportunity to practise analysing learner language. Of course, teachers analyse learner language all the time. They try to determine whether students have learned what has been taught and how closely their language matches the target language. But progress cannot always be meas ured in these terms. Sometimes language acquisition progress is reflected in a decrease in the use of a correct form that was based on rote memoriza tion or chunk learning. New errors may be based on an emerging ability to generalize a particular grammatical form beyond the specific items with which it was first learned. In this sense, an increase in error may be an indica tion of progress. Far example, like first language learners, second language learners usually learn the irregular past tense forms of certain common verbs befare they learn to apply the regular simple past -ed marker. That means that a learner who says 'I buyed a bus ticket' may know more about English grammar than one who says 'I bought a bus ticket'. Without further infor mation, we cannot conclude that the one who says 'bought' would use the regular past -ed marker where it is appropriate, but the learner who says 'buyed' has provided evidence of developing knowledge of a systematic aspect of English.

Teachers and researchers cannot read learners' minds, so they must infer what learners know by observing what they do. Like those who study first language acquisition, we observe learners' spontaneous language use, but we also design procedures that help to reveal more about the knowledge underlying their observable use oflanguage. Without these procedures, it is often difficult to determine whether a particular behaviour is representative of something systematic in a learner's current language knowledge or simply an isolated ítem, learned as a chunk.

Like first language learners, second language learners do not learn language simply through imitation and practice. They produce sentences that are not exactly like those they have heard. These new sentences appear to be based on interna! cognitive processes and prior knowledge that interact with the language they hear around them. Both first and second language acquisition are best described as developing systems with their own evolving rules and patterns, not simply as imperfect versions of the target language.

## Contrastive analysis, error analysis, and interlanguage

Until the late 1960s, people tended to see second language learners' speech simply as an incorrect version of the target language. According to the con trastive analysis hypothesis (CAH), errors were assumed to be the result
of transfer from learners' first language. Detailed analysis of learners' errors revealed, however, that not all errors made by second language learners can be explained in terms of first language transfer alone. A number of studies show that many errors can be explained better in terms oflearners' develop ing knowledge of the structure of the target language rather than an attempt to transfer patterns of their first language (Richards 1974). Furthermore, sorne of the errors are remarkably similar to those made by young first lan guage learners, for example, the use of a regular -ed past tense ending on an irregular verb.

A simplified version of the CAH would predict that, where differences exist, errors would be bi-directional, that is, for example, French speakers learning English and English speakers learning French would make errors on paral lel linguistic features. Helmut Zobl (1980) observed that this is not always the case. For example, in simple English sentences, direct objects, whether nouns or pronouns, come after the verb ('The dog eats the cookie. The dog eats it.'). In French, direct objects that are nouns follow the verb (Le chien mange le biscuit-literally, 'The dog eats the cookie'). However, direct object pronouns precede the verb (Le chien le mange-literally, 'The dog it eats'). The CAH would predict that a native speaker of English might make the error of saying: 'Le chien mange le' when learning French, and that a native speaker of French might say 'The dog it eats' when learning English. In fact, English speakers learning French are more likely to make the predicted error than French speakers learning English. This may be due to the fact that English speakers learning French hear many examples of sentences with subject-verb-object word order (for example, Le chien mange le biscuit) and make the incorrect generalization-based on both the word order of their first language and evidence from the second language-that all direct objects come after the verb. French-speaking learners of English, on the other hand, hearing and seeing no evidence that English direct object pronouns precede verbs, do not tend to use this pattern from their first language.
The finding that many aspects of learners' language could not be explained by the CAH led a number of researchers to take a different approach to ana lysing learners' errors. This approach, which developed during the 1970s, became known as 'error analysis' and involved detailed descriptions of the errors second language learners made. The goal of this research was to dis cover what learners really knew about the language. As Pit Corder observed in a famous artide published in 1967, when learners produce correct sen tences, they may simply be repeating something they have already heard; when they produce sentences that differ from the target language, we may assume that these sentences reflect the learners' current understanding of the rules and patterns of that language. We saw this in the example of a learner who says 'buyed' instead of 'bought.' Error analysis differed from contras tive analysis in that it did not set out to predict errors. Rather, it sought to
discover and describe different kinds of errors in an effort to understand how learners process second language data. Error analysis was based on the hypothesis that, like child language, second language learner language is a system in its own right-one that is rule-governed and predictable.

Larry Selinker ( 1972) gave the name interlanguage to learners' developing second language knowledge. Analysis of a learner's interlanguage shows that it has sorne characteristics influenced by previously learned languages, sorne characteristics of the second language, and sorne characteristics, such as the omission of function words and grammatical morphemes, that seem to be general and to occur in all interlanguage systems. Interlanguages have been found to be systematic, but they are also dynamic, continually evolving as learners receive more input and revise their hypotheses about the second language. The path through language acquisition is not necessarily smooth and even. Learners have bursts of progress, then reach a plateau for a while before something stimulates further progress. Selinker also coined the term fossilization to refer to the fact that sorne features in a learner's language seem to stop changing. This may be especially true for learners whose exposure to the second language does not inelude instruction or the kind of feedback that would help them to recognize differences between their interlanguage and the target language.

## ACTIVITY Analyse learner language

The following texts were written by two learners of English, one a French speaking secondary school student, the other a Chinese-speaki ng ad ult learner. Both learners were describing a cartoon film entitled The GreatToy Robbery (National Film Board of Canada). After viewi ng the film, they were asked to retell the story inwriti ng, as ifthey were telling it to someone who had not seen the film.

Read the texts and answer the followi ng questions:
Can you understand what each learner is trying to say?
I Exami ne the errors made by each learner. What kinds of errors interfere most with you r ability to understand?
3 Do both learners make the same kinds of errors?
4 In what ways do the two interlanguages differ?
Learner I: French first language, secondary school student
Du ring a sun ny day, a cowboy go inthe desert with his horse. he has a big hat. His horse eat a flou r. Inthe same time, Santa Clause go ina city to give sorne surprises. He has a red costume and a red packet of surprises. You have th ree robbers inthe mou ntai nwho sees Santa Clause with a king of glaces that it permitted us to see at a long distance. Every robbers have a horse. They go in
the way of Santa Clause, not Santa Clause but his pocket of surprises. After they will go in a city and they go in a saloon. [...]
(Unpu blished data from P. M.Lightbown and B.Barkman)
Learner 2: Chinese first language,adult
This year Christmas comes soon! Santa Claus ride a one horse open sleigh to sent present for child ren. on the back of his body has big packet. it have a lot of toys. inthe way he meet th ree robbers.They want to take his big packet. Santa Claus no way and no body help, so only a way give them, then three robbers ride their horse dashing through the town. There have saloon, they go to dri nk sorne beer and open the big packent.They plays toys inthe Bar.They meet a cow boy in the saloon.
(Unpublished data provided by M. J.Martens)

Perhaps the most striking thing here is that many error types are common to both learners. Furthermore, both make errors of spelling and punctuation that we might find in the writing of a young first language speaker of English. Even though French uses grammatical morphemes to indicare person and number on verbs and Chinese does not, both these learners make errors of subject-verb agreement-both leaving off the third person -s marker and overusing it when the subject is plural ('a cowboy go' and 'three robbers in the mountain who sees' by Learner 1 and 'Santa Claus ride' and 'they plays' by Learner 2). Such errors reflect learners' understanding of the second language system itself rather than an attempt to transfer characteristics of their first language. They are sometimes referred to as 'developmental' errors because they are similar to those made by children acquiring English as their first lan guage. Sometimes these are errors of overgeneralization, that is, errors caused by trying to use a rule in a context where it does not belong, for example, the $-s$ ending on the verb in 'they plays'. Sometimes the errors are better described as simplification, where elements of a sentence are left out or where all verbs have the same form regardless of person, number, or tense.

One can also see, especially in Learner 2's text, the influence of classroom experience. An example is the use of formulaic expressions such as 'one horse open sleigh' which is taken verbatim from a well-known Christmas song that had been taught and sung in his English as a Second Language (ESL) class. The vivid 'dashing through the town' probably comes from the same source, with the substitution of 'town' for 'snow'.

For those who are familiar with the English spoken by native speakers of French, sorne of the errors (for example, preposition choice 'in the same time') made by the first learner will be seen as probably based on French. Similarly, those familiar with the English of Chinese speakers may recog nize sorne word arder patterns (for example, 'on the back of his body has big packet') as based on Chinese patterns. These may be called transfer or
'interference' errors. What is most clear, however, is that it is often difficult to determine the source of errors. Thus, while error analysis has the advan tage of describing what learners actually do rather than what they might do, it does not always give us clear insights into why they do it. Furthermore, as Jacquelyn Schachter pointed out in a 1974 article, learners sometimes avoid using sorne features of language that they perceive to be difficult for them. This avoidance may lead to the absence of certain errors, leaving the analyst without information about sorne aspects of the learners' develop ing interlanguage. The absence of particular errors is difficult to interpret, and the phenomenon of 'avoidance' may itself be a part of the learner's sys tematic second language performance.

## Developmental sequences

Second language learners, like first language learners, pass through sequences of development: what is learned early by one is learned early by others.

Among first language learners, the existence of developmental sequences may not seem surprising because their language learning is partly tied to their cog nitive development and to their experiences in learning about relationships between people, events, and objects around them. But the cognitive develop ment of adult or adolescent second language learners is much more stable, and their experiences with the language are likely to be quite different, not only from the experiences of a small child, but also different from each other. Furthermore, second language learners already know another language that has different patterns for creating sentences and word forms. In light of this, it is more remarkable that we find developmental sequences that are similar in the developing interlanguage of learners from different language back grounds and also similar to those observed in first language acquisition of the same language. Moreover, the features of the language that are most frequent are not always learned first. Far example, virtually every English sentence has one or more anides ('a' or 'the'), but even advanced learners have difficulty using these forms correctly in all contexts. Finally, although the learner's first language does have an influence, many aspects of these developmental stages are similar among learners from different first language backgrounds.

In Chapter 1 we saw sorne developmental sequences for English first lan guage acquisition of grammatical morphemes, negation, and questions. Researchers in second language acquisition have also examined these, as well as other features. They have found patterns in the development of syntax and morphology that are similar among learners from different language back grounds. Evidence for these developmental patterns first carne from studies oflearners whose primary learning environment was outside the classroom. Far example, Jürgen Meisel, Harald Clahsen, and Manfred Pienemann
( 1981) identified developmental sequences in the acquisition of German by speakers of several Romance languages who had little or no instruction.

Subsequent research has shown that learners who receive instruction exhibit similar developmental sequences and error patterns. Inthe interlanguage of English speakers whose only exposure to German was in university dasses in Australia, Pienemann (1988) found patterns that were similar to those of the uninstructed learners. In Chapter 6, we will discuss other studies that have investigated the influence of instruction on developmental sequences.

## Grammatical morphemes

Researchers have examined the development of grammatical morphemes by learners of English as a second language in a variety of environments, at different ages, and from different first language backgrounds. In analysing each learner's speech, researchers identify the obligatory contexts for each morpheme, that is, the places in a sentence where the morpheme is necessary to make the sentence grammatically correct. For example, in the sentence 'Yesterday I play baseball for two hours', the adverb 'yesterday' creates an obligatory context for a past tense, and 'for two hours' tells us that the required form is a simple past ('played') rather than a past progressive ('was playing'). Similarly, 'two' creates an obligatory context for a plural -s on 'hours'.

For the analysis, obligatory contexts for each grammatical morpheme are counted separately, that is, one count for simple past, one for plural, one for third person singular present tense, and so on. After counting the number of obligatory contexts, the researcher counts the correctly supplied morphemes. The next step is to divide the number of correctly supplied morphemes by the total number of obligatory contexts to answer the question 'what is the percentage accuracy for each morpheme?' An accuracy score is created for each morpheme, and these can then be ranked from highest to lowest, giving an accuracy order for the morphemes.

The overall results of the studies suggested an order that was similar but not identical to the developmental sequence found for first language learners. However, the order the researchers found was quite similar among second language learners from different first language backgrounds. For example, most studies showed a higher degree of accuracy for plural $-s$ than for posses sive - $\boldsymbol{S}$, and for -ing than for regular past (-ed). Stephen Krashen summarized the order as shown in Figure 2.1. The diagram should be interpreted as showing that learners will produce the morphemes in higher boxes with higher accuracy than those in lower boxes, but that within boxes, there is no dear pattern of difference.

Figure 2.1 Krashen's ( 1982) summary of second /anguage grammatical morpheme acquisition sequence

The similarity among learners suggests that the accuracy arder cannot be described or explained in terms of transfer from the learners' first language, and sorne researchers saw this as strong evidence against the CAH. However, a thorough review of all the 'morpheme acquisition' studies shows that the learners' first language does have an influence on acquisition sequences. Far example, learners whose first language has a possessive form that resembles the English $S$ (such as German and Danish) seem to acquire the English possessive earlier than those whose first language has a very different way of forming the possessive (such as French or Spanish). And even though ani des appear early in the sequence, learners from many language backgrounds (including Slavic languages, Chinese, and Japanese) continue to struggle with this aspect of English, even at advanced levels. Learners may do well in supplying articles in certain obligatory contexts but not others. Ifthe lan guage sample that is analysed contains only the 'easier' obligatory contexts, che learner may have a misleadingly high accuracy score.

Another reason why something as difficult as English articles appears to be acquired early is that the arder in the diagram is based on the analysis of correct use in obligatory contexts only. Itdoes not take into account uses of grammatical morphemes in places where they do not belong, for example, when a learner says, 'The France is in Europe'. These issues led researchers
to question the adequacy of obligatory context analyses as the sale basis for understanding developmental sequences. Teresa Pica (1983) argued that accuracy seores should take account of overuse and incorrect uses to deter mine a score for target-like use rather than reflect only use in obligatory contexts.

The morpheme acquisition literature raises other issues, not least of them the question of why there should be an arder of acquisition for these language features. Sorne of the similarities observed in different studies seemed to be due to the use of particular tasks for collecting the data, and researchers found that different tasks tended to yield different results. Nevertheless, a number of studies have revealed similarities that cannot be explained by the data col lection procedures alone. As with first language acquisition, researchers have not found a single simple explanation for the arder. Jennifer Goldschneider and Roben DeKeyser (2001) reviewed this research and identified a number of variables that contribute to the arder. Salience (how easy it is to notice the morpheme), linguistic complexity (for example, how many elements you have to keep track of), semantic transparency (how clear the meaning is), similarity to a first language form, and frequency in the input all seem to play arole.

## Negation

The acquisition of negative sentences by second language learners follows a path that looks nearly identical to the stages we saw in Chapter 1 for first language acquisition. However, second language learners from different first language backgrounds behave somewhat differendy within those stages. This was illustrated in John Schumann's (1979) research with Spanish speakers learning English and Henning Wode's (1978) work on German speakers learning English.

## Stage 1

The negative element (usually 'no' or 'not') is typically placed befare the verb or the element being negated. Often, it occurs as the first word in the sen tence because the subject is not there.

No bicycle.
I no like it.
Not my friend.
'No' is preferred by most learners in this early stage, perhaps because it is the negative form that is easiest to hear and recognize in the speech they are exposed to. Italian- and Spanish-speaking learners may prefer 'no' because it corresponds to the negative form in Italian and Spanish (No tienen muchos libros). They may continue to use Stage 1 negation longer than other learners because of the similarity to a pattern from their first language. Even at more advanced stages, they may also use Stage 1 negatives in longer sentences or
when they are under pressure. Thus, similarity to a learner's first language may slow clown a learner's progress through a particular developmental stage.

## Stage 2

At this stage, 'no' and 'not' may alternate with 'don't'. However, 'don't' is not marked for person, number, or tense and it may even be used befare modals like 'can' and 'should'.

He don't likeit.
I don't can sing.
Stage 3
Learners begin to place the negative element after auxiliary verbs like 'are', 'is', and 'can'. But at this stage, the 'don't' form is still not fully analysed.

You can not go there.
He was not happy.
She don't likerice.
At this stage, German speakers, whose first language has a structure that places the negative after the verb may generalize the auxiliary-negative pattern to verb-negative and produce sentences such as:

They come not [to] home. (Sie kommen nicht nach Hause. )

## Stage 4

In this stage, 'do' is marked for tense, person, and number, and most interlan guage sentences appear to be just like those of the target language.

It doesn't work. We didn't have supper.
However, sorne learners continue to mark tense, person, and number on both the auxiliary and the verb.

I didn't went there.

## Questions

fanfred Pienemann, Malcolm Johnston, and Geoff Brindley (1988) described a sequence in the acquisition of questions by learners of English from a variety of first language backgrounds. An adapted version of the sequence is shown in Stages 1-6 below. The examples (except those in Scage 6) come from French speakers who were playing a game in which they had to ask questions in arder to find out which picture the other player ,(the researcher) was holding. As we saw for negation, the overall sequence is similar to the one observed in first language acquisition. And again, there are sorne differences that are attributable to first language influence.

## Suzge 1

Single words, formulae, or sentence fragments.

Dog?
Four children?
What's that?

## Stage 2

Declarative word order, no inversion, no fronting.
It's a monster in the right comer?
The boys throw the shoes?
Declarative order with rising intonation is common in yes/no questions in informal spoken French. French speakers may hypothesize that in English, as in French, inversion is optional.

## Stage 3

Fronting: do-fronting, wh-fronting without inversion, other fronting.
Do you have a shoes on your picture?
Where the children are playing?
Does in this picture there is four astronauts?
Is the picture has two planets on top?
French has an invariant form est-ce que (literally 'is it that') that can be placed before a declarative sentence to make a question. For example, Jean aime le cinéma becomes Est-ce que eean aime le cinéma? ('is it that) John likes movies?' French speakers may think that 'do' or 'does' is such an invariant form and continue to produce Stage 3 questions for sornetime.

## Stage 4

lnversion in wh- + copula; yes/no questions with other auxiliaries.
Where is the sun?
Is there a fish in the water?
At Stage 4, German speakers may infer that if English uses subject-auxiliary inversion, it may also permit inversion with full verbs, as German does, leading them to produce questions such as 'Like you baseball?' (Magst du basebalP.)

Stage 5
Inversion in wh- questions with both an auxiliary and a main verb.
How do you say 'proche'?
What's the hoydoing?
French-speaking learners may have difficulty using Stage 5 questions in which the subject is a noun rather than a pronoun. They may say (and accept as grammatical) 'Why do you like chocolate?' but not 'Why do chil dren like chocolate?' In this, they are drawing on French, where it is often
ungrammatical to use inversion with a noun subject (*Pourquoi aiment les enfants le chocolat?).

## Stage 6

Complex questions.
question tag: It's better, isn't it?
negative question: Why can't you go?
embedded question: Can you tell me what the date istoday?
Pienemann's developmental sequence for questions has been the basis for a number of studies, sorne of which will be discussed in Chapter 6. Alison Mackey and her colleagues have done a number of these studies, and she pro vided the data in Table 2.2. These examples come from three adult Japanese learners of English as a second language who were interacting with a native speaker in a 'spot the differences' task. In this task, learners have similar but not identical pictures and they have to ask questions until they work out how the picture they can see is different from the one their interlocutor has. Note that progress to a higher stage does not always mean that learners produce fewer errors.

## ACTIVITY Analyse learners' questions

Using the information about the developmental sequence for questions, circle the stage of second language question development that best corresponds to ea.ch question.
(Hint: Read all of each learner's questions befare you begi $n$.)

|  | Stage |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ${ }_{\text {i }}$ Learner 1 |  |  |  |  |  |  |
| 1 Where is he going and what is he saying? | 1 | 2 | 3 | 4 | 5 | 6 |
| 2 Is the room his room? | 1 | 2 | 3 | 4 | 5 | 6 |
| 3 Is he taking out his skate board? | 1 | 2 | 3 | 4 | 5 | 6 |
| 4 What is he thinking? | 1 | 2 | 3 | 4 | 5 | 6 |
| 5 The girl, what do you, what does she do, what is she doing? | 1 | 2 | 3 | 4 | 5 | 6 |
| - |  |  |  |  |  |  |
| ${ }^{4}$ Learner 2 |  |  |  |  |  |  |
| J. 6 Are they buying sorne things? | 1 | 2 | 3 | 4 | 5 | 6 |
| $\ldots$. 7 Is they bought present? | 1 | 2 | 3 | 4 | 5 | 6 |

| 8 Is they're retirement people? | 1 | 2 | 3 | 4 | 5 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 6 |  |  |  |  |  |$|$| 9 Is this perf ume or ... 1don't know. | 2 | 3 | 4 | 5 | 6 |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathbf{1}$ And it is necktie? | 1 | 2 | 3 | 4 | 5 | 6 |
|  |  |  |  |  |  |  |
| Learner 3 |  |  |  |  |  |  |
| t1Are there any shuttle? Space shuttle? | 1 | 2 | 3 | 4 | 5 |  |
| 12 lnside, is there any girl? | 1 | 2 | 3 | 4 | 5 | 6 |
| 13 You don't see? | 1 | 2 | 3 | 4 | 5 | 6 |
| 4 What are, what the people wearing? | 1 | 2 | 3 | 4 | 5 | 6 |
| IS And they are carrying pink box? | 1 | 2 | 3 | 4 | 5 | 6 |
| Answer key <br> Learner I: Questions 1, 4, and 5 are Stage 5 questions. Question <br> interesting because it shows the speaker self-correcting, suggesting that <br> Stage 5 is still a level that requires sorne greater effort. Questions <br> are Stage 4 questions. |  |  |  |  |  |  |

Learner 2: Questions 6 and 9 could be Stage 4 questions. However, the fact that questions 7 and 8 are Stage 3 questions suggests that this speaker has not actually progressed from 'fronting' to 'inversion', particularly since question $I O$ is a Stage 2 question.

Learner 3: Questions 11 and 12 are Stage 4 questions. Questions 13 and 15 are Stage 2 questions. Question 14 shows the speaker apparently on the verge of a Stage 5 question, then retreating to a Stage 3 question.

Table 2.2 Questions byJapanese-s peaking learners of English

## Possessive determiners

A developmental sequence for the English possessive forms 'his' and 'her' has been observed in the interlanguage of French- and Spanish-speaking learn ers. In English, the choice of 'his' or 'her' (or 'its') is determined by the natural gender of the possessor. In French and Spanish (and many other languages), the correct form of the possessive determiner matches the grammatical gender of the object or person that is possessed. This can be illustrated with the following translation equivalents for French and English:

Sa mere $=$ his mother or her mother
Son chien $=$ his dog or her dog
Ses enfants = his children or her children

Note that when the object possessed is a body part, French typically uses a definite artide rather than a possessive determiner.

Il s'est casséle bras = He broke the [his] arm.
Joanna White $(1998,2008)$ studied the acquisition of possessive determiners by French-speaking students, adapting a developmental sequence that was first proposed by Helmut Zobl (1984). White found a total of eight stages in the sequence, but they can be grouped into three main stages. The examples shown below come from French-speaking students learning English. They are describing cartoon drawings of family events and interactions.

## Stage 1:Pre-emergence

No use of 'his' and 'her'. Definite artide or 'your' used for ali persons, genders, and numbers.

The little boy play with the bicyde.
He have band-aid on the arm, the leg, the stomach.
This boy cry in the arm of your mother.
There is one girl talk with your dad.
Stage 2:Emergence
Emergence of 'his' and/or 'her', with a strong preference to use only one of the forms.

The mother is dressing her little boy, and she put her dothes, her pant, her coat, and then she finish.
The girl making hisself beautiful. She put the make-up on his hand, on his head, and his father is surprise.

## Stage 3:Post-emergence

Differentiated use of 'his' and 'her' but not when the object possessed has natural gender.

The girl fell on her bicyde. She look his father and cry.
The dad put her litde girl on his shoulder, and after, on his back.
At the end of the post-emergence stage, in what White (2008) calls Stage 8, learners finally achieve error-free use of 'his' and 'her' in all contexts indud ing natural gender and body parts.

The litde girl with her dad play together. And the dad take his girl on his shoulder and he hurt his back.

When English speakers learn French, or other languages that use grammati cal gender as the basis for choosing possessive determiners, they must also learn a new way of determining the gender of the possessive determiner. The need to learn the grammatical gender of each and every noun further adds co the challenge.

## Relative clauses

Second language learners first acquire relative clauses that refer to nouns in the subject and direct object positions, and only later (and in sorne cases, never) learn to use them to modify nouns in other sentence roles (for example, indi rect object and object of preposition). A summary of the observed pattern of acquisition for relative clauses is shown in Table 2.3. It is referred to as the accessihility hierarchy, and it reflects the apparent ease with which learners have access to certain structures in the target language.

| Part of speech | Relative clause |
| :--- | :--- |
| Subject | The girl who was sick went home. |
| Direct object | The story that I read was long. |
| Indi rect object | The man who[m] Susan gave the present to <br> was happy. |
| Object of preposition | 1found the book that John was tal king about. |
| Possessive | 1know the woman whose father is visiting. |
| Object of comparison | The person that Susan is taller than is Mary. |

Photocopiable © Oxford University Press

## Table 2.3 Accessibility hierarchy for relative clauses in English (adapted from Doughty 199 I)

Unlike the study of grammatical morphemes, negation, and questions, the study of relative clauses was not inspired by research on child language. Rather, it carne from patterns that Edward Keenan and Bernard Comrie (1977) observed in a large number oflanguages. They found that those lan guages that included the structures at the bottom of the list in Table 2.3 would also have those at the top, but the opposite was not necessarily true. Subsequently, Susan Gass (1982) and others found that if a second language learner could use one of the structures at the bottom of the list, he or she would probably be able to use any that precede it. On the other hand, a learner who could produce sentences with relative clauses in the subject or direct object positions (at the top of the list) would not necessarily be able to use them in any of the clause types further clown the list.

Despite the similarity of the general pattern, several types of first language influence have also been observed in the acquisition of relative clauses. First, it has been observed that for learners whose first language does not have a particular clause type (for example, object of comparison), it is more dif ficult to learn to use that type in English. Second, where learners have a first language with a substantially different way of forming relative clauses (for example, Chinese and Japanese, where the relative clause precedes the noun
it modifies), they may avoid using relative clauses even when their interlan guage is fairly advanced. Third, first language influence is seen in the errors learners make. For example, Arabic speakers often produce both the relative marker and the pronoun it replaces (for example, 'The man who I saw him was very angry') as they would in Arabic.

## Reference to past

A number of researchers, including Jürgen Meisel (1987), have observed the developing ability to use language to locate events in time. The research has shown that learners from different first language backgrounds and acquiring a variety of second languages, acquire the language for referring to past events ina similar pattern.

Like young children, learners with limited language may simply refer to events in the arder in which they occurred or mention a time or place to show that the event occurred in the past.

Viet Nam. We work toohard.
My son come. He work in restaurant.
Later, learners start to attach a grammatical morpheme marking the verb for past, although it may not be the one that the target language uses for that meaning.

Me working long time. Now stop.
Past tense forms of irregular verbs may be used befare the regular past is used reliably.

We went to school every day. We spoke Spanish.
After they begin marking past tense on regular verbs, learners may overgen eralize the regular -ed ending or the use of the wrong past tense form (for exarnple, the present perfect rather than the simple past).

My sister catched a big fish.
She has lived here since fifteen years.
Kathleen Bardovi-Harlig (2000) and others have found that learners are more likely to mark past tense in sentences such as 'I broke the vase' and 'My sister 6:xed it with glue' than in sentences such as 'She seemed happy last week' or -t.ly father swam in that lake'. These differences appear to be due to the 'lexical aspect', that is, the kinds of meanings expressed by the different verbs. Learners icem to find it easier to mark past tense on verbs that refer to something whose md point can easily be determined. These are referred to as 'accomplishments' md 'achievements' ('I ran three miles.' 'My brother took an aspirin and went to bed'). For 'activities' that may continue for sorne period ('I swam all afternoon') or 'states' that may be perceived as constants ('He seemed happy to sit by the bke'), learners use simple past markers less frequently.

First language can have an influence here too. Laura Collins (2002) investi gated the different English verb forms used by French speakers. The past tense that is most commonly used in spoken French and that is usually a transla tion of a simple past form in English is a form that resembles the present perfect in English. Thus, the equivalent of 'Yesterday he ate an apple' is Hier il a mangé u nepomme - literally, 'Yesterday he has eaten an apple'. Teachers often comment on French speakers' tendency to overuse the present perfect. In Collins' study, learners completed passages by filling in blanks with the appropriate form of a verb. As expected, in places where English speakers would use the simple past, French speakers did sometimes use the perfect (either present perfect or past perfect) forms. Furthermore, they used them more frequently than a comparison group of Japanese speakers. However, the French speakers were more likely to use perfect forms for achievement and accomplishment verbs than for the states and activities. Collins observes, 'The [first language] influence <loes not appear to override the effect oflexical aspect; rather it occurs within it' (p. 85).

## Movement through developmental sequences

We have seen in this section that, as in first language acquisition, there are systematic and predictable developmental sequences in second language acquisition. However, it is important to emphasize that developmental stages are not like closed rooms. Learners do not leave one behind when they enter another. In examining a language sample from an individual learner, one should not expect to find behaviours from only one stage. On the contrary, at a given point in time, learners may use sentences typical of several different stages. It is perhaps better to think of a stage as being characterized by the emergence and increasing frequency of new forms rather than by the com plete disappearance of earlier ones. Even when a more advanced stage comes to dominate in a learner's speech, conditions of stress or complexity in a com municative interaction can cause the learner to slip back to an earlier stage.

In addition, as we have already noted, progress to a higher stage <loes not always mean fewer errors. For example, a learner may produce correct ques tions at Stage 1or Stage 3, but those correct forms are not necessarily based on underlying knowledge of subject-verb inversion. That is, correct questions at Stage 1 are formulaic chunks, not sentences that have been constructed from the words that make them up. At Stage 2, learners have advanced, in the sense that they are forming original questions, but the word arder of those questions is not grammatical in the target language. At Stage 3, questions are formed by placing a question form (most often a wh- word or a form of the verb 'do') at the beginning of a sentence with declarative word arder. This may result in questions such as 'Do you want to go?' that conform to English patterns. However, when the learner asks a question such as 'Do you canhelp
me?' we can see that the learner's interlanguage rule really is something like 'Put a question word at the beginning of the sentence.'

Another important observation about developmental sequences is the way they interact with first language influence. Learners do not appear to assume that they can simply transfer the structures of their first language into the second. Rather, as Henning Wode (1978) and Helmut Zobl (1980) observed, when they reach a developmental stage at which they perceive a 'crucial similarity' between their first language and their interlanguage, they may generalize their first language pattern and end up making errors that speakers of other languages are less likely to make. They may also have difficulty moving beyond that stage if their errors do not interfere with communication.

## More about.first language inftuence

One reason that sorne researchers rejected the hypothesis that 'transfer' or 'interference' would best explain a learner's difficulties with the target language was the fact that contrastive analysis was dosely associated with behaviourist views oflanguage acquisition. In rejecting behaviourism, sorne researchers also discarded contrastive analysis. In doing so, they potentially lost an essential source of information about language acquisition.

Researchers at the European Science Foundation carried out a study that created sorne valuable opportunities to examine the influence of the first language on second language learning. Adult language learners, most of whom had little or no second language instruction, were followed as they learned another European language. Por each target language, learners from cwo different first language backgrounds were compared. Also, for each first language background, the progress oflearners in their acquisition of the two target languages was studied. As Wolfgang Klein and Clive Perdue (1993) report, there were substantial similarities in the interlanguage patterns of the learners, in spite of the great variety in the first and second language combi nations. The similarities were greatest in the earliest stages of second language acquisition, when learners produced similar simple sentences.

There is no doubt that learners draw on the patterns of other languages they lrnow as they try to discover the complexities of the new language they are learning. The patterns of those earlier languages are firmly established, and as learners have experience with the new language, there is an interplay between rhe new and old patterns. As Nick Ellis (2009: 153) put it, 'The language calculator has no "dear" button.' In learning something new, we build on what we already know.

We have seen sorne ways in which the first language interacts with develop mental sequences. When learners reach acertain stage and perceive a similarity to their first language, they may linger longer at that stage (for example, the extended use of preverbal 'no' by Spanish speakers) or add a sub-stage (for example, the German speaker's inversion of subject and lexical verbs in ques tions) to the sequence which, overall, is similar across learners, regardless of their first language. They may learn a second language rule but restrict its application (for example, the French speaker's rejection of subject-auxiliary inversion with noun subjects that we saw in Stage 5 questions on page 50).

The first language may influence learners' interlanguage in other ways as well. fu we saw earlier, the phenomenon of avoidance that Jacquelyn Schachter ( 1974) described appeared to be caused at least in part by learners' perception that a feature in the target language was so distant and different from their first language that they preferred not to try it.

Other researchers have also found evidence oflearners' sensitivity to degrees of distance or difference and a reluctance to attempt a transfer when they perceive the languages as too different. In one revealing study, Ha.kan Ringbom (1986) found that the interference errors made in English by both Finnish-Swedish and Swedish-Finnish bilinguals were most often trace able to Swedish, not Finnish. The fact that Swedish and English are closely related languages that actually do share many characteristics seems to have led learners to take a chance that a word or a sentence structure that worked in Swedish would have an English equivalent. Finnish, on the other hand, belongs to a completely different language family, and whether their own first language was Swedish or Finnish, learners appeared reluctant to draw on Finnish in learning English.

The risk-taking associated with this perception of similarity has its limits, however. For example, Eric Kellerman (1986) observed that learners often believe that idiomatic or metaphorical uses of words are unique to a particu lar language. Kellerman found that Dutch learners of English were reluctant to accept that certain idiomatic expressions or unusual uses of words were also possible in English. For example, they rejected 'The wave broke on the shore' but accepted 'He broke the cup' even though both are straightforward translations of sentences with the Dutch verb breken.

Another way in which learners' first languages can affect second language acquisition is by making it difficult for them to notice that something they are saying is not a feature of the language as it is used by more proficient speakers. Lydia White (1991) gave the example of adverb placement in French and English. Both languages allow adverbs in several positions in simple sentences. However, as the examples in Table 2.4 show, there are sorne differences. English, but not French, allows SAYO order; French, but not English, allows SVAO.

| S =Subject V =Verb O =Object A = Adverb |
| :--- |
| ASVO |
| Often, Mary drinks tea. |
| Souvent, Marie boit duthé. |
| SVOA <br> Mary drinks tea often. <br> Marie boit du thé souvent |
| SAYO <br> Mary often d rinks tea. <br> *Marie souvent boit du thé. |
| SVAO <br> *Mary d rinks often tea. <br> Marie boit souvent du thé. |
| Note:The asterisk (*) means that the sentence is not grammatical. |

## Table 2.4 Adverb placement in French and English

It seems fairly easy for French-speaking learners of English to add SAYO to their repertoire and for English-speaking learners of French to add SYAO, but both groups have difficulty getting rid of a pattern that does not occur in the target language if it is similar to one in their first language. English speaking learners of French continue to accept SAYO as grammatical, and French-speaking learners of English accept SYAO. As White points out, it is difficult to notice that something is not present in the input, especially when its translation equivalent sounds perfectly all right and communication is not disrupted. This may be even more challenging when learners interact with others from the same first language background. Their own errors are not likely to cause misunderstanding and, in fact, they may hear others make the same errors. We will return to this when we look at the role of instruction and feedback on errors in Chapters 5 and 6.

Our understanding of the relationship between first- and later-learned languages has been refined in recent decades. The term cross-linguistic influ ence is now often used, in part to reflect the fact that the relationship is by no means unidirectional. That is, as we acquire a second or third language, the patterns that we learn can also have an impact on the way we use and under stand the language(s) we learned earlier. Current views of second language development emphasize the interaction between the first language (or other previously learned languages), cognitive processes, and the samples of the target language that learners encounter in the input. As extensive reviews by Terence Odlin (2003) and Scott Jarvis and Aneta Pavlenko (2008) show, the complexity of this relationship has inspired seores of investigations.

So far this chapter has focused on the acquisition of morphology and syntax in the second language. We now turn to the learning of sorne other important components of communicative competence: vocabulary, pragmatics, and pronunciation.

## Vocabulary

In 1980, Paul Meara characterized vocabulary learning as a 'neglected aspect oflanguage learning'. Researchers in the 1970s and early 1980s were drawn to syntax and morphology because of the way error patterns and develop mental sequences of these features might reveal something about universals in languages and language acquisition. How different things are now! Just as Meara was commenting on the state of neglect, an explosion of research on vocabulary learning was beginning, and the acquisition of vocabulary has become one of the most active areas in second language acquisition research.

For most people, the importance of vocabulary seems very clear. As it has often been remarked, we can communicate by usingwords that are not placed in the proper arder, pronounced perfectly, or marked with the proper gram matical morphemes, but communication often breaks clown if we do not use the correct word. Although circumlocution and gestures can sometimes compensate, the importance of vocabulary can hardly be overestimated.

The challenge of acquiring a large enough vocabulary for successful commu nication in a variety of settings has been the focus of much recent research. Every language has an astonishingly large number of words. English, which has built its vocabulary from a great variety of source languages, is variously estimated to have anywhere from 100,000 to one million words, depending in part on how words are counted. For example, sorne would treat 'teach, teacher, teaching, and taught' as separare words while others would count all of them as part of one 'word'-a single root from which the others are derived.

An educated adult speaker of English is believed to know at least 20,000 words; sorne estimares suggest a number that is more than twice that. But most everyday conversation requires a far smaller number, something more like 2,000 words. Similarly, although Chinese and Japanese have tens of thou sands of characters, most are rare, and non-technical material can usually be read with a knowledge of about 2,000 characters. Even so, acquiring a basic vocabulary is a significant accomplishment for a second language learner.
As we saw in Chapter 1, children learn thousands of words in their first lan guage with little observable effort. The task of acquiring a large vocabulary is quite different for second language learners. For one thing, they are likely to be exposed to far smaller samples of the language to be learned. Also, the contexts in which second language learners encounter new vocabulary may not be as helpful as those in which children learn the first one or two thou sand words of their first language. If they are older children or adults, the words they are exposed to may be more difficult, referring to meanings that are not easily guessed from context. Marcella Hu and Paul Nation (2000) showed that, in arder to understand a text without frequent stops to consult a dictionary, one needs to know more than 95 per cent of the words-a rare case for second language learners at most stages of acquisition. Although the rwo or three thousand most frequent words in English make up as much as 80-90 per cent of most non-technical texts, less frequent words are crucial to che meaning of many things we hear and read. For example, the meaning of a newspaper article about a court case may be lost without the knowledge of words such as 'testimony', 'alleged', or 'accomplice'.

The first step in knowing a word is simply to recognize that it is a word. Paul leara and his colleagues (2005) have developed tests that take advantage of this fact. Sorne of these tests take the form of word lists, and learners are instructed to check 'yes' or 'no' according to whether or not they know the word. Each list also includes some items that look like English words but are not. The number of real words that the learner identifies is adjusted for guess ing by a factor that takes account of the number of non-words that are also chosen. Such a procedure is more effective than it might sound. A carefully constructed list can be used to estimare the vocabulary size of even advanced learners. For example, if shown the following list: 'frolip, laggy, scrule, and
albeit', a proficient speaker of English would know that only one of these words is a real English word, albeit a rare and somewhat odd one. On the other hand, even proficient speakers might recognize none of the following items: 'goniometer, micelle, laminitis, throstle'. Even our computer's spell checker rejected two out of four, but all are real English words, according to the New Oxford Dictionary ofAmerican English.

Among the factors that make new vocabulary more easily learnable by second language learners is the frequency with which the word is seen, heard, and understood. Paul Nation (2001) reviews a number of studies suggesting that a learner needs to have many meaningful encounters with a new word before it becomes firmly established in memory. The estimates range as high as 16 times in sorne studies. Even more encounters may be needed before a learner can retrieve the word in fluent speech or automatically understand the meaning of the word when it occurs in a new context. The ability to understand the meaning of most words without focused attention is essential for fluent reading as well as for fluent speaking.

Frequency is not the only factor that determines how easily words are learned, however, as illustrated by the words in the three lists shown in Table 2.5.

| List 1 | List 2 | List 3 |
| :--- | :--- | :--- |
| friend | hamburger | government |
| more | Coke | responsibility |
| town | T-shirt | dictionary |
| book | Facebook | elementary |
| hunt | taxi | remarkable |
| sing | pizza | description |
| box | hotel | expression |
| smile | dollar | international |
| eye | Internet | dénouement |
| night | disco | entente |

Table 2.5 English words that may be 'easy' or 'difficult' for second language /earners
All of the words in List 1 look easy because they are simple one-syllable words that refer to easily illustrated actions or objects. They are also quite common words in English, appearing among the 1,000 most frequent words. And yet, they are not likely to be known to students who have not had previous instruc tion in English or exposure to the language outside school. Furthermore,
chere is nothing in che written form or che pronunciation of che words them selves that gives a clue to their meaning. Ifstudents are to learn them, they muse see or hear che words in contexts that reveal cheir meaning, and, as a rule, they muse do chis many times befare che link between a word and its meaning is well established.

On che other hand, sorne students who have never studied English might already know words in List 2, because they are pare of an internacional vocabulary. With increasing internationalization of communications, many languages have 'borrowed' and adapted words from other languages. Students throughout che world may be surprised to learn how many words they already know in che language they are trying to learn.

The words in List 3 look difficult. They are rather long, not easily illustrated, and most are fairly infrequent in che language. However, many students would either 'know' them on sight or learn them after a single exposure because they look like their translation equivalent in other languages that they already know. Sorne, such as 'nation' and 'dictionary', are cognates (words chat have come from che same original root); others, such as 'dénoue ment' and 'entente', are borrowed words (words that have been adopted from other languages). These words that look alike and have shared meaning can help learners expand their vocabulary.

Teachers should not assume chat students will always recognize borrowed words or cognates in their second language. Sorne cognates are identical in form and meaning, while others may require sorne knowledge of how spell ing patterns are related in che two languages (for example, 'water' and \Vtisser in English and German respectively or 'music' and musique in English and French). Even with different spellings, words are likely to be easier to recog nize in their written form chan they are in che spoken language. Learners may need guidance in recognizing them, as illustrated in che following question, asked by an eight-year-old in a Quebec hockey arena: 'Hé coach, comment on dit 'coach'en anglais?' ('Hey, coach. How do you say 'coach' in English?'). And after a moment's refl.ection, English speakers may realize that chey know both speciality items in a Japanese restaurant that calls itself 'Sushi and Bisuteki.'

On che other hand, students may have particular difficulty with words that look similar in che two languages bue have different meanings. These 'false cognates' may come from different origins or they may have evolved differ ently from che same origin. For example, che English verb 'demand' has a different meaning from its French cousin demander, which means 'request' or 'ask a question', even though they carne from che same Latín verb.

Sorne theorists have argued that second language learners, like children learning their first language, can learn a great <leal of vocabulary with little intencional effort. Stephen Krashen (1989) has asserted that che bese source of vocabulary growth is reading for pleasure. There is no doubt that reading
is an important potential source of vocabulary development for second lan guage learners as it is for first language learners. However, there are sorne problems with the notion that vocabulary growth through reading requires little effort. fu noted above, it is difficult to infer the meaning of a new word from reading unless one already knows 95 per cent or more of the other words, and learners usually need to have many meaningful encounters with a word befare they recognize it in new contexts or produce it in their own speaking and writing. As we saw in Chapter 1, Dee Gardner's (2004) research demonstrates that certain types of words are rare in narratives. Thus, stu dents who read mainly fiction may have little chance oflearning words that are essential for their academic pursuits. Conversely, reading mainly science texts will not provide many opportunities to learn the vocabulary of social interaction.

Research on vocabulary learning through reading without focused instruction confirms that sorne vocabulary can be learned without explicit instruction (see Chapter 6, Study 17). On the other hand, Jan Hulstijn and Batia Laufer (2001) and others provide evidence that vocabulary development is more successful when learners are fully engaged in activities that require them to attend carefully to the new words and even to use them in productive tasks. lzabella Kojic-Sabo and Patsy Lightbown (1999) found that effort and the use of good learning strategies, such as keeping a notebook, looking words up in a dictionary, and reviewing what has been learned were associated with better vocabulary development. Cheryl Boyd Zimmerman (2009) provides many practica! suggestions for teaching vocabulary and also for helping learners to continue learning outside the classroom.
Even with instruction and good strategies, the task of acquiring an adequate vocabulary is daunting. What does it mean to 'know' a word:

- Grasp the general meaning in a familiar context?
- Provide a definition or a translation equivalent?
- Provide appropriate word associations?
- Identify its component parts or etymology?
- Use the word to complete a sentence or to creare a new sentence?
- Use it metaphorically?
- Understand a joke that uses homonyms (words that sound alike but mean different things, such as 'cents', 'sense', 'scents')?

Second language learners whose goal is to use the language for both social and academic purposes must learn to do all these things.

## Pragmatics

Pragmatics is the study of how language is used in context to express such things as directness, politeness, and deference. Even if learners acquire a vocabulary of 5,000 words and a good knowledge of the syntax and mor phology of the target language, they can still encounter difficulty in using language. They also need to acquire skills for interpreting requests, respond ing politely to compliments or apologies, recognizing humour, and managing conversations. They need to learn to recognize the many meanings that the same sentence can have in different situations. Think of the many ways one might interpret an apparently simple question such as 'Is that your dog?' It might precede an expression of admiration for an attractive pet, or it might be an urgent request to get the dog out of the speaker's flowerbed. Similarly, the same basic meaning is altered when it is expressed in different ways. Por example, we would probably assume that the relationship between speaker and listener is very different if we hear 'Give me that book' or 'I wonder if you'd mind letting me have that book when you've finished with it'.

The study of how second language learners acquire this aspect of language is referred to as 'interlanguage pragmatics' (Bardovi-Harlig 1999). Sorne of this research has focused on the ways in which learners express speech acts such as inviting and apologizing in relation to differences in their proficiency level or their first language background. Other studies have examined learn ers' ability to perceive and comprehend pragmatic features in the second
language and to judge whether a particular request is appropriate or inap propriate in a specific context.

Since the early 1990s more research has directly investigated the acquisition of second language pragmatic ability. This includes longitudinal and cross sectional studies describing the acquisition of severa! different speech acts. One that has been the focus of considerable attention is 'requesting'. Requests are an interesting pragmatic feature to examine because there are identifiable ways in which requests are made within particular languages as well as differences in how they are expressed across different languages and cultures.
In a review of longitudinal and cross-sectional studies on the acquisition of requests in English, Gabriele Kasper and Kenneth Rose (2002) outline a series of five stages of development. Stage 1 consists of minimal language that is often incomplete and highly context-dependent. Stage 2 includes primarily memorized routines and frequent use of imperatives. Stage 3 is marked by less use of formulas, more productive speech, and sorne mitiga tion of requests. Stage 4 involves more complex language and increased use of mitigation, especially supportive statements. Stage 5 is marked by more refinement of the force of requests. The five stages, their characteristics and examples are given below.

## Stage 1:Pre-basic

Highly context-dependent, no syntax, no relational goals.
Me no blue.
Sir.

## Stage 2: Formulaic

Reliance on unanalysed formulas and imperatives.
Let's play the game.
Let's eat breakfast.
Don't look.

## Stage 3: Unpacking

Formulas incorporated into productive language use, shift to conventional indirectness.

Can you pass the pencil please?
Can you do another onefor me?

## Stage 4: Pragmatic expansion

Addition of new forms to repertoire, increased use of mitigation, more complex syntax.

Could I have another chocolate because my children-1 have five children. Can I see it so I can copy it?

## Stage 5: Fine tuning

Fine tuning of requestive force to participants, goals, and contexts.
You could put sorne Blu Tack clown there.
Is there any more white?
Learning how to make and reject suggestions has also been extensively inves tigated. Kathleen Bardovi-Harlig and Beverly Hartford (1993) observed differences between the way in which native and non-native speakers of English communicated with their professors as they discussed their course selections in academic advising sessions. These differences contributed to their greater or lesser success in negotiating their academic plans. For example, the non-native speakers did not initiate suggestions whereas native speakers initiated a great deal. There was also a tendency on the part of the non-native speakers to reject suggestions made by the advisor in ways that the advisors might find rude or inappropriate. For example, they would reject an advisor's suggestion to take a particular course by saying 'I think I am not interested in that course', instead of saying 'My schedule conflicts with that course', or 'I think this other course would better meet my needs', which was more typical of native-speaker rejection responses. The non-native speakers were also much less adept than the native speakers at using mitigation. For example, native speakers were observed to say 'I think I would like to take this course', whereas the non-native speakers said 'I will take that course'.

Over a period of four and a half months, the researchers observed progress in sorne aspects of the non-native speakers' pragmatic ability.For example, they learned to take a more active role in the advising interaction and to provide reasons for rejecting suggestions that the advisors were likely to perceive as more credible or acceptable. Even so, they continued to have sorne difficulty inmitigating their suggestions and rejections.

For a long time, it was assumed that second language classrooms could not provide appropriate opportunities for students to learn many different speech acts. This was especially true in teacher-fronted classrooms where the dominant interaction pattern was 'teacher initiation-learner response ceacher feedback' and where the emphasis was almost always on producing full sentences that were grammatically correct (see further discussion of chis in Chapter 5). In communicative, content-based, and task-based lan goage teaching, there are more opportunities not only for a greater variety of input but also for learners to engage in different roles and participant organization structures (for example, pair and group work). This enables learners to produce and respond to a wider range of communicative func tions. Furthermore, research on the teaching ofpragmatics has demonstrated that pragmatic features can be successfully learned in dassroom settings and that explicit rather than implicit instruction is most effective (Kasper and Rose 2002). This is good news for foreign language learners who do nothave
extensive exposure to conversational interaction outside the classroom. The question is no longer whether second language pragmatics should be taught but rather how it can be integrated into classroom instruction.

## Phonology

fu noted earlier, grammar has been the focus for second language teachers and researchers for a long time. Vocabulary and pragmatics have also received more attention in recent years. However, we know less about pronunciation and how it is learned and taught. Pronunciation was a central component in language teaching when the audiolingual approach was dominant. Several techniques for teaching pronunciation were developed at that time, and most of them focused on the pronunciation of segmentals, getting learners to perceive and to produce distinctions between single sounds in minimal pair drills (for example, 'ship' and 'sheep').

When the audiolingual approach was replaced by other ways of teach ing, attention to pronunciation was minimized if not totally discarded. Furthermore, evidence for the critica! period hypothesis, suggesting that native-like pronunciation was an unrealistic goal for older second language learners (see Chapter 3), led to the argument that instructional time would be better spent on teaching something that learners could learn more success fully. When communicative language teaching (CLT) was first introduced in the late 1970s, little attention was given to the teaching of pronunciation. Ifit was taught, the emphasis was on suprasegmentals (rhythm, stress, and intonation)-aspects of pronunciation that were considered more likely to affect communication (Celce-Murcia, Brinton, and Goodwin 1996).
Although research on the teaching and learning of pronunciation is not as extensive as that in other language domains, there is theoretical and empirical work to help us understand the processes involved in phonological develop ment in a second language and the factors that contribute to it. For example, contrastive analysis helps to explain some aspects of first language influence on second language learners' pronunciation. We can all think of examples from our own experiences or those of our students. Japanese and Korean learners of English often have problems hearing and producing / and $r$ because these sounds are not distinct in their language. Spanish speakers will often say 'I espeak e-Spanish' because Spanish words do not have consonant clusters beginning with $s$ at the beginning of a word. French speakers may place stress on the last syllable of a word because French usually stresses the last syllable. Few languages have the $t h$ sounds that are frequent in English, and learn ers may substitute similar sounds from their first language (for example, $t$ or $d$, s or z ). Sometimes, however, learners overcompensate for sounds that they know are difficult. Thus, learners may pronounce a th (as in 'thin' or 'this') where a $t$ or a $d$ sound belongs (saying 'thin' when they mean 'tin' for
example). Such errors are similar to the overgeneralization errors that we saw for grammatical morphemes. Ifthey replace earlier correct pronunciation of $t$ or $d$ sounds, this may represent progress in learners' ability to notice and produce the $t h$ sound.

The relationship between perception and production of sounds is complex. Evelyn Altenberg (2005) developed a series of tasks to explore Spanish speakers' perceptions and production of English consonant dusters at the beginning of a word. In one task, they had to say whether certain invented words were possible 'new English words'. The Spanish speakers were quite good at recognizing what English words are supposed to sound like. They accepted pseudowords like 'spus' and rejected those like 'zban', even though both words would be unacceptable as 'new Spanish words'. She found that they could usually write (from dictation) pseudowords with initial dusters such as $s p$ and $s m$. However, in their own production, these same learners might still insert a vowel at the beginning ofwords such as 'spoon' and 'smile'.

As we have seen with regard to grammar and vocabulary, it is hypothesized that a greater difference between the learner's native language and the target language can lead to greater difficulty. The evidence supporting the hypoth esis comes partly from the observation that it takes learners longer to reach a high leve! offluency in a particular second or foreign language if that language is substantially different from the languages they already know. For example, a speaker of Chinese faces a greater challenge in learning English than <loes a speaker of German or Dutch. Language distance affects pronunciation as well as other language systems. Theo Bongaerts (1999) collected speech samples from highly proficient speakers who had learned Dutch in their adulthood and who carne from a wide variety of first language backgrounds. When native speakers of Dutch were asked to judge the speech samples, only those learners who spoke a language that was dosely related to Dutch (for example, English or German) were judged to have native-like accents. None of the speakers whose first languages were more distant from Dutch (for example, Vietnamese) were judged to have native-like pronunciation.

There has been little research to document the developmental sequences of individual sounds in second language phonological acquisition. Nonetheless, there is evidence for similarity in the acquisition of sorne features of stress and rhythm and it also dear that the learner's first language plays an important role. Other factors such as the amount and type of exposure to the target language and the degree of use of the first language have been identified as influential contributors to pronunciation. Thorsten Piske, Ian MacKay, and James Flege (2001) have reponed that longer periods of exposure to the second language can lead to improved pronunciation. It has also been observed that adults who continue to make greater use of their first language may have stronger accents in the second language (Piske 2007).

Learners' ethnicaffiliation and their sense ofidentity are also related tohowthey produce the sounds and rhythms of a second language. Elizabeth Gatbonton, Pavel Trofimovich, and Michael Magid (2005) found a complex relationship between feelings of ethnic affiliation and second language learners' acquisi tion of pronunciation. Among other things, they found that learners who had achieved a high degree of accuracy in pronouncing the second language were sometimes perceived as being less loyal to their ethnic group than those whose second language speech retained a strong 'foreign accent'. Such perceptions can affect learners' desire to achieve high levels of proficiency in the second language, especially in contexts where there are conflicts between groups or where power relationships imply a threat to one group's identity.

Pavel Trofimovich (2005) has looked at learning pronunciation from a somewhat unusual perspective. His research raises questions about how well learners perceive the specific sounds of the new language while their focus is on meaning. Second language learners of Spanish were asked to listen to a list of familiar Spanish words. For the purpose of comparison, they also heard a list of words in English, their native language. One group of participants were told to 'just listen' to the words; the second group were asked to pay attention to how good the recording qualiry was; the third group were asked to rate the 'pleasantness' of the things the words referred to. Then they heard another list, which included both the original words and sorne new words, and they were asked to repeat each word as they heard it. Trofimovich then compared how quickly each learner started to pronounce the words they had already heard and the new words. The difference in the time it took them to react to 'old' and 'new' words is a measure of how easily words could be retrieved from memory.
fu expected, the participants were always faster at retrieving the old words in their native language, and two groups of learners also showed this pattern for their second language. But the third group, who had been told to focus on the 'pleasantness' of the meanings, did not retrieve the old words faster. Trofimovich suggests that when learners focus primarily on meaning, they may not be able to also pay attention to the sounds that make up the words. In Chapter 6, we will review other research showing that learners sometimes fail to notice certain language forms-grammatical morphemes, vocabulary words, syntactic patterns, pragmatic features-when their focus is on under standing meaning.

Few studies have investigated the effectiveness of pronunciation instruction, but the results of recent research suggest that it can make a difference, par ticularly if the instruction focuses on suprasegmental rather than segmental aspects of pronunciation (Hahn 2004). Tracey Derwing and her colleagues (2003) carried out a series of studies to determine how intelligible learners were judged to be. They found that learners who were given pronunciation lessons emphasizing stress and rhythm were judged to be easier to understand
than learners who received lessons focused on individual sounds. Even though the learners who were given instruction on individual sounds were more accurate in their use of those sounds, this did not seern to increase listeners' perception of the intelligibility of their speech to others. Findings like these support the current emphasis on suprasegrnentals in pronunciation classes.

One of the controversia! issues in pronunciation is related to the question of whether the goal of second language acquisition is to sound like a 'native speaker.' One obvious problern with the question is that it suggests that there exists a single correct variety of English, and this is far from true. Not only are there rnany different pronunciations of English by American, Australian, British, Canadian 'native speakers', there are also many other varieties of English that have come to be used as a linguafranca around the world. Jane Setter and Jennifer Jenkins (2005) and Barbara Seidlhofer (2011) are arnong the rnany scholars who stress the role of English as a linguafranca (ELF). Indeed, there are now far more speakers of ELF than of English as a first language.

A related question is whether intelligibility rather than native-like pro nunciation is the standard that learners should strive toward. Studies of relationships between English native speakers' perceptions of foreign accent, their perceptions of cornprehensibility, and their actual ability to understand what speakers are saying show that the three are related. However, research by Murray Munro and Tracey Derwing (2011) shows that the presence of a strong foreign accent <loes not necessarily result in reduced intelligibility or cornprehensibility.

Unfortunately, research evidence <loes not change the fact that sorne listen ers respond negatively to second language speakers' pronunciation. In sorne situations, accent still serves as a rnarker of group rnernbership and is used as the basis for discrirnination. Thus, sorne second language learners, particu larly those who have achieved a high level of knowledge and performance in other aspects of the target language, rnay be rnotivated to approxirnate a more 'native-like' accent for personal and professional reasons. Other second language learners view this as irrelevant to their goals and objectives as users of the second language (Derwing and Munro 2009).

Research related to teaching pronunciation is gaining more attention. It is already clear that decontextualized pronunciation instruction is not enough and that a cornbination of instruction, exposure, experience, and rnotiva tion is required iflearners are to change their way of speaking. Robin Walker (201O) provides guidance for teaching pronunciation in away that recognizes the irnportance of preparing students for interacting with other speakers of English as a lingua franca.

## Sampling learners' language

One of the challenges of studying learners' language is the difficulty of col lecting samples of their speech or writing that are large enough to ensure that analyses and their findings are based on more than just a few learners or from just a few examples from a larger number oflearners. Researchers often find it difficult to recruit learners, to obtain their consent to participate in a study, and to persuade them to remain available over the time periods that are necessary to show development. It can also be challenging to schedule sessions far recording speech or collecting writing samples, and to transcribe or digitize the speech samples far analysis.

Computer-based tools are making it possible far researchers to ask and answer new questions and to revisit sorne of the tentative answers to ques tions that have been around far a long time. Far example, corpus linguistics has provided us with large collections of naturally occurring data that can be used to discover infarmation about the frequency of different language features (words, phrases, grammatical patterns) in a variety oflanguage con texts and registers. Sorne of these corpora contain language samples that have been collected from newspapers and conversations, whereas others are more specific to particular types oflanguage. In addition, there are learner corpora and pedagogic corpora. More and more researchers are making their learner language data available to others so that each corpus oflearner language data can be used far a number of different studies. Sorne of these corpora are avail able in CD or DVD farmat or online (Tarone and Swierzbin, 2009). The links between corpus research and second language teaching are also becom ing increasingly apparent (Bennet, 2010; Sinclair, 2004). For example, if a corpus of classroom language reveals that certain features occur frequently in classroom input, teachers might decide to facus on features that occur less frequently. Similarly if corpus research reveals that specific grammatical fea tures are rarely used by native speakers in conversational interaction, teachers (and textbooks) may devote less time to the oral practice of these features.

## Summary

The language that second language learners produce and understand changes as they have more exposure to the language and as they use it in a greater variety of situations. Describing those changes has been the facus of this chapter. We have seen that there are strong patterns of similarity across learn ers of different ages, learning in different contexts, and starting from different first language backgrounds. The facus of this chapter has been mainly on these similarities. In Chapter 3, we will turn our attention to sorne of the ways in which learners differ from each other and how those individual dif ferences affect how quickly and how well they succeed in second language acquisition.

## Questions for reflection

What are the general rules or patterns of negative sentences inEnglish? Looki ng at the developmental sequence that has been described far English negation, think about what learners seem to notice first. Is it word arder? Special words? What featu res seem hardest far them to acqui re?

2 How would you collect samples of learner language far a study of the acquisition of grammatical morphemes? What kind of speaking or writing task would be most effective inleading learners to create obligatory contexts far each of the morphemes listed in Figure 2.1 ?Do you think sorne morphemes would be relatively easy to create contexts far? Which ones do you think would be difficult? Do you think the 'wug test' would be a useful tool?

3 What aspects of learners' interlanguage are most likely to affect their ability to use language effectively outside the classroom? Word arder? Grammatical morphemes? Vocabulary? Phonology? Pragmatics? Do you think priorities far classroom interaction and instruction reflect the importance of these different language features?

## Suggestions for further reading

Ellis, R. and G. Barkhuizen. 2005. Analysing LearnerLanguage. Oxford: Oxford University Press.
Analysing Learner Language introduces readers to different approaches to investigating learner language. Italso serves as an extensive review of pub lished research using a range of methods and techniques for gathering and analysing data. Each chapter is devoted to a particular analytic approach, including error analysis, frequency analysis, and sociocultural analysis, as well as a chapter by Michael Barlow on how computer tools can be used. The book will be of special interest to students who are embarking on second language acquisition research at the post-graduate leve!.

Nation, I.S. P. 2001. Learning Vocabulary in Another Language. Cambridge: Cambridge University Press.
This comprehensive book covers research and theory and their implica tions for teaching and testing vocabulary development in a second or foreign language. Although many books on vocabulary teaching and learning have been published since this one, it remains an essential and accessible text for teachers and post-graduate students who wish to under stand both the challenges of vocabulary learning and those involved in teaching and assessing vocabulary knowledge.

Tarone, E. and B. Swierzbin. 2009. Exploring Learner Language. Oxford: Oxford University Press.
The authors collected speech and writing samples from a group of English language learners from different LI backgrounds participating in the same tasks. This created a data base showing how each learner tried to achieve the same communication goals. The text is supplemented by a DVD of the learners engaged in the oral tasks. Exercises focus on different approaches to understanding the learners' emerging language systems, including error analysis, developmental sequences, learners' response to feedback, and communication strategies. Many of the ideas that are introduced in this chapter of How Languages Are Learned are illustrated in the examples of learners' language that are presented in this book.

# 3 INDIVIDUAL DIFFERENCES IN SECOND LANGUAGE LEARNING 

## Preview

As we saw in Chapter l, children are almost always successful in acquiring the language or languages that are spoken (or signed) to them in early child hood, provided that they have adequate opportunities to use the language over time. This contrasts with our experience of second language learners, whose success varíes greatly. Both educators and researchers have an interest in understanding how the characteristics of individuals are related to their ability to succeed in learning a second language.

Many of us believe that individual differences that are inherent in the learner can predict success or failure in language learning. Such beliefs may be based on our own experience or that of people we have known. Por example, many teachers are convinced that extroverted students who interact without inhi bition in the second language and seek opportunities to practise language skills will be the most successful learners. In addition to an outgoing per sonality, other characteristics often believed to predict success in language learning are intelligence, motivation, and the age at which learning begins.

To what extent can we predict differences in the success of second language acquisition if we have information about learners' personalities, their general and specific intellectual abilities, their motivation, or their age? In this chapter, we will review sorne of the studies that have sought to understand the relationships between individual differences and learning outcomes.

## ACTIVITY Reflect on language learning experience

Befare you read this chapter, use the questionnai re in Table 3.1 to reflect on you $r$ own experience as a language learner.Usi ng additional copies of the questionnai re, interview several friends, colleagues, or family mem bers about llleir experiences of learni ng a second or foreign language. Keep the responses
to the question naire and refer to them as you read this chapter about individ ual differences in second language learning.

Ia What language do you speak best? Do you speak more than one language equally well?
b When did you begin to learn this language (these languages)?
2 Which second or foreign language(s) have you learned with the most success?

3 Which second or foreign language(s) have you learned with the /east success?

4 For the languages you mentioned in response to questions 2 and 3, answer the following questions in the appropriate colum ns:

|  | Languages learned successfully | Languages not learned successfully |
| :---: | :---: | :---: |
| How old were you when you first tried to learn the language? |  |  |
| Did you have a choice about learning this language or were you req uired to learn it? |  |  |
| Do you currently speak this language regularly? |  |  |
| Do you regularly read this language for information or enjoyment? |  |  |
| How much of your learning experience with this language was in a foreign language classroom? |  |  |
| lfyou no longer use this language on a daily basis, can you estímate how many years you spent learning or usi ng it? |  |  |
| Estimate how many hours of classroom instruction you had for this language. |  |  |

| How much time have <br> you spent living in a place <br> where the language is <br> spoken? |  |  |
| :--- | :--- | :--- |
| Have you used the <br> language to learn other <br> subjects at school? At <br> what level (elementary, <br> secondary, university)? |  |  |
| Do you have personal or <br> emotional attachments <br> to this language? For <br> exam ple, do you have <br> peers or family members <br> who speak this language? |  |  |
| Do/did you enjoy <br> studying the grammar of <br> this language? |  |  |
| Do/did you enjoy <br> studying vocabulary in <br> this language? |  |  |
| Are/were you a successful student in other school subjects? |  |  |
| Do you think of you rself as a person who likes to socialize? |  |  |
| Do you think of you rself as a person who learns a new language easily? |  |  |

## Research on learner characteristics

Perhaps the best way to begin our discussion is to describe how research on the influence of individual differences on second language learning is usually done. When researchers are interested in finding out how a variable such as motivation is related to second language learning outcomes, they usually select a group oflearners and give them a questionnaire to measure the type and degree of their motivation. Then sorne kind of test is used to assess their second language proficiency. The test and the questionnaire are both scored, and the researcher uses a statistical procedure called a correlation. The cor relation is an indication of how likely it is that learners with high seores on the motivation questionnaire will also have high seores on the language
test. If the two variables (motivation and language proficiency) are found to be correlated, the researcher will try to discover just what the relationship between them is. Note that correlations may be positive or negative. That is, one may find a pattern suggesting that learners with higher motivation seores have higher language proficiency seores (apositive correlation), or one might, in sorne circumstances, find that learners with lower motivation seores do better on proficiency measures (a negative correlation).

Although the correlation procedure seems straightforward, it requires careful interpretation. One problem is that, unlike variables such as height or age, it is not possible to direcdy observe and measure motivation, extroversion, or even intelligence. These are just labels for an entire range of behaviours and characteristics. Funhermore, characteristics such as these are not inde pendent of each other, and researchers have sometimes used the same label to describe different sets of behavioural traits. For example, in motivation questionnaires, learners may be asked how often they use their second lan guage outside a classroom context. The assumption behind the question is that those who repon that they frequendy do so are highly motivated to learn. This seems reasonable, but it is not so simple. Ifa learner responds that he or she frequendy interacts with speakers of the second language, it may not be because he or she is more motivated to learn than one who reports less interaction. Rather, it might be that this individual lives where there are more opportunities-or a greater necessity-for language practice than those who repon a low frequency of interaction. Because it is usually impossible to separate these two variables (i.e motivation or desire to interact and oppor tunities or the need to interact), we cannot conelude whether it is motivation, necessity, or opponunity that is being measured by this question.
Perhaps the most serious error in interpreting correlations is the conclusion that one of the variables causes the other. The fact that two things tend to occur together or increase and decrease in a similar pattern <loes not neces sarily mean that one causes the other. While it may be that one variable influences the other, it may also be that both are influenced by something else entirely. Research on motivation is perhaps the best context in which to illus trate this. Learners who are successful may indeed be highly motivated. But can we conclude that they became successful because of their motivation? It is also plausible that early success heightened their motivation, or that both success and motivation are due to their special aptitude for language learning or the favourable context in which they were learning.

Another difficulty in assessing the relationship between individual learner characteristics and second language learning is how language proficiency is defined and measured. In the L2 learning literature, sorne studies repon that learners with a higher intelligence quotient (IQ) are more successful language learners than those with a lower IQ, while other studies repon no such cor relation. One explanation for these conflicting findings is that the language
proficiency tests used in different studies do not measure the same kind of knowledge. For example, IQ may be less closely correlated to measures of conversational fluency than to tests that measure metalinguistic knowledge.

Research on individual differences must also take into account the social and educational settings in which learners find themselves. Bonny Norton and Kelleen Toohey (2001) argue that, even when individuals possess sorne of the characteristics that have been associated with successful language learning, their language acquisition may not be successful if they are not able to gain access to social relationships in situations where they are perceived as valued partners in communication. Members of sorne immigrant and minority groups are too often marginalized by social and educational practices that limit their opportunities to engage in communication with peers, colleagues, and even teachers. In these social conditions, individuals who approach a new language with the cognitive and motivational characteristics typical of successful language learners may not achieve the proficiency that these char acteristics would predict.

Understanding the relationship between individual characteristics, social sit uations, and success in second language learning is a challenge. Nevertheless, research in this area is of great importance to both researchers and educators. Researchers seek to know how different cognitive and personality variables are related and how they interact with learners' experiences, so that they can gain a better understanding of human learning. Educators hope to find ways of helping learners with different characteristics to achieve success in second language learning. The larger community is also concerned because of the enormous impact second language learning has on shaping opportunities for education, employment, mobility, and other societal benefits.

Let's look at sorne of the individual characteristics that have been investigated in the effort to discover explanations for differences in learning outcomes.

## Intelligence

The term 'intelligence' has traditionally been used to refer to performance on certain kinds of tests. These tests are often associated with success in school, and a link between intelligence and second language learning has sometimes been reported. Over the years, sorne research has shown that IQseores were a good means of predicting success in second language learning. However, as suggested above, IQtests may be more strongly related to metalinguistic knowledge than to communicative ability. For example, in a study with stu dents in French immersion programmes in Canada, Fred Genesee (1976) found that, while intelligence was related to the development of French second language reading, grammar, and vocabulary, it was unrelated to oral production skills. This suggests that the kind of ability measured by tradi tional IQ tests may be a strong predictor when it comes to learning that
involves language analysis and rule learning but may play a less important role outside the classroom or in classrooms where the instruction focuses more on communication and interaction. Indeed, many students whose general academic performance is weak experience considerable success in second language learning if they are given the right opportunities.

Many educators have been inB.uenced by Howard Gardner's (1993) pro posal that individuals have 'multiple intelligences' and that traditional IQ tests have assessed only a limited range of abilities. Among the 'multiple intelligences' Gardner includes abilities in the areas of music, interpersonal relations, and athletics, as well as the verbal intelligence that is most often associated with success in school.

## Language learning aptitude

Specific abilities thought to predict success in language learning have been studied under the title of language learning 'aptitude'. One of the pioneers in this area, John Carroll (1991), has characterized aptitude in terms of the ability to learn quickly. Thus, we may hypothesize that a learner with high aptitude may learn with greater ease and speed but that other learners may also be successful if they persevere.

Over several decades, the most widely used aptitude measures have been the Modern Language Aptitude Test (MLAT) (Carroll and Sapon 1959) and the Pimsleur Language Aptitude Battery (PLAB) (Pimsleur 1966). All the tests are based on the view that aptitude has several components, for example, the ability to identify and memorize new sounds, understand the function of particular words in sentences, figure out grammatical rules from language samples, and remember newwords. While early research revealed a substantial relationship between performance on the MLAT or PLAB and performance in foreign language learning, these studies were conducted at a time when lan guage teaching was based on grammar translation or audiolingual methods.

With the adoption of a more communicative approach to teaching, many teachers and researchers carne to believe that the abilities targeted by these tests were irrelevant to the process oflanguage acquisition. However, others suggest that sorne of the abilities measured by aptitude tests are predictive of success even in settings where the emphasis is on communicative interac tion. Por example, Leila Rama (2002) found that children who were good at analysing language (one component of aptitude that is targeted by the tests) were the most successful learners in an English second language programme in which activities almost never involved direct attention to grammar.

Nick Ellis (2001) and others have hypothesized that working memory (WM) capacity may be the most important variable in predicting success for learners in many language learning situations. Working memory, also called
'short-term memory' refers to the active processing of information. Although long-term memory capacity is very large indeed, working memory capacity is limited. That means that only a certain amount of information can be processed at a given time, and individuals differ in the amount of informa tion they can process in working memory. Peter Skehan (1989) suggests that successful language learners need not be strong in all of the components of aptitude. For example, sorne may have strong memories but only average abilities in language analysis.

Learners' strengths and weaknesses in these different aptitude components may account for their ability to succeed in different types of instructional programmes. In a Canadian language programme for adult learners of French, Marjorie Wesche (1981) studied the progress of students who were placed in instructional programmes that were either compatible or incom patible with their aptitude profile. In the compatible groupings, students with high analytic ability but average memory were assigned to teaching that focused on grammatical structures; learners with good memory but average analytic skills were placed in a class organized around the functional use of che second language. In the incompatible groupings, students were placed in classes that did not correspond to their aptitude profiles. Wesche reponed a high level of student and teacher satisfaction when students were matched with compatible teaching environments. In addition, sorne evidence indi cated that matched students were able to attain significantly higher levels of achievement than those who were mismatched. While few schools could offer such choices to their students, teachers may be able to ensure that their ceaching activities are sufliciently varied to accommodate learners with dif ferent aptitude profiles.

Further support for the claim that a particular type of instruction cannot benefit all learners in the same way comes from a study with secondary stu dents of French as a foreign language in New Zealand. Rosemary Erlam (2005) explored whether there was a relationship between aptitude and the effectiveness of three different types of instruction, which she called deduc tive, inductive, and structured input. Students were assessed on three measures oflanguage aptitude: language analytic ability, phonemic coding ability, and working memory.They were then divided into three groups and given differ ent types of instruction on direct object pronouns in French.

Learners in the deductive instruction group received explicit rule-based grammar instruction followed by the opportunity to practise the rules they had learned. Learners in the inductive group received no grammar instruc rion; instead they participated in activities that encouraged them to figure out the different meanings conveyed by direct object pronouns and then to produce them. Learners in the structured input instruction group received aplicit rule-based grammar instruction but did not produce the target
forms. Instead they participated in activities that exposed them to spoken and written examples of direct object pronouns.

Erlam found that ali learners benefited from the deductive instruction regardless of differences in aptitude. This was interpreted as support far Peter Skehan's (1989) hypothesis that more structured teaching may even out indi vidual differences compared with less structured teaching. Erlam's findings also showed that learners with greater language analytic ability and memory capacity were able to benefit more from the inductive and structured input instruction on written (but not oral) tests. This supports the hypothesis thar learners with greater aptitude can figure out the rules of language based on input, and that they are able to consolidate this knowledge without the need to produce language-at least in terms of their written ability.

Befare we leave the topic of language learning aptitude, it is perhaps appro priate to look at two extremes of the aptitude continuum. Sorne people whose academic performance is usually very good find themselves frustrated in their attempts to learn a foreign language. Lenore Ganschow and Richard Sparks (2001) and their colleagues have studied many cases of young adults who find foreign language learning exceedingly difficult. They identified several ways in which these students differ from successful learners. Most perform poorly on at least sorne of the measures that make up aptitude tests. Sorne have problems with certain kinds of verbal skills, even in their own lan guage. What is perhaps most important about this research is that, with great effort and instructional support, sorne of these students are able to succeed in spite of their difficulties. The challenge is to find instructional approaches that meet the needs oflearners with a variety of aptitude profiles.

At the other end of the aptitude continuum we find individuals whose achievements seem to defy every prediction about what is possible in second language learning. Lorraine Obler (1989) reponed on the case of one American man who seemed able to acquire oral fluency in a new language in 'a matter of weeks'. Neil Smith and lanthi-Maria Tsimpli (1995) followed a polyglot savant who learned many languages with apparent ease. This achievement was panicularly astonishing in light of the fact that his overall cognitive functioning and social skills were quite limited.

Such exceptional learners suggest that an aptitude for language learning is at least partly independent of cognitive, social, and personality characteris tics that are often associated with successful learning. Nevenheless, Michael Erard's (2012) review of the cases of sorne of history's most successful learners of multiple languages shows that their unusual talent was also associated with a willingness to work hard at tasks that many would consider too boring or difficult, such as using word cards to study vocabulary.

## Learning styles

Sorne researchers have investigated individual differences in terms of 'learn ing style', defined as an individual's 'natural, habitual, and preferred way(s) of absorbing, processing, and retaining new information and skills' (Reid 1995: viii). We have all heard people say that they cannot learn something until they have seen it. They would fall into the group called 'visual' learn ers. Others, who may be called 'auditory' learners, seem to learn best 'by ear'. For others, referred to as 'kinaesthetic' learners, physical action such as miming or role-play seems to help the learning process. These are referred to as perceptually-based learning styles. Considerable research has also focused on distinctions between different cognitive learning styles. Individuals have been described as field independent or field dependent, according to whether they tend to separare details from the general background or to see things more holistically.A typical measure of this cognitive style is the embed ded figures test, in which panicipants are asked to find a simple geometric shape embedded in a more complex one. For a number of years, it was widely reponed that there was a strong relationship between field independence and success in second language learning. However, a review of the research led Zoltán Dornyei and Peter Skehan (2003) to conclude that more research will be needed to identify the nature of the relationship.

There are many questions about how learning styles interact with success in language learning. For one thing, it is difficult to determine whether they reflect immutable differences or whether they develop (and thus can be changed) through experience. There is a need for considerably more research. Nevertheless, when learners express a preference for seeing something written or spending more time in a language laboratory, we should not assume that their ways of working are wrong, even if they seem to be in confüct with the pedagogical approach we have adopted. Instead, we should encourage learn ers to use all means available to them. At a minimum, research on learning styles should make us sceptical of claims that a single teaching method or textbook will suit the needs of all learners.

## Personality

A number of personality characteristics have been proposed as likely to affect second language learning, but it has not been easy to confirm in empiri cal studies. As with other research investigating the effects of individual characteristics on second language learning, studies of a similar personality trait produce different results. Por example, it is often argued that an extro verted person is well suited to language learning but research does not always support this conclusion. Although sorne studies have found that success in language learning is correlated with learners' seores on questionnaires meas uring characteristics associated with extroversion such as assertiveness and adventurousness, others have found that many successful language learners would not get high seores on measures of extroversion. Lily Wong Fillmore (1979) observed that, in certain learning situations, the quiet observant learner may have greater success.

Another aspect of personality that has been studied is inhibition. It has been suggested that inhibition discourages risk-taking, which is necessary
for progress in language learning. This is often considered to be a particular problem for adolescents, who are more self-conscious than younger learn ers. In a series of studies in the 1970s, Alexander Guiora and his colleagues (1972) found support for the claim that inhibition is a negative force, at least for second language pronunciation performance. One study involved an analysis of the effects of small doses of alcohol, known for its ability to reduce inhibition, on pronunciation. Study participants who drank small amounts of alcohol did better on pronunciation tests than those who did not drink any. While results such as these are interesting, they may have more to do with performance than with learning. We may also note, in passing, that when larger doses of alcohol were administered, pronunciation rapidly deteriorated!

Learner anxiety-feelings of worry, nervousness, and stress that many stu dents experience when learning a second language-has been extensively investigated. For a long time, researchers thought of anxiety as a perma nent feature of a learner's personality. In fact, the majority of language anxiety scales like the Foreign Language Classroom Anxiety Scale (Horwitz, Horwitz, and Cope 1986) measure anxiety in this way. So, for example, stu dents are assumed to be 'anxious' if they 'strongly agree' with statements such as 'I become nervous when I have to speak in the second language classroom'. However, such questionnaire responses do not take account of the possibility that anxiety can be temporary and context-specific.

Other researchers investigating learner anxiety in second language classrooms see anxiety as dynamic and dependent on particular situations and circum stances. This permits distinctions to be made between for example, feeling anxious when giving an oral presentation in front of the whole class but not when interacting with peers in group work. Whatever the context, anxiety can interfere with the learning process. Peter Maclntyre (1995) argues that 'because nervous students are focused on both the task at hand and their reactions to it ... [they] will not learn as quickly as relaxed students' (p. 96).

Of course, it has also been argued that not all anxiety is bad and that a certain amount of tension can have a positive effect and even facilitare learning. Experiencing anxiety befare a test or an oral presentation can provide the right combination of motivation and focus to succeed. Because anxiety is often considered to be a negative term, sorne researchers have chosen to use other terms they consider to be more neutral. In a study of young adults learning French in an intensive summer programme, Guy Spielmann and Mary Radnofsky (2001) used the term 'tension'. They found that tension, as experienced by the learners in their study, was perceived as both beneficia! and detrimental and that it was also related to the learners' social interactions inside and outside the classroom.

A learner's willingness to communicate (WTC) has also been related to anxiety. We have all experienced occasions when we tried to avoid commu nicating in a second language. WTC may change with the number of people present, the topic of conversation, the formality of the circumstances, and even with whether we feel tired or energetic at a given moment. A colleague in Canada, who works in the area of second language learning and speaks several languages, recently confessed that he avoided the comer store in his neighbourhood because the proprietor always spoke French to him. He rec ognized the proprietor's efforts to help him improve his skills in this new language, and was grateful for it, but, as he told us with embarrassment, it was just easier to go to the store where he could use English.

This is consistent with research carried out by Richard Clément, Peter Maclntyre, and their colleagues, who argue that learners who willingly communicate in a wide range of conversational interactions are able to do so because of their communicative confidence. In a series of studies they have shown that communicative confidence is shaped by two variables: how relaxed L2 learners are and how competent (or incompetent) they feel about their L2 ability. These factors are directly influenced by previous contacts with L2 speakers and are considered to be the main contributors to commu nicative confidence (Clément, Baker, and Maclntyre 2003).

Several other personality characteristics such as self-esteem, empathy, domi nance, talkativeness, and responsiveness have also been studied. The research does not show a clearly-defined relationship between one personality trait and second language acquisition. And, as indicated earlier, the major dif ficulty in investigating personality characteristics is that of identification and measurement. Another explanation has been offered for the mixed findings. Personality variables seem to be more consistently related to conversational skills than to the acquisition of grammatical accuracy or academic language. Finally, most of the research on personality variables has been carried out within a quantitative research paradigm, that is, an approach that relies heavily on relating learners' seores on personality questionnaires to their language test performance. Sorne researchers have argued that a more quali tative approach to understanding and investigating personality variables is needed to adequately capture their depth and complexity, especially as they emerge and evolve over time.

Despite the contradictory results and the problems involved in carrying out research in the area of personality characteristics, many researchers believe that personality will be shown to have an important influence on success in language learning. This relationship is an intricate one, however, in that it is probably not personality alone, but the way in which it combines with other factors, that influences second language learning.

## Attitudes and motivation

Roben Gardner and his colleagues have carried out a programme of research on the relationship between a learner's attitudes toward the second or foreign language and its community, and success in second language learning (Masgoret and Gardner 2003). As is the case with other variables, it is not easy to determine whether positive attitudes produce successful learning or successful learning engenders positive attitudes, or whether both are affected by other factors. Although the research cannot prove that positive attitudes cause success in learning, there is ample evidence that positive attitudes are associated with a willingness to keep learning.

Motivation in second language learning is a complex phenomenon. It has been defined in terms of two factors: on the one hand, learners' communi cative needs, and on the other, their attitudes towards the second language community. Iflearners need to speak the second language in a wide range of social situations or to fulfil professional ambitions, they will perceive the communicative value of the second language and are therefore likely to be motivated to acquire proficiency in it. Similarly, if learners have favourable attitudes towards the speakers of the language, they will desire more contact with them. Roben Gardner and Wallace Lamben (1972) coined the terms instrumental motivation (language learning for immediate or practica! goals) and integrative motivation (language learning for personal growth and cul tural enrichment through contact with speakers of the other language). For a long time integrative motivation was considered to be the stronger predictor of successful learning. In sorne contexts, however, instrumental motivation was found to be a better predictor. Thus, both types of motivation have been found to be related to success in second language learning. However, in sorne learning environments, it is difficult to distinguish between these two types of orientation to the target language and its community. Funhermore, early research tended to conceptualize motivation as a stable characteristic of the learner. More recent work emphasizes the dynamic nature of motivation and tries to account for the changes that take place over time.

Zoltán Dornyei (2001a) developed a process-oriented model of motivation that consists of three phases. The first phase, 'choice motivation' refers to getting staned and to setting goals, the second phase, 'executive motivation', is about carrying out the necessary tasks to maintain motivation, and the third phase, 'motivation retrospection', refers to students' appraisal of and reaction to their performance. An example of how one might cyde through these phases would be: a secondary school learner in Poland is excited about an upcoming trip to Spain and decides to take a Spanish course (choice moti vation). After a few months of grammar lessons he becomes frustrated with the course, stops going to dasses (executive motivation) and finally decides to drop the course. A week later a friend tells him about a great Spanish
conversation course she is taking, and his 'choice motivation' is activated again. He decides to register in the conversation course and in just a few weeks he develops sorne basic Spanish conversational skills and a feeling of accomplishment. His satisfaction level is so positive (motivation retrospec tion) that he decides to enrol in a more advanced Spanish course when he returns from his trip to Spain.

In a book devoted to helping second language teachers generate and maintain learners' motivation, Dornyei (2001b) proposes and describes concrete and innovative methods and techniques that can help teachers motivate learners throughout these three phases.

## Motivation in the classroom

In a teacher's mind, motivated students are usually those who participare actively in dass, express interest in the subject matter, and study a great deaL Teachers also have more influence on these behaviours and the motivation they represent than on students' reasons for studying the second language or their attitudes toward the language and its speakers. Teachers can make a positive contribution to students' motivation to learn if dassrooms are places that students enjoy coming to because the content is interesting and relevant to their age and level of ability, the learning goals are challenging yet manage able and dear, and the atmosphere is supportive. Teachers must also keep in mind that cultural and age differences will determine the most appropriate ways for them to motivate students.

Litde research has investigated how pedagogy interacts direcdy with moti vation in second/foreign language dassrooms. One exception is a study by Marie Guilloteaux and Zoltán Dornyei (2008) who explored the links between teachers' motivational practice and students' motivation for L2 learning. It was a large-scale study with 27 teachers and over 1,300 learners in English as a Foreign Language (EFL) dassrooms in Korea. The teach ers' motivational strategies were described using a dassroom observation scheme-the Motivation Orientation of Language Teaching (MOLT). MOLT identified 25 motivational practices used by the teachers that were relatively easy to define and to observe. They were divided into four cat egories that are described below along with examples of the motivational behaviours induded within each.

1 Teacher discourse: arousing curiosity or attention, promoting autonomy, stating communicative purpose/utility of activity
2 Participation structure: group work/ pair work
3 Activity design: individual competition, team competition, intellectual challenge, tangible task product
4 Encouraging positive retrospective self-evaluation and activity design: effective praise, elicitation of self/peer correction session, dass applause.

In each lesson, the learners' motivation was measured in terms of their level of engagement. The proportion of students who paid attention, who actively participated, and who eagerly volunteered during activities was calculated. A three-level scale was used to measure engagement in each observed lesson: very low (a few students), low (one third to two thirds of the students) and high (more than two thirds of the students). Learners also completed a ques tionnaire about their motivation levels specifically related to their EFL class.

The researchers found significant positive correlations between the teachers' motivational practices, the learners' engagement behaviours, and the learners' self-reports on the questionnaire. The researchers acknowledge that corre lation results do not indicate cause-effect relationships. Nevertheless, the findings are important because this is the first study to provide 'any empiri cal evidence concerning the concrete, classroom-specific impact oflanguage teachers' motivational strategies' (Guilloteaux and Dornyei 2008: 72).

## Identity and ethnicgroup affiliation

Social factors in the wider community can also affect motivation, attitudes, and language learning success. One such factor is the social dynamic or power relationship between languages. For example, members of a minority group learning the language of a majority group may have different attitudes and motivation from those of majority group members learning a minority language. Even though it is impossible to predict the exact effect of such societal factors on second language learning, the fact that languages exist in social contexts cannot be overlooked when we seek to understand the vari ables that affect success in learning. Children as well as adults are sensitive to social dynamics and power relationships.

A good example of how relations of power in the social world affect interac tion between second language learners and target language speakers comes from the work of Bonny Norton Peirce. Drawing from data collected in a longitudinal case study of the language learning experiences of immigrant women in Canada, she argues that concepts such as instrumental and inte grative motivation do not adequately capture the complex relations of power, identity, and language learning. Instead, she uses the term 'investment' to -capture the relationship of the language learner [and his/her identity] to the changing social world.' (Norton Peirce 1995: 10).All the participants in her smdy were highly motivated to learn English. However, there were social situations in which they were reluctant to speak and these were typically ones in which there was a power imbalance. Their experiences in those situations limited the opportunities they had to practise and to continue to develop the second language outside the classroom.

Working with immigrant children in English-medium kindergarten classes, Kelleen Toohey (2000) observed that they were quickly assigned identities
such as successful/unsuccessful, big/small, talkative/quiet, etc. in their first year of school. Of course, they also had the identity of 'being ESL'. Because learners' identities impact on what they can do and how they can participare in classrooms, this naturally affects how much they can learn. For example. one of the 'ESL' children was consistently excluded from imaginative interac tive activities with her peers; another learner was perceived as someone who never listened or did the 'right thing'. Toohey argues that these identities could eventually lead to their isolation and to restricted or less powerful par ticipation in their classroom community. While Toohey is careful to point out that identities are not static and can change over time, it is equally impor tant to keep in mind that 'classrooms are organized to provide occasions upon which sorne children look more and sorne less able, and judgements are made which become social facts about individual children' (Toohey 2000: 77).

The two studies above describe how issues of identity and investment play important roles for both children and adults when learning a second lan guage. Research has also documented how these factors contribute in complex and sometimes contradictory ways when learning a foreign lan guage. For example, it has been observed that Japanese students are often reluctant to speak English in communicative lessons despite high levels of motivation to learn the language. Furthermore, when students with high levels of English language proficiency do communicate they often speak with a strong Japanese accent and intentionally produce grammatical errors for fear that they might be perceived as considering themselves to be superior (Greer 2000).

In a study with secondary school Japanese learners of English as a foreign lan guage, Yasuyo Tomita (2011) observed that the students were more willing to communicate during activities that combined a focus on form and meaning than in exclusively meaning-based activities. In observations and interviews with the students, she concluded that learners were not willing to invest in English communication with each other unless they were able to establish their identities as 'learners' by discussing language form and raising ques tions about grammar. In exclusively communicative activities learners were reluctant to use English to communicate their ideas or opinions for fear that they would be identified as 'show offs' and pretending to be someone other than Japanese.

## Learner beliefs

Second language learners are not always aware of their individual cognitive or perceptual learning styles, but virtually all learners, particularly older learn ers, have strong beliefs and opinions about how their instruction should be delivered. These beliefs are usually based on previous learning experiences
and the assumption (right or wrong) that a particular type of instruction is the best way far them to learn.

Research on learner beliefs about the role of grammar and corrective feedback in second language learning confirms that there is often a mismatch between students' and teachers' views. In two large-scale studies Renate Schulz (2001) found that virtually all students expressed a desire to have their errors cor rected while very few teachers felt this was desirable. In addition, while most students believed that 'formal study of the language is essential to the even tual mastery of the language', just over half of the teachers shared this view.

Shawn Loewen and his colleagues (2009) asked 745 learners of different languages to express their beliefs about grammar instruction and corrective feedback. They found that sorne but not all learners valued grammar instruc tion. For example, learners of English as a second language did not value it as much as did learners of foreign languages. This might have been related to the fact that the ESL learners had more years of previous grammar instruction compared to the foreign language learners and thus they were less enthusi astic about it and ready far more focus on communication. Overall, learners did not value corrective feedback as much as grammar instruction except far those learning Chinese and Arabic who valued both. The researchers sug gested that this might be because the two languages are non Indo-European and thus more difficult far English speakers to learn than, far example, Spanish, German, and French.

Nina Spada and her research team (2009) have examined not whether learn ers perceive grammar instruction as useful but rather if they have preferences far when it should be taught. In a series of studies with learners (and teachers) of English as a second language and English as a foreign language, question naires were administered to 450 learners, asking them whether they preferred to focus on grammar separately from or embedded within communicative practice. The overall results indicated that both groups oflearners preferred integrating attention to grammar within communicative practice. However, the ESL learners also reponed that they valued separating grammar from communicative interaction much more than the EFL learners. This makes intuitive sense given that in the ESL context where there are more oppor tunities far communication outside the classroom, learners appreciate the opportunity to focus on grammar separately from communication when they are in the classroom. In the EFL context, however, where few opportu nities far exposure to the L2 are available, the classroom is seen as the only place far communication-thus a preference far integrating grammar with communicative practice. The results from the ESL and EFL teachers who also participated in the studies showed that they tended to share their stu dents' views (Spada and Santos Lima 2010 (in preparation)).

## Individual differences and classroom instruction

There are many questions about how the existence of individual differences should influence instruction. On a simple practica! level, it is not possible for a teacher with 50 students-or even one with 10 students-to customize instruction to suit the abilities or preferences of each one. Nevertheless, there can be little doubt that an instructional approach that rigidly adheres to a single way of teaching all students and an expectation that all students can learn in the same way will deprive sorne students of learning opportunities. Zoltán Dornyei (2005) has reviewed the research on individual differences and proposes a number of ways for educators to help learners make the most of their individual abilities and learning preferences.

Learners' instructional preferences, whether due to inherent differences in their approach to learning or to their beliefs about how languages are learned, will influence the kinds of strategies they use in trying to learn new mate rial. Teachers can help learners expand their repertoire of learning strategies and thus develop greater flexibility in their ways of approaching language learning.

## Age and second language learning

We now turn to a learner characteristic of a different type: the age at which learning begins. Age is easier to define and measure than personality, apti tude, or motivation, but the relationship between age and success in second language acquisition is hardly less complex or controversia!.

It is frequendy observed that most children from immigrant families even tually speak the language of their new community with native-like fluency, while their parents often fall short of such high levels of proficiency, especially in the spoken language. To be sure, many adult second language learners achieve excellent language skills. One often sees reference to Joseph Conrad, a native speaker of Polish who became a majar writer in the English language, and it is not uncommon to find adult second language learners with a rich vocabulary, sophisticated syntax, and effective pragmatic skills, even though there may be subde differences between their language use and that of those who began learning the language while very young.

As we saw in Chapter 1, the Critica! Period Hypothesis is that there is a time in human development when the brain is predisposed for success in language learning. It has been hypothesized that there is a critica! period for second language acquisition just as there is for first language acquisi tion. Developmental changes in the brain, it is argued, affect the nature of language acquisition, and language learning that occurs after the end of the
critica! period may not be based on the innate biological structures believed to contribute to first language acquisition or second language acquisition in early childhood. Rather, older learners may depend on more general learn ing abilities-the same ones they might use to acquire other kinds of skills or information. It is argued that these general learning abilities are not as effective for language learning as the more specific, innate capacities that are available to the young child. It is most often claimed that the critica! period ends somewhere around puberty, but sorne researchers suggest it could be even earlier. Others find evidence that there may be multiple critica! periods, related to different aspects of language learning. For example, the ability to acquire the pronunciation patterns of a new language may end earlier than the ability to acquire vocabulary.
Of course, as we saw in Chapter 2, it is difficult to compare children and adults as second language learners. In addition to possible biological dif ferences suggested by the Critica! Period Hypothesis, the conditions for language learning are often very different. Younger learners in informal lan guage learning environments usually have more time to devote to learning language. They often have more opportunities to hear and use the language in environments where they do not experience strong pressure to speak Huently and accurately from the very beginning. Furthermore, their early imperfect efforts are often praised, or at least accepted. Older learners are more likely to find themselves in situations that demand more complex language and the expression of more complicated ideas. Adults are often embarrassed by their lack of mastery of the language and they may develop a sense of inadequacy after experiences of frustration in trying to say exactly what they mean. Such negative feelings may affect their motivation and willingness to place them selves in situations where they will need to use the new language.

Research based on the CPH in addition to personal experience or informal observation of adult learners' difficulties has led sorne educators and policy makers as well as many parents to conclude that second language instruction is most likely to succeed if it begins when learners are very young. However, sorne studies of the second language development of older and younger learn ers learning in similar circumstances have shown that older learners are more efficient than younger learners. By using their metalinguistic knowledge, memory strategies, and problem-solving skills, they make the most of second or foreign language instruction. In educational settings, learners who begin learning a second language at primary school level do not always achieve greater proficiency in the long run than those who begin in adolescence. Furthermore, there are countless anecdotes about older learners (adolescents and adults) who achieve excellence in the second language. Does this mean that there is no critica! period for second language acquisition?

## lhe critical period: More thanjust pronunciation?

Most studies of the relationship between age of acquisition and second language development have concluded that older learners typically have a noticeable 'foreign accent' in the spoken language. But what about other linguistic features? Is syntax (word order, overall sentence structure) as dependent on age of acquisition as phonological development? What about morphology?

Mark Patkowski (1980) studied the relationship between age and the acquisition of features of a second language other than pronunciation. He hypothesized that, even if accent were ignored, only those who had begun learning their second language before the age of 15 could achieve full, native-like mastery of that language. Patkowski studied 67 highly educated immigrants to the United States. They had started to learn English at various ages, but all had lived in the United States for more than five years. He compared them to 15 native-born Americans with a similarly high level of education, whose variety of English could be considered the second language speakers' target language.

The main question in Patkowski's research was: 'Will there be a difference between learners who began to learn English before puberty and those who began learning English later?' However, he also compared learners on the basis of other characteristics and experiences that sorne people have sug gested might be as good as age in predicting or explaining a person's success in mastering a second language. Por example, he looked at the total amount of time a speaker had been in the United States as well as the amount of formal ESL instruction each speaker had had.

A lengthy interview with each person was tape-recorded. Because Patkowski wanted to remove the possibility that the results would be affected by accent, he transcribed five-minute samples from the interviews and asked trained native-speaker judges to place each transcript on a scale from O (no knowl edge of English) to 5 (a level of English expected from an educated native speaker).

The findings were quite dramatic. The transcripts of all native speakers and 32 out of 33 second language speakers who had begun learning English before the age of 15 were rated $4+$ or 5 . The homogeneity of the pre-puberty learners suggests that, for this group, success in learning a second language was almost inevitable. In contrast, 27 of the 32 post-puberty learners were rated between 3 and 4, but a few learners were rated higher ( $4+$ or 5 ) and one was rated at $2+$. The performance of this group looked like the sort of range one would expect if one were measuring success in learning almost any kind of skill or knowledge: sorne people did extremely well; sorne did poorly; most were in the middle.

When Patkowski examined the other factors that might be thought to affect success in second language acquisition, the picture was much less dear. There was, naturally, sorne relationship between those factors and learning success, but it often turned out that age was so dosely related to the other factors that it was not really possible to separate them completely. Por example, length of residence in the United States sometimes seemed to be a fairly good predic tor. However, it was often the case that those with longer residence had also arrived at an earlier age. Similarly, amount of instruction, when separated from age, did not predict success as well as age of immigration did. Thus, Patkowski found that far learners who acquire a second language primarily in the 'natural' environment, age of acquisition is an important factor in setting limits on the development of native-like mastery of a second language and that this limitation does not apply only to pronunciation.

## lntuitions ofgrammaticality

Jacqueline Johnson and Elissa Newport (1989) conducted a study of 46 Chinese and Korean speakers who had begun to learn English at different ages. All were students or faculty members at an American university and all had been in the United States far at least three years. The study also induded a comparison group of 23 native speakers of English. The participants were asked to make grammaticality judgements of a large number of sentences that tested 12 rules of English morphology and syntax. They heard recorded sentences and had to indicate whether each sentence was correct. Half of the sentences were grammatical, half were not.

Johnson and Newport found that age of arrival in the United States was a significant predictor of success on the test. Learners who began earliest achieved the highest seores on the judgement task. Those who began later were less likely to judge the sentences correcdy and their performance on the test varied more widely.

Robert DeKeyser (2000) carried out a replication of theJohnson and Newport study, working with Hungarian immigrants to the United States. He also found a strong relationship between age of immigration and performance on the judgement task. In addition, he asked participants to take language aptitude tests and found that, far participants who began learning English as adults, aptitude seores were correlated with success. However, there was no such correlation far those who learned English in childhood. These findings appear to confirm the hypothesis that adult learners may learn language in a way that is different from the way young children learn.

## Rate oflearning

Sorne research suggests that older learners may have an advantage in terms of the rate of learning. They appear to learn faster in the early stages of second language development. In 1978, Catherine Snow and Marian Hoefnagel Hohle published a study on a group of English speakers who were learning Dutch as a second language while living in the Netherlands. The learners included children as young as three years old as well as older children, ado lescents, and adults. On tests administered when learners had been in the country far less than a year, adolescents were by far the most successful learn ers. They were ahead of everyone on nearly all of the tests. Furthermore, it was the adults, not the children, whose seores were second best. In other words, adolescents and adults learned faster than children in the first few months of exposure to Dutch.

By the end of the year, the children were catching up, or had surpassed, the adults on severa! measures. Nevertheless, the adolescents retained the highest levels of performance overall. The fact that the young children were catching up, together with evidence from other studies, suggests that they would probably surpass the older learners if they continued to have adequate opportunity to use the language. However, this study shows that adults and adolescents can make considerable and rapid progress in their proficiency in a second language in contexts where they use the language in social, personal, professional, or academic interaction.

One view of critica! period research that has had an important impact on the way we look at studies oflanguage acquisition has been expressed in the work of Vivian Cook (2008). He makes a strong case far the inappropriate ness of using the criterion of 'indistinguishable from a native speaker' as the basis far success in second language acquisition. Indeed, Cook argues that a second language speaker or bilingual person should not be compared to monolingual native speakers because the real goal is 'multicompetence', that is, knowledge of multiple languages that inform and enrich one another.
Research on the long-term outcomes of second language learning as well as the rate of learning at different ages brings us to a question that is probably of greatest interest to most readers of this book: What can we conclude about the role of age when learning takes place primarily in an educational setting?

## Age and second language instruction

Many people who have never heard of the critica! period hypothesis believe that, in school programmes far second or foreign language teaching, 'younger is better'. However, both experience and research show that starting early is no guarantee of success and that older learners can attain high levels of profi ciency in their second language. In considering the best age at which to begin
second language instruction, it is essential to think carefully about the goals of an instructional programme and the context in which it occurs before we jump to conclusions about the necessiry-or even the desirabiliry-of the earliest possible start (Lightbown 2008a).

As we have seen, there is strong evidence that differences in learning outcomes are associated with age oflearning. We have also seen that, especially for older learners, reaching high levels of second language proficiency involves apti tude, motivation, and the appropriate social conditions for learning. Thus, decisions about the age at which instruction should begin cannot be based solely on research on the critical period hypothesis, which focuses only on age and on the attainment of native-like proficiency.
In educational settings, it is particularly important to assess the goals and the resources available for second language development. In these settings, research has shown that older children and adolescents progress more rapidly than younger children particularly in the early stages oflearning. The knowl edge and skills that older learners are able to acquire in a relatively short period of time will satisfy the needs of many learners whose goal is to use the language for everyday communication, to succeed on foreign language examinations, or to read texts for an academic course rather than to speak with native-like pronunciation.

When the objective of second language learning is native-like proficiency in the target language, it may indeed be desirable for the learner to be com pletely surrounded by the language as early as possible. However, as we saw in Chapter 1, early intensive exposure to the second language may entail the loss or incomplete development of the child's first language. When the goal is basic communicative abiliry for all students in an educational system, and when it is assumed that the child's native language will continue to be an important part of their lives, it may be more efficient to begin second or foreign language teaching later.

In most second- and foreign-language classrooms, learners receive only a few hours of instruction per week. Those who start later (for example, at age 10, 11, or 12) often catch up with those who begin earlier. In Ciare Burstall's (1975) landmark study, students who had made progress in early-start pro grammes, sometimes found themselves placed in secondary school classes with students who had had no previous instruction. Teachers who had both the more advanced early-start students and the students who had had fewer total hours of instruction tended to teach to a lower common denominator, and differences between the two groups of students essentially disappeared. This situation is not at all uncommon. Furthermore, in many educational settings, starting instruction earlier may not actually entail many more total hours of instruction. Por example, in Quebec, responding to pressure from parents, the age at which instruction in English as a second language began
was lowered in recent years from about age 9 or 10 to age 6 , but the total number of hours of instruction was not increased. Rather, the number of minutes of instruction per week was spread over more years (Lightbown, 2012). Thus, after years of classes, learners who have had an early start may feel frustrated by the lack of progress, and their motivation to continue may be diminished. Clearly the age at which instruction begins is not the only variable that determines success in the second language classroom.

For many years, it was difficult to compare early-start and later-start learners because of all the variations in their educational contexts. Since the 1990s, many more studies have allowed us to investigate this question more effec tively. Sorne large-scale research projects have been particularly useful in separating the effect of age and other factors in school-based foreign lan guage learning. For example, in Spain, the Barcelona Age Factor (BAF) project studied the effects of changing the age of beginning to teach English to Catalan/Spanish bilingual students.

When the starting age for teaching English was lowered, Carmen Muñoz and her colleagues took advantage of the opportunity to compare the learning outcomes for students who had started learning at different ages. They were able to look at students' progress after 100, 416, and 726 hours of instruc tion. Tu.ose who had begun to learn later (aged 11, 14, or 18+) performed better on nearly every measure than those who had begun earlier (aged 8). Tu.is was particularly true of measures based on metalinguistic awareness or analytic ability. On listening comprehension, younger starters showed sorne advantages. Muñoz suggests that this may be based on younger learners' use of a more implicit approach to learning while older learners' advantages may reflect their ability to use more explicit approaches, based on their greater cognitive maturity. She points out that, in foreign language instruction, where time is usually limited, 'younger learners may not have enough time and exposure to benefit fully from the alleged advantages of implicit learning' (Muñoz 2006:33).

One of the advantages of the BAF project is that the researchers were able to follow the same learners' language development over severa! years. Tu.is enabled them to examine whether the early learners would eventually surpass the older learners as has been observed in the 'natural' setting. Tu.is did not happen-although the younger learners caught up, the older learners main tained their advantage over time.

Decisions about when to start second language instruction in schools should be based on realistic goals and on realistic estimates of how long it takes to achieve them. One or two hours a week will not produce advanced second language speakers, no matter how young they were when they began. Older learners may be able to make better use of the limited time they have for second language instruction.

Age is only one of the characteristics that determine the way in which an individual approaches second language learning and the eventual success of that learning. The opportunities for learning (both inside and outside the dassroom), the motivation to learn, and individual differences in aptitude for language learning are also important factors that affect both rate oflearn ing and eventual success in learning. It is important to remind ourselves that sorne older learners do achieve the highest level of success and that many more are able to use their languages in a variety of personal, social, and work place activities.

## ACTIVITY Reflect on individual differences and language learning success

Look back at the notes you made inTable 3.1 about you r language learn ing experience and that of you $r$ colleagues and friends.

Which cases confirm your expectations about the variables that are associated with success-or the lack of it-in second language learning?
2 Which ones seem to challenge those expectations?
3 To what extent do you think that the contexts in which the learning took place are responsible for the outcomes?
4 To what extent do you think the differences in outcome are due to differences inherent in the individuals?

5 Do you think that the individuals might have experienced different outcomes in different situations?

## Summary

In this chapter, we have learned that the results of research on individual differences are not always easy to interpret. This is partly due to the dif ficulty of defining and measuring individual characteristics and to the fact that the characteristics are not independent of one another. In addition, rela tionships between individual characteristics and learning environments are complex, and different learners will react differently to the same learning conditions. Indeed, the same learner will react differently to the same condi tions at different times. Researchers are beginning to explore the nature of these complex interactions, but it remains difficult to predict how a particu lar individual's characteristics will influence his or her success as a language learner. Nonetheless, in a dassroom, the goal of the sensitive teacher is to creare a learning environment with a wide variety of instructional activities so that learners with different abilities and learning preferences can be suc cessful in learning a second language.

## Questions for reflection

Think of an example of a member of a majority group learning the language of a mi nority group and one of a member of a minority group learning a majority group's language. How might the power relationships between groups of speakers affect the attitudes of language learners? How might the status of the languages affect opportu nities for learning?

2 As a second/foreign language teacher or learner, what are you r views about teachi ng grammar? Do you have any specific preferences for how it should be taught or when? Do you know what you r students' preferences might be for grammar teachi ng. If not, do you thin kit would be usefulto findout?
3 lfyou were teaching English as a foreign language ina country with limited opportunities for secondary and post-secondary education in English, what recommendations would you make regardi ng the age at which English instruction would begi n ? What research would you draw on in supporting you r recommendations?

## Suggestions for further reading

Dornyei, Z. 2005. The Psychologyof the Language Learner: Individual Differences in Second Language Acquisition. Mahwah, NJ: Lawrence Erlbaum and Associates.
Dornyei reviews decades of research on how individual differences affect second language learning. The book covers personality variables, aptitude, motivation, learning styles, learning strategies, and other individual char acteristics such as anxiety and willingness to communicate that may vary according to the learning environment. Both thorough and accessible, this review concludes by emphasizing the evidence that individual differences are strongly affected by the situation in which learning takes place rather than being 'context-independent and absolute.'

Muñoz, C. (ed.). 2006. Age and the Rate of Foreign Language Learning. Clevedon: Multilingual Matters.
The Barcelona Age Factor study is the basis of this edited volume. Ten chapters report on various aspects of studems' learning of English, com paring the outcomes for students whose foreign language instruction began at different ages. In addition to the specific research reports on, for example, the students' oral fluency, vocabulary, and rate oflearning, there is an overview chapter in which Carmen Muñoz, the project director and editor of the volume, discusses the project in terms of broader issues of age and language learning at school.

Robinson, P.(ed). 2002. Individual Differences and Instructed Language Learning. Amsterdam: John Benjamins.
The contributors to this edited collection focus on interactions between individual learner characteristics and learning contexts. The chapters in the first section focus on theoretical work related to aptitude, motiva tion, anxiety, and emotion. Each chapter in the second section describes research investigating how individual learner variables interact with a par ticular learning context to affect L2 learning. This includes classroom and laboratory studies examining learner variables in relation to different types of instruction and studies of natural versus instructed L2 learning.

## 4 EXPLAINING SECOND LANGUAGE LEARNING

## Preview

A general theory of second language acquisition needs to account for lan guage acquisition by learners with a variety of characteristics in a variety of contexts. In this chapter we examine sorne of the theories that have been offered to account for second language developmental progress and final learning outcomes. We will look at how the behaviourist and innatist expla nations for first language acquisition that we saw in Chapter 1 have been extended to account for second language acquisition. We will also look at sorne theories from cognitive psychology that have increasingly informed second language research in recent years. These theories emphasize the way the mind perceives, retains, organizes, and retrieves information. Finally, we will look at sociocultural theory, a perspective that places second language acquisition in a larger social context.

## The behaviourist perspective

As we saw in Chapter 1, behaviourist theory explained learning in terms of imitation, practice, reinforcement (or feedback on success), and habit forma tion. Much of the early research within behaviourist theory was done with laboratory animals, but the learning process was hypothesized to be the same forhumans.

## Second language applications: Mimicry and memorimtion

Behaviourism had a powerful influence on second and foreign language teaching, especially in North America, from the 1940s to the 1970s. Nelson Brooks (1960) and Robert Lado (1964) were two proponents of this per spective. Their influence was felt directly in the development of widely used
audiolingual teaching materials and in teacher training. Classroom activities emphasized mimicry and memorization, and students learned dialogues and sentence patterns by heart. Because language development was viewed as the formation of habits, it was assumed that a person learning a second language would start off with the habits formed in the first language and that these habits would interfere with the new ones needed for the second language. Thus, behaviourism was often linked to the contrastive analysis hypothesis. However, as we saw in Chapter 2, researchers found that many of the errors learners make are not predictable on the basis of their first language, nor do they always make the errors that would be predicted by a simple comparison of their first and second languages. This discovery led to the rejection of both the contrastive analysis hypothesis and behaviourism, leading to a period during which both the role of the first language and the role of practice in learning a second language received limited attention in both research and pedagogy.

InChapter 2, we saw ample evidence that second language learners draw on what they already know-including previously learned languages. However, we also saw that they are sometimes reluctant to transfer certain first language patterns, even when the translation equivalent would be correct. And we saw that first language influence may become more apparent as more is learned about the second language, leading learners to see similarities that they had not perceived at an earlier stage. All this suggests that the influence of the learner's first language may not simply be a matter of habits, but a more subtle and complex process of identifying points of similarity, weighing the evidence in support of sorne particular feature, and even reflecting (though not necessarily consciously) about whether a certain feature seems to 'belong' in the target language.

By the 1970s, many researchers were convinced that behaviourism and the contrastive analysis hypothesis were inadequate explanations for second lan guage acquisition. As we shall see, however, as research on second language acquisition has evolved, the explanations offered by behaviourism and the contrastive analysis hypothesis have been revisited and understood in terms of new learning theories.

## The innatist perspective

As we saw in Chapter 1, the rejection of behaviourism as an explanation for first language acquisition was partly triggered by Chomsky's critique of it. Chomsky argued that innate knowledge of the principies of Universal Grammar permits all children to acquire the language of their environment during a critical period of their development. While Chomsky did not make specific claims about the implications of his theory for second language learning, Lydia White (2003) and other linguists have argued that Universal

Grammar offers the best perspective from which to understand second lan guage acquisition. Others, for example Robert Bley-Vroman (1990) and Jacquelyn Schachter (1990) have suggested that, although UG may be an appropriate framework for understanding first language acquisition, it does not offer a good explanation for the acquisition of a second language, espe cially by learners who have passed the critica! period. In their view, this means that second language acquisition has to be explained by sorne other theory, perhaps one of the more general psychological theories described below.

Vivian Cook (2003) and others point out that there is still 'the logical problem' of second language acquisition. That is, we need an explanation for the fact that learners eventually know more about the language than they could reasonably have learned if they had to depend entirely on the input they are exposed to. The implication is that knowledge of UG must be avail able to second language learners as well as to first language learners. Sorne of the theorists who hold this view claim that the nature and availability of UG are the same in first and second language acquisition. Others argue that UG may be present and available to second language learners, but that its exact nature has been altered by the acquisition of other languages.

Researchers working within the UG framework also differ in their hypoth eses about how formal instruction or the availability of feedback will affect learners' knowledge of the second language. Bonnie Schwartz (1993), for example, concludes that instruction and feedback change only superficial aspects of language performance and do not affect the underlying system atic knowledge of the new language. She argues that language acquisition is based on the availability of natural language in the learner's environment. Interaction with speakers of that language is suflicient to trigger the acquisi tion of the underlying structure of the language. Lydia White (1991) and others agree that acquisition of many grammatical features of the new lan guage takes place naturally when learners are engaged in meaningful use of the language. However, they also suggest that, because the nature of UG is altered by the acquisition of the first language, second language learners may sometimes need explicit information about what is not grammatical in the second language. Otherwise, they may assume that sorne structures of the first language have equivalents in the second language when, in fact, they do not. In Chapter 2, we saw a good example of this in White's study of the placement of English adverbs in sentences produced by French speakers. In Chapter 6 (Studies 18 and 33), we will see sorne research on the effect of instruction and feedback on such language features.

Researchers who study second language acquisition from a UG perspective are usually interested in the language competence of advanced learners their knowledge of complex grammar-rather than in the simple language of beginning learners. They are interested in whether the competence that underlies the use of the second language resembles the competence underlying
the language performance of native speakers. Thus, their investigations often involve grammaticality judgement or other methods to probe what learners know about the language rather than observations of natural language use.

## Second language applications: Krashen's 'MonitorModel'

Perhaps the best known model of second language acquisition influenced by Chomsky's theory of first language acquisition is Stephen Krashen's (1982) Monitor Model, first described in the early 1970s, at a time when there was growing dissatisfaction with language teaching methods based on behaviour ism. Krashen described his model in terms of five hypotheses.

In the acquisitionl learning hypothesis, Krashen suggests that we 'acquire' lan guage as we are exposed to samples oflanguage that we understand in much the same way that children pick up their first language-with no conscious attention to language form. We 'learn' on the other hand through conscious attention to form and rule learning. In Krashen's view, far more language is acquired than learned.

Next, according to the monitor hypothesis, second language users draw on what they have acquired when they engage in spontaneous communica tion. They may use rules and patterns that have been learned as an editor or 'monitor', allowing them to make minor changes and polish what the acquired system has produced. Such monitoring takes place only when the speaker/writer has plenty of time, is concerned about producing correct lan guage, and has learned the relevant rules.

The natural order hypothesis was based on the finding that, as in first language acquisition, second language acquisition unfolds in predictable sequences, as we saw in Chapter 2. The language rules that are easiest to state (and thus to learn) are not necessarily the first to be acquired.

The comprehensible input hypothesis is that acquisition occurs when one is exposed to language that is comprehensible and contains $i+1$. The ' $i$ ' rep resents the level oflanguage already acquired, and the ' $+J$ ' is a metaphor for language (words, grammatical forms, aspects of pronunciation) that is just a step beyond that level.

Krashen's affective filter hypothesis is proposed to account for the fact that sorne people who are exposed to large quantities of comprehensible input do not necessarily acquire language successfully. The 'affective filter' is a meta phorical barrier that prevents learners from acquiring language even when appropriate input is available. Affect refers to feelings of anxiety or negative attitudes that, as we saw in Chapter 3, may be associated with poor learn ing outcomes. A learner who is tense, anxious, or bored may filter out input, making it unavailable for acquisition.

The Monitor Model been challenged by other researchers and theorists, sorne of whom have argued that it is not possible to test Krashen's hypotheses in empirical research (McLaughlin 1987) or that he has drawn the wrong conclusions from research (White 1987). Nevertheless, his ideas about second language development were influential during a period when second language teaching was in transition from structure-based approaches that emphasized learning rules or memorizing dialogues, to approaches that emphasized using language with a focus on meaning. Since then, aswe will see in Chapter 6, communicative language teaching, including immersion, con tent-based, and task-based language teaching, has been widely implemented. Krashen's hypotheses, especially the comprehensible input hypothesis, have been a source of ideas for research in second language acquisition. Classroom research has confirmed that students can make a great deal ofprogress through exposure to comprehensible input without direct instruction. Studies have also shown, however, that students may reach a point from which they fail to make further progress on sorne features of the second language unless they also have access to guided instruction. Sorne insights from learning theories developed in cognitive psychology help to explain why this may be so.

## ACtivity Examine the Monitor Model

A nu mber of writers have questioned the val idity of Krashen's Monitor Model, partly on the basis that it is difficult to test the five hypotheses in empirical studies. Nevertheless, Krashen's views have remai ned influential insecond language teaching.

1 Can you think of sorne reasons why this might be so?

2 Which of the hypotheses do you find intuitively convincing?
3 Which ones leave you sceptical? Why?

## The cognitive perspective

Since the 1990s, research and theories from cognltlve psychology have become increasingly central to our understanding of second language devel opment. Sorne of these theories use the computer as a metaphor for the mind, comparing language acquisition to the capacities of computers for storing, integrating, and retrieving information. Sorne draw on neurobiology, seeking to relate observed behaviour as directly as possible to brain activity.

As in first language acquisition, cognitive and developmental psychologists argue that there is no need to hypothesize that humans have a language-spe cific module in the brain or that acquisition and learning are distinct mental processes. In their view, general theories of learning can account for the gradual development of complex syntax and for learners' inability to sponta neously use everything they know about a language at a given time. As noted above, sorne linguists have also concluded that, while the innatist perspective provides a plausible explanation for first language acquisition, something else is required for second language acquisition, since it so often falls short of full success. From the cognitive psychology perspective, however, first and second language acquisition are seen as drawing on the same processes of perception, memory, categorization, and generalization. The difference líes in the circumstances of learning as well as in what the learners already know about language and how that prior knowledge shapes their perception of the new language.

## Information processing

Cognitive psychologists working in an information-processing model of human learning and performance see second language acquisition as the building up of knowledge that can eventually be called on automatically for speaking and understanding. Roben DeKeyser (1998), Richard Schmidt (2001) and others have suggested that learners must pay attention at first to any aspect of the language that they are trying to learn or produce. 'Pay atten tion' in this context is accepted to mean 'using cognitive resources to process information' but there is a limit to how much information a learner can pay attention to. Thus, learners at the earliest stages will tend to use most of their resources to understand the main words in a message. In that situation, they may not notice the grammatical morphemes attached to sorne of the words, especially those that do not substantially affect meaning. Gradually, through experience and practice, information that was new becomes easier to process, and learners become able to access it quickly and even automatically. This
frees up cognitive processing resources to notice other aspects of the language that, in turn, gradually become automatic.
Por proficient speakers, choosing words, pronouncing them, and string ing them together with the appropriate grammatical markers is essentially automatic. Purthermore, much of what these speakers say is drawn from pre dictable patterns oflanguage that are at least pardy formulaic. That is, fluent speakers do not create new sentences by choosing oneword at a time but rather by using strings of words that typically occur together. This use of patterns applies not only to idiomatic expressions, but also to much conversational language and written language in a specific genre (Ellis, Simpson-Vlach, and Maynard 2008).

Another aspect of automaticity in language processing is the retrieval of word meanings. When proficient listeners hear a familiar word, even for a split second, they cannot help but understand it. Such automatic responses do not use up the kind of resources needed for processing new information. Thus, proficient language users can give their full attention to the overall meaning of a text or conversation, whereas less proficient learners use more of their attention on processing the meaning of individual words and the relationships between them. The lack of automatic access to meaning helps to explain why second language readers need more time to understand a text, even if they eventually do fully comprehend it. The information processing model suggests that there is a limit to the amount of focused mental activity we can engage in at one time.

Information processing approaches to second language acquisition have been explored by many researchers. Drawing on J. R. Anderson's (1995) work, Roben DeKeyser $(1998,2001,2007)$ and others have investigated second language acquisition as 'skill learning'. They suggest that most learn ing, including language learning, starts with declarative knowledge, that is, knowledge that we are aware of having, for example, a grammar rule. The hypothesis is that, through practice, declarative knowledge may become pro cedural knowledge, or the ability to use the knowledge. With continued practice, the procedural knowledge can become automatized and the learner may forget having learned it first as declarative knowledge.

According to this perspective, once skills become automatized, thinking about the declarative knowledge while trying to perform the skill actually disrupts the smooth performance ofit. Think, for example, of trying to drive a car or skate while intentionally thinking about and preparing every move. With enough practice, procedural knowledge eclipses the declarative knowl edge, which, in time, may be forgotten. Por this reason, fluent speakers may not even realize that they once possessed the declarative knowledge that set the process in motion.

Sometimes changes in language behaviour do not seem to beexplainable in terms of a gradual build-up of fluency through practice. These changes have been described in terms of restructuring (McLaughlin 1990). They seem to be based on sorne qualitative change in the learner's knowledge. Restructuring may account for what appear to be bursts of progress, when learners suddenly seem to 'put it all together', even though they have not had any new instruction or apparently relevant exposure to the language. Itmay also explain apparent backsliding, when a systematic aspect of a learner's lan guage incorporares too much or incorporares the wrong things. For example, as we saw in Chapter 2, when a learner finally masters the use of the regular -ed ending to show past tense, irregular verbs that had previously been used correctly may be affected. Thus, after months of saying 'I saw a film', the learner may say 'I seed' or even 'I sawed'. Such overgeneralization errors are not based on practice of those specific items but rather on their integration into a general pattern.

Another concept from psychology offers insight into how learners store and retrieve language. According to transfer-appropriate processing (TAP), information is best retrieved in situations that are similar to those in which it was acquired (Lightbown 2008b). This is because when we learn something our memories also record aspects of the context in which it was learned and even the cognitive processes involved in the way we learned it, for example, by reading or hearing it. To date, most of the research on transfer-appropriate processing has been done in laboratory experiments, for example, comparing the learning of word lists under different conditions. However, the hypothesis seems to offer a plausible way of explaining a widely observed phenomenon in second language learning: knowledge that is acquired mainly in rule learn ing or drill activities may be easier to access on tests that resemble the learning activities than in communicative situations. On the other hand, if learners' attention is drawn to grammatical forms during communicative activities in which their cognitive resources are occupied with a focus on meaning, the retrieval of those forms on a grammar test may be more difficult. In Chapter 6, a classroom investigation of L2 learning influenced by transfer appropriate processing is described in Study 40.

## Usage-based learning

As seen in the discussion of first language acquisition in Chapter 1, cognitive psychologists, unlike innatists, see no need to hypothesize the existence of a neurological module dedicated exclusively to language acquisition. They argue that what is innate is simply the ability to learn, rather than any specific linguistic principles. Sorne usage-based theories also attribute less impor tance to the kind of declarative knowledge that characterizes skill learning and traditional structure-based approaches to second language instruction. As Nick Ellis (2002) explains, the emphasis is on the frequency with which
learners encounter specific linguistic features in the input and the frequency with which language features occur together. According to this view, learn ers develop a stronger and stronger network of associations or connections between these features as well as between language features and the contexts in which they occur. Eventually, the presence of one situational or linguistic feature will activate the other(s) in the learner's mind. For example, learners might get subject-verb agreement correct, not because they know a rule but because they have heard examples such as 'I say' and 'he says' so often that each subject pronoun activates the correct verb farm.

Connections may be strong because the language features have occurred together frequently or they may be relatively weaker because there have been fewer opportunities to experience them together. Sorne of the evidence far usage-based views comes from the observation mentioned above that much of the language we use in ordinary conversation or in particular genres is predictable, and to a considerable extent based on farmulaic units or chunks. As suggested by Nick Ellis $(2003,2005)$ and others, language is at least partly learned in units larger than single words, and sentences or phrases are not usually put together one word at a time. As noted in Chapter 1, usage-based research has shown that a learning mechanism, simulated by a computer program, can not only 'learn' from input but can also generalize, even making overgeneralization errors.

## The competition model

Elizabeth Bates and Brian MacWhinney (1981) described the 'competition model' as an explanation far both first and second language acquisition that takes into account not only language farm but also language meaning and language use. Through exposure to thousands of examples oflanguage asso ciated with particular meanings, speakers of a particular language come to understand how to use the 'cues' that signal specific functions. For example, the relationship between words in a sentence may be signalled by word arder, grammatical markers, and the animacy of the nouns in the sentence. Most languages make use of multiple cues, but they differ in the primacy of each. This becomes clear in a situation where the meaning of a sentence is not immediately obvious. What helps you figure out the meaning? English uses word arder as the most common indicator of the relationships between sentence components. Most English sentences have the arder Subject-Verb Object (SVO). That is, the typical English sentence mentions the subject first, then the verb, then the object.

Two- and three-year old English-speaking children can usually use cues of animacy and their knowledge of the way things work in the world to inter pret odd sentences. Thus, if they hear a string of words such as 'Box push hoy', they will act it out by making a hoy doll push a tiny box, facusing on
the fact that the 'hoy' is the natural agent of action in this situation. However, the SVO pattern is so strong in English that, by the time they are four years old, children hearing this sentence will ignore the fact that boxes don't nor mally move on their own, and carefully demonstrate how the box pushes the hoy. For English speakers, word order patterns are stronger than animacy cues at this point. At this age, children may attribute the SVO relationship to sentences in the passive voice. That is, 'The box was pushed by the hoy' may be interpreted as 'The box pushed the hoy.' Only later do they learn to pay attention to the grammatical markers that distinguish the active voice sentence from the passive word order.

In contrast, Spanish and Italian have more flexible word order, and speak ers of these languages rely more on grammatical markers (for example, the agreement of subject and verb, the case marking of pronouns) or on the animacy of nouns to understand how sentence elements are related. When English speakers are learning these languages, they may have difficulty sup pressing their tendency to rely on word order as the basis for interpretation. For example, an English speaking learner ofltalian may find it confusing to hear sentences such as Il giocattolo guarda il bambino (the toy-is looking at-the hoy). An ltalian speaker, accustomed to more flexible word order, focuses on the animacy of the two nouns and concludes that the most rea sonable interpretation is that the hoy is looking at the toy. According to the competition model, second language acquisition requires that learners learn the relative importance of the different cues appropriate in the language they are learning (MacWhinney 1997).

## ACTIVITY Look at how different cues lead to sentence interpretation

Consider the following sentences:
1 The boy eats the apple.
2 The apple eats the boy.
3 The dog sees the bal 1 .
4 The ball chases the dog.
5 The ball is chased by the dog.
1 Do they all follow the patterns of English grammar?
2 How can you tell which nou nrefers to the agent (the one who performs the action)?

3 In each sentence, what cue tells you which nou n is the agent?
4 Is there more than one cue?
5 How are sentences 4 and 5 above different from each other?

6 Accordi ng to the competition mode/, how might these sentences be interpreted by speakers of a language with a more flexible word order than English? What would those speakers focus on?

The cognitive perspective emphasizes the role of general human abili ties to process and learn information-including language-on the basis of experience. In recent years, the term 'cognitive linguistics' has emerged and highlights the view that language is but one of the complex knowledge systems that humans acquire. Peter Robinson and Nick Ellis (2008) suggest that cognitive linguistics draws from and builds on a number of different approaches that have in common the hypothesis that language is learned through our perceptual and cognitive experiences and that like all other aspects oflearning, language learning involves the discovery, categorization, and determination of patterns through the use oflanguage.

## Language and the brain

Another area of work within but not limited to the cognitive perspective is concerned with language learning and the brain. Sorne of the questions investigated include whether first and second languages are acquired and represented in the same areas of the brain and whether the brain processes second language input differently from first language input. For a long time the assumption was that language functions were located in the left hemisphere of the brain. Nonetheless, recent brain imaging studies show activation in different locations in both hemispheres of the brain during lan guage processing. This is true for both first and second languages. However, differences have been observed, depending on the learners' age and level of proficiency. Por example, when learners who acquire a second language later in life are given a grammatical task to complete, they show activation in the same neural areas that are activated for Ll processing but also activation in other areas of the brain. This is not the case with younger learners who show activation only in the areas for L1 processing (Beretta 2011). Other studies have measured the electrical activity in brain waves to explore differences in rhe processing oflanguage input. Sorne of this research has shown that as an L2 learner's proficiency increases, the brain activity looks more like that of first language processing. There is also evidence that semantic processes are rhe first to look more like L1 processing patterns followed by syntactic pro cesses as proficiency in the L2 increases (Hahne 2001).

While it is fascinating to think about connections between second language learning and the brain, it is important to keep in mind that this is a young discipline. Furthermore, the limited research that has been conducted has produced mixed findings. Therefore any implications oflanguage and brain research for second language teaching are premature.

## Second language applications: Interacting, noticing, processing, andpractising

A number of hypotheses, theories, and models for explaining second lan guage acquisition have been inspired by the cognitive perspective.

## The interaction hypothesis

Evelyn Hatch (1978), Michael Long (1983, 1996),Teresa Pica (1994), Susan Gass (1997), and many others have argued that conversational interaction is an essential, if not sufficient, condition for second language acquisition. These researchers have studied the ways in which speakers modify their speech and their interaction patterns in order to help learners participate in a conversation or understand meaning in a new language. Long (1983) agreed with Krashen that comprehensible input is necessary for language acquisition. However, he focused on the question of how input could be made comprehensible. He argued that modified interaction is the neces sary mechanism for making"language comprehensible. That is, what learners need is opportunities to interact with other speakers, working together to reach mutual comprehension through negotiation for meaning. Through these interactions, interlocutors figure out what they need to do to keep the conversation going and make the input comprehensible to the less profi cient speaker. According to Long, there are no cases of beginner-level learners acquiring a second language from native-speaker talk that has not been mod ified in sorne way.

Modified interaction does not always involve linguistic simplification. Itmay also include elaboration, slower speech rate, gesture, or the provision of addi tional contextual cues. Sorne examples of conversational modifications are:

1 Comprehension checks-efforts by the native speaker to ensure that the learner has understood (for example, 'The bus leaves at 6:30. Do you understand?').
2 Clarification requests-efforts by the learner to get i:he native speaker to clarify something that has not been understood (for example, 'Could you repeat please?'). These requests from the learner lead to further modifica tions by the native speaker.
3 Self-repetition or paraphrase- the more proficient speaker repeats his or her sentence either partially or in its entirety (for example, 'She got lost on her way home from school. She was walking home from school. She got lost.').

Long (1996) revised the interaction hypothesis, placing more emphasis on cognitive factors such as 'noticing' and corrective feedback during inter action. When communication is difficult, interlocutors must 'negotiate for meaning', and this negotiation is seen as the opportunity for language
development. Related to this is Merrill Swain's (1985) comprehensible output hypothesis. She argued that when learners must produce language that their interlocutor can understand, they are most likely to see the limits of their second language ability and the need to find better ways to express their meaning. The demands of producing comprehensible output, she hypoth esized, 'push' learners ahead in their development.

## The noticing hypothesis

Richard Schmidt (1990, 2001) proposed the noticing hypothesis, sug gesting that nothing is learned unless it has been 'noticed'. Noticing does not itself result in acquisition, but it is the essential starting point. From this perspective, comprehensible input does not lead to growth in language knowledge unless the learner becomes aware of a particular language feature.

Schmidt's original proposal of the noticing hypothesis carne from his own experience as a learner of Portuguese. After months of taking classes, living in Brazil, and keeping a diary, he began to realize that certain features of language that had been present in the environment for the whole time began to enter his own second language system only when he had noticed them. This was because they were brought to his attention in class or sorne other experience made them salient. Drawing on psychological learning theories, Schmidt hypothesized that second language learners could not begin to acquire a language feature until they had become aware of it in the input. Susan Gass (1988) also described a learning process that begins when learn ers notice something in the second language that is different from what they expected or that fills a gap in their knowledge of the language.
The question of whether learners must be aware that they are 'noticing' something in the input is the object of considerable debate. According to information processing theories, anything that uses up our 'mental 'process ing space', even if we are not aware of it or attending to it intentionally, can contribute to learning. From a usage-based perspective, the likelihood of acquisition is best predicted by the frequency with which something is avail able for processing, not by the learner's awareness of something in the input.

These questions about the importance of awareness and attention con tinue to be the object of research. Severa! researchers have found ways to track learners' attention as they engage in second language interaction. For example, Alison Mackey, Susan Gass, and Kim McDonough (2000) had learners watch and listen to themselves in videotaped interactions and asked questions leading them to explore what they were thinking as they partici pated in those interactions. Ron Leow (1997) developed crossword puzzles that learners had to solve while thinking aloud, thus providing sorne insight into what they noticed about language as they worked. Merrill Swain and Sharon Lapkin (1998) recorded learners in pair work and kept track of the
language features they mentioned. These research designs cannot tell us if learners noticed things they did not mention. However, they do make it pos sible to identify sorne things that learners were aware of and to look at how this awareness is related to measures of their language knowledge. The extent to which learners' noticing oflanguage features affects their second language development will come up again in our discussion of research on second language acquisition in the classroom in Chapters 5 and 6.

## Input processing

In his research with American university students learning foreign languages, Bill VanPatten (2004) observed many cases of students misinterpreting sen tences. For example, as predicted by the competition model discussed earlier in this chapter, when English speakers heard sentences in Spanish, they used word order to interpret the relationships among the nouns in the sentence. Thus, they interpreted 'La sigue el señor' as 'She (subject pronoun) follows the man'. The correct interpretation is 'Her (object pronoun) follows the man' (subject of the sentence). In other words, the correct English translation would be 'The man follows her'. In order to understand that, students need to learn that in Spanish, a pronoun object often precedes the verb and that, rather than rely on the word order alone, it is essential to pay attention to whether the form of the pronoun indicares a subject or an object.
VanPatten argued that the problem arose in part from the fact that learn ers have limited processing capacity and cannot pay attention to form and meaning at the same time. Not surprisingly, they tend to give priority to meaning, overlooking sorne features of the language form. When the context in which they hear a sentence helps them make sense of it, that is a good strategy for understanding the general idea, but it may interfere with learners' progress in acquiring the language. In Chapter 6 we will see how VanPatten developed instructional procedures that require learners to focus on the spe cific language features in order to interpret the meaning, thus pushing them to acquire those features.

## Processability theory

Jürgen Meisel, Harald Clahsen, and Manfred Pienemann (1981) studied the acquisition of German by a group of adult migrant workers who had little or no second language instruction. They analysed large samples of their speech and described the details of developmental sequences in their production of simple and complex sentences. They concluded that the sequence of develop ment for features of syntax and morphology was affected by how easy these were to process. Ease of processing was found to depend to a large extent on the position of those features in a sentence. Features that typically occurred at the beginning or end of a sentence were easier to process (and learn) than those in the middle. All learners acquired the features in the same sequence,
even though they progressed at different rates. The researchers also found that sorne language features did not seem to be affected by these constraints and could be learned and used by learners who were at different developmen tal stages. These were referred to as variational features.

Pienemann $(1999,2003)$ developed processability theory on the basis of research with learners of different languages in a variety of settings, both instructional and informal. One important aspect of his theory is the inte gration of developmental sequences with first language influence. He argues that his theory explains why learners do not simply transfer features from their first language at early stages of acquisition. Instead, they have to develop a certain level of processing capacity in the second language before they can use their knowledge of the features that already exist in their first language. We saw examples of this in the acquisition of negatives and questions in Chapter 2.

## lhe role of practice

One component of language learning that has seen a renewal of interest within the cognitive perspective is practice. As we saw in discussions of the behaviourist perspective, an approach to learning that is based on drill and that separares practice from meaningful language use does not usually lead to communicative competence. This does not mean, however, that practice is not an essential component oflanguage learning. Roben DeKeyser ( 1998) asserts that sorne classroom interpretations of behaviourism missed the point that practice is only effective if one practises the behaviour that one wishes to learn. As we will see in Chapter 6, the drills that characterized audiolingual instruction often failed to make the connection between the language pat terns being drilled and the meaning(s) associated with them.

Researchers are now looking more dosely at how practice converts dec;larative knowledge to procedural knowledge and then to automatic performance. Note that from the cognitive perspective, the practice needed for language development is not mechanical, and it is not limited to the production of language. Listening and reading are also affected by opportunities for prac tice. Lourdes Ortega (2007) has proposed three principles for practice in the foreign language classroom that she sees as compatible with the research carried out from what she calls the 'cognitive-interactionist' perspective:

1 Practice should be interactive.
2 Practice should be meaningful.
3 There should be a focus on task-essential forms.
Elizabeth Gatbonton and Norman Segalowitz $(1988,2005)$ have devel oped an approach to language teaching called ACCESS (Automatization in Communicative Contexts of Essential Speech Segments). It draws on the cognitive perspective and is based on classroom activities which, by their
nature, require learners to use meaningful units of language repetitively in contexts where there are genuine exchanges of meaning. The goal is to provide opportunities for using these units with sufficient frequency that they will become automatic. Segalowitz (2010) has emphasized the impor tance of increasing the amount of language that can be used automatically, thus freeing more cognitive resources for learning new things. Paul Nation (2007) has suggested that automaticity, which he, like Segalowitz, refers to as 'fluency' may be the most neglected aspect oflanguage teaching in contexts where instruction focuses primarily on meaning.

## The sociocultural perspective

As we saw in Chapter 1, Vygotsky's theory assumes that cognitive develop ment, includinglanguage development, arises as a result of social interactions. Unlike the psychological theories that view thinking and speaking as related but independent processes, sociocultural theory views speaking and thinking as tightly interwoven. Speaking (and writing) mediares thinking, which means that people can gain control over their mental processes as a conse quence of internalizing what others say to them and what they say to others. This internalizing is thought to occur when an individual interacts with an interlocutor within his or her zone of proximal development (ZPD)-that is, in a situation in which the learner can perform at a higher level because of the support (scaffolding) offered by an interlocutor.

In sorne ways, this approach may appear to restare sorne of the hypotheses encountered elsewhere in this chapter. In fact, people sometimes wonder whether the ZPD is the same as Krashen's $i+l$. William Dunn and James Lantolf (1998) addressed this question in a review anide, arguing that it is not possible to compare the two concepts because they depend on very different ideas about how development occurs. The ZPD is a metaphorical location or 'site' in which learners co-construct knowledge in collaboration with an interlocutor. In Krashen's $i+1$, the input comes from outside the learner and the emphasis is on the comprehensibility of input that includes language structures that are just beyond the learner's current developmental level. The emphasis in ZPD is on development and how learners co-con struct knowledge based on their interaction with their interlocutor or in prívate speech.

Vygotskyan theory has also been compared to the interaction hypothesis because of the interlocutor's role in helping learners understand and be under stood. These two perspectives differ primarily in the emphasis they place on the interna! cognitive processes. In the interaction hypothesis, the emphasis is on the individual cognitive processes in the mind of the learner. Interaction facilitares those cognitive processes by giving learners access to the input they need to activare interna! processes. In Vygotskyan theory, greater importance
is attached to the conversations themselves, with learning occurring through the social interaction. Sociocultural theory holds that people gain control of and reorganize their cognitive processes during mediation as knowledge is internalized during social activity.

## Second language applications: Learning by talking

Extending Vygotskyan theory to second language acquisition, Jim Lantolf (2000), Richard Donato (1994), and others are interested in showing how second language learners acquire language when they collaborate and inter act with other speakers. Traditionally, the ZPD has been understood to involve an expert and a novice. However, recent work has broadened the term to include novice-novice or learner-learner interactions. An example of this is in Communication task B in Chapter 5 (p. 137). In that excerpt, the learners are struggling with French reflexive verbs as they try to construct a storyline from pictures. The example is from the work of Merrill Swain and Sharon Lapkin (2002), who have investigated sociocultural explanations for second language learning in Canadian French immersion programmes. Their work has its origins in Swain's comprehensible output hypothesis and the notion that when learners have to produce language, they must pay more attention to how meaning is expressed through language than they ordi narily do for the comprehension of language. Swain (1985) first proposed che comprehensible output hypothesis based on the observation that French immersion students were considerably weaker in their spoken and written production than in their reading and listening comprehension. She advo cated more opportunities for learners to engage in verbal production (i.e. output) in French immersion classrooms. Since then, she and her colleagues have carried out extensive research to investigate the effects of output on second language learning.

Swain's early work on the output hypothesis was influenced by cognitive theory, but more recent work has been motivated by sociocultural theory. Using the term collaborative dialogue, Swain and Lapkin and their col leagues have carried out a series of studies to determine how second language learners co-construct linguistic knowledge while engaging in production tasks (i.e. speaking and writing) that simultaneously draw their attention to form and meaning. fu shown in Communication task B in Chapter 5, learn ers were testing hypotheses about the correct forms to use, discussing them together and deciding what forms were best to express their meaning. Swain (2000) considers collaborative dialogues such as these as the context where 'language use and language learning can co-occur. It is language use mediat ing language learning. Itis cognitive activity and it is social activity' (p. 97).
Therefore the difference between the sociocultural perspective and that of other researchers who also view interaction as important in second language
acquisition is that sociocultural theorists assume that the cognitive pro cesses begin as an externa! socially mediated activity and eventually become internalized. Other interactionist models assume that modified input and interaction provide learners with the raw material that is interpreted and analysed through interna! cognitive processes.

## Summary

In the end, what all theories oflanguage acquisition are intended to account for is the ability of human learners to acquire language within a variety of social and instructional environments. All of the theories discussed in this chapter and in Chapter 1 use metaphors to represent something that cannot be observed directly.

Linguists working from an innatist perspective draw much of their evidence from studies of the complexities of proficient speakers' knowledge of lan guage and from analysis of their own intuitions about language. Cognitive and developmental psychologists argue that it is not enough to know what the final state of knowledge is and that more attention should be paid to cor pus-based studies of the input, as well as to the developmental steps leading up to the achievement of high levels of proficiency.

Recent cognitive perspectives have often involved computer simulations or controlled laboratory experiments where people learn specific sets of care fully chosen linguistic features, often in an invented language. Many linguists argue that this does not entitle psychologists to generalize to the complexities of the linguistic knowledge that learners eventually have.

Interactionists emphasize the role of negotiation for meaning in conversa tional interactions. This perspective and the sociocultural perspective provide insights into the ways in which learners can gain access to new knowledge about the language when they have support from an interlocutor. Sorne linguists challenge the interactionist position, arguing that much of what learners need to know is not available in the input, and so they put greater emphasis on innate principies oflanguage that learners can draw on.

Both linguists and psychologists draw sorne of their evidence from neuro logical research. At present, most of the research on language representation in the brain and specific neurological activity during language processing is inconclusive. However, advances in technology are rapidly increasing oppor tunities to observe brain activity more directly. Such research will eventually contribute to reinterpretations of research that previously could examine only the observable behaviour oflearners speaking or performing other lan guage tasks.

Educators who are hoping that language acquisition theories will give thern insight into language teaching practice are often frustrated by the lack of
agreement among the 'experts'. The complexities of second language acquisi tion, like those of first language acquisition, represent puzzles that scientists will continue to work on far a long time. Research that has theory develop ment as its goal has important long-term significance far language teaching and learning, but agreement on a 'complete' theory of language acquisition is probably, at best, a long way off. Even if such agreement were reached, there would still be questions about how the theory should be interpreted far language teaching practice.

While sorne teachers watch theory development with interest, they must still continue to teach and plan lessons and assess students' performance in the absence of a comprehensive theory of second language learning. A growing body of applied research draws on a wide range of theoretical orientations, sometimes explicitly stated, sometimes merely implied. This research may provide information that is more helpful in guiding teachers' reflections about pedagogy. In Chapters 5 and 6, we will examine language acquisition research that has focused on learning in the dassroom.

## Questions for reflection

Several theories for L2 learning have been proposed inthis chapter. Is one of them more consistent with you r own understandi ng of how languages are learned? lfso, how have you r experiences as a teacher or learner brought you to this view?
2 Schmidt's notici ng hypothesis-that all second language learning inadu lts involves awareness of what is bei ng learned-is somewhat controversia!.
That is, it has been argued that it is also possi ble to learn incidental $y$, without any awareness or even an intention to learn. However, second language learners certain ly do have 'aha' moments when they suddenly u nderstand something about how the target language works. Do you have any examples of noticing from you r own language learning experiences, or from those of you r students?
3 From the perspective of the interaction hypothesis, modified interaction is seen as an essential resou rce for second language learners.This is distinguished from modified (or simplified) input. Can you think of sorne examples of each? What are sorne of the featu res of modified interaction that you think are especially hel pful to learners? Are there sorne features that may not support learning? What are the contexts in which second language learners are most likely to benefit from modified interaction? Do you think that sim plified input is (also) important?

## Suggestions for further reading

Dornyei, Z. 2009. The Psychology of Second Language Acquisition. Oxford: Oxford University Press.
This overview of the theories that have been proposed to explain second language acquisition is both comprehensive and easy to read. Dornyei pro vides detailed treatment of the theories that are discussed in this chapter, focusing particularly on those arising from the research in cognitive psychology. In addition, the book introduces the work in neurobiology that provides a new level of explanation for language acquisition and use.

Swain, M., P. Kinnear, and L. Steinman. 201O. Sociocultural Theory and Second Language Education: An Introduction through Narratives. Bristol: Multilingual Matters.
In this book the authors cover the key concepts of sociocultural theory (for example, mediation, zone of proximal development, privare speech, collaborative dialogue) through the use of narratives. The narratives come from the voices of language learners and teachers from different educa tional contexts. The book is of particular interest to readers motivated to understand how sociocultural theory relates to the teaching and learning of second languages.

VanPatten, B. and J.Williams (eds.). 2007. Theories in Second Language Acquisition: An Introduction. Mahwah, NJ: Lawrence Erlbaum Associates.

VanPatten and Williams set out a list of observations that have arisen from research studies in second language acquisition. Then, well-known authors discuss how the theoretical framework in which they have done their own research would explain these observations. Por example, there are chapters on Universal Grammar, sociocultural theory, skill acquisition theory, pro cessability, and input processing. The chapters are brief (about 20 pages, induding discussion questions and readings) and written in a style that is accessible to those with limited background in research and theory. The final chapter, by Lourdes Ortega, provides a concise overview of the differ ent theories and identifies sorne ongoing challenges for explaining second language acquisition.

## 5

# OBSERVI NG LEARNING AND TEACH ING IN THE SECOND LAN GUAG E CLASSROOM 

## Preview

In this chapter we explore different ways in which researchers have observed and described what goes on in second language classrooms. Before we do this, let us take a moment to reflect on the differences between classroom settings for language learning and other settings where people learn a new language without instruction.

As we saw in the activity in Chapter 2, learning a second language in a non instructional setting is different from learning in the classroom. Many believe that learning 'on the street' is more effective. This belief may be based on the fact that most successful learners have had experience using the language outside the classroom. What is special about this 'natural' language learning? Can we creare the same environment in the classroom? Should we? Or are there essential contributions that only instruction and not natural exposure can provide?

## Natural and instructional settings

Natural acquisition contexts should be understood as those in which the learner is exposed to the language at work or in social interaction or, if the learner is a child, in a school situation where most of the other children are native speakers of the target language and where the instruction is directed toward native speakers rather than toward learners of the language. Insuch a classroom, much of a child's learning take places in interaction with peers as well as through instruction from the teacher.

In structure-based instructional environments, the language is taught to a group of second or foreign language learners. The focus is on the language itself, rather than on the messages carried by the language. The teacher's goal is to see to it that students learn the vocabulary and grammatical rules of the target language. Sorne students in structure-based classes may have
opportunities to continue learning the target language outside the class room; for others, the classroom is the only contact with that language. In sorne cases, the learners' goal may be to pass an examination rather than to use the language for daily communicative interaction beyond the classroom.

Communicative, content-based, and task-based instructional environments also involve learners whose goal is learning the language itself, but the style of instruction places the emphasis on interaction, conversation, and language use, rather than on learning about the language. The topics that are discussed in communicative and task-based instructional environments are often of general interest to the learner, for example, how to obtain a driver's license. In content-based language teaching (CBLT), the focus of a lesson is usually on the subject matter, such as history or mathematics, which students are learning through the medium of the second language. In these classes, the focus may occasionally be on the language itself, but the emphasis is on using the language rather than talking about it. The language that teachers use for teaching is not selected solely for the purpose of teaching a specific feature of the language, but also to make sure learners have the language they need to interact in a variety of contexts. Students' success in these courses is often measured in terms of their ability to 'get things done' in the second language, rather than on their accuracy in using certain grammatical features.

## In natural acquisition settings

When people learn languages at work, in social interactions, or on the play ground, their experiences are often quite different from those of learners in dassrooms. Complete Table 5.1 on the next page. As you look at the pattern of + and -signs you have placed in the chart, you will probably find it marches the descriptions below.

- Language is not presented step by step. The learner is exposed to a wide variety of vocabulary and structures.
- Learners' errors are rarely corrected. If their interlocutors can under stand what they are saying, they do not remark on the correctness of the learners' speech. They would probably feel it was rude to do so.
- The learner is surrounded by the language for many hours each day. Sometimes the language is addressed to the learner; sometimes it is simply overheard.
- The learner usually encounters a number of different people who use the target language proficiendy.
- Learners observe or participare in many different types of language events: brief greetings, commercial transactions, exchanges of informa tion, arguments, instruction at school and in workplace interactions.

## ACTIVITY Compare learning contexts

The chart in Table 5.1 is similar to the one in Table 2.1 in Chapter 2. Inthat chart, we compared the profiles of first and second language learners. In this one, we compare natu ral and instructional contexts for second language learning.Think about the characteristics of the four contexts represented by each colu mn. For each context, decide whether the characteristics on the left are present or absent. Mark a plus $(+)$ inthe table ifthe characteristic is typical of that context. Mark a minus (-) if it is something you usually do not find in that context. Write '?' if you are not sure. Note that the 'Comm unicative instruction' colu mn has been subdivided into teacher-student and student student interaction. What happens when learners tal k to each other? Is that different from what happens in teacher-student interaction?

| Characteristics | Natural <br> acquisition | Structure- <br> based <br> instruction | Communicative <br> instruction |  |
| :--- | :--- | :--- | :--- | :--- |
|  |  |  | Teacher- <br> student | Student- <br> student |
| Learning one <br> thing at a time |  |  |  |  |
| Frequent <br> feedback on <br> errors |  |  |  |  |
| Am ple time for <br> learning |  |  |  |  |
| High ratio of <br> native speakers <br> to learners |  |  |  |  |
| Variety of <br> language and <br> discou rse types |  |  |  |  |
| Pressu re to <br> speak |  |  |  |  |
| Access to <br> modified input |  |  |  |  |

Table 5. I Contexts for language learning

- Older children and adults may also encounter the written language in the use of video and web-based materials.
- Learners must often use their limited second language abiliry to respond to questions or to get information. In these situations, the emphasis is on getting meaning across clearly, and more proficient speakers tend to be tolerant of errors that do not interfere with meaning.
- Modified input is available in many one-to-one conversations. In situ ations where many native speakers are involved in the conversation, however, learners may have difficulry getting access to language they can understand.

## In structure-based instructional settings

lhe events and activities that are rypical of structure-based instruction differ from those encountered in natural acquisition settings. In grammar transla tion approaches, there is considerable use of reading and writing, as learners translate texts from one language to another, and grammar rules are taught explicitly. In audiolingual approaches there is little use of translation, and learners are expected to learn mainly through repetition and habit formation, although they may be asked to figure out the grammar rules for the sentences they have memorized.

- Linguistic items are presented and practised in isolation, one item at a time, in a sequence from what teachers or textbook writers believe is 'simple' to that which is 'complex'.
- Errors are frequently corrected. Accuracy tends to be given prioriry over meaningful interaction.
- Learning is often limited to a few hours a week.
- In situations of foreign language learning the teacher is often the only native or proficient speaker the student comes in contact with.
- Students experience a limited range of language discourse rypes. lhe most rypical of these is the lnitiation/Response/Evaluation (IRE) exchange where the teacher asks a question, a student answers, and the teacher evaluares the response. lhe written language students encoun ter is selected primarily to provide practice with specific grammatical featu.res rather than for its content.
- Students often feel pressure to speak or write the second language and to do so correctly from the very beginning.
- Teachers may use the learners' native language to give instructions or for classroom management. When they use the target language, they tend to modify their language in arder to ensure comprehension and compliance.

Language classrooms are not all alike. The conditions for learning differ in terms of the physical environment, the age and motivation of the stu dents, the amount of time available for learning, and many other variables. Classrooms also differ in terms of the principies that guide teachers in their language teaching methods and techniques. Designers of communicative language teaching programmes have sought to replace sorne of the charac teristics of structure-based instruction with those more typical of natural acquisition contexts.

## In communicative instructional settings

In communicative and content-based instruction, the emphasis is on the communication of meaning, both between teacher and students and among the students themselves in group- or pair- work. Grammatical forms are focused on only in arder to clarify meaning. The assumption is that, in focus ing on meaning, learners will acquire the language in a way that is similar to natural acquisition.

- Input is simplified and made comprehensible by the use of contextual cues, props, and gestures, rather than through structural grading. Students provide each other with simplified and sometimes erroneous input.
- There is a limited amount of error correction on the part of the teacher, and meaning is emphasized over form. Students tend not to overtly correct each other's errors when they are engaged in communica tive practice. Because the focus is on meaning, however, requests for
clarification may serve as implicit feedback. Negotiating for meaning may help students see the need to say something in a different way.
- Learners usually have onlylimited time for learning. In a typical teacher fronted classroom with 25-30 students, individual students get very little opportunity to produce language in a 60 -minute class, and when they do, it is usually in the form of a short response to a teacher's ques tion. When students work in pairs or groups, they have opportunities to produce and respond to a greater amount and variety of language. Sometimes, however, subject-matter courses taught through the second language can add time for language learning. A good example of this is in immersion programmes where most or all the subject matter is taught to a group of students who are all second language learners.
- As in structure-based instruction, it is usually only the teacher who is a proficient speaker. Learners have considerable exposure to the inter language of other learners, particularly in student-student interaction. This naturally contains errors that would not be heard in an environ ment where the interlocutors are native speakers, but it provides many more opportunities for students to use the target language than is the case in most teacher-fronted activities.
- A variety of discourse types may be introduced through stories, peer and group-work, the use of 'authentic' materials such as newspapers and television broadcasts. Text materials may include both those modified for second language learners and those intended for native speakers. In the latter case, teachers use instructional strategies to help learners get the meaning, even if they do not know all the words and structures. In student-student interaction, learners may practise a range of sociolin guistic and functional features oflanguage through role-play.
- There is little pressure to perform at high levels of accuracy, and there is often a greater emphasis on comprehension than on production, espe cially in the early stages of learning.
- Modified input is a defining feature of this approach to instruction. The teacher makes every effort to speak to students in a level of language they can understand. Ifstudents speak the same first language, they may have little difficulty in understanding each other. Ifthey come from dif ferent language backgrounds, they may modify their language as they seek to communicate successfully.

General descriptions of classroom instruction such as those above cannot capture the individual characteristics of particular classrooms. Por this reason, researchers have developed a number of ways to study classroom learning and teaching. We will discuss two approaches to classroom research in this chapter. We will look first at observation schemes, in which research ers anticipate the occurrence of particular events and behaviours and make note of them within pre-planned frameworks or checklists. Then we will
look at classroom ethnography, an approach that requires the observer to describe what happens in the classroom, looking for patterns and relation ships, but trying not to limit the observation to any predetermined categories or expectations.

## Observation schemes

Many different observation schemes have been developed for use in second language classrooms. They differ in several respects, including the number of categories they contain, whether they focus on qualitative or quanti tative descriptions, and whether they are used throughout a lesson or on selected samples of classroom interaction. The schemes also differ in rela tion to whether they are used by observers in 'real time' while they are in the classroom, or used later outside the classroom to analyse audio or video recordings or transcripts of such recordings.

One example of a scheme developed specifically for second language class rooms is the Communicative Orientation of Language Teaching (COLT) Observation Scheme described by Nina Spada and Maria Frohlich (1995). COLT is divided into two parts. Part A describes teaching practices in terms of content, focus, and organization of activity types. When using Part A, the observer can record, for example, whether the pedagogical activities are teacher- or learner-centred, whether the focus is on language form or meaning, and whether there are opportunities for students to choose the topics for discussion. Part B describes specific aspects of the language pro duced by teachers and students, for example, how much (or how little) language students produce, whether their language production is restricted in any way, the kinds of questions teachers ask, and whether and how teach ers respond to learners' errors.

The COLT scheme and others like it have been used primarily in classroom research that is intended to look at how differences in teaching practices are related to differences in second language learning. Observation schemes have also been used in the training of new teachers and in the professional devel opment of experienced ones.

Below is an activity in which you are asked to use a set of pre-determined categories similar to those used in the COLT scheme to characterize the nature of interaction between teachers and students and between students and students.

## Classroom comparisons: Teacher-student interactions

Excerpts from four transcripts of second language classroom interaction are given in this and the following section. The first two present teacher-student interaction. The transcripts come from classrooms that differ in their approach
to second language teaching; one of them represents structure-based instruc tion; the other, a communicative approach. Structure-based approaches emphasize language form through either metalinguistic instruction (for example, grammar translation) or pattern practice (for example, audiolingual).

With each transcript, there is a chart where you can indicare whether certain things are happening in the interaction, from the point of view of the teacher and that of the students. Befare you begin reading the transcripts, study the following interpretations of the categories used in the charts:

1 Errors: Are there errors in the language of either the teacher or the students?
2 Feedback on errors: When students make errors, do they receive feedback? From whom?
3 Genuine questions: Do teachers and students ask questions to which they don't know the answer in advance?
4 Display questions: Do teachers ask questions that they know the answers to so that learners can display their knowledge of the language (or lack of it)?
5 Negotiation for meaning: Do the teachers and students work to under stand what the other speakers are saying? What efforts are made by the teacher? By the students?
6 Metalinguistic comments: Do the teachers and students talk about language, in addition to using it to transmit information?

In the following excerpts, T represents the teacher; S represents a student. (The first two examples come from unpublished data collected by P. M. Lightbown, N. Spada, and B. Barkman.)

## Classroom A: A structure-based approach

(Students in this class are 15-year-old French speakers.)

T OK, we finished the book-we finished in the book Unit 1, 2, 3 . Finished. Workbook 1,2, 3. So today we're going to start with

Unit 4. Don't take your books yet, don't take your books. In 1, 2, 3 we worked in what tense? What tense did we work on? OK?
s Past.
T In the past-What auxiliary in the past?
s Did.
T Did (writes on board '1-2-3 Past'). Unit 4, Unit 4, we're going to work in the present, present progressive, present continuous-OK? You don't know what it is?
s Yes
т Yes? What is it?
s Little bit.
т A little bit.
S
T Eh?
s Uh, present continuous
T Present continuous? What's that?
S e-n-g
T i-n-g
s Yes.
т What does that mean, present continuous? You don't know? OK, fine. What are you doing, Paul?
s Rien [nothing].
T Nothing?
s Rien-nothing.
т You're not doing anything? You're doing something!
s Not doing anything.
T You're doing somethingl
s Not doing anything.
T You're doing something-Are, are you listening to me? Areyou talking with Marc? What are you doing?
s No, no-uh-listen-uh-
T Eh?
s to you.
T You're listening to me.
s Yes.
T Oh. (writes 'What are you doing? I'm listening to you' on the board).
s Je-[I ...].
T What are you-? You're excited.
s Yes.
T You're playing with your eraser (writes 'I'm playing with my eraser' on the board). Would you clase the door please, Bernard? Claude, what is he doing?

S Clase the door.

т He is closing the door (writes 'He's closing the door' on the board). What are you doing, Mario?

## Classroom B: A communicative approach

(Students in this class are 10-year-old French speakers. In this activity, they are telling their teacher and their classmates what 'bugs' them. They have written 'what bugs them' on a card or paper that they hold while speaking.)

s It bugs me when a bee string me.
т Oh, when a bee stings me.
s Stings me.
т Do you get stung often? Does that happen often? The bee stinging many times?
s Yeah.
T Often? (Teacher turns to students who aren't paying attention) OK. Sandra and Benoit, you may begin working on a research project, hey? (Teacher turns her attention back to 'What bugs me')
s It bugs me (inaudible) and my sister put on my dothes.
т Ah! She borrows your dothes? When you're older, you may appreciate it because you can switch dothes, maybe. (Turns to check another student's written work) Mélanie, this is yours, I will check OK. It's good.
s It bugs me when l'm sick and my brother doesn't help me-my-my brother, 'cause he-me-.
T OK. You know-when (inaudible) sick, you're sick at home in bed and you say, oh, to your brother or your sister: 'Would you pleaseget me a drink of water?'-'Ah! Drop dead!' you know, 'Go play in the traffic!' You know, it's not very nice. Martín!
s Itbug me tohave-
т Itbugs me. It bugzz me.
s Itbugs me when my brother takes my bicycle. Every day.

т Every day? Ah! Doesn't your bro-(inaudible) his bicycle? Could his brother lend his bicycle? Uh, your brother doesn't have a bicycle?
s Yeah! A new bicycle (inaudible) bicycle.
т Ah, well. Talk to your mom and dad about it. Maybe negotiate a new bicycle for your brother.
(inaudible)
He has a new bicycle. But his brother needs a new one too.
Yes!
Hey, whoa, just a minute! Jean?
Martin's brotherhas -
Martin, who has a new bicycle? You or your brother?
My brother.
And you have an old one.
(inaudible)
And your brother takes your old one?
(inaudible) bicycle.
His bicycle! How old is your brother?
March 23.
His birthday?
Yeah!
And how old was he?
Fourteen.
Fourteen. Well, why don't you tell your brother that when he takes your bike you will take his bike? And he may have more scratches than he figures for. OK?

## Characteristics of input and interaction

Compare the two charts you have completed so far. What kinds of second language input and opportunities for interaction are available to learners in each of the environments that these transcripts exemplify? How are they different?

## ClassroomA

1 Errors: Very few on the part of the teacher. However her speech does have sorne peculiar characteristics typical of this type of teaching, for example, the questions in statement form-often asked with dramatic rising into nation (for example, 'You don't know what it is?'). Students don't make too many errors because they say very little and what they say is usually limited by the lesson.
2 Feedback on errors: Yes, whenever students do make errors, the teacher reacts.
3 Genuine questions: Yes, a few, but they are almost always related to dass room management. No questions from the students.

4 Display questions: Yes, almost all of the teacher's questions are of this type. Interestingly, however, the students sometimes interpret display ques tions as genuine questions (T: What are you doing, Paul? S: Nothing.). The teacher wants students to produce a sentence-any sentence-in the 'present continuous' but the student worries that he's about to get in trouble and asserts that he is doing 'nothing'. This is a good example of how the teacher's pragmatic intent can be misinterpreted by the student, and of how strongly, even in this setting, students seek to find genuine meaning in language.
5 Negotiation for meaning: Very little, learners have no need to paraphrase or request clarifications, and no opportunity to determine the direction of the discourse; the teacher is focused only on the formal aspects of the learners' language. All the effort goes into getting students to produce a sentence with the present continuous form of the verb.
6 Metalinguistic comments: Yes, this is how the teacher begins the lesson and lets the students know what really matters!

## Classroom B

1 Errors: Yes, students make errors. And even the teacher says sorne odd things sometimes. Her speech also contains incomplete sentences, simpli fied ways of speaking, and an informal speech style.
2 Feedback on errors: Yes, sometimes the teacher repeats what the student has said with the correct form (for example, 'he bugzz me'-emphasizing the third person singular ending). However, this correction is not consist ent or intrusive as the focus is primarily on letting students express their meanings.
3 Genuine questions: Yes, almost all of the teacher's questions are focused on getting information from the students. The students are not asking ques tions in this exchange. However, they do sometimes intervene to change the direction of the conversation.
4 Display questions: No, because there is a focus on meaning rather than on accuracy in grammatical form.
5 Negotiation for meaning: Yes, from the teacher's side, especially in the long exchange about who has a bicycle!
6 Metalinguistic comments: No. Even though the teacher clearly hopes to get students to use the third person ending, she does not say so in these words.
You no doubt noticed how strikingly different these two transcripts are, even though the activities in both are teacher-centred. Inthe transcript from Classroom A, the focus is on form (i.e. grammar) and in Classroom B, it is o meaning. In Classroom A, the only purpose of the interaction is to practisd the present continuous. Although the teacher uses real classroom events anJ sorne humour to accomplish this, there is no real interest in what studen
are doing. Rather the teacher is highlighting their ability to say what they are doing, using the correct verb form. There is a primary focus on correct grammar, display questions, and error correction in the transcript from Classroom A. In the transcript from Classroom B, the focus is on meaning, conversational interaction, and genuine questions, although there are sorne brief references to grammatical accuracy when the teacher feels it is necessary.

## Classroom comparisons: Student-student interactions

This section presents sorne student-student interactions. The transcripts are based on the interactions between second language learners engaged in dif ferent communicative tasks.

As in the previous section, there is a chart with each transcript where you can indicare whether certain things are happening in the interaction.

## Communication task A: Picture description

The following transcript is of two girls aged 11-12 years, both ESL learn ers in their first year of learning English in Australia. The first learner (S1) is from Hong Kong; the second (S2) is from Somalia. They are engaged in a task where S1 is describing a picture for 52 to draw. They are sitting at a table, separated by a small barrier, so that they can see each other's faces and hands (when they gesture), but not each other's picture. The picture S1 is drawing is a black outline containing stick figures-a hoy flying a kite and a girl holding his hand. The stick figures are standing on sorne grass near a tree. Square brackets indicare non-target pronunciation. (This transcript comes from unpublished data collected by Alisan Mackey, Rhonda Oliver, and Jennifer Leeman.)

s 1 And o-on the right, there is a [tree]. lt's a- a, the ki-, the kite is up. (Points up in the air) This is the kite. (Points up again) This is the kite. (Points yet again) And the [tree] is up there.
s2 Toree bird?
si Huh?
s2 Is a three bird?
si Huh?
s2 Up, up-up the kite?
S I Yeah, the kite is u-, the kite is up and the [tree] is clown. (Points directions)
s2 Tu.e [bird] clown?
S I Tu.e kite-, the [tree] is clown.
s2 What's the [tee]?
si Huh?
s2 What's the [tree]? (Imitares Learner 1 's production)
s i Feel?
s2 Fell?
Fell clown? (Points clown)
s I No, it's not the fell clown. No, it's just at the bottom.
s2 Tu.e bird?
s । No, the tree.
s2 Tu.e tree? (Emphatic stress)
si Yes.
s2 It is left and right?
s । It's right. (Points)
s2 It's long? It's [little]?
s । It's-what?
s2 It's long and [little]?
s । Um, a little-. It-, um, a middle size.
s2Middle size tree?
s I Yes.
s2 It's little. (Says as drawing the tree)

## Communication task B: Jigsaw

Tu.e following transcript is of two students in a Grade 7 French immersion classroom. They are engaged in a jigsaw activity based on a series of eight pictures telling the story of a young girl being awakened by her alarm dock early in the morning. One student has pictures $1,3,5$, and 7 , and the other student has pictures $2,4,6$, and 8 . They take turns telling the story portrayed by the pictures and then they display all the pictures in sequence and write the story they have just told. Telling the story requires the use of a number of reflexive verbs in French. In the third person, the form se is placed between the subject and the finite verb. Thus, elle se leve (she gets up) and elle se souvient (she remembers) are correct. Tu.e learners are called Dara (D) and Nina (N). Inthe transcript incorrect uses of the reflexive verbs are in italics; other errors are not marked. (Tu.e data are from Swain and Lapkin 2002.)

D Elle. [She]
D Elle se souvient, non, Elle souvient qu'elle a un ... une pratique de chorale, alors elle se leve. [She remembers, no. She remembers that she has a choir practice so she gets up]
D Tout acoup [Suddenly]
n Elle ssse [She ssse]
D Elle souvient [She remembers]
N se souvient ou souvient? [Remembers or remembers?]
D Elle souvient ... ahh, elle se souvient ... Elle souvient ... Elle se souvient, no. [She remembers ... ahh, she remembers ... She remembers ... She remembers, no]
N pas... [not]
D Elle souvient qu'elle doit aller au band ...? [She remembers that she has to go to band]
N Chorale. [Choir]
D Chorale. [Choir]
N Tout acoup elle souvient qu'elle ... doit aller ala chorale [All of a sudden she remembers that she has to go to choir]
D [very softly] elle se souvient ... non. [She remembers ... no]
D Alors, elle [So, she]
N non, wait. Tout acoup elle ... se souvient? [no, wait ... all of a sudden she ... remembers?]
D Je pense pas que e'est se souvient. [I don't think it's remember]
N oh, souvient ... souvient. [oh remember ... remember]
D Elle souvient qu'elle a le chorale. [She remembers that she has choir]
N Qu'elle doit se préparer. [that she has to get ready]
D Oui. [Yes]
N pour le chorale ... non, tout acoup elle souvient qu'il y a une pratique de chorale. [for choir ... no, all of a sudden she remembers that there's a choir practice]

## Characteristics of input and interaction

Compare the two charts you have completed. As befare, what kinds of second language input and opportunities for interaction are available to learners in each of the environments that these transcripts exemplify? How are they dif ferent from each other and the teacher-student interactions you looked at previously?

## Communication task A

1 Errors: There are many errors in the speech of both learners. This ineludes grammatical and pronunciation errors. These errors are present in several breakdowns in the learners' conversation.
2 Feedback on errors: There is no error correction in terms of form as the learners struggle to understand each other's meaning. The difficulty they are having in communication may serve as a kind of implicit feedback. That is, the fact that the interlocutor does not understand may signal that there is something wrong with what they have said.
3 Genuine questions: Yes, there are many genuine questions. Naturally, S2 asks most of these questions because she needs to get the information from S1 in arder to draw the picture. S1 also asks sorne genuine questions and these are almost always to ask for clarification.
4 Display questions: No, there are no display questions because they are engaged in a real communication-gap exchange. $S 2$ cannot see the picture that S 1 is describing. Therefore all the questions asked are genuine questions.
5 Negotiation for meaning: Yes, indeed! Both learners are trying hard to understand each other, even though they often fail to do so. This involves many comprehension questions and clarification requests, as well as repeti tions of each other's utterances, often with emphasis, trying tounderstand what the other learner has just said.
6 Metalinguistic comments: None.

## Communication task B

1 Errors: Both learners make several grammatical errors, most notably the repeated failure to produce the reflexive form of the verb se souvenir.
2 Feedback on errors: There is no actual error correction provided. Neither learner is really sure what the correct form is. Instead, there is metalinguis tic reflection and discussion as they try to figure out whether they are using the correct form of the verb sesouvenir.
3 Genuine questions: The questions that are asked are genuine. The content is language form, but the students are genuinely sharing information about how to complete the task.
4 Display questions: There are no display questions. The students are actively collaborating to reconstruct the story and are asking genuine questions of each other.

5 Negotiation for meaning: At this point in the interaction, the students have agreed on the content of the story. Thus, there is more negotiation of form, that is, more discussion of whether they are using the correct forms to say what they've agreed they want to say.
6 Metalinguistic comments: Although they are not using words such as 'verb' or 'pronoun', the students are talking about language as they focus on trying to find the right form.

These two transcripts of student-student interaction are very different from each other. In the first communication task, the children are focused exclu sively on meaningand on trying to understand each other in orderto complete the information-gap activity. They are constandy using comprehension and clarification requests as they negotiate for meaning in this task. In the second student-student transcript, however, the learners are focused on both form and meaning. While reconstructing the story, they make several explicit statements about whether they are using the correct form of the reflexive verb se souvenir and continually question the grammatical accuracy of their use of this form as they continue to discuss the content of the story.

In the activities in the preceding pages, we have described and compared teacher-student and student-student interaction in terms of six observation categories. Sorne observation schemes use many more categories, covering a broad range of instructional practices and procedures. Others focus on one specific feature of classroom instruction and interaction. In the following sections, we review classroom research in which one particular feature of instruction has been examined. Five studies examine corrective feedback, four investigare teachers' use of questions and one describes the amount and distribution of time for L2 learning.

## Correctivefeedback in the classroom

## Study 1:Recasts in content-based classrooms

Roy Lyster and Leila Ranta (1997) developed an observation scheme which describes different types of corrective feedback teachers give on errors and also examines student uptake-an indication that the student has noticed the feedback.. This scheme was developed in French immersion classrooms where second language students learn the target language via subject-matter instruction (i.e. content-based language teaching). It has also been used to describe feedback in other types of second language instruction.

They developed their scheme by observing the different types of corrective feedback provided during interaction in four French immersion classrooms with 9-11-year-old students. They began their observations by using a com bination of sorne categories from Pan B of the COLT scheme and other categories from models that had examined feedback in both first and second
language learning. They adjusted sorne of the categories to fit their data, and they also developed additional categories. This resulted in the identi fication of six corrective feedback types, defined below. The definitions are taken from Lyster and Rama (1997: pp. 46-8). The examples come from 10-11-year-old students in ESL classes that we have observed.

Explicit correction refers to the explicit provision of the correct form. fu the teacher provides the correct form, he or she clearly indicares that what the student had said was incorrect (for example, 'Oh, you mean ...', 'You should say ...').
s The dog run fastly.
T 'Fasdy' doesn't exist. 'Fast' <loes not take -ly. That's why I picked 'quickly'.

Recasts involve the teacher's reformulation of all or part of a student's utter ance, minus the error. Recasts are generally implicit in that they are not introduced by 'You mean', 'Use this word', or 'You should say.'

S 1 Why you don't likeMarc?
т Why don't you likeMarc?
s2 I don't know, I don't likehim.
Note that in this example the teacher <loes not seem to expect uptake from S1. It seems she is merely reformulating the question S1 has askedS2.

Clarification requests indicate to students either that their utterance has been misunderstood by the teacher or that the utterance is incorrect in sorne way and that a repetition or a reformulation is required. A clarification request includes phrases such as 'Pardon me ...' lt may also include a repetition of the error as in 'What do you mean by ... ?'

т How often do you wash the dishes?
s Fourteen.
T Excuse me. (Clarification request)
s Fourteen.
T Fourteen what? (Clarification request)
s Fourteen for a week.
т Fourteen times a week? (Recast)
s Yes.Lunch and dinner.
Metalinguisticfeedback contains comments, information, or questions related to the correctness of the student's utterance, without explicidy providing the correct form. Metalinguistic comments generally indicare that there is an error somewhere (for example, 'Can you find your error?'). Also, metalin guistic information generally provides either sorne grammatical terminology that refers to the nature of the error (for example, 'lt's masculine') or a word definition in the case oflexical errors. Metalinguistic questions also point to
the nature of the error but attempt to elicit the information from the student (for example, 'Is it feminine?').
s We look at the people yesterday.
T What's the ending we put on verbs when we talk about the past?
s e-d
Elicitation refers to at least three techniques that teachers use to directly elicit the correct form from the students. First, teachers elicit completion of their own utterance (for example, 'It's a ...'). Second, teachers use questions to elicit correct forros (for example, ... 'How do we say x in English?'). Third, teachers occasionally ask students to reformulate their utterance.
s My father cleans the plate.
т Excuse me, he cleans the - - ?
s Plates?
Repetition refers to the teacher's repetition of the student's erroneous utter ance. In most cases, teachers adjust their intonation so as to highlight the error.

In this example, the repetition is followed by a recast:
s He's in the bathroom.
T Bathroom? Bedroom. He's in the bedroom.
In the next example, the repetition is followed by metalinguistic comment and explicit correction:
s We is ...
т We is? But it's two people, right? You see your mistake? You see the error? When it's plural it's 'we are'.

Lyster and Rama found that all teachers in the content-based French immer sion classes they observed used recasts more than any other type of feedback. Indeed, recasts accounted for more than half of the total feedback provided in the four classes. Repetition of error was the least frequent feedback type pro vided. The other types of corrective feedback fell in between. Student uptake was least likely to occur after recasts and more likely to occur after clarification requests, metalinguistic feedback, and repetitions. Furthermore, elicitations and metalinguistic feedback not only resulted in more uptake, they were also more likely to lead to a corrected form of the original utterance.

Lyster (1998) has argued that students receiving content-based language teaching (where the emphasis is on meaning not form) are less likely to notice recasts than other forros of corrective feedback, because they may assume that the teacher is responding to the content rather than the form of their speech. Indeed, the double challenge of making the subject-matter com prehensible and enhancing knowledge of the second language itself within content-based language teaching has led Merrill Swain (1988) and others to
condude that 'not all content teaching is necessarily good language teaching' (p. 68). The challenges of content-based language teaching will be discussed further in Chapter 6.

Since Lyster and Ranta reponed their findings, many more observation studies of corrective feedback in second or foreign language dassrooms have been carried out. Sorne of them report similar results-that recasts are the most frequently occurring type of feedback and that they appear to go unno ticed by learners. However, others report that learners do notice recasts in the dassroom. Below, two studies are described in which learners were observed to notice and to respond to recasts provided by their teachers.

## Study 2:Recasts andprívate speech

In a study with adult foreign language learners of Japanese, Amy Ohta (2000) examined the oral language that learners addressed to themselves during dassroom activities. She was able to obtain this private speech by attaching microphones to individual students during dassroom interaction that focused on grammar and metalinguistic instruction. In this context, Ohta discovered that learners noticed recasts when they were provided by the instructor. Furthermore, learners were more likely to react to a recast with private speech when it was directed to another learner or to the whole class rather than when the recast was directed to their own errors. On the basis of these findings, she conduded that recasts do get noticed in dassroom interaction even if they do not lead to uptake from the student who originally produced the error.

## Study 3:Recasts in different instructional settings

Roy Lyster and Hirohide Mori (2006) compared learners' immedi ate responses to corrective feedback in French and Japanese immersion classrooms. They found that the teachers in both contexts used correc tive feedback in similar ways. However, the effects of recasts on learners' uptake were different. In the Japanese immersion dasses, learners frequently repaired their utterances after receiving recasts whereas learners in the French immersion dasses rarely did. Instead, the greatest proportion of repair carne after prompts, that is, the feedback types that indicated to students that a correction was needed and that encouraged them to self-correct.

In their efforts to understand these differences Lyster and Mori carried out a detailed analysis of the instructional characteristics in these classes. Using the COLT observation scheme described above to capture differences in the pedagogical practices, they discovered that there was an analytic orientation in the Japanese classrooms leading the teachers and learners to focus their attention on language form and accuracy. The orientation in the French immersion dasses was more experiential with a greater focus on content and communication of messages. Lyster and Mori argued that because the Japanese learners' attention was regularly drawn to form, they were primed
to notice the corrective function of recasts. In the more meaning-oriented French immersion classes, however, recasts were less likely to signal to the learner that the teacher was responding to a language error. Thus is likely that learners assumed that the teachers' recast was simply a confirmation of what they had said.

These findings and those from other research led Lyster and Mori to propase the counterbalance hypothesis. According to this hypothesis, feedback is more likely to be noticed iflearners are oriented in a direction that is opposite to what they have become accustomed to in their instructional environment. One example of this would be that learners who receive L2 instruction that is focused on meaning/content need feedback that directs their attention to form more explicidy.

## Study 4: Correctivefeedback in context

Rhonda Oliver and Alisan Mackey (2003) carried out a descriptive study of an Australian primary ESL classroom with 6-12-year-olds. They inves tigated whether teachers' provision and learners' use of corrective feedback differed depending on varying contexts for interaction in a lesson. They iden tified four contexts in which teachers and learners interacted:

1 content exchanges: the teacher imparted knowledge or asked questions about the content of the curriculum
2 management exchanges: the teacher talked about the organization of the lesson and appropriate classroom behaviour
3 communication exchanges: the emphasis was on students using English in meaningful ways, and
4 explicit language-focused exchanges: the emphasis was on grammar and the use of metalinguistic terminology.

Oliver and Mackey found that learners produced significandy more errors in the communication exchanges. Thus opportunities for feedback were great est in this context. The researchers found that feedback was provided in all instructional contexts but that it was most frequent in the explicit language focused exchanges, followed by content, communication, and management. When they examined how learners reacted to the corrective feedback, they found that learners modified theiroutput most oftenwithin explicit language focused exchanges, only sorne of the time in content and communication exchanges, and never in management exchanges. Interestingly, the types of corrective feedback also varied across contexts: recasts were used at a consist endy high rate in management, communication, and content exchanges, but less so in explicit language-focused exchanges; explicit corrective feed back was rarely provided during content, management, and communication exchanges, and frequendy during explicit language-focused contexts.

Oliver and Mackey's study emphasizes how differences in the instruc tional context affect teachers' feedback and learners' response to it. It is also important to keep in mind that different corrective feedback types can be interpreted differently depending on how they are delivered. Recasts are a case in point. In a study of corrective feedback in four different instruc tional contexts, Younghee Sheen (2006) observed many contrasting types of recasts, including recasts that were declarative versus interrogative, reduced versus non-reduced, single words or short phrases versus long phrases or clauses. Recasts can also differ according to whether they are delivered with or without stress or emphasis. In a study of adult learners of English, Shawn Loewen and Jenefer Philp (2006) found that recasts containing 'prosodic stress were thirteen times more likely to result in successful uptake' (p. 547), that is, uptake in which the student produced the corrected form. However, these interactions were not associated with improved performance on a sub sequent test.
Other factors that may affect learners' reactions to different types of feedback include age and learning goals. For example, adults may be more likely to interpret recasts as feedback on language form, particularly if a high level of accuracy in the second or foreign language is one of their goals.

In this chapter we have examined the role of corrective feedback primarily in terms of learners' oral production. Most of this research has been con cerned with the effects of corrective feedback in relation to learners' linguistic growth and more specifically, learners' grammatical development. There is also an extensive body of research that has investigated the role of corrective feedback on learners' written production. This research has been primarily concerned with whether corrective feedback can help learners improve their writing performance. Less attention has been given to whether and how written corrective feedback contributes to learners' linguistic development. One recent study which has done that is Younghee Sheen's research described in Study 5 below.

## Study 5: Oraland written correctivefeedback

Younghee Sheen (201O) compared the effects of two types of oral and written corrective feedback on adult ESL learners' accurate use of arrides. The oral corrective feedback consisted of recasts or metalinguistic information; par allel written corrective types were direct correction or direct metalinguistid feedback. Five groups participated in the study, of which one was a controll group. The other groups each received one of the following: 1) oral recasts,, 2) oral metalinguistic feedback, 3) written direct correction, and 4) writtenj direct metalinguistic feedback.

All groups participated in two 30-minute activities in which they were askedl to read a story and then retell it either in the written or the oral mode. Learnersl in the oral corrective feedback group received either recasts or metalinguisticJ
feedback every time they made an anide error while they retold the story. Learners who wrote the story received their narratives with corrections for anide errors two days later. To determine whether learners improved their ability to use anides correctly, their knowledge of anides was tested befare the instructional treatment, immediately after the treatment, and again 3-4 weeks later. The tests induded a speeded dictation, a written narrative, and an error-correction task. All groups, except for the one that received oral recasts, significantly outperformed the control group on all immediate and delayed post-tests. Sheen interprets these findings as evidence that the medium (oral versus written) in which corrective feedback is provided is less important than the explicitness of the corrective feedback (recasts versus metalinguistic feedback).

## Questions in the classroom

Teachers' questioning behaviour has been the focus of a good <leal of research in second language dassrooms. Questions are fundamental in engaging stu dents in interaction and in exploring how much they understand. Two types of questions that have been extensively examined are referred to as 'display' questions (to which the teacher already knows the answer) and 'genuine' or 'referential' questions (to which the teacher may not know the answer). The role they play in dassroom interaction has been examined in a number of studies.

## Study 6: Teachers'questions in ESL classrooms

Michael Long and Charlene Sato (1983) examined the forms and functions of questions asked by teachers in ESL dassrooms and compared them with questioning behaviours observed outside the dassroom between native and non-native speakers. They were panicularly interested in differences between the quantity of 'display' and 'information' ('genuine' or 'referential') ques tions. Audio recordings made of the interactions between teachers and students in six adult ESL dasses revealed that teachers asked more display questions than information questions. In the native speaker/non-native speaker conversations outside the dassroom, referential questions were more frequent than display questions. The researchers conduded that teacher learner interaction is a 'greatly distoned version of its equivalent in the real world' (p. 284), and they argued that the interactional structure of dassroom conversation should be changed.

Even though language teaching methods have changed since the Long and Sato study, other dassroom studies on teachers' questioning behaviour have also reponed disproponionately higher numbers of display questions. In the context of communicative language teaching, teachers have been urged to use fewer display questions because they are thought to lead to short, simple responses that require little cognitive effon on the pan of the learner. Instead,
they have been encouraged to ask more referential (or genuine) questions since the latter are thought to require more cognitive processing and to gen erate more complex answers.

More recendy, however, a re-evaluation of display questions has taken place. This is based on the observation that there are different ways in which display questions can be asked in classrooms. One is for the teacher to ask a series of questions in a drill-like format such as 'Doyou have a brother?', 'Does he have a brother?', 'Do you have a sister?', 'Does she have a sister?' In this context, display questions do not have a meaningful or communicative purpose. In other contexts, however, display questions can serve important pedagogic and interaction functions. The study below describes teachers' use of display questions in a more positive light.

## Study 7: Scajfolding and display and referential questions

In a case study of one teacher's adult ESL class, Dawn McCormick and 1 Richard Donato (2000) explored how the teacher's questions were linked to her instructional goals. Working within sociocultural theory, the researchers chose the concept of scaffolding to investigate teacher questions as 'media tional tools within the dialogue between the teacher and students' (p. 184). As we saw in Chapter 1 and Chapter 4, scaffolding refers to a process in which, for example, a more knowledgeable (or expert) speaker helps a less knowledgeable (or novice) learner by providing an interactional framework that the learner can build on.
McCormick and Donato identified six functions of scaffolding (for example, drawing the novice's attention to the task, and simplifying or limiting the task demands). The researchers examined another function-the teacher's use of questions during scaffolded interactions-and how it contributed to class participation and learner comprehension. In the example below, they argue that the teacher's use of the display question 'Who usually lives in palaces?' serves an important pedagogic function because it draws the learn ers' attention to the word 'palace' through the display question and facilitates the learners' comprehension of the word.

T Palace?
s 1 Like castle?
s2 Special place, very good.
S3 Very nice.
T Casde, special place, very nice. Who usually lives in palaces?
ss Kings.
т Kings, and queens, princes and princesses.
ss Yeah
S4 Mayb beautiful house?
T Big, beautiful house, yeah, really big.

McCormick and Donato suggest that questions should be examined within the framework of scaffolded interaction and with reference to the teacher's goals in a particular lesson or interaction.

## Study 8: Open and closed questions

Another distinction similar to the one between display and genuine ques tions is that between open and closed questions. Closed questions typically have only one possible answer and they usually lead to simple one-word responses, making them quick and easy to respond to. Open questions have more than one possible answer and invite elaboration, typically leading to longer and more complex answers, including, for example, explanation and reasoning. In content and language-integrated learning (CLIL) classes in Austria, Christiane Dalton-Puffer (2006) observed and audio recorded the types of questions asked by English teachers, as well as the responses students gave to them. Students produced a greater quantity and quality of output after open questions. In addition, open questions that asked learners not just for facts but also for reasons or explanations led to the most complex lin guistic outcomes. Dalton-Puffer concluded that asking more complex open questions would benefit learners in these CLIL classrooms but that this level of question/response interaction requires a high level of competence in the foreign language on the part of the teacher.

## Study 9: Wáittime and teachers'questioningpractices

Another aspect of teachers' questioning behaviour is 'wait time'-the amount of time the teacher pauses after having asked a question to give the student time to respond. Joanna White and Patsy Lightbown (1984) did a quan titative analysis of wait time in audiolingual ESL classes. They found that teachers typically gave students no more than a second or two before they directed the question to another student or answered the question them selves. They also tended to repeat or paraphrase the question severa! times rather than silendy wait for the student to formulate a response. Although such rapid question/answer patterns are typical of audiolingual classes, they also occur in communicative instruction. Finding a balance between placing too much pressure on students to respond quickly and creating awkward silences seems to be a real challenge.

Research has shown that when teachers are trained to give their students more time to respond to questions, not only do students produce more responses but their responses are also longer and more complex. Not surprisingly, this effect has been observed to be stronger with open/referential questions com pared with closed/display questions (Long et al. 1985).

In classrooms with students at different age levels and in different kinds of instruction, finding the right balance can lead to students providing fuller answers, expanding their ideas, and more successfully processing the material to be learned.

## Study 10: Timefor learning languages inschool

Earlier in this chapter we talked about the differences between learning a second language in the natural setting compared with the classroom (see Table 5.1). One of the major differences is the amount of time available for learning. In the natural setting there is ample time to learn whereas in the ; typical classroom setting, learners have limited time. One of the ways to provide more time for learning a second/foreign language is vía content-based instruction. However, this is not always feasible or desirable (Lightbown 2012). Other alternatives include increasing the total instructional time or distributing time more intensively over the school year.

We know that it takes a great deal of time to learn a second language, but little research has been done to investigate how the distribution of instruc tional time affects L2 learning. Exceptions to this include the work of sorne Canadian researchers who have examined different amounts and distribu tions of time in English and French as a second language programmes. In one study in Quebec, learners receiving intensive ESL instruction for five hours every day for five months of one school year (in Grade 5 or 6) were compared to learners at the end of secondary school who had received the same total amount of instruction spread over 7-8 years of schooling. On a number o measures, the students who received the intensive instruction performed as well as or better than those whose instruction was delivered in what has beenJ called a 'drip feed' approach (Lightbown and Spada 1994).

In subsequent research, comparisons were made between groups of Grade 5 and 6 students who participated in intensive English language instruction during a single school year, but with the time distributed differently: sorne students received five hours of English a day for five months; others received the same total number of hours, doing two and a half hours of English each day for 10 months. The researchers found that both groups benefited from the overall increase in hours of instruction with sorne additional advantages for learners receiving the more intensive instruction (Collins et al. 1999; Collins and White 2011). The advantages were evident not only in superior language abilities but also in attitudes toward the language and satisfaction with language learning experiences. Similar findings have been reponed for different models of intensive and core French programmes (Netten and Germain 2004; Lapkin, Hart, and Harley 1998).

The classroom observation studies we have described in this chapter focus on specific features of classroom interaction. In these studies, the feature of interest was determined in advance of the observation on the basis of sorne hypothesis about what aspects of classroom instruction and interaction are important for learning, that is, whether a particular type of corrective feed back led to more learner repair, whether a particular type of question led to more learner output, and how the distribution of time affected learning
outcomes. We now turn to a different approach to describing and interpret ing instructional settings for second language learning.

## Ethnography

Ethnography is a way of observing teaching and learning in second or foreign language dassrooms without a set of predetermined categories. Instead, the observer takes extensive notes of the activities, practices, and interactions and looks for the patterns that emerge. This approach to dassroom observation is similar to the way in which an anthropologist takes field notes in study ing a group of people in their natural surroundings. In doing ethnographic research, the observer can either be a participant in the dassroom activities, for example, as a teacher's aid, or as a non-participant, someone who sits quietly and unobtrusively in the background, observing and recording.

Ethnographic approaches to understanding teaching and learning involve qualitative studies that are much broader in scope than the studies using observation schemes described above. That is, ethnographies in second or foreign language classrooms do not focus solely on learning or on teaching but also on social, cultural, and political realities and their impact on learners' cognitive, linguistic, and social development. Por example, Martha Crago's (1992) language socialization research with Inuit children led her to argue that if children come from a culture in which silence is a respectful and effec tive way to learn from an adult, their second language instructor needs to know this so that the children's behaviour is not misinterpreted as refusal to participare or inability to comprehend.

Here are summaries of three ethnographies carried out in second and foreign language dassrooms: one in the South Pacific, one in Canada, and one in Europe.

## Study 11:Langu, age in the home and school

Karen Watson-Gegeo (1992) carried out a longitudinal study over several years with nine families in the Solomon Islands. She explored language-use practices in the home and in the school. Observations in the homes revealed environments that were rich and stimulating for both linguistic and cognitive development. Nevertheless, a large number of the children failed in school. A detailed analysis uncovered many differences in language use and values between the home and school setting. There was no use of the children's first language in school. Their first language was replaced with a restricted and often incorrect version of English. Although these language issues were con tributing factors to the children's failure, a broader analysis of the social and cultural context revealed other, more influential factors at play. Evidently, part of the children's language socialization experience at home induded parents negatively portraying their own experiences at school, expressing
fears about their children's ability to succeed and raising fundamental ques tions about the value of school in their lives. The researcher concludes that these factors were central in contributing to the children's lack of continued cognitive and linguistic development in school.

## Study 12: Separation of second language learners inprimary schools

 In a longitudinal study, Kelleen Toohey (2000) observed a group of chil dren aged 5-7 in kindergarten, Grade 1, and Grade 2 in Vancouver, Canada. The group included children who were native speakers of English, as well as children whose home language was Cantonese, Hindi, Polish, Punjabi, or Tagalog. All the children were in the same class, and English was che medium ofinstruction. Toohey identified three classroom practices that led to che sep aration of the ESL children. First, che ESL children's desks were placed close to the teacher's desk, on the assumption that they needed more direct help from the teacher. Sorne of them were also removed from the dassroom twice a week to obtain assistance from an ESL teacher. Second, instances in which the ESL learners interacted more with each other usually involved borrow ing or lending materials but chis had to be done surreptitiously because the teacher did not always tolerate it. Finally, there was a 'rule' in the classroom that children should not copy one another's oral or written productions. This was particularly problematic for the ESL children because repeating the words of others was often the only way in which they could participate in conversacional interaction. According to Toohey, these dassroom prac tices led to the exdusion of ESL students from activities and associations in school and also in the broader community in which they were new members. Furthermore, such practices did not contribute positively to the children's ESL development.Study 13:Sociopolitical change andforeign language classroom discourse In an ethnographic study of English-medium content classes in Hungarian secondary schools, Patricia Duff ( 1995) examined the impact of sociopolitical changes on pedagogical practice. She compared che structure and participa tion patterns of two classroom activities. One is a tradicional activity called afelelés which is a heavily ritualized recitation format closely associated with Soviet-oriented policies that were rejected after the fall of communism in the late 1980s.As a result, in many English-medium dasses in Hungary, thefeleléJ was replaced by a more open-ended activity called 'student lecture' in which students prepared and presented material to che class in a less ritualized way.

In an examination of the kind oflanguage produced by students when par ticipating in student lectures, Duff observed a large number of spontaneo 1 comments and questions produced in English rather than Hungarian. Sh also noted how students appeared to incorporate feedback provided by th teacher (and other students) in their subsequent production, how the teache and students worked together to negotiate meaning and form, and how thej
developed their fluency, accuracy, and comprehension skills in the process. On the basis of these findings, Duff concluded that sociopolitical transfor mation affects classroom practice and ultimately second language learning.

## Summary

In this chapter we have reviewed sorne of the ways in which different features of second language instruction can be described and interpreted. We have presented descriptions and examples of how classrooms differ in terms of their overall instructional focus and provided examples of different ways in which classroom observation has been carried out. We have included sum maries of studies examining specific pedagogical features (i.e. corrective feedback and question types) as well as those examining the broader social, cultural, and political context and its relationship to second or foreign lan guage learning.
We have also provided examples of charts and taxonomies that can be used to observe and describe different aspects of the interactions that take place between teachers and students in the classroom setting. We encourage you to try out one of these tools to observe and describe the interactions in your own classroom or that of a colleague. The information you gain from engag ing in this small-scale research may help you make decisions about your own pedagogical practice.

In the next chapter, we will examine different views about how languages are best learned in classroom settings and examine sorne research relevant to these positions.

## Questions for reflection

1Do you think you may have a preference far usi ng a particular type of corrective feedback in you $r$ teachi ng? Far example, would you consider you rself to be a 'recaster' or a 'prompter' or do you think you use a range of different feedback types? What could you do to find out?

2 Are you teaching in multili ngual classrooms where many of you r students have a first language other than the language of instruction? Do you group these students together to respond to their needs or do you integrate them with the rest of the class? What do you think are the advantages/ disadvantages of either decision?

3 The charts that you used to analyse the teacher-student tal k and student student tal kinthis chapter include six featu res (far example, errors, genuine questions, negotiation far meani ng). Do you think there are other features that should be included in this chart?You can base you r decision on the transcri pts provided in this chapter or on you r own teachi ng experience.

## Suggestions for further reading

Spada, N. and M. Frohlich. 1995. The Communicative Orientation of Language Teaching Observation Seheme: Coding Conventions and Applications. Sydney: Macmillan.

This book describes the origins and purposes of the Communicative Orientation of Language Teaching (COLT) observation scheme. COLT describes the pedagogical practices and verbal interactions that take place between teachers and students with the aim of describing the instruction as being more or less communicatively oriented. lt also provides detailed guidelines and illustrations for using COLT including how to collect data, how to code the data, and how to analyse it. Also included are descrip tions of how COLT has been used in second/foreign language classrooms throughout the world.

## Toohey, K. 2000. Learning English at School-Jdentity, Social Relations and Classroom Practice. Clevedon: Multilingual Matters.

This book addresses a common educational practice in many countries in the world in which children from minority language backgrounds are taught in mainstream English-medium classes. Through a longitudinal description of a group of children learning English from kindergarten to the end of Grade 2 in a Canadian school, the reader is introduced to a range of social and critica! perspectives on education and how they can be applied to child second language learning. The book provides important insights and useful guidance about how teachers and schools can support minority language children in their efforts to become educated through the medium of English.

Wajnryb, R. 1992. Classroom Observation Tasks:A Resource Bookfar Language Teachers and Trainers. Cambridge: Cambridge University Press.

This book is mainly addressed to teachers to illustrate how they can use observation to learn about their own teaching. Readers are guided through a variety of different tasks and shown how to observe, analyse, and reflect on various aspects ofinstruction including learners, language, lessons, and teaching strategies.

## 6

 SECOND LAN GUAGE LEARNING IN THE CLASSROOM
## Preview

In this chapter, we examine six proposals for second and foreign language teaching, provide examples from classroom interaction to illustrate how the proposals get translated into classroom practice, and discuss research find ings that help to assess their effectiveness. The labels we have given these proposals are:

1 Get it right from the beginning
2 Just listen ... and read
3 Let's talk
4 Get two forone
5 Teach what is teachable
6 Get it right in the end

## Proposals for teaching

Many theories have been proposed for the best way to learn a second lan guage in the classroom. Even more teaching methods and materials have been developed to implement these theories. But the only way to answer the question 'What is the best way to promote language learning in classrooms?' is through research that specifically investigates relationships between teach ing and learning.

To assess proposals for classroom practice, we need to use a range of research approaches, from large-scale quantitative to in-depth qualitative studies. fu we saw in Chapter 5, quantitative research may be essentially descriptive. However, it may also be experimental, involving careful control of the vari ables that may influence learning. The goal of experimental studies is usually to identify specific variables that may affect learning similarly in different environments and find ways of measuring these effects. These studies often
involve large numbers of learners in an effort to avoid the possibility that the unusual behaviour of one or two individuals might lead to a misleading conclusion about learners in general.

Qualitative research, including ethnographies and case studies, often involves small numbers, perhaps one class or only one or two learners in that class. The emphasis is not on what is most general but rather on a thorough under standing of what is particular about what is happening in this classroom. As pointed out by Ann Burns (201O) and others, while quantitative and qualita tive research are important in assessing theoretical proposals, action research carried out by teachers in their own classrooms is also essential to answer spe cific local questions. In this chapter we focus mainly on experimental studies. These are studies that were designed to test hypotheses about how teaching affects second language learning. Readers are encouraged to follow up with further reading but also to explore related questions through research activi ties within their own teaching and learning environments.

## 1 Get it rightfrom the beginning

'Get it right from the beginning' is probably the proposal that character izes more second and foreign language instruction than any other kind. Although communicative language teaching has come to dominate in sorne environments, the structure-based approaches discussed in Chapter 5, espe cially grammar translation, remain widespread.

The grammar translation approach has its origin in the teaching of classi cal languages (for example, Greek and Latin). Students were presented with vocabulary lists, often accompanied by translation equivalents, and grammar rules. The original purpose of this approach was to help students read lit erature rather than to develop fluency in the spoken language. It was also thought that chis approach provided students with good mental exercise to help develop their intellectual and academic abilities.

In a typical grammar translation activity, students read a text together line by line and are asked to translate it from the target language into their native language. Students may answer comprehension questions based on the passage, often in their first language. The teacher draws attention to a specific grammar rule that is illustrated by the text (for example, a certain verb form). Following this, the students are given an exercise in which they are asked to practise the grammar rule, for example, by filling in the blanks with the appropriate verb form in a series of decontextualized sentences that may or may not be related to the text they have read and translated.

Audiolingual instruction arase in part as a reaction to the grammar transla-; tion approach. The argument was that, unlike grammar translation teaching, $;$ in which students learned about the language, audiolingual teaching would
lead students to actually speak the language (Brooks 1960; Lado 1964). In Chapter 4, we saw that the audiolingual approach was based on behav iourism and contrastive analysis. The examples below reflect audiolingual teaching. It is evident that, even though the emphasis is on the oral language, students rarely use the language spontaneously.Teachers avoid letting begin ning learners speak freely out of concerns that this would allow them to make errors. The errors, it is said, could become habits. So it is better to prevent these bad habits befare they happen and 'Get it right from the beginning.'

## Example 1

(A group of 15-year-old students involved in an exercise based on the simple present of English verbs.)
s 1 And uh, in the afternoon, uh, I come home and uh, uh, I uh, washing my dog.
T Iwash.
s1 My dog.
т Every day you wash your dog?
s1 No. [ben]
s2 Il n'a pas de chien! (= He doesn't have a dog!)
s 1 Non, mais on peut le dire! (= No, but we can say we do!)
(Unpublished data from P.M. Lightbown and B. Barkman)
Clearly, in this case, the student's real experience with his dog (or even the fact that he did or did not have a dog) was irrelevant. What mattered was the correct use of the simple present verb!

## Example 2

(A group of 12-year-old learners of English as a foreign language.)
$\mathrm{T} \quad$ Repeat after me. Is there any butter in the refrigerator?
CLASS Is there any butter in the refrigerator?
t There's very little, Mom.
class There's very little, Mom.
$\mathrm{T} \quad$ Are there any tomatoes in the refrigerator?
CLASS Are there any tomatoes in the refrigerator?
T There are very few, Mom.
class There are very few, Mom.
(Unpublished data from P.M. Lightbown and B. Barkman)
Pure repetition. The students have no reason to get involved or to think about what they are saying. Indeed, sorne students who have no idea what the sentences mean will successfully repeat them anyway, while their minds wander off to other things.

## Research findings

Many adult learners, especially those with good metalinguistic knowledge of their own language, express a preference far structure-based approaches. Learners whose previous language learning experience was in grammar translation classes may also prefer such instruction. As we saw in Chapter 3, learners' beliefs about the kind of instruction that is best can influence their satisfaction and success. The grammar translation approach is useful far the study of grammar and vocabulary and can be valuable far understanding important cultural texts. The audiolingual approach with its emphasis on speaking and listening was used successfully with highly motivated adult learners in intensive training programmes far government personnel in the United States. However, there is little classroom research to support such approaches far students in ordinary school programmes that must serve the needs of students who bring different levels of motivation and aptitude to the classroom. In fact, it was the frequent failure of traditional grammar translation and audiolingual methods to produce fluency and accuracy in second language learners that led to the development of more communica tive approaches to teaching in the first place.

Supporters of communicative language teaching have argued that language is not learned by the gradual accumulation of one grammatical feature aftel another. They suggest that errors are a natural and valuable part of the lan guage learning process. Furthermore, they believe that the motivation ol learners is often stifled by an insistence on correctness in the earliest stagei
of second language learning. These opponents of the 'Get it right from the beginning' proposal argue that it is better to encourage learners to develop 'fluency' before 'accuracy'.

Sorne researchers and educators have reacted to the version of communica tive language teaching that advocates an exclusive focus on meaning. They argue that allowing learners too much 'freedom' without correction and explicit instruction will lead to early fossilization of errors. Once again we hear the call for making sure that learners 'Get it right from the beginning'.

Unfortunately, it is difficult to test whether an emphasis on form in the early stages of second language learning will, in the long run, lead to better results than those achieved when the emphasis is on meaning in the early stages. To test that hypothesis, it would be necessary to compare groups that are similar in all respects except for the type of instruction they receive. However, it is not easy for researchers to find proper comparison groups. This is because there are many parts of the world where one finds predominantly structure based approaches to language teaching, and in these settings there are no (or very few) classrooms where the teaching places an emphasis on meaning. On the other hand, with the widespread adoption of communicative language teaching in other parts of the world, it is difficult to find classrooms that are exclusively structure-based. Nonetheless, sorne findings from second lan guage classroom research do permit us to assess the effects of instruction that is strongly oriented to the 'Get it right from the beginning' approach. These include descriptive studies of the interlanguage development of second lan guage learners in audiolingual programmes (Study 14), and comparisons of the development of second language proficiency between groups of students receiving different combinations of form- and meaning-based instruction (Study 15).

## Study 14:Audiolingual pattern dril/

li1 the late 1970s, Patsy Lightbown ( 1983a/b) carried out a series oflon gitudinal and cross-sectional investigations into the effect of audiolingual instruction on interlanguage development. The investigations focused on French-speaking learners aged 11-16 in Quebec, Canada. Students in these programmes typically participated in the types of rote repetition and pattern practice drill we saw in Examples 1 and 2.
The learners' acquisition of certain English grammatical morphemes (for example, plural -sand the progressive -ing) was compared with the acquisition of grammatical morphemes observed in the interlanguage of uninstructed second language learners (see Chapter 2, p. 46). The results showed differ ences between the developmental sequences we saw there and the relative accuracy with which these classroom learners produced them. These findings suggested that the type of instruction students had experienced-isolated
pattern practice drills-resulted in a developmental sequence that appeared to be different from that oflearners in more natural learning environments.

For a time after their instruction had focused on it, learners reliably pro duced a particular grammatical morpheme in its obligatory contexts. For example, after weeks of drilling on present progressive, students usually sup plied both the auxiliary be and the -ing ending (for example, 'He's playing hall'). However, they also produced one or more of the morphemes in places where they did not belong ('He's want a cookie'). The same forms were pro duced with considerably less accuracy in obligatory contexts when they were no longer being practised in class and when the third person singular simple present $-s$ was being drilled instead. At this point, many students appeared to revert to what looked like a developmentally earlier stage, using no tense marking at all (for example, 'He play hall'). These findings provided evi dence that an almost exclusive focus on accuracy and practice of particular grammatical forms does not mean that learners will be able to use the forms correctly outside the classroom drill setting, nor that they will continue to use them correctly once other forms are introduced. Not surprisingly, this instruction, that depended on repetition and drill of decontextualized sen tences, did not seem to favour the development of comprehension, fluency, or communicative abilities either.

## Study 15: Grammarplus communicativepractice

In one of the earliest experimental studies of communicative languageteach ing, Sandra Savignon (1972) studied the linguistic and communicative skills of 48 college students enrolled in French language courses at an American university. The students were divided into three groups: a 'communicative' group, a 'culture' group, and a control group. All groups received about four • hours per week of audiolingual instruction where the focus was on the prac tice and manipulation of grammatical forms. In addition, each group had a special hour of different activities. The 'communicative' group had one hour per week devoted to communicative tasks in an effort to encourage practice in using French in meaningful, creative, and spontaneous ways. The 'culture' group had an hour devoted to activities, conducted in English, designed to 'foster an awareness of the French language and culture through films, music, and art'. The control group had an hour in the language laboratory doing • grammar and pronunciation drills similar to those they did in their regular class periods.
Tests to measure learners' linguistic and communicative abilities were administered befare and after instruction. The tests oflinguistic competence included a variety of grammar tests, teachers' evaluations of speaking skills, and course grades. The tests of communicative competence included meas ures of fluency and of the ability to understand and transmit information in a variety of tasks, which included: discussion with a native speaker of French,
interviewing a native speaker of French, reporting facts about oneself or one's recent activities, and describing ongoing activities in French.

At the end of the period of instruction, there were no significant differences between groups on the linguistic competence measures. However, the com municative group scored significandy higher than the other two groups on the four communicative tests developed for the study. Savignon interpreted these results as support for the argument that second language programmes that focus only on accuracy and form do not give students sufficient oppor tunity to develop communication abilities in a second language. Even more important in the context of the 'Get it right from the beginning' approach was the evidence that opportunities for freer communication did not cause learners to do less well on measures oflinguistic accuracy.

## Interpreting the research

The studies reviewed above provide evidence to support the intuitions of teachers and learners that instruction based on the 'Get it right from the beginning' proposal has important limitations. Learners receiving audiolin gual or grammar-translation instruction are often unable to communicate their messages and intentions effectively in a second language. Experience has also shown that primarily or exclusively structure-based approaches to teaching do not guarantee that learners develop high levels of accuracy and linguistic knowledge. In fact, it is often very difficult to determine what stu dents know about the target language. The classroom emphasis on accuracy often leads learners to feel inhibited and reluctant to take chances in using their knowledge for communication. The results from these studies provide evidence that learners benefit from opportunities for communicative practice in contexts where the emphasis is on understanding and expressing meaning.

It is important to emphasize that in the Savignon study, all students contin ued to receive their regular, grammar-focused instruction. They differed only in terms of the presence or absence of an additional communicative practice component. Inother words, this study offers support for the argument that meaning-based instruction is advantageous, not that form-based instruction is not. The contributions of communicative practice and grammar-focused instruction will be discussed in more detail in relation to the 'Get it right in the end' proposal.

## 2 Just listen ... and read

'Just listen ... and read' is based on the hypothesis that language acquisition takes place when learners are exposed to comprehensible input through lis tening and/or reading. As noted in Chapter 4, the individual whose name is most closely associated with this proposal is Stephen Krashen (1985, 1989). This is a controversia! proposal because it suggests that second language
learners do not need to produce language in order to learn it, except perhaps to get other people to provide input by speaking to them. According to this view, it is enough to hear (or read) and understand the target language.

Read Example 3 to get a feel for how this theory of classroom second language learning can be implemented in a classroom. This description shows that one way to obtain comprehensible input is to provide learners with listening and reading comprehension activities with no (or very few) opportunities to speak or interact with the teacher or other learners in the classroom.

## Example 3

It is time for English class at a primary school in a French-speaking com munity in New Brunswick, Canada. The classroom looks like a miniature language lab, with about thirty small desks, on each of which there is a cas sette player and a set oflarge earphones. Around the room, shelves and racks display seores of books. Each book is packaged with an audiocassette that contains a recording of its content. The materials are not strictly graded, but sorne sets of books are very simple, and other sets are grouped so that they are gradually more challenging. There are pre-school children's books with a picture and a word or two on each page; illustrated stories with a few sen tences per page; picture dictionaries; ESL textbooks for children; illustrated science books about animals, weather, vehicles, etc. Students (aged 8-10) enter the classroom, select the material they want, and take it to their indi vidual workspace. They insert the cassette, put on their earphones, and open their books. They hear and read English for the next 30 minutes. For sorne of the time the teacher walks around the classroom, checking that the machines are running smoothly, but she <loes not interact with the students concern ing what they are doing. Sorne of the students are listening with closed eyes; others read actively, mouthing the words silently as they follow each line with a finger. The classroom is almost silent except for the sound of tapes being inserted and removed or chairs scraping as students go to the shelves to select new tapes and books.

## Research findings

Research relevant to the 'Just listen ... and read' proposal includes studies of comprehension-based teaching and extensive reading (Day et al. 2011). We will also look at sorne comprehension-based instruction in which the input is manipulated in ways that are intended to increase the likelihood that stu dents will pay attention to language form as well as meaning.

## Study 16: Comprehension-based instructionfor children

Example 3 was a description of a real programme implemented in experi mental classes in a French-speaking region in Canada. From the beginning of their ESL instruction at age eight, students only listened and read during their daily 30-minute ESL period. There was no oral practice or interaction
in English at all. Teachers did not 'teach' but provided organizational and technical support. Thus, learners received native-speaker input from tapes and books but they had virtually no interaction in English with the teacher or other learners. They guessed at meaning by using the pictures or by recogniz ing cognate words that are similar in French and English. Occasionally they could refer to translation equivalents of a few words, taped inside a book's back cover.

Patsy Lightbown and her colleagues investigated the second language devel opment of hundreds of children in this comprehension-based programme and compared their learning with that of students in the regular ESL pro gramme, which was mainly an audiolingual approach. All the students in both programmes had classes that lasted 30 minutes per day. After two years, learners in the comprehension-based programme knew as much English as (and in sorne cases more than) learners in the regular programme. This was true not only for comprehension but also for speaking, even though the learners in the experimental programme had never practised spoken English in their classes (Lightbown et al. 2002; Trofimovich et al. 2009).

The students' English language abilities were reassessed three years later, when they were in Grade 8. Sorne students had continued in the comprehension only programme throughout that time. On comprehension measures and on sorne measures of oral production, they continued to perform as well as stu dents in the regular programme. On other measures, sorne groups of students in the regular programme had made greater progress, especially in writing. Those students were in classes where the regular programme included not only audiolingual instruction but also other speaking and writing compo nents, teacher feedback, and classroom interaction.

## Study 17:Readingfor words

Finding reading material for primary school students learning a second lan guage is challenging. Finding reading material for adults in early stages of second language acquisition is challenging too, but graded readers specially designed for adult ESL learners are increasingly available. These simplified literary classics, biographies, romances, and thrillers offer interesting and age-appropriate content, while the vocabulary and writing style remain simple. Marlise Horst (2005) used simplified readers in a study of vocabulary development among adult immigrants who were enrolled in an ESL pro gramme in a community centre in Montreal, Canada. The 21 participants represented several language backgrounds and proficiency levels. In addition to the activities of their regular ESL class, students chose simplified readers that were made available in a class library. Over a six-week period, students took books home and read them on their own.

Horst developed individualized vocabulary measures so that learning could be assessed in terms of the books each student actually read. She found that
there was vocabulary growth attributable to reading, even over this short period, and that the more students read, the more words they learned. She concluded that substantial vocabulary growth through reading is possible, but that students must read a great deal (more than just one or two books per semester) to realize those benefits. fu we saw in Chapter 2, when we interact in ordinary conversations, we tend to use mainly the 1,000 or 2,000 most frequent words. Thus, reading is a particularly valuable source of new vocabulary. Students who have reached an intermediate level of proficiency may have few opportunities to learn new words in everyday conversation. It is in reading a variety of texts that students are most likely to encounter new vocabulary. The benefit of simplified readers is that students encounter a reasonable number of new words. This increases the likelihood that they can figure out the meaning of new words (or perhaps be motivated to look them up). Ifthe new words occur often enough, students may remember them when they encounter them in a new context.

Other research that explores the 'Just listen ... and read' proposal includes studies in which efforts have been made to draw second language learners' attention to language forms in the input, for example, by providing high frequency exposure. to specific language features through an input flood, highlighting the features through enhanced input, and/or providing pro cessing instruction. All of these are described in more detail below but the emphasis in all cases is on getting learners to notice language forms in the input, not on getting them to practise producing the forms. The next three studies are examples of this research.

## Study 18: Inputflood

Martha Trahey and Lydia White (1993) carried out a study with young French-speaking learners (aged 10-12) in intensive ESL classes in Quebec such as those described in Chapter 5, Study 10. The goal of the research was to determine whether high-frequency exposure to a particular form in the instructional input would lead to better knowledge and use of that form by the students. The linguistic form investigated was adverb placement in English (see Chapter 2, p. 58). For approximately 10 hours over a twoweek period, learners read a series of short texts in which they were exposed to liter ally hundreds ofinstances of adverbs in English sentences-so many that the investigators referred to this study as an 'input flood'. There was no teaching of adverb placement, nor was any error correction provided. Instead, stu dents simply read the passages and completed a variety of comprehension activities based on them.

Although learners benefited from this exposure to sentences with adverbs in all the correct positions, their learning was incomplete. They improved in their acceptance of sentences with word order that is grammatical in English but not in French ('The children quickly leave school'). However,
they continued to accept sentences that are grammatical in French but not in English ('The children leave quickly school'). The students' inability to recog nize that adverbs in this position are ungrammatical in English suggests that the input flood could help them add something new to their interlanguage, but did not lead them to get rid of an error based on their first language. As noted in Chapter 2, Lydia White (1991) argued that although exposure to language input provides learners with positive evidence (information about what is grammatical in the second language), it fails to give them negative evidence (information about what is not grammatical). Positive evidence is not enough to permit learners to notice the absence in the target language of elements that are present in their interlanguage (and their first language). Thus, more explicit information about what is not grammatical in the second language may be necessary for learners' continued development. This is dis cussed in more detail in the section 'Get it right in the end'.

## Study 19:Enhanced input

Michael Sharwood Smith (1993) coined the term 'input enhancement' to refer to a variety of things that might draw learners' attention to features in the second language, thus increasing the chances that they would be learned. In a study involving enhanced input, Joanna White (1998) examined the acquisition of possessive determiners (specifically 'his' and 'her'; see Chapter 2, p. 53) by French-speaking learners aged 11-12 in intensive ESL dasses. Students received approximately 10 hours of exposure to hundreds of posses sive determiners through a package of reading materials and comprehension activities provided over a two-week period. The majar difference between this study and Trahey and White's input flood is that typographical enhance ment was added. That is, every time a possessive determiner appeared in the texts, it was in bold type, underlined, italicized, or written in capital letters. The hypothesis was that this would lead the learners to notice the possessive determiners as they read the texts.

White compared the performance oflearners who had read the typographi cally enhanced passages with that oflearners who read the same texts without enhancement. She found that both groups improved in their knowledge and use of these forms and that there was little difference between them. In interpreting these findings, White questions whether the enhancement was sufficiendy explicit to draw the learners' attention to possessive determin ers. That is, even though the forms were highlighted by the use of bold type, capital letters, etc., students did not learn how to choose the possessive deter miner to match the gender of the possessor. In subsequent research, White found that learners made more progress when they were given a simple rule and then worked together to find the correct possessive determiners (Spada, Lightbown, and White 2005).

Enhancing the input
Study 20:Processing instruction
Bill VanPatten (2004) and his colleagues have investigated the effects of pro cessing instruction, another approach to comprehension-based learning. In processing instruction, learners are put in situations where they cannot com prehend a sentence by depending solely on context, prior knowledge, or other clues. Rather they must focus on the language itself. In one of the first studies, adult learners of Spanish as a foreign language received instruction on differ ent linguistic forms, for example, object pronouns (VanPatten and Cadierno 1993). fu noted in Chapter 4, VanPatten found that English-speaking learn ers of Spanish tended to treat the object pronouns, which precede the verb in Spanish, as if they were subject pronouns. Thus, a sentence such as La sigue el señor (literally 'her (object) follows the man (subject)') was interpreted as 'She follows the man'.

Two groups were compared in the study, one receiving processing instruc tion, the other following a more traditional approach. The processing instruction group received explicit explanations about object pronouns and did sorne activities that drew their attention to the importance of noticing that object pronouns could occur before the verb. Then, through a variety of focused listening and reading exercises, learners had to pay attention to how the target forms were used in arder to understand the meaning. For example, they heard or read La sigue el señor and had to choose which picture-a man following a woman or a woman following a man-corresponded to the sen tence. A second group of learners also received explicit information about the target forms but instead of focusing on comprehension practice through processing instruction, they engaged in production practice, doing exercises to practise the forms being taught. After the instruction, learners who had received the comprehension-based processing instruction not only did better
on the comprehension tasks than learners in the production group, they also performed as well on production tasks.

Interpreting the research
Research on comprehension-based approaches to second language acquisi tion shows that learners can make considerable progress if they have sustained exposure to language they understand. The evidence also suggests, however, that comprehension-based activities may best be seen as an excellent way to begin learning and as a supplement to other kinds of learning for more advanced learners.

Comprehension of meaningful language is the foundation oflanguage acqui sition. Active listening and reading for meaning are valuable components of classroom teachers' pedagogical practices. Nevertheless, considerable research and experience challenge the hypothesis that comprehensible input is enough. VanPatten's research showed that forcing students to rely on spe cific linguistic features in arder to interpret meaning increased the chances that they would be able to use these features in their own second language production.

Another response to comprehension-based approaches is Merrill Swain's (1985) comprehensible output hypothesis. She argues that it is when stu dents have to produce language that they begin to see the limitations of their interlanguage (see Chapter 4). However, as we will see in the discussion of the 'Let's talk' proposal, iflearners are in situations where their teachers and classmates understand them without difficulty, they may need additional help in overcoming those limitations.

## 3 Let'stalk

Advocates of the 'Let's talk' proposal emphasize the importance of access to both comprehensible input and conversational interactions with teachers and other students. They argue that when learners are given the opportunity to engage in interaction, they are compelled to negotiate for meaning, that is, to express and clarify their intentions, thoughts, opinions, etc., in a way that permits them to arrive at mutual understanding. This is especially true when the learners are working together to accomplish a particular goal, for example in task-based language teaching (TBLT). According to the interaction hypothesis, negotiation leads learners to acquire the language forms-the words and the grammatical structures-that carry the meaning they are attending to. This is the theoretical view underlying the teacher-student behaviour in the transcript from Classroom B and from the student-student interaction in Communication task A in Chapter 5.

Negotiation for meaning is accomplished through a variety of modifications that naturally arise in interaction, such as requests for darification or confir mation, repetition with a questioning intonation, etc.

Look for negotiation for meaning in the examples below and compare this with the examples given for the 'Get it right from the beginning' proposal.

## Example 4

(A group of 12-year-old ESL students are discussing a questionnaire about pets with their teacher.)
s And what is 'feed'?
т Peed? To feed the dog?
s Yes, but when Idon't have a ...
T Ifyou don't have a dog, you skip the question.

## Example 5

(Students from Classroom B, as they settle in at the beginning of the day.)
т How are you doing this morning?
s i I'm mad!
s2 Why?
т Oh hoy.Yeah,why?
s 1 Because this morning, my father say no have job this morning.
T Your father has no more job this morning? Or you haveno job?
s 1 My father.

How different these examples are from the essentially meaningless interac tion often observed in dassrooms where the emphasis is on 'getting it right from the beginning'. Such genuine exchanges of information must surely enhance students' motivation to participate in language learning activities.

But do they, as advocates of this position daim, lead to successful language acquisition? Note, for example, that, although the conversation proceeded in a natural way, the student in Example 4 never did find out what 'feed' meant.

## Research findings

Most of the early research that examined the 'Let's talk' proposal was descrip tive in nature, focusing on such issues as: How does negotiation in dassrooms differ from that observed in natural settings? How do teacher-centred and i student-centred dassrooms differ in terms of conversational interaction? Do task types contribute to different kinds of interactional modifications? Several studies also examined relationships between modifications in conver sational interaction and comprehension.

In the mid-1990s researchers began to directly explore the effects of interac tion on second language production and development over time. Most of
these studies have been carried out in laboratory settings and are motivated by Michael Long's (1996) updated version of the interaction hypothesis (see Chapter 4). Compared with the original version stating that conver sational interaction promotes second language development (Long 1983), the updated version integrates learner capacities that contribute to second language learning (far example, attention) and features of interaction that are most likely to facilitate learning. Corrective feedback has been identified as one feature that is believed to play a crucial role in helping learners to make connections between farm and meaning. In fact, as we will see later in this chapter, research relevant to the updated interaction hypothesis is more in line with the 'Get it right in the end' proposal.

## Study 21: Learners talking to learners

In one of the early descriptive studies on learner interaction, Michael Long and Patricia Porter (1985) examined the language produced by adult learn ers perfarming a task in pairs. There were 18 participants: 12 non-native speakers of English whose first language was Spanish, and six native English speakers. The non-native speakers were intermediate or advanced learners of English.
Each individual learner participated in separate discussions with a speaker from each of the three levels. For example, an intermediate-level speaker had a conversation with another intermediate-level speaker, another with an advanced-level speaker, and another with a native speaker of English. Long and Porter compared the speech of native and non-native speakers in con versations, analysing the differences across proficiency levels in conversation pairs. They faund that learners talked more with other learners than they did with native speakers. Also, learners produced more talk with advanced-level learners than with intermediate-level partners, partly because the conversa tions with advanced learners lasted longer.

Long and Porter examined the number of grammatical and vocabulary errors and false starts and faund that learner speech showed no differences across contexts. That is, intermediate-level learners did not make any more errors with another intermediate-level speaker than they did with an advanced or native speaker. This was an interesting result because it called into question the argument that learners need to be exposed to a native-speaking model (i.e. teacher) at all times to ensure that they produce fewer errors. Overall, Long and Porter concluded that although learners cannot always provide each other with the accurate grammatical input, they can offer each other genuine communicative practice that includes negotiation far meaning. Supporters of the 'Let's talk' proposal argue that it is precisely this negotia tion far meaning that is essential far language acquisition.

Study 22:Learner language andproficiency leve!
George Yule and Doris Macdonald (1990) investigated whether the role that different proficiency-level learners play in a two-way communication task led to differences in their interactive behaviour. They set up a task that required two learners to communicate information about the location of dif ferent buildings on a map and the route to get there. One learner, referred to as the 'sender', had a map with a delivery route on it, and this speaker's job was to describe the delivery route to the 'receiver' so that he or she could draw the delivery route on a similar map. The task was made more challenging by the fact that there were minor differences between the two maps.

To determine whether there would be any difference in the interactions according to the relative proficiency of the 40 adult participants, differ ent types of learners were paired together. One group had high-proficiency learners in the 'sender' role and low-proficiency learners in the 'receiver' role; the other group had low-proficiency 'senders' paired with high-proficiency 'recel-vers'.

When low-proficiency learners were senders, interactions were considerably longer and more varied than when high-proficiency learners were the senders. The explanation for this was that high-proficiency senders tended to act as if the lower-level receiver had little contribution to make in the completion of the task. As a result, the lower-level receivers were almost forced to play a passive role and said very little. When lower-level learners were the senders however, much more negotiation for meaning and a greater variety of interac tions between the two speakers took place. Based on these findings, Yule and Macdonald suggest that teachers should sometimes place more advanced stu dents in less dominant roles in paired activities with lower-level learners.

## Study 23: The dynamics ofpair work

In a longitudinal study with adult ESL learners in an Australian university, Neomy Storch (2002) observed the patterns of interaction between 10 pairs . of students completing different tasks over one semester. She identified four i distinct patterns of interaction: 'collaborative' interaction consisted of two learners fully engaged with each other's ideas; 'dominant-dominant' inter action was characterized by an unwillingness on the part of either learner to engage and/or agree with the other's contributions; 'dominant-passive' consisted of one learner who was authoritarian and another who was willing to yield to the other speaker, and 'expert-novice' interaction consisted of one learner who was stronger than the other but actively encouraged and supported the other in carrying out the task. To investigate whether the four types of interaction led to differences in learning outcomes, Storch iden tified learning events that occurred during the interactions (for example, learning that the definite article is used with the names of sorne countries). Then she looked at whether that language knowledge was maintained in
a subsequent task. Storch found that learners who participated in the col laborative and expert-novice pairs maintained more of their L2 knowledge over time. Learners who participated in the dominant-dominant and domi nant-passive pairs maintained the least. Storch interprets this as support for Vygotsky's theory of cognitive development (see Chapter 4) and the claim that when pair work functions collaboratively and learners are in an expert novice relationship, they can successfully engage in the co-construction of knowledge.

## Study 24:Interaction and second language development

Alisan Mackey (1999) asked adult learners of ESL to engage in different communicative tasks, for example, story completion and picture sequencing with native speakers of English. The tasks were designed to provide con texts for learners to produce questions. Prior to participating in the tasks, the learners were assessed in terms of the stage they had reached in learning ques tions, as described in Chapter 2. They were then divided into five groups. The learners in Group 1, referred to as 'Interactors,' carried out the tasks with native speakers, who modified their language as they sought to clarify meaning for the learners. Learners in Group 2 received the same modified input as learners in Group 1 but they were not as advanced in their acquisi tion of question forms and thus were referred to as the 'Interactor Unreadies.' Learners in Group 3, the 'Observers,' were asked to listen to the learner and the native speaker as they carried out the task but they did not interact in any way. Learners in Group 4, the 'Scripteds' carried out the same tasks with the native speakers but the native speakers used language that had been simpli fied and scripted in such a detailed manner that communication breakdowns did not occur and thus no negotiation for meaning took place. There was also a control group of learners who did not participare in any of the tasks but completed all the tests.

Both Interactors and Interactor Unreadies demonstrated more sustained progress in their question formation development than learners who did not engage in interaction (i.e. Observers, Scripteds, and Control). The Observers and the Scripteds were similar to the Control group learners, who changed very little. Mackey also notes that the significant increase in development for the lnteractors was maintained on the delayed post-tests administered one month after the treatment tasks. These results are interpreted as support for the hypothesis that negotiated interaction leads to L2 development.

## Study 25:Learner-learner interaction in a 'Jhaiclassroom

In a study relevant to the updated version of the interaction hypothesis, Kim McDonough (2004) investigated the use of pair- and small-group activities in English as a foreign language classes in Thailand. Students engaged in interactional activities in which they discussed environmental problems in their country. The topic was chosen as one that would generare contexts for
the use of conditional clauses such as 'If people didn't leave water running while brushing their teeth, they would save an estimated 5-10 gallons each time' (p. 213). Learners were audio-recorded as they discussed the environ mental problems.

The recorded conversations were examined to see the extent to which stu dents used interactional features that are believed to facilitate second language learning, for example, negative feedback (i.e. clarification requests, explicit correction, and recasts) and modified output (i.e. a learner's more accurate/ complex reformulation of his or her previous utterance). Learners were tested on their ability to produce conditional clauses in a pre-test, an immediate i post-test, and a delayed post-test.

McDonough found that learners who had used more negative feedback and modified output in their interactions significantly improved in the accu racy of their conditional clauses. Those who made less use of these features did not. McDonough also explored opinions about the usefulness of pair work and small-group activities, asking whether such activities contributed to learning. She found that the students did not perceive pair- and group activities as useful for learning English. This was true both for students who seemed to have made effective use of the interaction for learning and those who had not. The fact that learners were sceptical of the benefits of group and pair-work activities suggests a need to take account of learners' beliefs about learning (see Chapter 3) and to share with them our reasons for using these activities.

## Interpreting the research

Research based on the interaction hypothesis has investigated factors that contribute to the quality and quantity of interactions between second language learners. It has provided sorne useful information for teaching. Certainly, the studies by Long and Porter, Yule and Macdonald, and Storch contribute to a better understanding of how to organize group and pair work more effectively in the classroom. The Mackey and McDonough studies are two examples of research that have measured second language development in relation to different aspects of conversational interaction. Mackey's study used one-on-one pair-work activities between trained native speakers and non-native speakers focusing on a single grammatical feature in a laboratory context. Thus it is difficult to relate the findings to the kind of interactions that take place in classrooms. The McDonough study helps to fill this gap because it is a classroom study that also demonstrates the benefits of interac tion on second language learning over time.

Recently, a number of laboratory studies have also examined the effects o different interactional features on specific aspects of second language learn-i ing over time. Severa! studies have shown that implicit corrective feedback!
(far example, recasts) in pair-work situations is beneficia!. A recent review of this research confirms that the positive effects far recasts are strongest in the laboratory setting (Mackey and Goo 2007). This may be because recasts are more salient in pair work, particularly if only one farm is recast consistently (Nicholas, Lightbown, and Spada 2001).

In McDonough's classroom study, recasts (and other farms of corrective feedback) were more likely to have been noticed because the Thai learners were accustomed to traditional grammar instruction and a facus on accuracy. This is not always the case, however. As we learned in Chapter 5, when the instructional facus is on expressing meaning through subject-matter instruc tion, the teachers' recasts may not be perceived by the learners as an attempt to correct their language farm but rather as just another way of saying the same thing. Later in this chapter we will look at classroom studies related to the 'Get it right in the end' position that have investigated the effects of more explicit corrective feedback on second language learning.

## 4 Get twofarone

In content-based language teaching, learners acquire a second or fareign language as they study subject matter taught in that language. It is imple mented in a great variety of instructional settings, far example, immersion programmes and the content and language-integrated learning (CLIL) pro grammes in Europe described in Study 8 in Chapter 5. Other educational programmes such as the European Schools extend this further by offering instruction in two or more languages in addition to students' home language. The expectation of this approach is that students can get 'two far one', learn ing the subject matter content and the language at the same time.

In immersion and CLIL programmes, students choose (or their parents choose far them) to receive content-based instruction in a second language. In many educational situations, however, no other option is available. For example, in sorne countries, the only language of schooling is the language of a previous colonial power. In others, educational materials are not available in all local languages, so one language is chosen as the language of education. In countries of immigration, students often have access to schooling only through the majority language. Other students may have access to bilingual education programmes that allow sorne use of a language they already know, but the transition to the majority language is usually made within a year or two.

## Research findings

In many contexts for content-based instruction, it is simply assumed that students will develop both their academic skills and second language ability.

In recent years, researchers have sought to examine this assumption more critically.

## Study 26:French immersionprog;rammes in Canada

Research in Canadian French immersion programmes is often cited in support of the 'Get two for one' proposal. Most immersion programmes are offered in primary and secondary schools, but sorne universities also offer content-based instruction that expands opportunities for students to use their second language in cognitively challenging and informative courses. What have the studies shown?

In terms of popularity and longevity, French immersion has been a great success. Thousands of English-speaking Canadian families have chosen this option since its first implementation in the 1960s (Lambert and Tucker 1972), both in areas where French is spoken in the wider community and in those where French is rarely heard outside the classroom. Numerous studies have shown that French immersion students develop fluency, high levels of listening comprehension, and confidence in using their second language. They also maintain a level of success in their academic subjects that is com parable to that of their peers whose education has been in English (Genesee 1987). Over the years, however, educators and researchers began to express concern about students' failure to achieve high levels of performance in sorne aspects of French grammar, even after several years of full-day exposure to the second language in these programmes.

Sorne researchers argue that the difficulty French immersion learners experi ence in their L2 production shows that comprehensible input is not enough (Harley and Swain 1984). They claim that the learners engage in too little language production because the classes are largely teacher-centred. Students are observed to speak relatively little and rarely required to give extended answers. This permits them to operate successfully with their incomplete knowledge of the language because they are rarely pushed to be more precise or more accurate. When students do speak, communication is usually sat isfactory in spite of numerous errors in their speech because the learners' interlanguages are influenced by the same first language, the same learning environment, and the same limited contact with the target language outside the classroom. Teachers also tend to understand students' interlanguage, so there is rarely a need to negotiate for meaning. Such successful communica tion makes it difficult for an individual learner to work out how his or her use of the language differs from the target language.

Another explanation for students' lack of progress on certain language fea tures is their rarity in French immersion instruction. For example, Merrill Swain (1988) observed that even history lessons, where past tense verbs might be expected to occur, were often delivered in the 'historical present' (for example, 'The ships go down to the Caribbean; they pick up sugar and
they take it back to England ...'). Roy Lyster (1994) found that the use of the second person pronoun vous to politely address an individual was used so rarely in classes that even after years of immersion instruction, students did not use it appropriately. Elaine Tarone and Merrill Swain (1995) noted that learners with only classroom exposure to the language did not have access to the speech styles that would be typical of interaction among native speakers of the same age. Increasingly, it was suggested that subject matter instruction needed to be complemented by instruction that focused on language form, including pragmatic features of the language. In sorne experimental studies, learners did benefit from form-focused instruction on particular language features (see the 'Get it right in the end' proposal).

## Study 27:Late immersion under stress in Hong Kong

In the 1960s the educational system in Hong Kong moved from one in which students studied either exclusively in English or in Cantonese to one in which the majority of students studied in Cantonese in primary school (Grades 1-6) and in English at secondary school (Grades 7-13). These late English immersion programmes were popular with Chinese parents who wanted their children to succeed professionally and academically in the international community. They were also seen as being consistent with the Hong Kong government's goal of maintaining a high level of Chinese English bilingualism.

In reviewing sorne of the research on teaching and learning behaviours in late English immersion classes in Hong Kong secondary schools, Keith Johnson (1997) raised concerns about the ability of the educational system to meet the demands for such programmes. He noted that students lacked the English proficiency needed to follow the secondary level curriculum suc cessfully. He also observed teachers' difficulties in effectively delivering the content because of limitations in their own English proficiency. He argued that several pedagogic behaviours contributed to the inability of learners to make adequate linguistic progress in these English immersion programmes. One of them was teacher talk that consisted of English, Chinese, and 'Mix' (a combination of English and Chinese).

Observational classroom studies revealed that Chinese and Mix predomi nated in the speech of teachers and that students interacted with the teacher and with each other in English only in minimal ways. Many students carne to the first year of secondary school without any literacy skills in English. To compensate for this, teachers employed a variety of strategies to help students comprehend texts. They reduced the vocabulary load, simplified the grammar, encouraged the use of bilingual dictionaries, and provided students with supplementary notes and charts in Chinese to assist their com prehension. Johnson observed that, while 'the texts are not translated, they are essentially pre-taught so that by the time students come to read the texts
for themselves the more able students at least are sufficiently familiar with the content to be able to deal with them' ( p.177). Although these strategies helped students understand the content, they may not have helped them learn to use the syntactic and discourse structures in the second language to establish form-meaning relationships. Therefore it is not surprising that the standards of reading in English at age 15 were reported to be significantly lower than those for Chinese. At the same time, however, the educational outcomes for Hong Kong students in content subjects continued to be high, comparable to, and in sorne areas superior to, achievements in other devel oped countries. In addition, the levels of Chinese LI reading proficiency remained high.

In spite of professional development efforts to help teachers achieve the dual goals of language and content insrruction, Philip Hoare and Stella Kong (2008) find that many teachers in the Hong Kong immersion programmes continue to have difficulty implementing immersion pedagogy. They attrib ute this in part to the pressure teachers feel in a society where performance on examinations is paramount. To ensure that their students do well on the content exams, teachers often feel that they must teach in Chinese or in a simplified English that does not give students access to the language that is appropriate for high-level academic work.

## Study 28: Dual immersion

In recent years, legislation has limited the availability of bilingual education for most minority language students in the United States. In most states, English language learners' education must take place entirely in English, or with only minimal support for learning through their first language. As we saw in Chapter 1, the result of this approach is often subtractive bilingualism.
Children gradually lose their first language or fail to develop it for academic purposes. In addition, they often fall behind in their academic work because they do not yet have the English language skills needed for dealing with the grade-level subject matter.
Sorne jurisdictions allow 'dual immersion' as an exception to the strict enforcement ofinstruction through English only. In dual immersion, minor ity language students learn English in classrooms where English-speaking children also learn the minority language students' home language. Patsy Lightbown (2007) observed classroom interaction and learning outcomes in a school where an equal number of native English- and native Spanish speaking students shared the classrooms. Starting in kindergarten, half their instruction was delivered in English by an English native speaker and half in Spanish by a native speaker of that language. Teachers coordinated closely to ensure that the subject matter instruction in the two languages was com plementary rather than redundant. Students' performance on a variety of measures administered rhrough Grade 3 showed that the programme was
beneficial for their developmem of English language skills, and Spanish speaking students made especially rapid progress in reading. Of particular importancewas the fact that students also continued to develop their Spanish language skills in ways that were not available to students whose instruction was either in English only or in transitional bilingual classes where there was very little support for their home language.

In other dual immersion programmes, the number of students and the amount of time are distributed differently, often with more time devoted to the teaching and learning of English, but sometimes with an early emphasis on the minority language that resembles the Canadian French immersion programmes, that is, where the English-speaking students receive nearly all their early instruction in their second language. This approach is preferred in settings where it is not possible to have a substantial number of students from the minority language. Indeed, a number of different models of dual immersion have been developed, but they all are based on the principie that the continued development of a child's home language is a strong foundation on which to build second language abilities (Howard et al. 2007).

In recent years, several research reviews have examined the evidence for different approaches to educating English language learners in the United States (August and Shanahan 2008; Genesee et al. 2006). The research con firms better outcomes, in both English language learning and subject matter knowledge, for minority language students in programmes that support the students' home languages than for those in English only or 'early exit' bilin gual programmes where they receive only token opportunities to continue learning through their home language. Kathryn Lindholm-Leary (2001) also found benefits for the majority language students in dual immersion programmes, where they share the challenges and achievements of second language learning with minority language students. She suggests that this approach 'has the potential to eradicate the negative status of bilingualism in the US' (p.1).

## Study 29: Inuit children in content-basedprogrammes

In an aboriginal community in Quebec, Canada, Nina Spada and Patsy Lightbown (2002) observed the teaching and learning of school subjects and language with lnuit children. The children had been educated in their first language, Inuktitut, from kindergarten to Grade 2 (aged 5-7). Then, except for occasional lessons in lnuit culture, their education was in one of Canada's official languages, French or English. Nearly all students had sorne difficulty coping with subject matter instruction in their second language.

In a case study of one French secondary-level class, they observed instruc tional activities, analysed instructional materials, and assessed studems' ability to understand and to produce written French. In the observation data from a social studies lesson, it was evident that the teacher had to work
very hard to help students understand a text on beluga whales. He did this in many ways-by paraphrasing, repeating, simplifying, checking for com prehension, gestures, etc. Despite his efforts it was clear that most students understood very little of the text. In their Prench language classes, these same students also lacked the terminology they needed to talk about grammatical gender in relation to adjective agreement.

When the students' performance on a wide range of measures was examined to assess their knowledge of Prench (for example, vocabulary recognition, reading comprehension, writing), it was evident that the students did not have the Prench language skills they needed to cope with the demands of typical secondary-level instruction. Purthermore, even though many of the students were able to speak Prench informally outside class, their oral abili ties were limited when they had to discuss more complex academic subject matter. As we saw in Chapter 1, teachers are sometimes misled by students' ability to use the language in informal settings, concluding that their aca demic difficulties could not be due to language problems.

The students' lack of age-appropriate academic Prench is a serious problem. Solving it will involve complex educational, social, and cultural questions. One pedagogical element that might contribute to a solution is a better balance between language and subject matter instruction, focusing on the language that the students need to succeed in school. Another possibility is that further development of the learners' Ll literacy would better prepare them for second language and subject matter learning. There is another good reason to support students' development of lnuktitut. There are increasing concerns that Inuktitut will be lost as future generations shift to English or Prench as their preferred language. An educational system that encourages the development of both first and second languages may ensure the survival of this heritage language (Taylor, Caron, and McAlpine 2000).

## Interpreting the research

Content-based language teaching has many advantages. In general, it increases the amount of time for learners to be exposed to the new language. It creares a genuine need to communicate, motivating students to acquire language in order to understand the content. Por older students, there is the advantage of content that is cognitively challenging and interesting in a way that is often missing in foreign language instruction, especially where lessons are designed around particular grammatical forms.

Nevertheless, there are also sorne problems with content-based instruction. Our research with Inuit children adds further evidence to Jim Cummins' (1984) claim that students need 5-7 years before their ability to use the language for cognitively challenging academic material has reached an age appropriate level. Por students from disadvantaged minority groups, this
delay in coming to grips with schooling can have lasting effects, as we saw in the discussion of subtractive bilingualism in Chapter 1. Majority language students in immersion programmes- in Canada and in Hong Kong-seem to do well in learning subject matter, and it is also noteworthy that they receive a substantial amount of subject matter instruction through their first language over the full course of their academic careers. Similarly, dual immersion programmes allow students from each language group to con tinue development of the home language and to continue learning subject matter content in that language. However, although students in content based language instruction are able to communicate with sorne fluency in the second language, they often fall short of the high levels oflinguistic accuracy that their years of schooling in the language might predict.

In recent years, proponents of content-based instruction have stressed the need to recall that content-based language teaching is still language teaching. For example, Jana Echevarria, Mary Ellen Vogt, and Deborah Short (2004) have done research and developed teacher education programmes that show the effectiveness of lessons that have both content objectives and language objectives.

## 5 Teach what is teachable

Manfred Pienemann (1988) and his colleagues have tried to explain why it often seems that sorne things can be taught successfully whereas other things, even after extensive or intensive teaching, seem to remain unacquired. Their research provides evidence that sorne linguistic structures, for example, basic word arder in sentences (both simple and complex) develop along a predict able developmental path. These are labelled developmental features. The developmental stages of English questions that we saw in Chapter 2 are based on this research. According to Pienemann (1988) any attempt to teach a Stage 4 word-order pattern to learners at Stage 1 will not work because learn ers have to pass through Stage 2 and get to Stage 3 befare they are ready to acquire what is at Stage 4. As we saw in 'Get it right from the beginning', students may produce certain structures after they have been taught them in class, but cease to use them later because they are not fully integrated into their interlanguage systems. The underlying cause of the stages has not been fully explained, but processability theory (see Chapter 4) suggests that they may be based at least in part on learners' developing ability to notice and remember elements in the stream of speech they hear.

Researchers supporting this view also claim that certain other aspects of language-for example, individual vocabulary items-can be taught at any time. Learners' acquisition of these variational features appears to depend on factors such as motivation, the learners' sense of identity, language aptitude,
and the quality of instruction, induding how learners' identities and cultures are acknowledged in the dassroom.

In Example 6 below, we see a teacher trying to help students with the word order of questions. The students seem to know what the teacher means, but the level oflanguage the teacher is offering them is beyond their current stage of development. Students are asking Stage 3 questions, which the teacher recasts as Stage 5 questions. The students react by simply answering the ques tion or accepting the teacher's formulation.

## Example 6

Students in an intensive ESL dass (11-12-year-old French speakers) inter viewing a student who had been in the same dass in a previous year (see Classroom B in Chapter 5).
s 1 Mylene, where you put your 'Kid of the Week' poster?
T Where did you put your poster when you got it?
s2 In my room.
(Two minutes later)
s3 Beatrice, where you put your 'Kid of the Week' poster?
T Where did you put your poster?
S4 My poster was on my wall and it fell clown.
In Example 7, the student is using the 'fronting' strategy that is typical of Stage 3 questions. The teacher's corrective feedback leads the student to imitate a Stage 4 question.

## Example 7

(The same group of students engaged in 'Famous person' interviews.)
s 1 Is your mother play piano?
T 'Is your mother play piano?' OK. Well, can you say 'Is your mother play piano?' or 'Is your mother a piano player?'
s 1 'Is your mother a piano player?'
s2 No.
In Example 8, the teacher draws the student's attention to the error and also provides the correct Stage 4 question. This time, however, the feedback is not followed by an imitation or a reformulation of the question, but simply by an answer.

## Example 8

(Interviewing each other about house preferences)
s 1 Is your favourite house is a split-level?
s2 Yes.
T You're saying 'is' two times dear. 'Is your favourite house a split-level?'
s 1 Asplit-level.
т OK.
In Example 9 the student asks a Stage 3 question, and the teacher provides a Stage 4 correction that the student imitates. The interaction suggests that the student is almost ready to begin producing Stage 4 questions. Note, however, that the student does not imitate the possessive 's, something that French speakers find very diflicult.

## Example 9

('Hide and seek'garue)
s Do the hoy is beside the teacher desk?
T Is the hoy beside the teacher's desk?
$\mathrm{s} \quad$ Is the hoy beside the teacher desk?
Research findings
The 'Teach what is teachable' view suggests that while variational features of the language can be taught successfully at various points in the learners' development, developmental features are best taught according to the learners' internal schedule. Furthermore, although learners may be able to produce more advanced forros on tests or in very restricted pedagogical exercises, instruction cannot change the 'natural' developmental course. The recommendation is to assess the learners' developmental level and teach what would naturally come next. Let us examine sorne studies that have tested this hypothesis.

## Study 30:Ready tolearn

Manfred Pienemann (1988) investigated whether instruction permitted learners to 'skip' a stage in the natural sequence of development. Two groups of Australian university students of German who were at Stage 2 in their acquisition of German word arder were taught the rules associated with Stage 3 and Stage 4 respectively. The instruction took place over two weeks and during this time learners were provided with explicit grammatical rules and exercises for Stage 3 and 4 constructions. The learners who received instruction on Stage 3 rules moved easily into this stage from Stage 2. However, those learners who received instruction on Stage 4 rules either con tinued to use Stage 2 rules or moved only into Stage 3. That is, they were not able to 'skip' a stage in the developmental sequence. Pienemann interprets his results as support for the hypothesis that for sorne linguistic structures, learners cannot be taught what they are not developmentally ready to learn.

## Study 31:Readies, unreadies, and recasts

Alison Mackey and Jenefer Philp (1998) investigated whether adult ESL learners who were at different stages in their acquisition of questions could advance in their production of these forms if they received implicit nega tive feedback (i.e. recasts) in conversational interaction. As described in Chapter 5 , recasts are paraphrases of a learner's incorrect utterance that involve replacing one or more of the incorrect components with a correct form while maintaining a focus on meaning. The researchers were interested in discovering whether adult learners who received modified interaction with recasts were able to advance in their production of question forms more than learners who received modified interaction without recasts. Furthermore, they wanted to explore whether learners who were at more advanced stages of question development ('readies') would benefit more from interaction with recasts than learners at less advanced stages of question development ('unreadies'). The results revealed that the 'readies' in the interaction plus recasts group improved more than the 'readies' in the interaction without recasts group. However, the 'unreadies' who were exposed to recasts did not show more rapid improvement than those who were not exposed to recasts.

Study 32: Developmental stage andfirst langu, age influence
Nina Spada and Patsy Lightbown (1999) have also investigated the acqui sition of questions in relation to learners' developmental 'readiness'. French-speaking students (aged 11-12) in intensive ESL classes received high-frequency exposure to question forms that were one or two stages beyond their developmental level. Learners who were judged on oral pre tests to be at Stage 2 or 3 were given high frequency exposure to Stage 4 and 5 questions in the instructional input.

The materials that contained the more advanced question forms were designed to engage the learners mainly in comprehension practice. There was no student production and thus no corrective feedback, nor was there any explicit instruction on question formation. The researchers wanted to know whether Stage 3 learners (i.e. those considered to be developmentally 'ready') would benefit more from the high-frequency exposure to Stage 4 and 5 ques tions than the Stage 2 learners, who were not yet developmentally 'ready'.

Learners' performance on an oral post-test measure indicated no advantage for the Stage 3 learners. In fact, there was little progress for either group. However, on a task that required learners to judge the grammaticality of written ques tions there was evidence that all students had sorne knowledge of Stage 4 and 5 questions. A more detailed examination of the learners' performance on this task showed that students tended to accept Stage 4 and 5 questions when the subject of the sentence was a pronoun (for example, 'Are you a good student?' or 'When are you going to eat breakfast?'). When the subject of the sentence was a noun, however, there was a tendency for students to reject higher stage ques tions (for example, 'Are the students watching TV?' or 'What is your brother
doing?'). This pattern in the students' performance appears to be related to a question rule in their first language that we saw in Chapter 2. That is, in French, questions with nouns in subject position are not inverted (far example, *Peut Jean venirchez moi? = 'Can John come to my house?'). In French questions with pronoun subjects, however, inversion is permitted (far example, Peut-il venir chez moi? = 'Can he come to my house?').

These results indicare that instruction timed to match learners' develop mental 'readiness' may move them into more advanced stages, but their performance may still be affected by other factors. In this study first language influence seems to be responsible far the learners' inability to generalize their knowledge of inversion to all questions.

## Interpreting the research

The results of these studies suggest that targeting instructional or interac tional input to learners when they are developmentally ready to progress further in the second language can be beneficial. However, other factors such as type of input and first language influence can interact with learners' developmental readiness in complex ways. Ifwe compare the types ofinstruc tional/interactional input across the three studies, Pienemann provided the most explicit instruction to learners who were both 'ready' and 'unready'. The results showed that learners who were 'ready' moved into the next stage of development, whereas learners who were not 'ready' did not. The results of the Mackey and Philp study also offer sorne support far the teachability hypothesis but reveal that developmental readiness is not the only predictor of success. The fact that the 'readies' benefited more from recasts than the 'unreadies' suggests that the type of instructional/interactional input is also important. The Spada and Lightbown study shows how the learners' first lan guage may interact with developmental readiness in contributing to learning outcomes. Furthermore, in that study there was no explicit instruction on questions. Learners were simply exposed to a high frequency of correctly formed higher-stage questions in the input. Thus, they received increased 'exposure' but no 'instruction', and, in the end, they did not show as much developmental change as learners who received focused instruction.

Sorne research appears to offer counter-evidence to the claim that it is ben eficial to teach what is developmentally next. This includes several studies that have used the accessibility hierarchy (see Chapter 2) to describe second language learners' progress in their acquisition of relative clauses. Results of these studies suggest that when low-level learners (far example, those who use relative clauses only in subject position) are taught relative clauses that are several stages beyond their current level, they not only learn what is taught, they also acquire the relative clause position(s) between the one taught and the one(s) they already knew. In sorne instances they even learn how to use relative clauses beyond the level they were taught (Ammar and Lightbown 2005; Eckman, Bell, and Nelson 1988; Hamilton 1994).

At first glance, this research seems to contradict Pienemann's claim that learners should be taught what is 'next'. However, it is also possible that the developmental paths of different linguistic features are based on differ ent sorts of processing abilities. Far example, Catherine Doughty ( 1991) suggested that once learners have learned to use relative clauses in one posi tion (usually the subject position), there is no constraint on their ability to learn the others. What all the studies of relative clause teaching and learning have in common is that learners acquire the relative clauses in an arder very similar to the accessibility hierarchy. That is, whether or not they learn what is taught, they make progress by learning subject, then direct object, then indirect object, and so on.

The 'Teach what is teachable' position is of great potential interest to syl labus planners as well as teachers. However, it must be emphasized that a description of a learner's developmental path is not in itself a templare for a syllabus. There are numerous practica! reasons for this, not least the fact that only a small number of language features have been described in terms of a developmental sequence. While Pienemann's work on processability theory (see Chapter 4) provides insights into the principles that may make sorne features more difficult than others, those principles are not easily translated into instructional sequences.

As Patsy Lightbown (1998) has suggested, the 'Teach what is teachable' research is important primarily for helping teachers understand why stu dents don't always learn what they are taught-at least not immediately. The research also shows that instruction on language that is 'too advanced' may still be helpful by providing learners with samples oflanguage that they will be able to incorporare into their interlanguage when the time is right. However, many other factors need to be taken into consideration in choosing language features to focus on. We will return to this point after we discuss the final proposal for language teaching, 'Get it right in the end.'

## 6 Get itright in the end

Proponents of the 'Get it right in the end' proposal recognize an important role for form-focused instruction, but they do not assume that everything has to be taught. Like advocates of the 'Let's talk', Two for one', and the 'Just listen ... and read' positions, they have concluded that many language fea tures-from pronunciation to vocabulary and grammar-will be acquired naturally iflearners have adequate exposure to the language and a motivation to learn. Thus, while they view comprehension-based, content-based, task based, or other types of essentially meaning-focused instruction as crucial for language learning, they hypothesize that learners will do better if they also have access to sorne form-focused instruction. They argue that learners will benefit in terms of both efficiency of their learning and the level of pro ficiency they will eventually reach.

Advocates of this proposal also agree with advocates of the 'Teach what is teachable' view that sorne things cannot be taught if the teaching fails to take the student's readiness (stage of development) into account. This pro posal differs from the 'Teach what is teachable' proposal, however, in that it emphasizes the idea that sorne aspects of language must be taught and may need to be taught quite explicidy. There are a number of situations in which guidance-form-focused instruction or corrective feedback-is expected to be especially important. Far example, when learners in a class share the same first language, they will make errors that are partly the result of transfer from that shared language. Because the errors are not likely to lead to any kind of communication breakdown, it will be virtually impossible for learners to discover the errors on their own.

Examples 10, 11, and 12are taken from a classroom where a group of 12-year old French speakers are learning English. In Example 10, they are engaged in an activity where the words in sentences are reordered to form new sen tences. The following sentence has been placed on the board: 'Sometimes my mother makes good cakes'.

## Example 10

T Another place to put our adverb?
$\mathrm{S}_{1}$ After makes?
T After makes.
s2 Befare good?
T My mother makes sometimes good cakes.
s3 No.
T No, we can't do that. It sounds yucky.
s3 Yucky!
T Disgusting. Horrible. Right?
S4 Horrible!
This is hardly a typical grammar lesson! And yet the students' attention is being drawn to an error that virtually all of them make in English.

Proponents of 'Get it right in the end' argue that what learners focus on can eventually lead to changes in their interlanguage systems, not just to an appearance of change. However, the supporters of this proposal do not claim that focusing on particular language points will prevent learners from making errors or that they will begin using a form as soon as it is taught. Rather, they suggest that the focused instruction will allow learners to notice the target features in subsequent input and interaction.

Form-focused instruction as it is understood in this position does not always involve metalinguistic explanations, nor are learners expected to be able to explain why something is right or wrong. They claim simply that the learners need to notice how their language use differs from that of a more proficient speaker. As we will see in the examples below, teachers who work in this
approach look for the right moment to create increased awareness on the part of the learner-ideally, at a time when the learner is motivated to say something and wants to say it as clearly and correctly aspossible.

## Example ll

(The students are practising following instructions; one student instructs, the others colour.)
s 1 Make her shoes brown.
t Now, her shoes. Are those Mom's shoes or Dad's shoes?
s2 Mom's.
т Mom's. How do you know it's Mom's?
s 1 Because it's her shoes.
As we saw in Chapter 4, French-speaking learners of English have difficulty with 'his' and 'her' because French possessives use the grammatical gender of the object possessed rather than the natural gender of the possessor in select ing the appropriate possessive form. The teacher is aware of this and-briefly, without interrupting the activity-helps the learners notice the correct form.

## Example 12

(The students are playing 'hide and seek' with a doll in a doll's house, asking questions until they find out where 'George' is hiding. Although a model for correct questions has been written on the board, the game becomes quite lively and students spontaneously ask questions that reflect their interlan guage stage.)
s 1 Is George is in the livingroom?
T You said 'is' two times, dear. Listen to you-you said 'Is George is in?' Look on the board. 'Is George in the' and then you say the name of the room.
s 1 Is George in the living room?
T Yeah.
s1 I win!
Note that the teacher's brief intervention does not distract the student from his pleasure in the game, demonstrating that focus on form does not have to interfere with genuine interaction.

Proponents of 'Get it right in the end' argue that it is sometimes necessary to draw learners' attention to their errors and to focus on certain linguistic (vocabulary or grammar) points. However, it is different from the 'Get it right from the beginning' proposal in acknowledging that it is appropriate for learners to engage in meaningful language use from the very beginning of their exposure to the second language. They assume that much of language acquisition will develop naturally out of such language use, without formal instruction that focuses on the language itself

Research findings
A great deal of research has examined issues related to this proposal. This includes both descriptive and experimental studies.

## Study 33:Form-focus experiments in intensive ESL

Since the 1980s, researchers have investigated the effects of form-focused instruction and corrective feedback on the developing English of French speaking students participating in intensive ESL classes in Quebec. For five months in either Grade 5 or Grade 6, students (aged 10-12) spent most of every school day learning English through a variety of communicative inter active activities.

In descriptive studies involving almost 1,000 students in 33 classes, Patsy Lightbown and Nina Spada (1990, 1994) observed that teachers rarely focused on language form. The emphasis of the teaching was on activities that focused on meaning rather than form, opportunities for spontaneous interaction, and the provision of rich and varied comprehensible input. In these classes, learners developed good listening comprehension and commu nicative confidence in English. However, they continued to have problems with linguistic accuracy and complexity.

In experimental studies with a smaller number of classes, the effects of form focused instruction and corrective feedback were examined with respect to adverb placement and question formation. In the first study, Lydia White selected adverb placement for investigation because of the differences between English and French that have already been discussed (see Chapter 2 and Study 17 in 'Just listen ... and read'). The hypothesis was that learners would persist in using adverb placement rules consistent with French (their first language) if they were not explicitly told how rules for adverb place ment differ in English and French. Questions were selected for the second study because they have been extensively investigated in the literature and considerable comparison data were available, particularly with regard to developmental stages (see Chapter 2).

Both experimental and comparison groups were tested befare and after the period of special instruction. Throughout the period of the experiments, all students continued to participare in the regular communicative activities that were typical of their instruction. The researchers gave each teacher a set of pedagogical materials to be used for the special form-focused instruction. The experimental groups received approximately eight hours of instruction on adverbs or questions over a two-week period. This included sorne explicit teaching of the rules associated with each structure as well as corrective feed back during the practice activities.

Learners who received explicit instruction on adverb placement dramatically outperformed the learners who did not. This was found on all the post-tests
(immediately following instruction and six weeks later). In the follow-up tests a year later, however, the gains made by the learners who had received the adverb instruction had disappeared and their performance on this struc ture was like that of uninstructed learners (White 1991).

In the question study the instructed group also made significantly greater gains than the uninstructed group on the written tasks immediately follow ing instruction. Furthermore, they maintained their level of knowledge on later testing (six weeks and six months after instruction). The instruction also contributed to improvement in oral performance that was sustained over time (White, Spada, Lightbown, and Ranta 1991).

The difference in long-term effects of the two studies may be due to a differ ence in the availability of the target forms in the classroom input to which learners were exposed. Analysis of classroom language showed that adverbs were extremely rare in classroom speech, giving learners little opportunity to maintain their newly-acquired knowledge through continued exposure and use. In contrast, there were hundreds of opportunities to hear and use questions every day in the classroom. Once learners had been given sorne focused instruction, it seems they were able to continue to advance in their knowledge and use of questions (Spada and Lightbown 1993).

In several of the studies carried out in intensive ESL programmes, there is evidence of the strong influence of the learner's first language on their second language development. In Study 32, we described the tendency of intensive ESL learners to reject inversion in questions when the subject is a noun but to accept inversion when the subject is a pronoun, consistent with their first lan guage. The influence of the learners' first language in their acquisition of the possessive determiners 'his' and 'her' was observed with this group oflearners (see Chapter 2 and Study 18). This led to the question of whether form focused instruction that includes explicit contrastive information about how the first and second language differ would help in their development of ques tion formation and possessive determiners. In a study to explore this, learners who received instruction on possessive determiners improved more in their knowledge and use of this feature than did learners who received instruction on question forms. This finding appeared to be related to differences between the form-meaning connections of these two features. That is, a misused pos sessive determiner ('He's going home with her mother') is more likely to lead to a communication breakdown than an ill-formed question (for example, 'Where he's going?'). Results like these point to the importance of consider ing how instruction may affect language features in different ways (Spada, Lightbown, and White 2005; White 2008).

As we saw in the discussion of the 'Get two for one' proposal, there is growing evidence that learners in content-based programmes such as French immersion need more opportunities to focus on form and receive corrective
feedback. A number of studies have explored the question of how this can best be accomplished.

## Study 34:Focusing ongender in French immersion

Birgit Harley (1998) examined the effects of instruction with young children in French immersion programmes. Six dasses of Grade 2 children (7-8 years old) were given focused instruction on a language feature that is known to be a persistent problem for French immersion students-grammatical gender.
For 20 minutes a day over a five-week period these children carried out many activities based on children's games (for example, 'I spy') that were modified to draw their attention to gender distinctions and which required them to choose between feminine and masculine arrides (une or un, laor le). Students were also taught how certain noun endings provide dues about gender (for example, -ette in la bicyclette for feminine, and -eau in le bateau for masculine).

The students were pre-tested on their knowledge of grammatical gender via listening and speaking tests befare the instruction began and the same tests were administered immediately after instruction and then again five months later. Learners who received instruction were much better at recognizing and producing accurate gender distinctions for familiar nouns than those who did not receive instruction. However, the instruction did not enable learners to generalize their learning to new nouns. Harley's interpretation of this is that too much new vocabulary was introduced in the later teaching activities and this meant that teachers spent more time teaching the meaning of words than the noun endings and their relationship to gender. Therefore, 'the input on noun endings was simply not available in sufficient quantity and intensity for the majority of students to establish the predictive relevance of the noun endings in question' (p. 169).

## Study 35:Focusing on sociolinguisticforms in French immersion

Roy Lyster (1994) examined the effects of form-focused instruction on the knowledge and use of sociolinguistic style variations in three dasses of Grade 8 French immersion students (about 13years old). One of the main features examined in his study was the distinction between the use of second person pronouns $t u$ and vous. In addressing an individual, $t u$ is used to indicare infor mality and familiarity while vous is used as a marker of respectful politeness, or social distance between speakers. Prior to instruction, immediately after, and again one month later, the learners were tested on their ability to produce and recognize these forms (in addition to others) in appropriate contexts.

The instruction took place for about 12 hours over a five-week period. During this time, students in the experimental dasses were given explicit instruction and engaged in guided practice activities that induded role-plays in a variety of formal and informal contexts and corrective feedback from teachers and peers. Students in the two comparison dasses continued with their regular instruction without any focused teaching or guided practice
in using sociolinguistically appropriate forms. On the immediate post-test, learners in the experimental classes performed significantly better than learn ers in the comparison classes on both written and oral production tasks and the multiple-choice test, and these benefits were maintained when learners were tested a month later.

Study 36:Focusing on verbforms in content-based science classrooms Catherine Doughty and Elizabeth Varela (1998) carried out a study with a group of ESL learners in their science classes. One class of middle-school stu dents (11-14years old) from a variety of first language backgrounds received corrective feedback on past tense and conditional verb forms in English. For several weeks, while students were engaged in oral and written work related to a series of science reports, the teacher provided corrective feed back on their errors in past tense and conditional forms-both explicitly and implicitly. Students' ability to use these forms was assessed befare and after the experimental period and again two months later. Their performance was compared to that of a group of students who were in another science class doing the same science reports but who did not receive corrective feedback on the verb forms.

Students who received the corrective feedback made more progress in using past and conditional forms than the comparison group both immediately after the period of focused feedback and two months later. Their progress was assessed in terms of both increased accuracy and the presence of inter language forms that showed students were doing more than repeating forms they had heard.

## Study 37:Recasts andprompts in French immersion classrooms

 In Chapter 5, we saw sorne of Roy Lyster's descriptive research on the dif ferent types of corrective feedback provided by teachers in Canadian French immersion programmes and learners' immediate responses (uptake) to that feedback. More recently, Lyster (2004) explored the effects of form-focused instruction and feedback type on second language learning in an experimen tal study with Grade 5 students in French immersion classes. There were three experimental groups and a comparison group. The experimental groups received approximately nine hours of explicit instruction over a five-week period, during which their attention was drawn to grammatical gender and the fact that word endings can give a clue to grammatical gender in French (see Study 34). Students in two of the experimental groups also received cor rective feedback in the form of either recasts or prompts when they produced errors in grammatical gender. These feedback types differ in that recasts provide learners with the correct model, whereas prompts signal the need for a correction and require the student to produce the target form through clarification requests, elicitation, and metalinguistic clues (see Chapter 5 for definitions and examples of these different types of feedback). The thirdexperimental group received the instruction but no corrective feedback, and the comparison group received neither instruction nor corrective feedback. All groups continued their regular French immersion programme of con tent-based instruction throughout the study and they were all tested befare the instructional treatment, immediately after, and again three months later.

On the post-tests all three experimental groups (i.e. those who received instruction) were significantly more accurate than the comparison group in assigning grammatical gender. In addition, the instruction + prompts group did significantly better than the instruction + recasts group on the written measures. However, there were no significant differences between the three experimental groups in terms of learners' performance on the oral tasks. Lyster interprets this finding as a task effect. That is, because of the timeconsuming nature of oral tasks, only a randomly selected sub-sample of students participated in this part of the study. These students met with the researcher in three intensive one-on-one sessions. In arder to ensure the accuracy of the data, the researcher encouraged students to speak as dearly as possible because previous research had shown that learners sometimes used a 'hybrid artide' that could be interpreted as either masculine or feminine. This emphasis on the dear articulation of artides provided all learners with individualized attention on the target feature and thus may be the reason why all three groups performed similarly on the oral measure.

## Study 38: Focus onform through collaborative dialogu,e

Motivated by sociocultural theory and the idea that language learning occurs in dialogue, Merrill Swain and Sharon Lapkin (2002) observed the language development of two Grade 7 French immersion students as they wrote a story collaboratively. Later, in a 'noticing' activity, the students compared what they had written with a reformulated version of the story. The students also took part in a stimulated recall of their noticing activity. Swain and Lapkin wanted to find out what students noticed about differences between their original version and the reformulated one and whether they made revisions to their original stories based on their collaborative talk about the reformulated version.

The talk that learners produced in all phases of the research was recorded, transcribed and coded for language-related episodes (LREs), 'any part of the dialogue where learners talk about the language they producéd, and reflect on their language use' (p. 292). An excerpt of the learners' collaborative talk from this study is presented in Chapter 5, Communication Task B. The LREs were coded in terms of whether they focused on lexical, grammatical, or dis course features. The researchers used the original story that the two learners created together as a pre-test and the stories that each learner constructed as a post-test. Both learners were much more accurate on the post-test version of the story. The researchers condude that the multiple opportunities for
learners to engage in collaborative talk on the language features in question led them to a greater understanding of their correct use.

## Study 39:Focus onform in task-based instruction

In a descriptive study investigating the importance of the teacher's role in task-based instruction, Virginia Samuda (2001) explored ways of guiding adult ESL learners' attention to form-meaning relationships by focusing on expressions of possibility and probability (for example, 'might', 'could', 'it's possible'). In a task design that took learners through a 'meaning to form to meaning progression', learners were first asked to work in groups to speculate on the identity of an unknown person (for example, age, gender, occupation) by looking at a set of objects thought to have come from that person's pocket. In carrying out this task, learners were observed to produce expressions of probability and possibility such as 'lt's possible that he smokes' and 'maybe it's a girl', but few instances of modal auxiliaries (for example, 'must', 'may') were used.

In the second phase of the task, the students were asked to come together as a whole group to tell each other what they had decided. During this phase, the teacher acted as a co-communicator and maintained the focus on meaning but gradually shifted to form by using the language that the learners had produced on their own and providing them with alternative ways of express ing uncertainty. Initially, this was done implicitly. Por example if a learner said something like 'We think uh 50 per cent he smokes', the teacher said 'So you're not certain that he smokes?' After each group had presented, the teacher provided a more explicit focus. She drew the learners' attention to other ways of expressing possibility and probability by overtly talking about language form as shown in the excerpt below (p. 131).

## st Businessman

T Businessman ninety? OK So you're 90 per cent certain he's a businessman, right? Here's another way to say this. You think it's 90 per cent certain, so you think he must be a businessman. He must be a businessman (writes it on the board). So this (points to 'must be' on board) is showing how certain how sure you are. Not 100 per cent, but almost 100 per cent. 90 per cent.

In the final stage of the task, the students prepared and presented a poster based on their conclusions about the identity of the unknown person to the whole class. During this time, the teacher responded to the content and not the form of their work. When the researcher examined the differences between expressions of probability and possibility that the students used in the first stage of this task and compared it with the final stage, there was evi dence of improvement in that many more instances of modal auxiliaries were present in the learners' speech.

## Study 40: The timing ofform-focused instruction

Nina Spada and her research team carried out a study to examine whether there may be a better time in the instructional sequence to draw learners' attention to form (Spada et al. 2012). Two classes of intermediate-level adult ESL learners were provided with 12 hours of instruction that differed in terms of whether attention to form was embedded in communicative activities or separated from communicative practice. They are referred to as integrated and isolated form-focused instruction. The target feature was the passive construction and learners were tested on their knowledge of it before instruction, immediately after instruction, and again three weeks later.

A second question motivating the research was whether the two types of instruction might lead to different kinds of L2 knowledge. This question was informed by transfer-appropriate processing theory and the idea that we are more likely to remember something we have learned if the cogni tive processes that are activated during the learning process are the same as those activated during retrieval (see Chapter 4). Thus, the researchers were interested in whether learners who obtained their knowledge of the passive while participating in communicative interaction (i.e. integrated FFI) were better at retrieving that knowledge on an oral communication task than the learners who received isolated FFI. Similarly, they wanted to explore whether learners who obtained their knowledge of the passive structure in grammar activities that were separated from communicative practice (i.e. isolated FFI) were better at retrieving their knowledge on a written grammar test than the learners who received integrated FFI.

Learners in both the integrated and isolated FFI classes improved signifi candy on both language measures over time. The findings also revealed sorne support for TAP in that learners who received integrated FFI outperformed the isolated FFI learners on the oral communication task and the learn ers who received isolated FFI outperformed the integrated learners on the written grammar test.

The overall results of this study point to the complementarity of the two types of instruction, likely due to the fact that they both provide a focus on form and meaning, albeit at different times.

## ACTIVITY Match pedagogical activities with teaching proposals

Below are brief descriptions of 12 pedagogical activities. Match each activity with the teaching proposal it represents and explain how you reached that conclusion. For example, an activity such as 'Fill inthe blanks with the correct form of the verb' represents the 'Get it right from the beginning' proposal because such grammatical exercises are typical of the grammar translation approach with its emphasis on rule learning and accu racy. Keep in mi nd
that in sorne cases, an activity is compatible with more than one teachi ng proposal. For example, ifthe sentences inthe 'Fill inthe blanks' activity carne from an earlier draft of a letter written for a communicative activity, it might be consistent with the 'Get it right inthe end' proposal because it integrates attention to language form in a meaning-based activity.

1 Role-play a conversation between a travel agent and a tou rist.
2 Memorize a dialogue about buying airline tickets.
3 Underline the past tense verbs while readi ng a story.
4 Arrange illustrations in the correct sequence after listeni ng to a story.
5 Work with a partner to write a story based on a cartoon strip.
6 Rearrange a set of scrambled words to form correct questions.
7 Debate or discuss a topic that was featured in a newspaper article.
8 Watch an episode of Sesame Street.
9 Demonstrate and describe the steps in a science experiment.
10 Interview a mystery guest and try to discover his or her occupation.
t1Play a game of 'Simon Says'.
12 Work in small groups to choose the ideal candidate for a job.

## Interpreting the research

The overall results of the studies described above provide support for the hypothesis that form-focused instruction and corrective feedback can help learners improve their knowledge and use of particular grammatical features. There is also compelling evidence that more explicit attention to form is par ticularly useful within communicative and content-based second and foreign language programmes. This has been confirmed in reviews and meta-analy ses of many studies that have investigated the contribution of form-focused instruction to L2 learning (Norris and Ortega 2000; Spada 2011). Sorne results also show, however, that the effects of instruction are not always longlasting. This may be related to whether there is continued exposure to a linguistic feature in the regular classroom input after the experimental treat mentends.

We have also seen that form-focused instruction may be more effective with sorne language features than with others. For example, the successful learn ing of the tul vous distinction in Lyster's (1994) study could be due to the fact that learning $t u$ and vous is essentially a matter of learning two impor tant vocabulary items and thus may have been less difficult to learn than syntactic features that affect meaning in less obvious ways. In the intensive ESL research, learners may have been more successful after instruction on
possessive determiners than questions because there is a stronger form meaning connection with possessive determiners than with questions.

Other language features for which form-focused instruction may play a crucial role are those that are influenced by the learners' first language, particularly when there are misleading similarities between L1 and L2. The difficulry may be increased in second language classrooms where learners share the same first language and reinforce each other's first language-based errors.

Finally, the rules associated with sorne language features are more complex than others. For example, the article system in English is both complex and abstraer and notoriously difficult to teach and learn. Thus, learners may be better off learning about articles vía exposure in the input. On the other hand a simple 'rule of thumb' such as 'put an $-s$ at the end of a noun to make it plural' may be a better target for instruction. In a recent meta-analysis of the effects of rype of instruction on 'complex' and 'simple' language features, however, Spada and Tomita (201O) report that explicit instruction promoted learning for both rypes of language features.

Research on integrated and isolated FFI is a reminder that the timing of form-focused instruction may also make a difference in L2 learning. Samuda's study with adult ESL learners is a good example of integrated FFI, illustrat ing how teachers can effectively direct students' attention to form within task-based instruction. The finding that isolated and integrated FFI lead to different kinds of L2 knowledge is intriguing and resonates with the experi ence of many teachers. That is, teachers of second/foreign languages know that explicit rule-based grammar teaching without communicative practice is likely to lead to a fairly good knowledge of the rules of grammar but not the abiliry to use the rules in meaningful and spontaneous language produc tion. These differences in L2 knowledge have been variously referred to as declarative versus procedural and learning versus acquisition, as discussed in Chapter 4, or as explicit versus implicit knowledge. Explicit knowledge is rypically described as conscious and analysed, whereas implicit knowledge is considered to be intuitive and unanalysed.

Sorne theorists and researchers claim that L2 instruction can lead to explicit knowledge only. Furthermore, they argue that the results from meta-analyses showing positive effects for L 2 instruction are due to the fact that the tests used to assess learners' progress in the majority of studies have measured explicit knowledge using, for example, discrete-point grammar tests. Fortunately, recent research has included a greater variery of language measures to tap into learners' intuitive L2 knowledge such as oral communication tasks and time-pressured tasks that require learners to retrieve their knowledge quickly without having time to 'think about it'. Nonetheless, we won't have a clear answer to the question of what type of knowledge results from L2 instruction
until valid and reliable tests of both implicit and explicit knowledge are used in a larger number of studies (Ellis et al. 2009).

Similar issues have been raised about research on corrective feedback but the central focus of this work has been on investigating whether certain types of corrective feedback are more effective than others. The results from Lyster's study in French immersion programmes suggests that learners benefit more from feedback that pushes them to self-correct (i.e. prompts) than from feed back that provides the correct form (i.e. recasts). Research in other contexts, however, has produced different results. For example, the majority oflabora tory studies of corrective feedback repon benefits for recasts over other types of corrective feedback including prompts (Mackey and Goo 2007). These conflicting findings are likely related to differences in context-the labora tory is a more controlled environment than the classroom, where there are competing demands on learners' attention. As a result, learners may notice certain types of feedback in the one-on-one laboratory interactions more than they do in the classroom in communicative or content-based classes, where the primary focus is on meaning.

As discussed in Chapter 5, the specific pedagogical activity in which correc tive feedback is provided also plays an important role in terms of whether learners recognize it as corrective feedback. The timing of corrective feedback may also be important in L2 learning. To date little research has explored whether it is preferable, for example, to provide feedback during or after communicative practice. One study of this issue was carried out by James Hunter (2012). He investigated the effectiveness offeedback that the teacher provided after students had participated in student-led conversations. His findings show that such an approach can result in a higher proportion of repair than feedback provided in whole-class teacher-led activities.

Recently there have been a number of meta-analyses of studies investigat ing the effectiveness of L2 corrective feedback on L2 oral production. The results are mixed, with sorne reporting benefits for recasts over other types of feedback (Li 201O) and others reporting advantages for prompts over recasts (Lyster and Saito 201O). Until there is greater consensus on the contributions of different types of corrective feedback on L2 learning, a prudent approach would be to provide learners with a variety of different types of corrective feedback and to keep in mind the counterbalance hypothesis presented in Chapter 5, which suggests that more explicit corrective feedback may be effective in contexts where the learners' attention is focused on meaning/ content while implicit feedback may be sufficient to attract learners' atten tion in contexts where the focus of instruction is typically on language form.

## Assessing the proposals

Although there is still much work to do, it seems evident that proposals rep resenting an almost exclusive facus on farm or those representing an almost exclusive facus on meaning alone can not be recommended. Approaches that provide attention to farm within communicative and content-based interac tion receive the most support from classroom research.
We know that sorne exceptionally gifted learners will succeed in second language learning regardless of the teaching method. In the schools of the world, grammar translation is no doubt the most widely applied method and most of us have met individuals whose advanced proficiency in a fareign language developed out of their experience in such classes. Similarly, audio lingual instruction has produced highly proficient second language speakers. However, we also know-from personal experience and research findings that these methods leave many learners frustrated and unable to participare in ordinary conversations, even after years of classes. Grammar translation and audiolingual approaches will continue to be used, but the evidence sug gests that 'Get it right from the beginning' does not correspond to the way the majority of successful second language learners have acquired their pro ficiency. On the other hand, in throwing out contrastive analysis, feedback on error, and metalinguistic explanations and guidance, the 'communicative revolution' may have gane too far.

There is increasing evidence that learners continue to have difficulty with basic structures of the language in programmes that offer little or no farm facused instruction. This calls into question extreme versions of the 'Just listen ... and read' and 'Get two far one' proposals. While there is good evidence that learners make considerable progress in both comprehen sion and production in comprehension-based programmes, we do not find support far the hypothesis that language acquisition will take care of itself if second language learners simply facus on meaning in comprehensible input. Comprehension-based approaches are most successful when they include guided attention to language features as a component of instruction.

The 'Let's talk' proposal raises similar concerns. Opportunities far learners to engage in conversational interactions in group and paired activities can lead to increased communicative competence and the ability to manage conversa tions in a second language. However, the research also shows that learners may make slow progress on acquiring more accurate and sophisticated language if there is no facus on farm. This is especially true in classes where students' shared language and learning backgrounds allow them to communicate successfully in spite of their errors. Because 'Let's talk' emphasizes meaning and attempts to simulare 'natural' communication in conversational inter action, the students' facus is naturally on what they say, not how to say it. Furthermore, when feedback on error takes the farm of recasts, learners may
interpret it as a continuation of the conversation rather than focus on form. Thus, programmes based on the 'Let's talk' approach are incomplete on their own, and learners' gains in confidence and conversational skills may not be matched by their development of more accurate and complex language.
It is important to emphasize that the evidence to support a role for form focused instruction and corrective feedback does not suggest a return to the 'Get it right from the beginning' approach. Research has shown that learn ers do benefit considerably from communicative interaction and instruction that is meaning-based. The results of research in French immersion, other content-based language teaching, and communicative ESL are strong indicators that learners develop higher levels of fluency through primarily meaning-based instruction than through rigidly grammar-based instruction. The problem is that certain aspects oflinguistic knowledge and performance are not fully developed in such programmes.

Research investigating the 'Teach what is teachable' proposal is not yet at a point where it is possible to say to teachers: 'Here is a list oflinguistic features and the arder in which they will be acquired. You should teach them in this arder'. The number of features that researchers have investigated in experi mental studies within this framework is far too small. On the other hand, there has been no strong evidence that teaching according to the develop mental sequences is necessary or even desirable or that it will improve the long-term results in language learning. What is most valuable about this pro posal is that it serves to help teachers set realistic expectations about the ways in which learners' interlanguage may change in response to instruction. The implications of 'Teach what is teachable' may be seen primarily in the fact that genuine progress in second language development must be measured in ways that include, but are not limited to, increased accuracy in language production.

According to the 'Get it right in the end' proposal, classroom activities should be built primarily on creating opportunities for students to express and understand meaningful language. However, this proposal is based on the hypothesis that form-focused instruction and corrective feedback are also essential for learners' continued growth and development. The challenge is to find the balance between meaning-based and form-focused activities. The right balance is likely to be different according to the characteristics of the learners. The learners' age, metalinguistic sophistication, prior educational experiences, motivation, and goals, as well as the similarity of the target lan guage to a language already known need to be taken into account when decisions are made about the amount and type of form focus to offer.

Classroom data from a number of studies offer support for the view that form-focused instruction and corrective feedback provided within the context of communicative and content-based programmes are more effective
in promoting second language learning than programmes that are limited to a virtually exclusive emphasis on comprehension, fl.uency, or accuracy alone. Thus, we would argue that second language teachers can (and should) provide guided, form-focused instruction and corrective feedback in certain circumstances. For example, teachers should not hesitate to correct persistent errors that learners seem not to notice without focused attention. Teachers should also be especially aware of errors that the majority of learners in a class are making when they share the same first language background. They should not hesitate to provide contrastive information about how a partic ular structure in a learner's first language differs from the target language. Teachers might also try to become more aware of language features that are just beginning to emerge in the second language development of their stu dents and provide sorne guided instruction in the use of these forms. It can also be useful to encourage learners to take part in the process by creating activities that draw their attention to the forms they use in communicative activities, by developing contexts in which they can provide each other with feedback, and by encouraging them to ask questions about language.

Decisions about when and how to provide form focus must take into account differences in learner characteristics, of course. Quite different approaches would be appropriate for, say, trained linguists learning a fourth or fifth language, young children beginning their schooling in a second language environment, both younger and older immigrants who cannot read and write their own language, and adolescents studying a foreign language for a few hours a week at school.

## Summary

Many teachers are aware of the need to balance form focus and meaning focus, and they may feel that recommendations based on research simply confirm their current classroom practice. Although this may be true to sorne extent, it is hardly the case that all teachers have a clear sense of how best to accomplish their goal. It is not always easy to step back from familiar prac tices and say, 'I wonder if this is really the most effective way to go about this?' Furthermore, it can be difficult to try out classroom practices that go against the prevailing trends in their educational contexts. Many teachers still work in environments where there is an emphasis on accuracy that virtually excludes spontaneous language use in the classroom. At the same time, the introduction of communicative language teaching methods has sometimes resulted in a complete rejection of attention to form and error-correction in second language teaching. But it is not necessary to choose between form based and meaning-based instruction. Rather, the challenge is to find the best balance between these two orientations.

Classroom-based research on second language learning and teaching has given us partial answers to many questions. Through continuing research and experience, researchers and teachers will fill in more details, always rec ognizing that no single answer will be adequate for all learning environmen ts. Among the questions we will continue to ask are these:

- How can classroom instruction provide the right balance of meaning based and form-focused instruction?
- Which features oflanguage will respond best to form-focused instruc tion, and which will be acquired without explicit focus iflearners have adequate access to the language?
- Which learners will respond well to metalinguistic information and which will require sorne other way of focusing attention on language form?
- When is it best to draw learners' attention to form-before, after, or during communicative practice?
- How should corrective feedback on language form be offered?
- When should learners be allowed to focus their attention on the content of their utterances?

Continued classroom-centred research, including the action research by teachers in their own classrooms, will provide further insights into these and other important issues in second language teaching and learning.

## Questions for reflection

1 Keeping in mi nd that individual learner differences play an im portant role in second language learning, do you think a particular learner profile might be more compati ble with one of the teachi ng proposals than another?

2 If you were going to experiment with a new approach to teachi ng in you r classroom, which of the six proposals described in this chapter would you choose? Why?

3 This chapter concludes with the suggestion that 'Get it right in the end' is the best approach. Is this consistent with you r own views? Why/why not?

## Suggestions for further reading

Ellis, R. 2012. Language Teaching Research and Language Pedagogy. Malden, MA: Wiley-Blackwell.
In this volume, Ellis focuses on research that is designed specifically to investigate the role of teaching in second language learning. He reviews both the methods and the findings from a vast number of studies. Ellis approaches the task from his dual perspectives as a researcher and as editor of the journal Language Teaching Research, which publishes the work of scholars and educators who are investigating language teaching around the world. Throughout the book, links are made between the research and its implications for language pedagogy.

Hedge, T. 2000. Teaching and Learning in the Language Classroom. Oxford: Oxford University Press.

This is a useful reference book for the classroom teacher. It covers a wide range of topics relevant to the teaching and learning of second/foreign languages. It is divided into four sections: a framework for teaching and learning, teaching the language system, developing the language skills, planning, and assessing learning. Each chapter moves from theoretical to practica! considerations and there is extensive use of tasks, activities, and teaching materials to motivate readers to reflect on the ideas presented in relation to their own practice.

Lyster, R. 2007. Learning and Teaching Language through Content: A Counterbalanced Approach. Amsterdam: John Benjamins.
This book provides a comprehensive description and analysis oflanguage teaching and learning in content-based classrooms. With a primary but not exclusive focus on research in French immersion programmes in Canada, Roy Lyster synthesizes decades of empirical work that has sought solutions to the challenges of teaching language and content simultane ously. The author's experience as both teacher and researcher is evident in the useful connections made between theory and practice.

Nation, I. S. P. and J. Macalister. 2010. Language Currículum Design. New York: Routledge.
Paul Nation has proposed four 'strands' that are seen as essential-and of equal importance-in a language teaching programme. The four strands are: meaning-focused input, meaning-focused output, language-focused learning, and fluency development. Together they represent a balanced approach to language teaching that is compatible with research on class room learning. Originally based on Nation's research in vocabulary learning, the four strands may also be seen as the elements of a lesson, a syl labus, or even a curriculum. Nation (2007) introduces the ideas, and this book elaborates on the full range of issues related to curriculum design.

## POPULAR IDEAS ABOUT LAN GUAG E LEARNING REVISITED

## Preview

In this chapter, we return to the 18 statements that you responded to in the Introduction and summarize sorne of the related research and theory that we have discussed in this book, sharing sorne of our own views about these popular opinions.

## ACTIVITY Review your opinions

In the Introduction, we asked you to indicate how strongly you agreed with sorne popular ideas about language learning. Before you continue reading this chapter,go back and complete the questionnaire again. Compare the responses you gave then and those you would give now. Have your views about second language acquisition been changed or confirmed by what you've read in the preceding chapters?

## Reflecting on the popular ideas: Learning from research

1 Languages are learned mainly through imitation
It is difficult to find support for the argument that languages are learned mainly through imitation, because first and second language learners produce many novel sentences that they could not have heard before. These sentences are based on their developing understanding of how the language system works. This is evident in children's sentences such as 'l'm hiccing up and I can't stop', and 'It was upside clown but I turned it upside right', and with second language learners who say 'The cowboy rided into town', or 'The man that I spoke to him is angry'. These examples and many others provide evi dence that language learners do more than internalize a large list of imitated
and memorized sentences. They also identify patterns in the language and extend them to new contexts.

Ifwe use a narrow definition of imitation (the immediate repetition of all or part of another speaker's utterance) we find that sorne children imitare a great deal as they acquire their first language. Even these children, however, do not imitare everything they hear. Instead, they selectively imitare certain words or structures that they are in the process of learning. Furthermore, children who do little overt imitation learn language as quickly and as well as those who imitare more. Thus, this type ofimitation may be an individual learning strategy but it is not a universal characteristic oflanguage learners.

Sorne second language learners also find it useful to imitare samples of the new language. Classroom researchers have observed students who repeat what they hear others say, and sorne advanced learners who are determined to improve their pronunciation find it helpful to spend time carefully listening to and imi tating language in a language laboratory or tutorial. However, for beginning learners, the imitation and rote memorization that characterizes audiolingual approaches to language teaching is not effective iflearners do not also use the sentences and phrases they are practicing in meaningful interaction. Learners need to do more than recite bits of accurate language in drills and dialogues.

Nevertheless, recent findings from corpus linguistics have provided a new appreciation for formulaic language use. We know from the discussion of usage-based theories discussed in Chapter 4 that a great deal of natural lan guage use is predictable on the basis of the frequency with which words or phrases occur together. Learners create strong associations between language features that tend to occur together. Thus, language is partly learned in chunks larger than single words. I-lowever, this internalization of the input does not depend on the learner's imitation of all or part of another person's utterance in a rote-repetition fashion. It is the combined exposure to language features in the input and their use in meaningful exchanges that leads to learning.

## 2 Parents usually correct young children when they make grammatical errors

There is considerable variation in the extent to which parents correct their children's speech. The variation is based partly on the children's age and partly on the parents' social, linguistic, and educational background. When children are very young, parents rarely comment on grammatical errors, although they may correct lapses in politeness or the choice of a word that doesn't make sense. $f u$ children reach school age, parents may correct the kinds of non-standard speech that they hope their children will outgrow, for example, 'Me and Fred are going outside now'.

Extensive observations of parents and children show that, as a rule, parents tend to focus on meaning rather than form when they correct children's
speech. Thus, they may correct an incorrect word choice, an incorrect state ment of the facts, or a rude remark, but they do not often react to errors that do not interfere with communication. What this tells us is that children cannot depend on consistent corrective feedback in arder to learn the basic structure (the word arder, the grammatical morphemes, the intonation pat terns) of their language. Fortunately, they appear to be able to acquire the adult form of the language with little or no explicit feedback.

The case for second language learners is more complex. On the one hand, both children and adults can acquire a great deal of language without any formal instruction or feedback on error. On the other hand, the evidence suggests that, without corrective feedback and guidance, second language learners may persist in using certain ungrammatical forms for years.

## 3 Highly intelligent people are good language learners

The kind ofintelligence that is measured by IQtests is often a good predictor of success in classrooms where the emphasis is on learning about the language (for example, grammar rules). People who do well on IQ tests may do well on other kinds of tests as well. However, in natural language learning settings and in classrooms where interactive language use is emphasized, research has shown that learners with a wide variety of intellectual abilities can be successful language learners. This is especially true if the emphasis is on oral communication skills rather than metalinguistic knowledge.

Most important, it must be recalled that language learning involves a great many different skills and abilities that are not measured by IQtests. Students should not be excluded from opportunities to learn another language on the grounds that they do not have the academic ability to succeed. In many educational contexts, students from immigrant or minority groups have no choice about learning a second language. What is essential is to find ways to engage the different abilities that students bring to the learning environment.

## 4 The best predictor of success in second language acquisition is motivation

Everyone agrees that learners who want to learn tend to do better than those who don't. But we must not interpret this too rigidly. Sometimes, even highly motivated learners encounter great challenges in language learning. We know, for example, that learners who begin learning a second language as adults rarely achieve the fluency and accuracy that children do in first language acquisition. This should not be taken as evidence that adult second language learners are not motivated to learn. It may be a reflection of changes that come with age or of other individual differences such as language learning aptitude, how the instruction interacts with individual learners' styles and preferences for learning, how much time the learner can devote to learning
the new language, and what opportunities the learner has to use the language outside the classroom.

Teachers have no influence over learners' intrinsic motivation for learning a second language. Students come to classrooms from different backgrounds and life experiences, all of which have contributed to their motivation to learn and their attitudes toward the target language and the community with which it is associated. The principal way that teachers can influence learners' motivation is by making the classroom a supportive environment in which students are stimulated, engaged in activities that are appropriate to their age, interests, and cultural backgrounds, and, most importantly, where students can experience success. This in turn can contribute to positive motivation, leading to still greater success.

## 5 Tu.e earlier a second language is introduced in school programmes, the greater the likelihood of success in learning

The decision about when to introduce second or foreign language instruction must depend on the objectives of the language programme in the particular social context of the school. When the objective is native-like performance in the second language, then it may be desirable to begin exposure to the language as early as possible, as long as learners have extensive exposure to and opportunities to use the second language in a variety of contexts. The research evidence is fairly strong that those who begin second language learn ing at an early age are most likely to eventually be indistinguishable from native speakers.

However, even in cases where native-like proficiency is targeted, it is impor tant to recognize certain disadvantages of an early start for second language learning. When an early start means that children have little opportunity to continue to develop their first language, the resulting subtractive bilingual ism may have lasting negative consequences.

For children from minority-language backgrounds, programmes promoting the development of the first language both at home and at school may be more important for long-term success in the second language than an early start in the second language itself. Research shows that a good foundation in the child's first language, including the development of literacy, is a sound base to build on. Children who can begin their schooling in a language they already know will have more self-confidence, will be able to learn more effec tively in the early school years, and will not lose valuable time in a period of limbo during which they struggle just to understand what is happening in the classroom.

For many children, there is no opportunity to have their early schooling in their first language. They are members of small minority groups where it is not practica! for schools to offer them an educational programme in their
first language, or they live in jurisdictions where legislation has mandated a single language of education far all children, regardless of their background. Far these children, it is crucial to have sensitive educators who respect the children's difficulty, who encourage parents to maintain the home language, and who understand that second language learning takes time and effort.

For foreign language instruction or far second language instruction where the level of proficiency that is targeted is not native-like performance by all students, the situation is quite different. When the goal of the educational programme is basic communicative skill far all students, and where there is a strong commitment to maintaining and developing the child's first language, it can be more efficient to begin second language teaching later. Older chil dren (far example, 10-year-olds) are able to catch up quickly with those who began earlier (far example, at 6-7 years old) in programmes offering only a few hours a week ofinstruction. This is especially true if the foreign language course includes a period of more intensive exposure to the new language.

All school programmes should be based on realistic estimares of how long it takes to learn a second language. One or two hours a week-even far seven or eight years-will not produce advanced second language speakers. This 'drip-feed' approach often leads to frustration, as learners feel that they have been studying 'far years' without making much progress. Sadly, they are often right about this.

## 6 Most of the mistakes that second language learners make are due to interference from their first language

First, we should recognize that knowledge of one or more languages can con tribute positively to many aspects of second or foreign language learning. If the languages are relatively clase cousins (far example, English and German, Spanish and French), there is much that learners already 'know'-including the alphabet, cognate words, as well as sorne basic principles of syntax.

On the other hand, the transfer of patterns from the native language is one of the majar sources of errors in learner language. When errors are caused by learners' perception of sorne partial similarity between the first and second languages, they may be difficult to overcome, especially when learners are frequently in contact with other learners who make the same errors.

Aspects of the second language that are different from the first language will not necessarily be acquired later or with more difficulty than those aspects that are similar. Second language learning is not simply a process of putting second-language words into first-language sentences. In fact, learners may not always be able to take advantage of similarities unless they are pointed out to them. Learners can be overly discriminating, failing to take advantage of similarities because they assume, sometimes incorrectly, that the languages must be different.

However, the first language is not the only influence on second language learning. Learners from different backgrounds often make the same kinds of errors, and sorne of these errors are remarkably similar to those made by first language learners. In such cases, second-language errors are evidence of the learners' efforts to discover the structure of the target language itself rather than attempts to transfer patterns from their first language.

## 7 The best way to learn new vocabulary is through reading

This statement is true but it does not tell the whole story. Children expand their vocabulary dramatically during their school years, and reading is the majar source of this growth. Second language learners can also increase their vocabulary knowledge through reading, but few second language learners will read the amount of target language text that a child reads in the course of more than a decade of schooling.

Research evidence suggests that second language learners benefit from oppor tunities to read material that is interesting and important to them. However, those who also receive guidance from instruction and develop good strate gies for learning and remembering words will benefit more than those who simply focus on getting the main ideas from a text. What is perhaps most striking in the research is the evidence that in arder to successfully guess the meanings of new words in a text, a reader usually needs to know more than 90 per cent of the words in that text.

## 8 It is essential for learners to be able topronounce all the individual sounds in the second language

Research on pronunciation has shown that second language speakers' ability to make themselves understood depends more on their ability to reproduce the phrasing and stress patterns-the 'melody' of the language-than on their ability to articulare each individual sound. Another important empha sis in current research is the undeniable fact that most languages of the world are spoken in many different varieties. Thus, it no longer seems appropriate to insist that learners be taught only one language variety or that only native speakers of a particular variety are the best teachers. Rather, learners need to learn to understand and produce language varieties that will permit them to engage in communicative interaction with the interlocutors they are most likely to encounter.

## 9 Once learners know 1,000 words and the basic structure of a second language, they can easily participate in conversations with native speakers

lt is true that most conversational language involves only a relatively limited number of words and sentence types. However, learners will find it easier to
understand and to make themselves understood if they also have an under standing of sorne of the pragmatic features of the new language. For example, it is useful far them to facus their attention on such things as how speakers show respect, apologize, or make requests. The cultural differences in these types of interactions sometimes lead to communication breakdown or mis understandings, even when the words and the sentence structures are correct.

## 10 Teachers should present grammatical rules one at a time, and learners should practise each one before going on to another

Second language learning is not simply linear in its development. Learners may use a particular farm accurately at Stage $x$ (suggesting that they have learned that farm), fail to produce the farm (or make errors when they attempt it) at Stage $y$, and produce it accurately again at Stage $z$. The decline in accuracy at stagey may show that learners are incorporating new infarma tion about the language into their interlanguage. We saw, far example, how learners may ask correct farmulaic questions such as 'What's that?' or 'How do you say proche in English?' and then produce questions like 'What you're doing with that?' at a later time. Language development is not just adding one rule after another. Rather, it involves processes of integrating new lan guage farms and patterns into an existing interlanguage, readjusting and restructuring until all the pieces fit.
Sorne structure-based approaches to teaching are based on the false assump tion that second language development is an accumulation of rules. This can be seen in the organization of textbooks that introduce a particular language feature in the first unit and reinfarce it in several subsequent units, and then move on the next feature, with only rare opportunities far learners to practise the ones previously taught. This isolated presentation and practice of one structure at a time does not provide learners with an opportunity to discover how different language features compare and contrast in normal language use. It is also likely that, without opportunities to continue hearing, seeing, and using them, the language features learned in the first unit will have been fargotten long befare the last.

## 11 Teachers should teach simple language structures before complex ones

Research has shown that no matter how language is presented to learners, certain structures are acquired befare others. This suggests that it is neither necessary nor desirable to restrict learners' exposure to structures that are per ceived in linguistic terms to be 'simple'-particularly when this involves the isolated presentation, ordering, and practice of 'simple' to 'complex' features.
At the same time, there is no doubt that second language learners benefit from the efforts of native speakers and fluent bilinguals to modify their speech
to help them understand. The language used in modified interaction may contain a variety of linguistic structures, sorne 'simple' and sorne 'complex'. However, it also indudes a range of adjustments that enable second language learners to engage in interactions with native and more advanced speakers of the second language more easily-more repetition, slower rate of delivery, paraphrasing, etc.

Teachers must also be aware, however, that sorne linguistic forms are so rare in dassroom language that learners have little opportunity to hear, use, and learn them if the teacher does not make a point of providing them. These are not necessarily difficult or complex forms. As we saw in Chapter 6, sorne 'simple' language forms turn out to be extremely rare in dassroom language, even in content-based instruction.

## 12 Learners' errors should be corrected as soon as they are made in order to prevent the formation of bad habits

Errors are a natural part oflanguage learning. This is true of the development of a child's first language as well as of second language learning by children and adults. Errors reflect the patterns of learners' developing interlanguage systems-showing gaps in their knowledge, overgeneralization of a second language rule, or an inappropriate transfer of a first language pattern to the second language.

Teachers have a responsibility to help learners do their best, and this indudes the provision of explicit, form-focused instruction and feedback on error. When errors are persistent, especially when they are shared by almost all stu dents in a dass, it is important to bring the problem to their attention. This does not mean that learners should be expected to adopt the correct form or pattern immediately or consistently. Ifthe error reflects a developmental stage, the instruction or feedback may be useful only when the learner is ready for it. It may be necessary to repeat feedback on the same error many times.

Of course, excessive feedback on error can have a negative effect on motiva tion; teachers need to be sensitive to their students' reactions to correction. The amount and type of correction that is offered will also vary according to the specific characteristics of the students, as well as their relationship with the teacher and with each other. Children and adults with little education in their first language will not benefit greatly from sophisticated metalin guistic explanations, but university students who are advanced learners of the language may find such explanations of great value. Immediate reaction to errors in an oral communication setting may embarrass sorne students and discourage them from speaking while others welcome such correction as exactly what is needed to help them notice a persistent error at just the moment when it occurs.

## 13 Teachers should use materials that expose students only to language structures they have already been taught

Such a procedure can provide comprehensible input of course, but-given a meaningful context-learners can comprehend the general meaning of oral or written texts that contain vocabulary and structures they have not 'mas tered'. Thus, restricting classroom second language materials to those that contain little or nothing that is new may have severa! negative consequences. There will undoubtedly be a loss of motivation if students are not sufficiently challenged. Students also need to develop strategies far dealing with 'real' or 'authentic' material if they are eventually going to be prepared far language use outside the classroom. They do this first with the teacher's guidance and then independently. Restricting students to step-by-step exposure to the lan guage extends their dependency.
When a particular language feature is introduced far the first time, or when the teacher feels there is a need far correction of a persistent problem, it is appropriate to use narrow-facus materials that isolate one element in a context where other things seem easy. But it would be a disservice to stu dents to use such materials exclusively or even predominantly. We should remember that learners who successfully acquire a second language outside classrooms certainly are exposed to a great variety of farms and structures they have not mastered.

## 14 W'hen learners are allowed to interact freely (for example, in group or pair activities), they copy each other's mistakes

The language that learners hear and read serves as input to their language development. The cognitive processes that allow them to learn from input are not 'shut clown' when they are interacting with other learners. Thus, when learners interact with each other, they may provide sorne incorrect input. Furthermore, when learners come from the same first language background and are at roughly the same level of proficiency, they are likely to understand each other very well, eliminating the need far negotiation far meaning that might lead them to replace their interlanguage patterns with more target like ones. Nevertheless, the benefits of pair and group work far outweigh the disadvantages, especially if the tasks are properly designed.
If the activities are well designed and learners are appropriately matched, pair and group work provides far more practice in speaking and participating in conversations than a teacher-centred class ever could. Somewhat surpris ingly, research has shown that learners do not produce any more errors in their speech when talking to learners at similar levels of proficiency than they do when speaking to learners at more advanced levels or to native speakers. The research also shows, however, that learners at similar levels cannot ordi narily provide each other with infarmation that would help to correct those
errors. Nonetheless, tasks can be devised in such a way that learners working together can discover not only how to express or interpret meaning but also how to discover the correct patterns in the second language. Inorder for this to happen, the tasks must be carefully planned to give learners access to the new language they need.

Group and pair work is a valuable addition to the variety of activities that encourage and promote second language development. Used in combina tion with individual work and teacher-centred activities, it plays an essential role in language teaching and learning.

## 15 Students learn what they are taught

Teachers know from experience that students don't learn everything they are taught! Fortunately, learners also learn a great deal that no one ever teaches them. They are able to use their own interna! learning abilities to discover many of the patterns and associations that underlie the language they are learning. In this sense, students learn much more than they are explicitly taught.

Sorne teaching methods typically give learners the opportunity to learn only a restricted number of words and sentence types. Even when the language teach ing method provides much richer language input, the fact that something is taught or made available in the input does not mean learners will acquire it right away. For example, sorne aspects of the second language emerge and evolve according to developmental sequences, and learners may be more likely to learn certain language features when they are developmentally ready. Thus, attempts to teach aspects of language that are too far away from the learner's current stage of development can be frustrating. Other language features, for example, vocabulary, can be taught at any time, as long as the learners are inter ested in the opportunity to learn and the teaching methods are appropriate to the learner's age, interests, needs, experiences, and learning styles.

## 16 Teachers should respond to students' errors by correctly rephrasing what they have said rather than by explicitly pointing out the error

This kind of feedback, referred to as 'recasts' has been found to be by far the most common type of feedback in second language classrooms. This has been shown to be true for learners at different ages and in different instructional settings-from audiolingual to communicative and content-based instruc tion. A recast has the advantage of not interrupting the flow of interaction. It is seen as indirect and polite, a way of giving students the information they need without embarrassing them.

Research in classes with a general focus on grammar and accurate language use shows that learners are responsive to this kind of feedback. Research in which learners interact individually with interlocutors has also shown that
recasts are perceived as corrective feedback, even though learners may not always know exactly which language features the feedback is focused on. However, in content-based instruction (for example, immersion classes) and in communicative instruction with younger learners, recasts often appear to be misinterpreted. Learners seem to hear them as confirmation of meaning rather than as correction of form. In these situations, recasts have been found to be more effective if the teacher has a method of signalling to the student tone of voice, gesture, or facial expression-that says to the student, 'I think I understand what you are saying, and I'm showing you how you can say it better'.

## 17 Students can learn both language and academic content (for example, science and history) simultaneously in classes where the subject matter is taught in their second language

The advantages of content-based instruction are numerous. Motivation is increased when the material that is used for language teaching has an inher ent value to the students: it creates a genuine, immediate need to learn the language. Content-based instruction is also often associated with the oppor tunity to spend more time in contact with the language, without losing out on instruction in other subject matter. In addition, the range of vocabulary and language features that students encounter in learning academic subjects is more varied than that which is typically available in second and foreign language classes.

Research has confirmed that students in content-based and immersion classes develop comprehension skills, vocabulary, and general communica tive competence in the new language. Teachers and researchers have also found, however, that the ability to understand the content and to function in classroom interaction does not ensure that students will continue to improve in certain aspects of their second language, especially in areas of accuracy on language features that do not usually interfere with meaning. Thus, for example, students can spend years in French immersion without achiev ing accuracy in marking nouns for gender or verbs for tense. Experimental studies in which an element of form-focused instruction was added to the content-based instruction have shown that, with guidance, students can improve in these areas as well. Both students and teachers need to keep in mind that content-based instruction is also language teaching.

## 18 Classrooms are good places to learn about language but not for learning how to use language

Sorne structure-based approaches to language teaching have tended to treat language as a set of grammar rules or as separate bits of information that need to be learned before learners can use the language as a communicative tool. Other approaches such as communicative language teaching, content-based,
and task-based instruction start from the principle that we learn language by using it to achieve a goal, for example, understanding a story, making a medical appointment, writing a science repon, or joining the fun on the playground. With this in mind, classroom activities are designed to prepare students to continue learning outside the classroom, by giving them experi ence in language usesthat are like those they will encounter there.

As we saw in Chapter 6, sorne theorists argue that second language instruction can only lead to knowledge about language (explicit knowledge) and question whether instruction can lead to the ability to use the language spontaneously and fluently (implicit knowledge) in a wide range of communicative contexts. Contemporary approaches to L2 instruction target the development of both types of L2 ability by ensuring that students use the language in meaningful interaction inside the classroom and that they learn effective strategies for using the language outside the classroom when they have opportunities to do so.

## ACTIVITY Support your opinion

Choose two or three of the 'popular ideas' that you find especially important. For each of these, identify and discuss how one or more of the research studies you have read about inthis book has strengthened you r agreement/ disagreement with the statement or has led you to change you r views.

## Conclusion

Knowing more about second language acquisition research will not tell you what to do in your classroom tomorrow morning. We hope, however, that this book has provided you with information that encourages you to reflect on your experience in teaching. We hope, in addition, that this reflection will contribute to a better understanding of your responsibilities as a teacher and your students' abilities and responsibilities as language learners.

As we have seen, language learning is affected by many factors. Among these are the personal characteristics and experiences of the learner, the social and cultural environment both inside and outside the classroom, the structure of the native and target languages, opportunities for interaction with speakers of the target language, and access to corrective feedback and form-focused instruction. It is clear that teachers do not have control over all these factors. Nevertheless, a better understanding of them will permit teachers and learn ers to make the most of the time they spend together in the twin processes of teaching and learning a second language.

## GLOSSARY

The glossary contains items that have a special or technical meaning in second language acquisition research and second language teaching. The definitions are intended to reflect the terms as we use them in this book.
accessibility hierarchy: A ranking of relative clauses developed by Keenan and Comrie (1977). Different languages use relative clauses to modify nouns in different grammatical roles. According to the accessibility hierarchy, for example, most languages allow relative clauses for sentence subjects, while fewer languages allow them for the object of comparison.
accuracy order: The relative accuracy of grammatical forms in learner language. For example, learners are often more accurate in using plural -s than in using possessive $S$. Sorne researchers have inferred that an accuracy arder is equivalent to a developmental sequence.
action research: Research carried out by teachers, often in their own classrooms or in collaboration with other teachers. The research goals and questions are local and specific to their own teaching environment.
active listening: A teaching technique in which students not only listen but also show their comprehension by their responses.
additive bilingualism: Learning a second language without losing the first.
American Sign Language (ASL): The gestural language used by many North Americans who are deaf or who interact with others who are deaf. It is a true language, with complex rules of structure and a rich vocabulary, all expressed through motions of the hands and body.
audiolingual approach: An approach to second or foreign language teaching that is based on the behaviourist theory oflearning and on structural linguistics, especially the contrastive analysis hypothesis. This instructional approach emphasizes the formation of habits through the repetition, practice, and memorization of sentence patterns in isolation from each other and from contexts of meaningful use.
auditory discrimination: The ability to distinguish language sounds, for example minimal pairs such as shipl sheep.
behaviourism: A psychological theory that all learning, whether verbal or non-verbal, takes place through the establishment of habits. According to this view, when learners imitate and repeat the language they hear in their
surrounding environment and are positively reinfarced far doing so, habit farmation (or learning) occurs.
bilingual education: Schooling in which students receive instruction in two (or more) languages, usually their home language and a second language.
bilingualism: The ability to use more than one language. The word itself does not specify the degree of proficiency in either language.
brain imaging: A variety of techniques that allow researchers to observe and track activity in the brain.
child-directed speech: The language that caretakers address to children. In sorne cases, this language is simpler than that which is addressed to adults. In sorne cultures, it is also slower, higher pitched, more repetitive, and includes a large number of questions.
chunk: A unit oflanguage that is often perceived or used as a single unit. Chunks include farmulaic expressions such as Thankyou or What's that? but also bits oflanguage that frequently occur together, far example, ice cream cone or significant difference.
classroom observation scheme: A tool (often in the farm of a grid) that consists of a set of predetermined categories used to record and describe teaching and learning behaviours.
cognate: A word in one language that comes from the same origin as a word in another language and has the same meaning, far example, 'nation' in English and nation in French or vaca and vache (cow) in Spanish and French. The term false cognate is used to refer to words that may come from the same origin but have evolved to have different meanings, far example, librairie (bookstore) in French does not have the same meaning as libraryin English.
cognitive: Relating to how the human mind receives, processes, stores, and retrieves infarmation. The facus is on interna! learning mechanisms that are believed to be used far learning in general, not just language learning alone.
cognitive maturity: The ability to engage in problem-solving, deduction, and complex memory tasks.
collaborative dialogue: A conversation between learners in which they work together to salve a problem, far example, reconstructing a story they have heard. While the facus is on the task, learners may also facus on the elements oflanguage that they need to complete the task.
communicative competence: The ability to use language in a variety of settings, taking into account relationships between speakers and differences
in situations. The term has sometimes been interpreted as the ability to convey messages in spite of a lack of grammatical accuracy.
communicative language teaching (CLT): CLT is based on the premise that successful language learning involves not only a knowledge of the structures and forms of a language, but also the functions and purposes that a language serves in different communicative settings. This approach to teaching emphasizes the communication of meaning in interaction rather than the practice and manipulation of grammatical forms in isolation.
competence: Linguist Noam Chomsky used this term to refer to knowledge oflanguage. This is contrasted with performance, which is the way a person actually uses language-whether far speaking, listening, reading, or writing. Because we cannot observe competence directly, we have to infer its nature from performance.
comprehensible input: A term introduced by Stephen Krashen to refer to language that a learner can understand. It may be comprehensible in part because of gestures, contextual information, or prior knowledge/experience.
comprehensible output hypothesis: The hypothesis that successful second language acquisition depends on learners producing language (oral or written). Swain (1985) proposed this hypothesis in response to Krashen's (1985) comprehensible input hypothesis.
comprehension-based instruction: A general term to describe a variety of second language programmes in which the focus of instruction is on comprehension rather than production.
connectionism: A theory of knowledge (including language) as a complex system of units that become interconnected in the mind as they are encountered together. The more often units are heard or seen together, the more likely it is that the presence of one will lead to the activation of the other.
content and language-integrated learning (CLIL): An approach to content-based language teaching that has been developed primarily in secondary schools in Europe.
content-based language teaching (CBLT): Second language instruction in which lessons are organized around subject matter rather than language points. Far example, in immersion programmes, students study science, history, mathematics, etc. in their second language.
contrastive analysis hypothesis (CAH): The expectation that learners will have less difficulty acquiring target language patterns that are similar to those of the first language than those that are different.
control group: In experimental studies, a group oflearners that differs from the experimental group only in terms of the single variable that the
researcher is investigating. Performance of the control group is used to show that the variable in question is the best (or only) explanation for changes in the experimental group. Also sometimes referred to as 'comparison group'.
corpus (plural: corpora): A principled collection of oral or written language samples that can usually be accessed and explored with computer based tools. Sorne of the most famous corpora contain millions of words from, for example, newspapers. Samples of the language produced by learners have also been collected for second language acquisition research.
corpus linguistics: An approach to the study oflanguage that is based on the analysis oflanguage corpora. See corpus.
corrective feedback: An indication to a learner that his or her use of the target language is incorrect.
correlation: A statistical procedure that compares the relative frequency or size of different variables in arder to determine whether there is a relationship between them.
counterbalance hypothesis: The hypothesis that learners' attention will be drawn to classroom events that are different from those they are accustomed to.
critical period hypothesis (CPH): The proposal that there is a limited period during which language acquisition can occur.
cross-linguistic inffuence: The effect on knowledge of one language by the knowledge of another. This term is preferred over previous terms such as interference to indicate that knowledge of one language can be beneficia! to learning another. The term also reflects the fact that the influence can go from a known language to the one being learned but also from the new language to one already known.
cross-sectional study: A study in which participants at different ages and/or stages of development are studied. This contrasts with longitudinal studies.
declarative knowledge: Information that we have and know we have. An example would be a rule such as 'the verb must agree with the subject to form a correct sentence'. In sorne skill learning theories, it has been hypothesized that all learning begins with declarative knowledge. This contrasts with procedural knowledge.
descriptive study: Research that does not involve any manipulation, change, or intervention in the phenomenon being studied. The researcher's goal is to observe and record what is happening. This contrasts with experimental study.
developmental features: Those aspects of a language which, according to Pienemann and his colleagues, develop in a particular sequence, regardless of input variation, learner motivation, or instructional intervention.
developmental sequence: The arder in which certain features of a language (far example, negation) are acquired in language learning. Also called developmental stages or arder of acquisition.
display question: A question to which the asker already knows the answer. Teachers often ask these questions (far example, Whatcolour isyour shirt?) to get the learner to display his or her knowledge of the language.
enhanced input: Input that is altered in an effort to make sorne language features more salient to learners. It can be more or less explicit, ranging from explicit metalinguistic comments to typographical enhancement (bold type or underlining) or exaggerated stress in speaking.
ethnography: Descriptive research in which the observer seeks to understand a group or community from within its own perspective. The research requires extensive periods of observation as well as consultation with group members to validate the observer's descriptions.
experimental study: Research designed to test a hypothesis about the impact of one or more specific variables on another variable. A strictly experimental study would have 'experimental' and 'control' groups that differ from each other only in the presence or absence of the variable(s) of interest. In educational research, it is often difficult to create all of the conditions that permit a study to be termed as a 'genuine' experimental study. In this book, the term is used in a non-technical sense to refer to research in which an attempt has been made to investigate a single variable in an educational setting.
field independent/field dependent: This distinction has been used to describe people who differ in their tendency to see the farest or the trees. That is, sorne people (called field independent) are very quick to pick out the hidden figures in a complicated drawing. Others (called field dependent) are more inclined to see the whole drawing and have difficulty separating it into parts.
first language ( Ll , mother tangue, native language): The language first learned. Many children learn more than one language from birth and may be said to have more than one 'first' language.
foreigner talk: The modified or simplified language that sorne native speakers address to second language learners. A special category of fareigner talk is teacher talk.
foreign language learning: This refers to the learning of a language, usually in a classroom setting, in a context where the target language is not
widely used in the community (for example, learning French in China). This is sometimes contrasted with 'second language learning', where the language being learned is used in the community (for example, learning ltalian in Florence).
form-focused instruction: lnstruction that draws attention to the forms and structures of the language within the context of communicative interaction. This may be done by giving metalinguistic information, simply highlighting the form in question, or by providing corrective feedback.
formulaic: Expressions or phrases that are often perceived and learned as unanalysed wholes. For example, a child or second language learner may first hear 'What's that?' as a single unit oflanguage rather than as three units.
fossilization: This term is used to describe a persistent lack of change in interlanguage patterns, even after extended exposure to or instruction in the target language.
function words: Words that are used mainly as linking or supporting words for nouns, verbs, adjectives, and adverbs. For example, prepositions ('to', 'far', 'by') and articles ('a', 'the') are two types of function words. They have little or no meaning when they occur alone, but they have an important effect on the meanings of the words they accompany.
generalization: Extending a pattern learned in one context to another one. See also overgeneralization.
genuine question: A question to which the asker does not know the answer in advance (for example, Whatdidyou do last weekend?). Also called 'referential' or 'information' questions. Contrasts with display question.
grammar translation: An approach to second language teaching characterized by the explicit teaching of grammar rules and the use of translation exercises.
grammatical morphemes: Morphemes are the smallest units oflanguage that carry meaning. A simple word is a morpheme (for example, 'book'), but when we talk about 'grammatical morphemes' we are usually referring to smaller units that are added to words to alter their meaning (for example, the -s in 'books' indicates plural) or function words (for example, the) which are ordinarily attached to another word.
grammaticality judgement: A test or task in which participants are asked to make a decision about whether a sentence is grammatically correct or not.
hypothesis (plural: hypotheses): A statement of a possible fact that can be tested through research. Most empirical research starts from one or more hypotheses and involves the design of a study that can either show support for the hypothesis or disprove it.
immersion programme: An educational programme in which a second language is taught via content-based instruction. That is, students study subjects such as mathematics and social studies in their second language. Typically, students in immersion programmes share the same first language and teachers adjust their instructional language and materials to meet the needs of second language learners.
information processing: A psychological theory based on the idea that learners' cognitive resources are limited and they can't pay attention to everything at the same time. But with repeated experience and practice, things which at first required attention become automatic, leaving more attention available for focus on something else.
innatist: In language acquisition research, this is the theoretical perspective based on the hypothesis that human beings are born with mental structures that are designed specifically for the acquisition oflanguage.
input: The language that the learner is exposed to (either written or spoken) in the environment.
input Hood: A technique for providing a large number of examples of a particular language feature in the input to learners. It has been used in research projects to explore questions related to whether comprehensible input is sufficient for language acquisition.
instrumental motivation: Motivation that is essentially practica!, such as the need to learn the language in arder to get a better job.
integrative motivation: Motivation for second language learning that is based on a desire to know more about the culture and community of the target language group and even a desire to be more like members of that group.
intensive ESL: In this book, 'intensive' ESL is used to refer to an instructional approach in Quebec where 10-12-year-old French-speaking students learn English as a second language. Most Quebec students in this age group have only an hour or two of ESL instruction each week. 'Intensive ESI.: classes provide much more time. Most of the classes observed in intensive ESL research set aside one five-month block of time in one school year and devore full days to ESL instruction during that period. The pedagogical approach observed in these classes is predominantly communicative language teaching. In contrast to immersion programmes, intensive ESL classes do not usually include content-based language teaching.
interaction hypothesis: The hypothesis that language acquisition is based both on learners' innate abilities and on opportunities to engage in conversations, often those in which other speakers modify their speech and
their interaction patterns to match the learners' communication requirements. The innate abilities are not seen as being specific to language or language acquisition.
interlanguage: A learner's developing second language knowledge. It may have characteristics of the learner's first language, characteristics of the second language, and sorne characteristics that seem to be very general and tend to occur in all or most interlanguage systems. Interlanguages are systematic, but they are also dynamic. They change as learners receive more input and revise their hypotheses about the second language.
interlocutor: A participant in a conversation.
language acquisition/language learning: In this book, these two terms are most often used interchangeably. However, for sorne researchers, most notably Stephen Krashen acquisition represents 'unconscious' internalization of language knowledge, which takes place when attention is focused on meaning rather than language form, and learning is described as a 'conscious' process that occurs when the learner's objective is to learn about the language itself, rather than to understand messages conveyed through the language.
language-related episodes (LREs): Parts of conversational interactions in which language learners talk about the language forms they are using and engage in self- and peer-correction.
longitudinal study: A study in which the same learners are studied over a period of time. This contrasts with a cross-sectional study.
meaning-hased instruction: See communicative language teaching.
meta-analysis (plural: meta-analyses): A statistical procedure that allows researchers to combine the findings from a large number of quantitative studies in order to assess the overall patterns of findings on a similar topie.
metalinguistic awareness: The ability to treat language as an object, for example, being able to define a word, or to say what sounds make up that word.
mitigation: Inpragmatics, a phrase or tone of voice used to reduce or soften the possible negative impact of what is said.
modified input: Adapted speech that adults use to address children and native speakers use to address language learners so that they will be able to understand. Examples of modified input include shorter, simpler sentences, and basic vocabulary.
modified interaction: Adapted conversation patterns that proficient speakers use in addressing language learners so that the learner will be able to understand. Examples of interactional modifications include comprehension checks, clarification requests, and self-repetitions.
morpheme: See grammatical morphemes.
native-like: The ability to comprehend and produce a second language at a level of performance that is indistinguishable from that of a nativespeaker.
native speaker: A person who has learned a language from an early age and who is deemed to be fully proficient in that language. Native speakers differ in terms of vocabulary and stylistic aspects oflanguage use, but they tend to agree on the basic grammar of the language. The notion 'native speaker' must always be understood within a specific geographic region or socioeconomic group because there is wide variation among 'native speakers' of most languages.
natural order: See developmental sequence.
negotiation of form: An interaction in which language learners work toward the correct form in a context where meaning is understood. If a teacher is involved in the interaction, he or she seeks to guide students to find the right form instead of providing it for them.
negotiation for meaning: Interaction between speakers who make adjustments to their speech and use other techniques to repair a breakdown in communication. See also modified interaction.
noticing hypothesis: The hypothesis, proposed by Richard Schmidt, that language learners learn only that which they have first 'noticed' or become aware of in the input.
obligatory contexts: Places in a sentence where a particular grammatical form is required if the sentence is to be correct. Far example, in the sentence 'Last week, my brother rent a car', the speaker has created an obligatory context for the past tense by the use of 'Last week', but has not used the required form of the verb in that context.
order of acquisition: See developmental sequence.
overgeneralization: This type of error is the result of trying to use a rule or pattern in a context where it does not belong, for example, putting a regular -edending on an irregular verb, as in 'buyed' instead of 'bought'.
pattern practice drill: A teaching technique in which learners are asked to practise sentences chosen to represent particular linguistic forms. Typical of the audiolingual approach.
performance: The way we use language in listening, speaking, reading, writing. Performance is usually contrasted with competence, which is the knowledge that underlies our ability to use language. Performance is subject to variations due to inattention or fatigue whereas competence, at least for the mature native speaker, is more stable.
phonemic: Small differences in language sounds that can change meaning within a particular language. For example, the consonants $p$ and $b$ are phonemic in English, but not in Arabic.
pragmatics: Aspects oflanguage use that go beyond vocabulary and grammar to inelude rules of how to use language appropriately in different contexts and with different speakers. It also includes an understanding of the implied as well as the explicit meaning oflanguage.
private speech: The language we use when we are talking to ourselves, not expecting anyone to hear or respond.
procedural knowledge: Knowledge that underlies fluent or automatic performance. It is contrasted with declarative knowledge.
processability theory: Manfred Pienemann's theory oflearners' developing ability to process linguistic elements in different sentence positions.
processing instruction: An approach to instruction in which learners are given explicit information about the language feature to be learned and their practice activities involve the comprehension (not production) of sentences or texts that cannot be understood without a focus on the language itself. The approach was developed by Bill VanPatten.
qualitative research: An approach that uses detailed descriptions of the phenomena being studied rather than counting or measuring the exact amount of sorne specific variable or variables. Qualitative research requires extensive observation and insightful interpretation.
quantitative research: An approach that requires precise counts or numeric measurements of variables. In a quantitative study, both the variable that is believed to affect learning and the learning itself are measured or 'quantified'. Quantitative research requires careful selection of the measurements that will be used to represent the variables being studied.
rate oflearning: The speed with which learners progress in their language development.
recast: To repeat a learner's incorrect utterance, making changes that convert it to a correct phrase or sentence. 'Recast' is also used as a noun, that is, a recast is the interlocutor's modified/corrected form of the learner's utterance.
register: A style or way of using language that is typical of or appropriate for a particular setting. For example, speaking and writing usually require different registers; the register used in writing a research repon is different from that used in writing a letter to a friend.
restructuring: Cognitive activity that is seen as causing changes in the way information is organized in the brain, even though no new information has been learned.
scaffolding: The language that an interlocutor uses to support the communicative success of another speaker. Itmay include the provision of missing vocabulary or the expansion of the speaker's incomplete sentence.
second language (L2): In this book, the term refers to any language other than the first language learned. Thus, it may actually refer to the third or fourth language.
segmental: The individual sounds of a language. Contrasted with 'suprasegmentals', which are patterns of intonation.
significant difference: This is a technical term that refers to differences between groups which, according to a variety of statistical tests, are unlikely to have happened by chance. Such differences can be small or large. Their 'significance' is due to the consistency of the differences as well as their size.
simplification: Leaving out elements of a sentence, for example, using the same form of a verb regardless of person, number, tense ('Igo today. He go yesterday').
sociocultural theory: An explanation for knowledge and learning that is based on the assumption that all learning is füst social then individual. Learning is viewed as a process that is socially mediated, that is, it is dependent on dialogue in face-to-face interaction. The claim is that during communication, learners jointly construct knowledge which is internalized by the individual.
standard variety: The variety of a given language that is typically used in formal writing and formal public speaking (including broadcasting). The standard variety of widely spoken languages may be different in different places. For example, American English, British English, Canadian English, and Indian English each has its own standard variety, as well as numerous ethnic, regional, and socioeconomic varieties.
structural grading: A technique for organizing or sequencing material in a textbook or lessons. The basis for the organization is a gradual increase in complexity of grammatical features.
subtractive bilingualism: Partially or completely losing the first language as a second language is acquired.
suprasegmentals: The sounds of a language that involve the melody and rhythm of the language (e.g. stress and intonation), rather than the pronunciation ofindividual sounds.
target language: The language being learned, whether it is the first language or a second (or third or fourth) language.
task-based language teaching (TBLT): Instruction in which classroom activities are 'tasks' similar to those learners might engage in outside the
second or foreign language classroom. Tasks may be complex, for example, creating a school newspaper, or more limited, for example, making a phone call to reserve a train ticket.
teacher talk: See modified input and foreigner talk.
transfer: The influence of a learner's first language knowledge in the second language. Also called 'interference'. The term 'cross-linguistic influence' is now preferred by many researchers. Itbetter reflects the complex ways in which knowledge of the first language may affect learners' knowledge and use of another.
transfer-appropriate processing (TAP): Cognitive psychologists have observed that when we learn something new, we also internalize sorne aspects of the circumstances and thinking processes that were present when we learned it. The TAP hypothesis is that knowledge is easier to retrieve if we are returned to or can recreare those circumstances and thinking processes.
universal grammar (UG): Innate linguistic knowledge which, it is hypothesized, consists of a set of principles common to all languages. This term is associated with Chomsky's theory oflanguage acquisition.
uptake: This term is sometimes used in a general sense to refer to what a learner notices and/or retains in second language input or instruction. Lyster and Ranta's (1997) definition refers to a learner's observable immediate response to corrective feedback on his/her utterances.
variable: An element or characteristic that can be measured or defined. Variables can differ in different groups or change over time within a group or individual. Sorne examples of variables that are commonly examined in language acquisition research include the amount of time a person has been learning the language, seores on aptitude tests, and performance on measures oflanguage knowledge.
variational features: In contrast to the developmental features in the framework developed by Pienemann and his colleagues, variational features (for example, vocabulary, sorne grammatical morphemes) can be learned at any point in the learner's development.
variety: A way of speaking and using language that is typical of a particular regional, socioeconomic, or ethnic group. The term 'dialect' is sometimes used. Sorne language varieties are stigmatized as 'uneducated' but each language variety has its own rules and patterns that are as complex and systematic as those of the so-called 'standard' language. Among the most studied non-standard varieties of English are British Cockney and African American Vernacular English.
willingness to communicate (WTC): The predisposition oflearners toward or away from communicating in a second/foreign language. Several
factors contribute to WTC including social, individual, situational, and motivational.
working memory (WM): The cognitive 'space' in which we actively process new information or information that is currently in focus. Also called 'short-term memory'.
zone of proximal development (ZPD): The metaphorical 'place' in which a learner is capable of a higher level of performance because there is support from interaction with an interlocutor. In Vygotsky's theory, learning takes place through and during interaction in the learner's ZPD.

## Oxford Handbooks for Language Teachers

This series provides a source of reference for both language teachers and teacher trainers. Fach title can be used both as basis for courses and seminars and as a longer term reference text for the teacher's bookshelf

## Fourth Edition

## How Languages are learned

This prize-winming readable mtroduction to researdh in language acquisition is recommended reading for second language teachers wonld wide Now in its fourth edition. Bow tanguages are tearned is Highly valued tor the way it relates language acquisition theory and researah to teaching and learning in the language classroom

New for this edition:

- ïlupated content gives teachers information about recent research on Le learning
- Activities and Questions for Reflection personalise content and support critical thinking
- Extra Activities Stuay Questions and videos available onlineat www.oup.com/elt/teacher/hial
- Also avaikble as an e-book: see wwwoup. com/er for details

Patsy M Iichiniown is Distinguished Professor Emeritus of Applied IInguistics at Concordia University, Montreal.

NINA SPADA is Professor in the Second Zanguage Etucation Program, Department of Cumiculum Teaching and Leaming: OISE University of Toronto.
